- 3. That on October 22nd, 1909, the City of Houston, respondent in the above styled case, passed an ordinance pre-scribing certain telephone rates to be charged in the City of 1525 Houston; that in December, 1917, the Southwestern Telegraph and Telephone Company, then owner of the telephone exchange in said City, applied to the City Council for an increase in the rates prescribed by the ordinance of 1909, said rates prescribed in said ordinance having become wholly unremunerative and confiscatory; that permission to increase said rates was not granted; that on August 1st, 1918, the property of the Southwestern Telegraph and Telephone Company in said Houston exchange was taken over by the United States Government and placed under the supervision of the Postmaster General of the United States; that thereafter the Postmaster General ordered said ordinance rates of 1909 increased, and that said rates were increased on February 1st, 1919; that the City filed an application in the State court for an injunction to restrain the enforcement of said increased rates, and that this Court, the cause having been removed to this Court, upheld the Government rates, and upon application of said The Southwestern Telegraph and Telephone

Company issued an injunction against the City of Houston interfering with the charging and collection of the increased rates during the period of Government control and operation; that on August 1st, 1919, the United States Government relinquished the control and operation of the property of the said The Southwestern Telegraph and Telephone Company, and that on August 7th, 1919, the Mayor of the City of Houston notified said The Southwestern Telegraph and Telephone Company that in accordance with the action of the City Council of the City, the City would insist upon the enforcement of

1526 the ordinance rates of 1909; that The Southwestern Telegraph and Telephone Company then applied to this Court for an injunction to restrain the City from interfering with the continued enforcement of the increased rates, alleging that the ordinance rates of 1909 confiscated its property in its Houston exchange; that a hearing was had and at the conclusion of the hearing the temporary injunction prayed for was denied and the case was referred to a Master.

- 4. That said ordinance of October 22nd, 1909, is general in its nature and prescribed confiscatory rates to be charged by telephone companies, and applies to all telephone companies doing business in the City of Houston, and is especially applicable to, and will be enforced against, Southwestern Bell Telephone Company, as the successor of The Southwestern Telegraph and Telephone Company in the ownership and operation of the local telephone exchange system in the City of Houston.
- 5. Southwestern Bell Telephone Company says that by virtue of its purchase of the property of The Southwestern Telegraph and Telephone Company in the City of Houston, all of the allegations of fact and of law contained in the original Bill of Complaint of The Southwestern Telegraph and Telephone Company, except as otherwise appears herein, are applicable to and are hereby adopted by the Southwestern Bell Telephone Company as its own, as fully and completely as if said Original Bill of Complaint had been originally prepared and filed by it.

Wherefore, premises considered, Southwestern Bell Telephone
Company prays that it may be substituted for and stand in
1527 the place of The Southwestern Telegraph and Telephone Company, the Complainant in the original suit, and that it may have the benefit of said suit, and of the orders, decrees and proceedings therein, and that this original Complaint be taken as supplemental to said Original Bill of Complaint filed by The Southwestern Telegraph and Telephone Company, and that Southwestern Bell Telephone Company be granted the relief prayed for in said Original Bill of Complaint in all respects as though the Original Bill of Complaint had been prepared and filed by it.

1528 STATE OF TEXAS, County of Dallas:

Before me, the undersigned authority, on this day personally appeared E. F. Carter, known to me to be a reputable person, who upon oath states that he was formerly General Manager of The Southwestern Telegraph and Telephone Company for the State of Texas, and that he is now General Manager of Southwestern Bell Telephone Company for the State of Texas; that he has read the foregoing instrument and that the facts and matters stated therein are correct.

Subscribed and sworn to before me this the 2nd day of June, A. D., 1920.

Notary Public in and for Dallas County, Texas.

THE SOUTHWESTERN TELEGRAPH AND TELEPHONE COMPANY

1.8

CITY OF HOUSTON et al.

This case coming on to be heard on motion of Southwestern Bell Telephone Company for permission to file its Original Complaint in the nature of a Supplemental Complaint, and it appearing that Defendants have waived notice and service, and the Court being fully advised of the causes and grounds upon which permission to file said Original Complaint, in the nature of a Supplemental Complaint, is sought, it is hereby ordered, adjudged and decreed that the motion be granted, and that Southwestern Bell Telephone Company be substituted for and in the place of The Southwestern Telegraph and Telephone Company, and that Southwestern Bell Telephone Company shall be subject to and have the benefit of all orders, decrees and judgments heretofore and hereafter made by this Court, and that the name of Southwestern Bell Telephone Company shall, in all subsequent orders and proceedings, be used in the place of The Southwestern Telegraph and Telephone Company, and the

Clerk of the Court is hereby ordered to file the same as of the date of this order as the Original Complaint in the nature of a Supplemental Complaint of said Southwestern Bell Telephone Company in the cause.

1530

GEORGE WHITFIELD JACK,

Judge.

Dated July 20th, 1920.

(Endorsed on back:) No. 108—In Equity. S. W. Teleg. & Tel. Co. vs. City of Houston et al. Order Permitting filing of Original Complaint in the nature of a Supplemental Complaint, of S. W. Bell Tel. Co. Filed July 20th, 1920. L. C. Masterson, Clerk; by J. L. Sexton, Deputy.

No. 108.

THE SOUTHWESTERN TELEGRAPH AND TELEPHONE COMPANY

13.

CITY OF HOUSTON et al.

Original Complaint in the Nature of a Supplemental Complaint of Southwestern Bell Telephone Company.

To said honorable court:

Now comes Southwestern Bell Telephone Company, hereinafter styled Complainant, and represents unto the Court as follows:

- 1. That it is a corporation organized under the laws of the State of Missouri, and was granted a permit to do business in the State of Texas on April 19th, 1920.
- 2. That for a valuable consideration, during the month of April, 1920, it purchased all of the telegraph and telephone property of the Southwestern Telegraph and Telephone Company in the State of Texas, and particularly the local telephone exchange and all of the telephone property in the City of Houston, Texas, by reason of which it became the legal and equitable owner thereof, and succeeded to all of the rights of The Southwestern Telegraph and Telephone Company.
- 3. That on October 22nd, 1909, the City of Houston, respondent in the above styled case, passed an ordinance prescribing certain telephone rates to be charged in the City of Houston; that in December, 1917, the Southwestern Telegraph and Telephone Company, then owner of the telephone exchange in said

City, applied to the City Council for an increase in the rates prescribed in the ordinance of 1909, said rates prescribed in said ordinance having become wholly unremunerative and confiscatory; that permission to increase said rates was not granted; that on August 1st, 1918, the property of The Southwestern Telegraph and Telephone Company in said Houston exchange was taken over by the United States Government and placed under the supervision of the Postmaster General of the United States: that thereafter the Postmaster General ordered said ordinance rates of 1909 increased, and that said rates were increased on February 1st, 1919; that the City filed an application in the State court for an injunction to restrain the enforcement of said increased rates, and that this Court, the cause having been removed to this Court, upheld the Government rates, and upon application of said The Southwestern Telegraph and Telephone Company issued an injunction against the City of Houston interfering with the charging and collecting of the increased rates during the period of Government control and operation; that on August 1st, 1919, the United States Government relinquished the control and operation of the property of the said The Southwestern Telegraph and Telephone Company, and that on August 7th. 1919, the Mayor of the City of Houston notified the said The

Southwestern Telegraph and Telephone Company that in accordance with the action of the City Council the City would insist upon the enforcement of the ordinance rates of 1909; that The Southwestern Telegraph and Telephone Company then applied to this Court for an injunction to restrain the City from interfering with the continued enforcement of the increased rates, alleging that the ordinance rates of 1909 confiscated its property in its Houston exchange; that a hearing was had and at the conclusion of the hearing the temporary injunction prayed for was denied and the case was referred to a Master.

- 4. That said ordinance of October 22nd, 1909, is general in its nature and prescribed confiscatory rates to be charged by telephone companies, and applies to all telephone companies doing business in the City of Houston, and is especially applicable to, and will be enforced against, Southwestern Bell Telephone Company, as the successor of The Southwestern Telegraph and Telephone Company in the ownership and operation of the local telephone exchange system in the City of Houston.
- 5. Southwestern Bell Telephone Company says that by virtue of its purchase of the property of The Southwestern Telegraph and Telephone Company in the City of Houston, all of the allegations of fact and of law contained in the original bill of complaint of The Southwestern Telegraph and Telephone Company, except as otherwise appears herein, are applicable to and are hereby adopted by Southwestern Bell Telephone Company as its own, as fully and completely as if said original bill of complaint had been 1534 originally prepared and filed by it.

Wherefore, premises considered, Southwestern Bell Telephone Company prays that it may be substituted for and stand in the place of The Southwestern Telegraph and Telephone Company, the complainant in the original suit, and that it may have the benefit of said suit, and of the orders, decrees and proceedings therein, and that this original bill of complaint be taken as supplemental to said original bill of complaint filed by The Southwestern Telegraph and Telephone Company, and that Southwestern Bell Telephone Company be granted the relief prayed for in said original bill of complaint in all respects as though the original bill of complaint had been prepared and filed by it.

D. A. FRANK, J. D. FRANK, WM. H. DULS, Solicitors for Southwestern Bell Telephyne Company, Plaintiff.

1535 STATE OF TEXAS, County of Dallas:

Before me, the undersigned authority, on this day personally appeared E. F. Carter, known to me to be a reputable person, who upon oath states that he was formerly General Manager of The Southwestern Telegraph and Telephone Company for the State of Texas, and that he is now General Manager of Southwestern Bell Telephone Company for the State of Texas; that he has read the foregoing instrument and that the facts and matters stated therein are true and correct.

Subscribed and sworn to before me this the 2nd day of June, A. D., 1920.

Notary Public in and for Dallas County, Texas.

(Endorsed on back:) No. 108—In Equity. The Southwestern Telegraph and Telephone Company vs. City of Houston et al. Original Complaint in the nature of a Supplemental Complaint of Southwestern Bell Telephone Company. Filed July 20th, 1920. L. C. Masterson, Clerk; by J. L. Sexton, Deputy.

1536 In the District Court of the United States for the Southern District of Texas, Houston Division.

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

THE CITY OF HOUSTON et al., Defendants.

To said honorable court:

Now comes Southwestern Bell Telephone Company, Complainant in above numbered and entitled cause, and represents unto the Court as follows:

That on the 23rd day of November, 1920, the Defendants filed with the Clerk of this Court a precipe, setting forth the portions of the record to be incorporated into the transcript on the appeal of this case to the United States Supreme Court; that under Equity Rule No. 75, Complainant is required to file within ten days from the 23rd day of November, 1920, a precipe with the Clerk of the Court, indicating such additional portions of the record as it may desire to be incorporated into the transcript; that by reason of the voluminous record in this case, it is impossible for Complainant to properly review the portion of the record prepared by the Defendants and the rest of the evidence and numerous exhibits in the case for the purpose of determining the additional portion of the record

which this Complainant may desire incorporated into the

1537 transcript.

Wherefore, premises considered. Complainant prays that the time within which it shall be required to file its precipe with the Clerk of this Court be enlarged for a period of 40 days.

JOSEPH D. FRANK, Solicitor for Complainant.

(Endorsed on back:) Equity No. 108. Southwestern Bell Telephone Co., Complainant, vs. The City of Houston et al., Defendants. Petition of Complainant for extension of time to file precipe. Filed 29th day of November, 1920. L. C. Masterson, Clerk; by J. L. Sexton, Deputy.

1538 In the District Court of the United States for the Southern District of Texas. Houston Division.

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Defendant,

THE CITY OF HOUSTON et al., Defendants.

On this the 26th day of November, A. D., 1920, came on to be heard the petition and application of Southwestern Bell Telephone Company, Complainant in the above entitled and numbered cause, for the enlargement of the time in which to file its Precipe with the Clerk of this Court, indicating the additional portions of the record desired by the Complainant to be incorporated into the transcript upon the appeal of this case to the United States Supreme Court, and said application having been duly considered, and the Court having heretofore entered an order extending the time in which to prepare the transcript of the record in this cause and to docket said cause in the Supreme Court of the United States until February 13th, 1921, and it appearing that there is good cause for the enlargement of the time for the filing of Complainant's precipe, as prayed by the Complainant, it is considered by the Court, and so ordered, adjudged and decreed that the time in which to file Complainant's precipe, setting forth the additional portions of the record to be incorporated into the transcript be and the same is 1539 hereby enlarged and extended for a period of 40 days.

GEO. WHITFIELD JACK,
Judge of the District Court of the United States
Sitting in the Southern District of Texas.

(Endorsed on back:) Equity No. 108. Southwestern Bell Telephone Company, Complainant, vs The City of Houston, et al., Defendants. Order of Court enlarging time for filing precipe by Complainant. Filed 29th day of November, 1920. L. C. Masterson, Clerk, by J. L. Sexton, Deputy.

1540 In the District Court of the United States for the Southern District of Texas, Houston Division.

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

VS.

THE CITY OF HOUSTON et al., Defendants.

Assignment of Errors.

Now comes Southwestern Bell Telephone Company, Complainant in the above entitled and numbered cause, and files the following Assignment of Errors upon which it will rely upon its prosecution of the appeal in the above entitled cause from the decree made and entered by this Honorable Court on the 18th day of September, 1920:

T

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Fourth exception to the report of the Special Master and in sustaining Defendants' Fourth exception to said report in setting aside the finding by the Special Master, that there should be included in the valuation of Complainant's property the sum of \$765,000.00 for that element of value over and above 1541 the value of Complainant's physical property, existing by reason of the fact that Complainant has an assembled and established telephone plant in the City of Houston, doing business and earning money, such value being referred to as going concern value, and in holding that the Complainant's agreement in accepting the merger ordinance of 1915 that the sum on which it should receive a fair return should be the capital actually invested, estopped Complainant from claiming any return upon such element of value,

because said contract and agreement is in violation of, and prohibited by Article I, Section 17, of the Constitution of the State of Texas, prohibiting the granting of any irrevocable, or uncontrollable grant, franchise, privilege or immunity, and for the further reason that the Court took as the capital actually invested the cost of the property as shown by Complainant's books and, as shown by the evidence, said books, in compliance with the Uniform System of Accounts prescribed by the Interstate Commerce Commission, showed only the original cost of the physical property, and the order and finding of the Court in eliminating the item of going concern value fails to permit Complainant to earn any return whatsoever upon said element of value, and is contrary to and not supported by the law or the evidence.

II.

That the United States Court for the Southern District of Texas, Houston Division, erred in not overruling in said decree Defendants' Fifth exception to the report of the Special Master, and erred in sustaining Defendants' Fifth exception to the Report of the

Master that the proper allowance for working capital to be included in the valuation of Complainant's property is \$238,000.00, and in substituting therefor the sum of \$120,000.00, or a reduction of \$118,000.00, because, as shown by the evidence, there was included in the amount allowed by the Special Master the value of certain telephone supplies and materials that are, and must be kept on hand by Complainant to take care of repairs and contingencies, and the Court's finding is based on Complainant's average monthly operating expenditures, which do not include the value of such supplies and materials, and the value of same are not included elsewhere in the report of the Special Master. And said order and decree is contrary to the law and the evidence.

III.

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Eighth exception to the report of the Special Master and erred in sustaining Defendants' Eighth exception to the report of the Special Master in setting aside the finding of the Special Master that Complainant was entitled to set aside out of its revenue a sum equal to 6.33 per cent of \$5,500,000.00, the reproduction cost new of Complainant's physical property, as a reserve for depreciation, or \$348,150.00 for the year 1919, and substituting therefor the sum of \$289,380.00, the same being 6.33 per cent of \$4,571,567.00, the actual cost of the property, or a reduction in the amount to be set aside as a reserve for depreciation of \$58,770.00, because

the Court used the original cost of the physical property as the basis for the reserve for depreciation, whereas the proper basis upon which the reserve for depreciation should be computed is the reproduction cost new of the physical property, and the finding of the Court is contrary to, and not supported by the evidence.

IV.

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Tenth exception to the report of the Special Master, and in sustaining Defendants' Tenth exception to said report in setting aside the finding of the Special Master that anything less than a return of eight per cent upon the value of Complainant's property is confiscatory, and in holding that Complainant is only entitled to earn a fair return upon the capital actually expended by Complainant in the Houston plant, plus an allowance of \$120,000.00 for working capital, making a total of \$4,691,567.00 upon which the Complainant would be entitled to earn a fair return, instead of upon \$6,000,000.00, the fair value of the property, because the Court's application of the fair return to which Complainant is entitled, is, and should be, based on the fair value of the property, and under the finding and holding of the Court Complainant is being deprived of any return whatsoever upon the difference between the original cost of its physical property, plus an allowance of \$120,000.00 for working capital, and the fair value of the property, which difference amounts to \$1,308,433.00, and Complainant, by the finding

of the Court and under the terms of the decree entered by the Court, is being deprived of an annual return of \$104,674.64, to which it is justly entitled, and the finding and holding of the

Court is contrary to the law and the evidence.

V.

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Eleventh exception to the report of the Special Master, and erred in sustaining Defendants' Eleventh exception to said report in setting aside the finding by the Special Master that Complainant is not estopped to claim more than a fair return upon the original cost of its property, and in holding that Complainant specifically waived the right to claim anything more than a fair return on its capital actually invested in its Houston plant, or the original cost of said property, by the terms of Subdivision "E" of Section "I" of the ordinance passed by the City of Houston in 1915, and accepted by the Southwestern Telegraph and Telephone Company, Complainant's predecessor, authorizing the consolidation of the properties of the Houston Home Telephone Company and The Southwestern Telegraph and Telephone Company in the City of Houston, and reading:

"The Southwestern Telegraph and Telephone Company agrees that it will not increase rates as at present charged by it for service in the City of Houston, unless it appears upon a satisfactory showing to be made before the City Council of the City of Houston, of all receipts and disbursements, and said showing must, in order to justify or warrant a raise in the rates, reasonably prove that there exists a necessity for an increase of charges in order that said Company may earn a fair return upon its capital actually invested in the Houston plant. And it is agreed for a term of five years from this date that a fair return upon said capital and investment is not less than 7 nor more than 8 per cent."

And in holding that said agreement constituted a contract binding upon the Complainant, because said contract, in so far as it attempts to fix the valuation upon which Complainant shall be entitled to earn a fair return is contrary to, in violation of, and expressly prohibited by Article "I," Section 17, of the Constitution of the State of Texas, which provides that "no irrevocable or uncontrollable grant of special privileges or immunities shall be made; and all privileges and franchises granted by the Legislature, or created under its authority, shall be subject to the control thereof." And said contract is void and unenforceable, because the Legislature of Texas has never delegated to the City of Houston, and under the provisions of Article "I." Section 17, of the Texas Constitution aforesaid, the Legislature of Texas can not delegate to the City of Houston the power to make said contract, because by the terms of said contract the City of Houston has attempted to and has abandoned its police power and governmental authority and duty to regulate the rates to be charged by Complainant, to the end that Complainant shall only be permitted to earn a fair return upon the value of its property, which value at different times may be either in excess of or below the capital actually invested, and the finding and holding of the Court is contrary to the law and the evidence.

1546 VI

That the United States District Court for the Southern District of Texas, Houston Division, erred in providing in its decree of September 18th, 1920, that the Defendants are restrained and enjoined from interfering with the Plaintiff in charging and collecting such rates as will not produce more than a fair return upon its capital actually invested, instead of restraining and enjoining the Defendants from interfering with Plaintiff in charging and collecting such rates as will not produce more than a fair return upon the fair value of the Plaintiff's property, because Plaintiff's capital actually invested in the Houston plant, as determined by the Court, is \$1,308,-433.00 less than the fair value of Plaintiff's property, and such order and decree of the Court has prevented and is preventing Plaintiff from earning any return whatsoever upon the said difference, and Plaintiff is entitled to earn a fair return upon the value of all of its property being used in furnishing telephone service to its telephone subscribers in the City of Houston, and said order and decree is contrary to the law and the evidence.

Wherefore, Complainant, Southwestern Bell Telephone Company, prays that said decree be reversed, and that said U. S. District Court

1547

for the Southern District of Texas, Houston Division, be ordered to enter a decree reversing the decision of the lower Court in said cause.

DAVID A. FRANK, JOSEPH D. FRANK, WILLIAM H. DULS, JOHN CHARLES HARRIS.

Bond on Appeal.

Know all men by these presents, That we, Southwestern Bell Telephone Company, as principal, and E. M. Reardon, of Dallas, Dallas County, Texas, and F. H. Blankenship, of Dallas, Dallas County, Texas, as sureties, are held and firmly bound unto the Defendants, The City of Houston, and A. E. Amerman, Mayor of the City of Houston, Texas, Dan M. Moody, Tax and Land Commissioner of the City of Houston, H. A. Halverton, Fire Commissioner of the City of Houston, Matthew Drennan, Street and Bridge Commissioner of the City of Houston, David Fitzgerald, Water Commissioner of the City of Houston, Kenneth Krahl, City Attorney of the City of Houston, B. F. Louis, City Solicitor of the City of Houston, and Searcy Baker, Superintendent of Police of the City of Houston, jointly and severally, and to each and all of them, as their interest may appear, in the sum of \$1,000.00, lawful money of the

1551 United States, to be paid to them jointly and severally, and to their respective executors, administrators and successors; to which payment, well and truly to be made, we bind ourselves, and each of us, jointly and severally, and each of our heirs, executors and

administrators, by these presents.

Sealed with our seals and dated this the 24th day of December,

A. D., 1920.

Whereas, the above named Complainant, Southwestern Bell Telephone Company, has prosecuted an appeal to the Supreme Court of the United States to reverse the judgment of the District Court for the Southern District of Texas, Houston Division, in the above entitled cause.

Now, therefore, the condition of this obligation is such that if the above named Complainant, Southwestern Bell Telephone Company, shall prosecute its said appeal to effect and answer all costs, if it fails to make good its plea, then this obligation shall be void; otherwise, to remain in full force and effect.

SOUTHWESTERN BELL TELEPHONE COMPANY, By JOSEPH D. FRANK, Its Agent and Attorney in Fact,

Principal.

E. M. REARDON,
Surety.
F. H. BLANKENSHIP,
Surety.

Approved: GEO. WHITFIELD JACK, Judge.

I, Louis C. Maynard, Clerk of the United States District
Court for the Northern District of Texas, do hereby certify
that E. M. Reardon and F. H. Blankenship, whose signatures appear
signed to the annexed bond, are, in my opinion, good and ample
security for the amount therein specified; and that each of said
sureties has property in the County of Dallas, State of Texas, subject to execution of a larger amount, and that if said bond was offered
to me for approval, the same would be accepted and approved.

Witness my hand and seal of office at Dallas, Texas, this the 24th day of December, A. D., 1920.

[SEAL.] LOUIS C. MAYNARD,

Clerk United States District Court

for the Northern District of Texas.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

VS.

CITY OF HOUSTON et al., Defendants

To said honorable court:

Now comes the Southwestern Bell Telephone Company, Complainant in the above numbered and styled cause, and represents to the Court as follows:

That it is and has been engaged in the work of preparing a Statement of the Evidence to be filed at the time of the filing of its precipe for the purpose of indicating the portions of the record which the Southwestern Bell Telephone Company, as the Appellee, will desire incorporated into the record, in addition to that portion of the record

set out in Defendant's Statement of the Evidence filed herein on the

19th day of November, 1920;

That the complete record in this cause is voluminous, and the Complainant is now having transcribed the additional portion of the testimony which it desires incorporated into the transcript, and that it expects to have this work completed by February 1st.

and the record in this cause does not have to be filed with the Clerk of the United States Supreme Court before February

13th, A. D., 1921.

Complainant further represents that when it files its Statement of the Evidence on February 1st, 1921, the same will be in such shape that the Clerk of this Court will not have any work to do, except

to bind the same together and certify thereto.

Wherefore, premises considered, Complainant prays that the time for the filing of its præcipe indicating the additional portions of the testimony which it desires to be incorporated into the transcript may be further extended and enlarged until the 1st day of February, A. D., 1921.

CITY OF HOUSTON et al., Defendants.

On this the 17th day of January, A. D., 1921, came on to be heard the Petition of the Complainant, Southwestern Bell Telephone Company, for a further extension and enlargement of the time for filing its præcipe, indicating the additional portions of the testimony which it will desire incorporated into the transcript, in addition to that portion of the record contained in the Defendants' Statement of the Evidence, filed herein on the 19th day of November, A. D., 1920, and said application having been duly considered, and it appearing that there is good cause for the enlargement and extension of said time, it

is considered by the Court, and so ordered, adjudged and decreed, that the time in which the Complainant, Southwestern Bell Telephone Company, shall be required to file its said præcipe is hereby enlarged and extended until the 1st day of February, A. D., 1921.

GEO. WHITFIELD JACK, United States District Judge.

Petition for an Extension and Enlargement of the Time Within ... Which to Prepare Transcript of the Record and to Docket Cause.

To said honorable court:

Now comes the Southwestern Bell Telephone Company, Complainant herein, and represents unto the Court as follows:

That both the Complainant and Defendants herein have filed Petitions for an appeal of this cause to the United States Supreme

Court, which have been granted:

That heretofore, on the 2nd day of January, A. D., 1921, this Honorable Court issued a Citation to the Defendants, commanding them to appear in this cause at Washington, D. C., within the thirty days;

That the time for the Southwestern Bell Telephone Company to file its transcript of the record and docket this cause in the 1561 Supreme Court of the United States will expire on the 2nd

day of February, A. D., 1921;

That heretofore, to-wit, on the 20th day of November, A. D., 1920, this Honorable Court, upon the application of the Defendants herein, granted said Defendants an enlargement and extension of the time within which to prepare their transcript of the record in the said cause, and to docket said cause in the Supreme Court of the United States, said order providing that said Defendants should have until the 13th day of February, A. D., 1921, within which to file a trans-

script of the record and docket said cause in the Supreme Court of

the United States;

That under the equity rules one record is sufficient when both parties appeal directly to the Supreme Court of the United States, and only one record will be filed in connection with the appeal in this cause;

That your Petitioner is now engaged in preparing its record and expects to have the same prepared by the 1st day of February, A. D., 1921, and desires to have the time for the filing of its transcript of the record and the docketing of the said cause extended and enlarged to February 13th, A. D., 1921.

Wherefore, premises considered, your Petitioner prays for an enlargement and extension of the time within which to prepare its transcript of the record in this cause, and within which to docket

this cause in the Supreme Court of the United States until the

1562 13th day of February, A. D., 1921.

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

VS.

CITY OF HOUSTON et al., Defendants.

To said honorable court:

Now come Plaintiff and Defendants in the above numbered and

styled cause, and represent unto the Court as follows:

That during the trial of this cause before the Special Master there was introduced in evidence by the Plaintiff one hundred seventy-seven (177) exhibits in connection with Plaintiff's testimony, and the Defendants introduced in evidence Kelsey Exhibits Nos. 1 and 2 and Lyndon Exhibits Nos. 1 to 15, inclusive, in connection with their testimony.

That said exhibits are material to the issues raised in the appeals which have been granted herein, and vary in length from one to sev-

eral hundred pages each;

That it is not practicable to have the same copied into the transcripts or bound therein owing to the length of a number of the exhibits and the mass of detailed figures contained therein.

1566 Your Petitioners would, therefore, respectfully suggest to this Honorable Court that it is necessary and proper to transmit the said exhibits with the transcript of the proceedings herein to the Clerk of the United States Supreme Court at Washington, D. C., for consideration in connection with the transcript of the proceedings herein.

Wherefore, premises considered, your Petitioners respectfully pray that an order be entered herein, as provided by Sec. 4 of Rule 8 of the Supreme Court, instructing the Clerk of this Court to forward with the transcript of the proceedings herein to the Clerk of the Supreme Court of the United States at Washington, D. C., for consideration by said Court in the review of the decree and judgment of this Court, Plaintiff's Exhibits Nos. 1 to 177, inclusive, and Defendants' Kelsey Exhibits Nos. 1 and 2 and Lyndon Exhibits Nos. 1 to 15, inclusive, with a request to the Clerk of the United States Supreme Court that said exhibits be carefully preserved and returned to the Clerk of this Court after the final determination of the respective appeals of the parties to this cause.

JOSEPH D. FRANK, Solicitor for Plaintiff. W. J. HOWARD, Solicitor for Defendants.

1567 (Endorsed on Back:) No. 108—In Equity. Southwestern Bell Telephone Company vs. The City of Houston et al. In the District Court of the United States for the Southern District of Texas, Houston Division. Joint application of Plaintiff and Defendants for order authorizing original exhibits to be forwarded to the Clerk of the U. S. Supreme Court. Filed 17th day of January, 1921. L. C. Masterson, Clerk, by M. Anderson, Deputy.

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

VS

CITY OF HOUSTON et al., Defendants.

Whereas, On the 20th day of July, 1920, after this cause had been finally determined by the Master, with the consent of the parties, and an order of the Court, Southwestern Bell Telephone Company was substituted in the place of The Southwestern Telegraph and Telephone Company as the Plaintiff, with the understanding and agreement that such substitution should in no way affect the litigation or prejudice either party on any question raised:

Therefore, it is agreed by and between the parties hereto that wherever the name The Southwestern Telegraph and Telephone Company appears in any of the papers constituting the record in this case which have been filed since July 20th, 1920, that the same shall be as legal and valid and have the same effect as if the name Southwestern Bell Telephone Company had been used, and it is further agreed and understood that the substitution of Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Telephone Company as party Plaintiff for The Southwestern Bell Teleph

western Telegraph and Telephone Company shall not in any 1571 manner or respect affect or prejudice the rights of either parties hereto on any issues arising in this cause.

JOSEPH D. FRANK,

Solicitor for Plaintiff.
W. J. HOWARD,

Equity. No. 108.

SOUTHWESTERN BELL TELEPHONE COMPANY, Complainant,

VS.

CITY OF HOUSTON et al., Defendants.

On this the — day of January, A. D., 1921, came on to be heard the joint application of the Plaintiff and Defendants herein for the issuance of an order authorizing and permitting the parties to have a portion of the testimony taken before Special Master incorporated in the record on appeal to the Supreme Court of the United States in question and answer form, and it appearing to the Court that a part of the testimony so introduced before the Special Master was of a technical nature, involving many computations and a mass of figures that it is impracticable to have such portions of the testimony incorporated in the record in narrative form, and that the parties, both Plaintiff and Defendants, desire to have such portions set forth in question and answer form, and it further appearing that the said record can be more properly made up by permitting portions of the said testimony to be set forth in question and answer form; it is considered by the Court that the said appli-

1573 cation should be and the same is hereby granted, to the extent that the parties Plaintiff and Defendants are hereby authorized and permitted to incorporate in the said record in question and answer form such parts of the evidence as may be of such technical character as to render it difficult to put in narrative form.

Life of Central Office Switch-boards in Texas.

F. M. Hoag, Witness.

This Exhibit consists of 13 mimeographed pages. It deals 1581 with the life of switch-boards that have been installed in various towns and cities in Texas and later removed. The first column shows the town or city in which the board was installed; the second gives the type of switchboard, (magneto, common battery, etc.); the third gives the dates when the particular board was in service (e. g. 1903-1907); the fourth, the number of years the board was in service and the fifth, the cause of the removal of the board. On the thirteenth page the following summary appears:

Total common battery boards	18
Total years in service	123
Average years in service	6.83
Total magneto boards	270
Total years in service	2034
Average years in service	7.53

Depreciation Reserve.

The percentage of realized depreciation from 1909 to 1917 inclusive, as shown by Plaintiff Exhibit No. 176, averages four per cent of the average book cost of the plant for these years. This per cent covers actual realized depreciation and provides nothing whatever as a reserve for replacements of any kind which must necessarily be realized in the future. The major items of plant such as central office equipment, buildings, underground cable, none of which are included in this four per cent average, must in time be replaced and the amount of these replacements when realized is so great that if not provided for by building up a reserve, the company would have no funds with which to make them.

During the years 1918 and 1919, replacements were restricted because of Government orders giving priority in men, material, and money to industries essential to winning the war, and the effect of these orders was also to delay replacements for some time after they

became ineffective.

Amount for reserve for replacements allowed to be set aside under Government control 5.72% based on prior three years.

(Signed)

E. F. CARTER.

61. Tabular View of License Contract Services.

partments of the General Staff: Department of Development and Research, Engineering Department, Legal Department, Executive Services, and (2) Instrument Services. The Advisory, Consulting, Financial and General Services are rendered by the following de-Department and Treasurer's Department, Accounting Department and Insurance Department. The services rendered by each of A chart showing in tabular form the services furnished to the Associated Companies by the General Staff of the American Telephone and Telegraph Company. These services are divided into two broad classes: (1) Advisory, Consulting, Financial and General these departments are described in considerable detail. They consist of such items as the following:

(a) Development in advance of apparatus and methods needed by the Associated Companies for improvements in their service.

The engineers of the Associated Companies call upon the General Engineering Staff for specific advice and assistance whenever in their opinion they require it. (b) Large amount of work done by the General Engineering Staff in an advisory capacity on specific engineering questions.

(c) Expert advice as to all legal questions arising in connection with the telephone business, based on comprehensive knowledge (d) Use of all patents owned or controlled by the American Telephone and Telegraph Company. The Associated Companies are

(e) Loaning money at ordinary rates of interest, taking stock without discount, and assisting in the sale of securities relieved of all responsibility for claims for infringement and all concern with patent matters of any kind.

(f) Developing and maintaining a uniform accounting system.

The above are but a few of the many services described on the chart.

The Instrument Services consist of furnishing to the Associated Companies all of the transmitters, receivers and induction coils required by the Associated Companies for giving telephone service, and also repairing and maintaining these instruments.

62. Letter of Theodore N. Vail to H. W. Pope, which is as follows:

"Subject, Central Office System.

. H. Forbes, President. Theodore N. Vail, General Manager.

Bradley, President and Treasurer.

The National Bell Telephone Company. No. 95 Milk Street. P. O. Box 3466.

Boston, June 26, 1879.

DEAB SIR:

Before putting in any exchange or starting in or even planning for a Central Office System, I think it would be well for you to we want to do in every case is to adopt the best system, and that we think we have. Then if there is anything better we consult thoroughly with Mr. Watson, and examine minutely into our standard system for Central Office Connections. What Please let me hear from you in regard to this. should of course want to adopt that.

THEO. N. VAIL,

63. Organization Chart, A. T. & T. Co., Dept. of Development and Research, Jan. 1, 1920. H. W. Pope, 699 Bway.

A chart showing the members of this department and their duties. The chart shows that on January 1, 1920, there were 226 employees, of whom about 130 were engineers. The engineers are listed under the broad subjects upon which they are working.

Abstract of Plaintiff's Exhibits Numbered 61 to 121-Continued.

64. Organization Chart, A. T. & T. Co., Engineering Dept., Jan. 1, 1920.

A chart showing the members of this department and their duties. The chart shows that on Jan. 1, 1920 there were 324 cmployees of whom about 150 were engineers. The engineers are listed under the broad subjects upon which they are working.

65. Bulletin on Transmission Equivalents.

A bulletin prepared in 1912 by the General Engineering Staff of the American Telephone and Telegraph Company, with a Supplement and Illustrative Examples prepared in 1914. It gives the transmission equivalents of the types of circuits and of the apparatus most generally used, with an explanation of how they were determined. The complete bulletin consists of 66 pages, of which 43 are illustrative charts and diagrams.

08. Titles of Some of the Circular Letters and Specifications That Have Been Prepared for the Associated Companies.

A list showing the titles of some of the circular letters and specifications that have been prepared by the General Engineering Staff for the use of the Associated Companies. This list consists of 31 pages and contains the titles of nearly 500 circular letters and about 300 specifications.

67. Rubber Cable.

Half-tone print of one of the early types of cables used in the Bell System. This cable was rubber insulated and contained 10 pairs of wires.

68. 1,200 Pairs Cable, Fanned Out.

Half-tone print showing a length of the 1,200 pair, No. 24 Gauge Cable developed by the General Engineering Staff. A portion of the lead sheath has been removed so as to show at one end the manner in which the cable is built up by layers, and at the other end the wires fanned out.

69. 1,200 Pair, Cable Section.

Half-tone print showing three sections of 1,200 pair cable, from one of which the wires have been pushed out.

73. Principal Stages in the Development of Paper-insulated Cable used in the Bell System.

Half-tone print showing sections of 10 full-size paper-insulated cables with the years in which they were developed. During the period 1888 to 1914 the number of wires which could be placed in a full-size cable (about 2½ inches in diameter) was increased from 100 No. 18 Gauge wires to 2,424 No. 24 Gauge wires. 71. A. T. & T. Co. Specifications No. 3012: "General Cable Splicing."

72. A. T. & T. Co. Specifications No. 3913: "Underground Cable Splicing."

75. A. T. & T. Co. Specifications No. 3916: "House Cable Splicing."

Companies in the years 1917 and 1918. They cover in great detail the methods and materials to be used in splicing the different types of cables. They consist of more than 200 pages and contain a great number of drawings illustrating the various methods Exhibits 71 to 75 inclusive are a series of handbooks prepared by the General Engineering Staff and sent to the Associated

76. Boston-Washington Type Duplex Cable.

Half-tone print showing a section of the Duplex Cable developed by the General Engineering Staff for use in the toll and long distance lines of the Bell System.

77. Cable Londing Coil and Section, Wire Core Type.

Half-tone print showing a cable loading coil and a section of the same. This loading coil is of the wire core type.

78. Wire Core for Cable Loading Coil and Sample of No. 38 B. & S. Gauge Core Wire Before Insulation Has Been Put On.

Half-tone print showing the wire core for the cable loading coil in Exhibit No. 77, and a spool of the bare No. 38 B. & S. gauge core wire. The wire core contains approximately 69,000 turns of wire and weighs 2.6 pounds. The insulation consists of an enamel film with which the wires are coated.

79. Iron Dust Core for Cable Loading Coil and One of the Core Rings.

Photograph of a new type of cable loading coil core developed recently by the General Engineering Staff. It consists of a number of rings bound together with cloth tage. These rings are not of solid iron but are composed of a very great number of small insulated particles of iron, pressed together by hydraulic pressure.

30. Oscillograph Records Showing Changes in Telephone Currents. Photo Follows Exhibit #121.

Half-tone print showing changes in the electrical current when different words are spoken into the telephone

Abstract of Plaintiff's Exhibits Numbered 61 to 121—Continued.

81. Repeater Bulb and Socket.

Half-tone print showing a repeater buil and socket complete, and the builb and socket separately.

82. Line and Cut-off Relay, Old Type.

Half-tone print showing two views of a combined line and cut-off relay of the old type.

83. Line Relay and Cut-off Relay, New Type.

Half-tone print showing two views of new types of line relays and cut-off relays developed by the General Engineering Staff.

1602 Abstract of Plaintiff's Exhibits Numbered 122 to 135, Inclusive, Filed in Connection With Testimony of R. F. Estabrook, a Witness for Plaintiff.

Ехнівіт 122.

Photograph No. 1 Common Battery Relay Switchboard, "A" Board.

This exhibit is a photograph of one of the types of standard switch-board equipment employed in central offices throughout the South-western territory in the State of Texas and in the City of Houston. The photograph shows the face of such type of switchboard, the details of which include the subscribers' multiple of 8,000 lines, the outgoing trunk multiple, the answering jacks and lamps and 'the operators' position equipment, including cords, cord supervisory signals, cord keye, etc.

Ехнівіт 123.

Photograph Incoming Trunk Switchboard, "B" Board.

This exhibit shows the face of the kind of "B" board equipment installed in connection with the "A" switchboard equipment illustrated in Exhibit 122. The photograph shows the subscribers' multiple of 10,500 lines, the incoming trunk cords, trunk signals, trunk ringing keys, etc., which comprise each "B" operator's position equipment.

Ехнівіт 124.

Diagram of a Local Multiple Connection.

This diagram is an excerpt from the Standard Local Operating Text Book, Traffic Circular No. 113, provided by the American Company to the Associated Companies. It is a schematic drawing to illustrate a connection through the local subscribers' multiple between calling and called telephones both connected with the same "A" switchboard.

1603

Ехнівіт 125,

Diagram of Call Circuit Trunk Connection.

This diagram is an excerpt from the Standard Local Operating Text Book, Traffic Circular No. 113, provided by the American Company to the Associated Companies. It is a schematic drawing to illustrate a connection between calling and called telephones when they are subscribers to different central offices and the completion of the call involves connection at an "A" position between a calling telephone and a call circuit trunk and at a "B" position between the same call circuit trunk and the called telephone line in the "B" multiple.

Ехнівіт 126.

Photograph Back of an "A" Switchboard.

This exhibit shows the apparatus and wiring on an "A" board section viewed from the back of the switchboard. The principal features shown are the switchboard cabling containing the multiple of subscribers' lines, the switchboard cabling containing the multiple of the outgoing trunk circuits, the shelf on which the fixed ends of the flexible "A" cords are connected at terminals to the cord circuit cables, the blocks of supervisory relays and resistances controlling the cord circuits, and at the bottom, the cables extending the subscribers' lines from the intermediate distributing frame to the answering jacks and lamps.

Ехнівіт 127.

Drawing of an "A" Position.

This exhibit is a diagram showing in more detail the principal items of equipment provided on a typical "A" position, each portion of the equipment being marked with its proper name or description.

Exhibits 122 to 127 were used by the witness in explaining the technical aspects of the switchboard equipment which is designed by the General Engineering Staff for the use of the Associated Companies.

1604

Ехнівіт 128.

No. 1-D Switchboard Equipment.

This exhibit consists of a bound copy of General Engineering Circular No. 787, issued by the Engineering Department of the A. T. & T. Company and comprising a general description of this type of board, a detailed description of all the component circuits, apparatus, racks, frames and power equipment with the complete information required for engineering and planning an installation of this equipment. In Section 11, page 28, are given the numbers and titles of twelve other general engineering circulars, the information in which is also referred to in connection with the engineering of this type of equipment. The circular consists of about 57 pages of typewritten matter and 145 pages of drawings of circuits and equipment.

Ехнівіт 129.

Standard Traffic Engineering Practices.

This exhibit consists of a copy of General Engineering Circular No. 644, issued by the Engineering Department of the A. T. & T. Company. It comprises about 92 pages of printed matter, tables,

charts, diagrams, etc., and describes engineering practices recommended for use in engineering local and toll central office equipments. It furnishes information as to the engineering studies and estimates on which switchboard requirements are based, descriptions of the various types of switchboards and the conditions for which each type is adapted, tables and other information for determining the quantities and most economical arrangement of equipment, and recommends the traffic engineering records and form of traffic study that are needed for proper engineering of switchboard requirements by an Associated Company.

1605

Ехнівіт 130.

Local Operating Practice.

This exhibit consists of copies of Traffic Circular No. 73 and supplements, which together constitute the standard local operating practices, prepared and issued to the Associated Companies by the Engineering Department of the American Company for the guidance of the central office operating forces. It consists of about 520 pages of printed matter issued in loose-leaf form at various dates and contains complete information for the guidance of "A" operators, "B" operators, toll switching operators, tandem operators, ringdown operators, multiple marking operators, trouble operators, information operators, rural operators and the supervisory forces who direct the work of these operating forces.

Ехнівіт 131.

Local Operating Text Book.

This exhibit consists of 140 printed pages issued as Traffic Circular No. 113 by the Engineering Department of the A. T. & T. Company. It provides information designed for the instruction of new employees of the Associated Companies who are to be trained for the operating of the local switchboards. The information is set up in the form of a series of lessons illustrated by diagrams of the equipment and arrangements.

Ехнівіт 132.

Traffic Records.

This exhibit consists of copies of Traffic Circulars No. 26, 22 pages, No. 27, 13 pages, No. 28, 12 pages, No. 29, 12 pages, and No. 77, 11 pages, issued by the Engineering Department of the American Company, all together comprising 72 pages of printed matter, which provides the Associated Companies with information as to the methods and forms to be employed in keeping records of the local and toll traffic which they handle and for equating the

volumes of traffic of different classes to a common traffic unit and for working these traffic records up into the form most

significant and useful for purposes of engineering and efficient administration.

Ехнівіт 133.

Operating Labor Costs.

This exhibit consists of a copy of a circular letter from Hammon V. Hayes, Chief Engineer of the American Company, to the Chie Engineers or other officials of all of the Associated Companies, date January 18, 1907, accompanied by 10 charts, all constituting recommendations and information as to improved methods to be use in determining the forces required to operate switchboards are stating that employment of these methods would result in saving to the Associated Companies which might equal nearly a million dollars a year in their operating costs.

Ехнівіт 134.

Adjustment of Force.

This exhibit consists of a copy of Traffic Circular No. 117, issued by the Engineering Department of the A. T. & T. Company and comprising 59 pages of printed matter, charts and tables describing methods that will result in the most satisfactory and economical determinations of the sizes of the forces required to operate local and toll switchboards and the arrangements of their hours of work which are most convenient to the employees and result in most satisfactory service and economical utilization of the employees' times

Ехнівіт 135.

Standard Toll Operating Methods.

This exhibit consists of copies of Traffic Circular No. 57 and supplementary circulars, comprising 115 pages of printed matter, anywhich constitute a description of the most efficient and economic methods to be employed in handling the toll traffic of the Associate Companies and operating their switchboards.

1607 Plaintiff's Exhibits Nos. 136-140, Inclusive.

H. Blair-Smith, Witness.

No. 136. Organization Chart—American Telephone and Telegrap Company.

This exhibit shows, in graphic form, the organizaton of the American Telephone and Telegraph Company. It gives the names of the officers and shows the lines of responsibility.

No. 137. Accounting Circular No. 8, Standard Telephone Accounts—Bell Telephone System—Effective January 1, 1913.

This exhibit consists of the accounting rules and classifications prescribed for Telephone Companies by the Interstate Commerce Commission in the Uniform System of Accounts for Telephone Companies, First Issue, effective January 1, 1913, together with modifications and amplifications. The exhibit contains a classification of all accounts by number codes and a description of what is covered by each account prescribed.

No. 138. Accounting Circular No. 12, Questions and Answers—(Interpretation and Rulings Relating to Standard Telephone Accounts)—Bell Telephone System—Effective July 1, 1916.

This exhibit states, in question and answer form, the interpretations and rulings issued by The Interstate Commerce Commission in its "Accounting Bulletin No. 11: Interpretations of Accounting Classifications embodied in the Uniform System of Accounts for Telephone Companies" effective July 1, 1916. It contains an index arranged numerically by account numbers and an index arranged alphabetically by subject, or account names, both of which refer to the particularly numbered question and answer to be referred to for correct classification.

No. 139. Accounting Bulletin 108-A, Standard Occupational Classification of Telephone Employees—Bell Telephone System—September 1, 1917.

This exhibit gives in Section I, pages 2 and 5, the rules and main occupational classes prescribed by The Interstate Commerce Commission, effective July 1, 1917. It also includes in Section II, pages 6 and 38, sub-classes of the main classes which have been prescribed for use by the Bell System.

No. 140. Circular of Harris Forbes & Company, of New York, Giving Data as to 7% First Mortgage Gold Bonds to the Amount of \$900,000.00 Issued by The Houston Gas Company.

1610 PLAINTIFF'S EXHIBITS Nos. 141 TO 145, INCLUSIVE.

E. V. Cox, Witness.

No. 141.

This Exhibit is a blank form of standard contract between the Western Electric Company and the Associated Companies, stating the terms according to which the Western Electric Company acts as manufacturing and supply agent of the Associated Companies.

The Exhibit is as follows:

This agreement, made this — day of ——, A. D., 19—, by and between Western Electric Company, a corporation organized and existing under the laws of the State of New York, party of the first part, hereinafter called the Electric Company, and ——, a corporation organized and existing under the laws of the State of —, party of the second part, hereinafter called the Telephone Company.

Witnesseth, That the said parties, for value received and in consideration of the agreements herein contained, do hereby, for themselves, their successors and assigns, covenant and agree as follows:

1611 Scope.

1. The Telephone Company hereby employs the Electric Company as its agent to procure for it all the articles which it may require for its own use, except those which are named or described in Appendix "A" hereto (which may hereafter be altered from time to time by mutual consent), and hereby agrees to procure all such articles through the Electric Company; provided, however, that nothing herein contained shall be construed as requiring the Telephone Company to purchase, or use any article, or articles manufactured or sold by the Electric Company unless it shall desire to do so.

Services.

2. The Electric Company agrees to procure by manufacture, purchase or otherwise from such sources and to deliver at its store rooms to such persons, in such quantities, in such a manner and at such times, as the Telephone Company may reasonably designate, any apparatus, supplies or material which the Telephone Company may reasonably require, and agrees that the store rooms established at such places as may be mutually agreed upon shall not be discontinued or moved to another city except by the consent of the Telephone Company, or on one year's notice in writing by the Electric Company.

The Electric Company shall not be required to deliver any apparatus, supplies, or material, or to buy any unusual large 1612 quantities of supplies or material, or to manufacture any special apparatus, except on the Telephone Company's written requisition, and the Telephone Company agrees to take within one year all the apparatus, supplies or material so bought or manufactured; or failing so to do, to thereupon reimburse the Electric Company for all actual loss sustained by it on account of such failure.

Remuneration.

- 3. The Telephone Company agrees to remunerate the Electric Company as follows:
- (a) For furnishing telephonic appliances manufactured under exclusive license from The American Bell Telephone Company, and

delivered at its warerooms, standard prices, uniform to all licensees of The American Bell Telephone Company.

(b) For furnishing underground, aerial and submarine cable manufactured by the Electric Company:

If shipped direct from factory, factory cost of such cable, plus

eight per centum (8%) at factory; or

If shipped from local storeroom, full reels, factory cost, plus ten per centum (10%), plus transportation charges to storerooms; less than full reels, factory cost, plus fifteen per centum (15%), plus transportation charges to store rooms. Actual loss on short lengths

of cable, caused by the Telephone Company's orders for 1613 less than full reels, shall be borne by the Telephone Com-

Factory cost shall include only the cost of productive labor, the cost to Electric Company of materials on the date order is received ly Electric Company, and the proper share of such expenses as are necessarily incurred for the purpose of manufacturing cable.

(c) For furnishing other manufacturers of the Electric Company: Prices as low as the Electric Company's prices to its most favored customers in the United States.

(d) For furnishing articles not made by the Electric Company, excluding hard-drawn copper wire:

If shipped from any storeroom of the Electric Company, cost to

the Electric Company, plus six per centum (6%); or

If shipped from any other point direct to Telephone Company, cost to the Electric Company, plus four per centum (4%).

(e) For furnishing hard-drawn copper wire:

If shipped from any storeroom of the Electric Company, cost to

the Electric Company, plus five per centum (5%); or

If shipped from any other point direct to the Telephone Company, cost to the Electric Company, plus one per centum (1%).

The term "Cost" as used in paragraphs (d) and (e) of 1614 this section means the net price which the Electric Company is obligated to pay the supplier after all rebates, discounts and commissions have been deducted. When transportation charges, in whole or in part, are treated by the supplier as a part of his net price to the Electric Company, they shall be included in "cost" as All other transportation charges, except cartage to herein defined. the Electric Company's storerooms on articles not made by the Electric Company, shall be charged the Telephone Company, but without the addition of the aforesaid percentages. Cartage charges to the Electric Company's storerooms shall be borne by the Electric Company.

Special Services.

4. The Electric Company further agrees, at the option of the Telephone Company, to undertake and perform, with due care and diligence, any or all of the following described special services (none of which is included in the undertakings of the Electric Company, as described in Section 2), for such remuneration as may be mutually agreed upon from time to time:

- (a) Receiving, storing and reissuing or disposing of any used apparatus, supplies and material returned by the Telephone Company.
- (b) Carrying any special stock of any articles which the Telephone Company may prescribe from time to time.
- 1615 (c) Receiving, storing and reissuing or disposing of furniture or fixtures, tools and construction outfits.
 - (d) Operating a local repair and emergency shop.
- (e) Receiving, storing and delivering telephones and transmitters.
 - (f) Mounting telephones and transmitters.
 - (g) Inspection of articles not made by the Electric Company.
 - (h) Cartage, except to the Electric Company's storerooms.
- (i) Prepayment of transportation charges on shipments to the Telephone Company, and taking up and adjusting claims with carriers.
- (j) Any special accounting or clerical work not ordinarily required of a Purchasing Agent.
- (k) Any other services not hereinbefore in this contract described.

Payment.

5. The Electric Company shall render a monthly statement of account, which shall be due and payable thirty (30) days after the date of its delivery to the Telephone Company.

If the Electric Company consents to deferred payment, any portion of said account not paid when due, shall thereafter bear in-

terest at a reasonable rate.

1616 If payment is deferred without its consent, the Electric Company may, on reasonable notice, suspend or terminate its obligations hereunder.

Defective Material.

6. The Electric Company shall be liable under this contract only for direct damages arising from failure to exercise reasonable care and diligence in performing its obligations hereunder; and, in addition, as to any articles manufactured by the Electric Company, or specially inspected by it under Section 4 (g) above, which prove to be defective, the Electric Company shall be obligated either to replace the same at its own expense or to take back and allow full credit therefor.

Articles to be replaced F. O. B. factory or destination in accord-

ance with delivery terms of the original shipment.

Arbitration.

7. Any question arising under this contract shall be referred for decision at the option of either party to such person or persons as the Presidents of the two Companies, parties hereto, may agree upon, and the decision of such person or persons or of a majority thereof shall be final and binding upon the parties hereto.

Delays.

8. Whereas, the due prosecution of the business of the 1617 Telephone Company requires that its apparatus, supplies and material shall be promptly furnished and as herein provided; and whereas, the time required to ascertain judicially whether the Electric Company shall or shall not have failed to perform its obligations hereunder might cause a delay which would work damage to the Telephone Company, it is agreed that whenever the President of the Telephone Company shall be of the opinion that the Electric Company has failed or is likely to fail in its obligations in this respect, the Telephone Company may, without notice or demand, purchase elsewhere such apparatus, supplies and material as in its opinion may be required to meet the emergency, and it shall thereafter be determined by arbitration, as above provided, whether or not the opinion so acted upon by the Telephone Company was erroneous, and what, if any, damage resulted to either the Telephone Company or the Electric Company; and it is hereby agreed that any assessment for damages which said arbitrator or arbitrators may make in the premises shall be accepted and paid by the party so assessed as a just obligation.

Duration.

9. This contract shall become operative — —, ——, and shall remain in force thereafter until terminated by mutual agreement or by one year's notice in writing from either party to the other, or by the termination of the license from The American Bell

1618 Telephone Company to the Telephone Company or to the

Electric Company.

In witness whereof, The parties hereto have caused these presents to be signed in their behalf by their respective officers thereunto duly authorized, and their corporate seal to be hereunto affixed the

y and year	first above written.

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

1621

This letter is to outline the conditions under which, beginning August 1, 1913, we (hereinafter referred to as the Electric Company) will carry stocks in our warehouse to meet the requirements of your Company (hereinafter referred to as the Telephone Company).

Classification and Responsibility.

All stocks may be considered as coming under one of the following three classifications:

(1) Apparatus or material which is considered standard to the Telephone Company and standard to the Electric Company (i e., Western Electric Company apparatus manufactured under license from the American Bell Telephone Company, or approved by the American Telephone & Telegraph Company, and material of not Western Electric manufacture which is commercially standard).

The Electric Company will assume all responsibility for the maintenance of stocks of this class of material in reasonable quantities. The Telephone Company's estimates of the future requirements will neither constitute an authorization by it, nor an obligation on the Electric Company's part to purchase more than, in the latter's opinion, is a reasonable stock.

(2) Material which is standard to the Telephone Company but special to the Electric Company (i. e., Apparatus or material manufactured under the Telephone Company's own specifications, which is used regularly by the Telephone Company, but not in general

use by other customers).

The Electric Company will stock material of this class in reasonable quantities without written authority for each purchase, but if the use of such material is abandoned, the Telephone Company will at the end of a reasonable period (within 60 days) relieve the Electric Company of the stock or reimburse it for any loss sustained in otherwise disposing of any reasonable quantity which it may have in its warehouse or for which it may have contracted.

(3) Material special to the Telephone Company and special to

the Electric Company.

The Electric Company will purchase material of this class only upon the Telephone Company's written requisition. Such 1623 material shall be taken by the Telephone Company within a reasonable time (30 days) after they have been notified that it is subject to their order. If not, it shall thereafter be carried as "unusual Special" stock and be subject to the charges for carrying such stocks.

Reasonable Stock.

A reasonable stock represents the Telephone Company's average requirements based upon the usage for ordinary construction and maintenance during the preceding six months, together with proper consideration for seasonal demands, condition of the market and length of time required to transport material from the main sources of supply to the Electric Company's warehouse.

Unusual and Storm Stocks.

The purchase of quantities of Class-"I" and "2" stock in excess of a reasonable stock, whether in anticipation of prospective future development, to secure favorable prices, or as protection against possible emergencies, such as fires or storms, shall be made only upon the specific written authorization of the Telephone Company, and shall be subject to the charges for carrying such stocks.

Service.

The Electric Company agrees to purchase and carry, in addition to the reasonable stocks regularly provided, such special stocks as the Telephone Company may authorize, or as may accumulate, upon the following terms:

Classification.

Quantities of material coming under Classes "I" and "2," in excess of a reasonable stock, are termed "Special Stocks" and are of two kinds:

- (1) "Unusual Stocks"—Quantities in excess of a reasonable stock, authorized by the Telephone Company for a special reason, such as to secure a favorable price, in anticipation of prospective future development, or as protection against storms.
- (2) "Emergency Stock"—Central Office Equipment, authorized by the Telephone Company to be held indefinitely for emergency purposes. Such "Special Stocks" will be carried by the Western Electric Company in such quantities and for such time as the Telephone Company may authorize.

Remuneration.

For carrying "Special Stocks" as described above, the Electric Company will charge the Telephone Company monthly at the rate of 8% per annum of the average investment in this class of material.

This charge to begin 30 days after the material is received and to continue until, upon the Telephone Company's authorization, the Electric Company takes it, in reasonable quantities, into its general stock, or otherwise disposes of it.

Yours truly,

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH,

June 1, 1919.

Returned Material.

E. F. Carter, General Manager, Southwestern Telegraph & Telephone Co., Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which, beginning June 1, 1919, we (hereinafter referred to as the Electric Company) will handle returned material for your Company (hereinafter referred to as the Telephone Company).

1. Service.

(1.1) The Electric Company agrees to receive, store and reissue or dispose of apparatus or material returned by the Telephone 1626 Company in the following manner:

2. Delivery to Warehouse.

(2.1) All transportation and cartage charges applying on material returned to the Electric Company's warehouses, sub-warehouses or other points designated by the Electric Company, are to be borne by the Telephone Company.

3. Inspection and Classification.

- (3.1) When received, the Electric Company will divide material into the following classes, based on such visual inspection as can be given by experienced warehouse employees, such classification to be subject to the approval of the Telephone Company.
- (3.2) No other inspection is contemplated in the rates or remuneration specified in Section 6 of this Agreement.

Class "A."

- (3.3) Telephonic appliances of Western Electric manufacture which the Telephone Company will not require within a reasonable time.
- (3.4) Large lots of Class "A" material may be returned by the Telephone Company direct from the field to Hawthorne.
- (3.5) Preliminary credit for such apparatus may be given at the Electric Company's allowance prices, and after it has been delivered to a space set aside for this class of material, the Telephone Company shall have no further responsibility. Final credit for this class of material cannot be issued until the material has been shipped to Hawthorne and their report of classification received; if a preliminary credit is issued by the local house, it shall be subject to adjustment to agree with the final report from Hawthorne.

Class "B."

- (3.6) Material which is of no value except as junk.
- (3.7) Space shall be provided for this material where it shall be kept until a sufficient quantity has accumulated to warrant disposition, when it will be sold and an adjustment made with the Telephone Company of the difference between the amount credited by the Electric Company and the actual proceeds of the sale.
- (3.8) Large lots of Class "B" material may be returned by the Telephone Company direct from the field to the purchaser, as directed by the Electric Company.
- (3.9) Class "B" material shall be credited when received at the current market price of junk of corresponding kinds. When it is sold an adjustment shall be made with the Telephone Company

for the difference between the amount credited by the Elec-1628 tric Company and the actual net proceeds of the sale.

Class "C."

(3.10) Apparatus and material of active types for which there is a probable demand within a reasonable time.

Class "D."

(3.11) All switchboard cords and plugs returned to the Electric Company for stock, repairs to be made if necessary.

Class- "C" and "D."

- (3.12) Material of these classes shall be credited to the Telephone Company at the price of corresponding new material, and will be re-issued to the Telephone Company at the price allowed on the credit.
- (3.13) If material so credited is not drawn from the Electric Company's warehouse within one year from the date of credit, it shall be subject to a carrying charge until it has been shipped to the Telephone Company or otherwise disposed of as authorized by the Telephone Company, the responsibility for the ultimate use or disposition of such material being with the Telephone Company.

4. Repairs.

(4.1) Necessary repairs to Class- "C" and "D" material shall be made under the terms of a supplementary agreement covering Section 4*D, and the cost of repairs shall be charged to the Telephone Company separately.

5. Insurance.

- (5.1) For insurance purposes, Class "C" and "D" material in the Electric Company's warehouse shall be valued at 50% of the current new value of similar material, and the Electric Company shall insure on the basis of 80% of this valuation.
- (5.2) In case of loss by fire, the Telephone Company shall reimburse the Electric Company in an amount equal to the difference between such insurance as the Electric Company may be able to collect on the Class "B," "C" and "D" material so lost and the amount credited to the Telephone Company by the Electric Company for such material.

6. Remuneration.

- (6.1) For performing the services described in the foregoing, the Electric Company will charge the Telephone Company monthly, as follows:
 - (6.2) Class A: For receiving, classifying, delivering to proper space in the warehouse, crediting and keeping the records.
- 1% of the value of all Class A material received at the warehouse and credited during the month.

1630

- (6.3) Class B: For receiving, classifying, crediting, keeping records, storing, selling and handling from the time it is received in the warehouse until it has been disposed of.
- 2½% of the selling price of Class B material sold from the warehouse during the month.
- (6.4) Class C: For receiving, classifying, issuing credit, keeping records, storing for a period not to exceed one year and reissuing or disposing of.
- 7% of the value of all material credited as Class "C" during the month.
- (6.5) Class D: For receiving, storing for a period not exceeding one year, and relssuing or disposing of.
- 2% of the value of all material credited as Class "D" during the month.
- (6.6) Direct Shipment: For keeping records and issuing credit for all classes of material which are returned direct from the Telephone Company to Hawthorne, or other purchaser.
- 1/2% of 1% of the value of such material credited during the month.
- (6.7) Carrying Charge: For carrying
 Class "C" and "D" material after it has been
 in the possession of the
 Electric Company for 1
 year.
- 8% per annum of the average monthly investment in such material.

7. Payments.

(7.1) Payments for the credits allowed the Telephone Company are to be made by the Electric Company on the terms under which its invoices are rendered.

8. Termination.

This Agreement may be altered by mutual agreement or terminated upon three months' notice in writing from either party to the other.

WESTERN ELECTRIC COMPANY, INC., (Signed) By R. W. VAN VALKENBURGH.

June 1, 1919.

Exceptions to Preceding Letter.

Paragraph 3.5.

For the convenience of both Companies and to simplify the accounting in connection with Class "A" material, no credit shall be issued until final report of allowance is received from Hawthorne.

Paragraph 3.9.

Credit shall not be issued for Class "B" material until it is finally disposed of, thus avoiding the necessity of a preliminary credit and a subsequent adjustment.

Paragraph 3.11.

Due to the fact that but few cords and plugs are returned and that the total value is not sufficient to warrant a separate classification, all cords and plugs shall be classified "C."

1632

Paragraph 6.5.

The provisions of this paragraph shall not become effective for the reason that cords and plugs shall be considered Class "C," as indicated in Paragraph 3.9 above.

WESTERN ELECTRIC COMPANY, INC., (Signed) By R. W. VAN VALKENBURGH.

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which, beginning August 1, 1913, we (hereinafter referred to as the Electric Company) will operate a local repair and emergency shop and recovery department for work required by your Company (hereinafter referred to as the Telephone Company).

Service.

The Electric Company agrees to operate Local Repair Shops on the following basis:

Repair and Emergency Shops.

A shop equipped to do the ordinary class of repairs to apparatus and material and to perform such emergency service as is required by the Telephone Company.

Recovery Shop.

A small department containing no machinery, but equipped to make minor or rub-up repairs to apparatus. All employees to be productive laborers, and the total output to be charged monthly without any detailed cost of the types of apparatus repaired.

Remuneration.

Repair and Emergency Shops.

So far as possible, standard repairs will be charged as agreed on flat prices, representing the Electric Company's cost; these prices to hold good until changes in costs of material and labor make a revision necessary. For any work not covered by standard prices, the Electric Company will charge actual cost of productive labor, plus 30% loading to cover shop expense, and material at prices usually charged your Company.

Recovery Shop.

The Electric Company will charge the Telephone Company monthly its actual cost of labor, plus 15% loading to cover department expenses and supervision expense, and material at prices usually charged your Company.

1634 Yours truly,

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

October 1, 1918.

A. B. Elias, General Manager, Southwestern Telegraph & Telephone Co., Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which, beginning October 1, 1918, we (hereinafter referred to as the Electric Company) will warehouse and distribute lead covered cable for your Company (hereinafter referred to as the Telephone Company).

1. Service.

General.

- (1.1) The Electric Company agrees to carry a reasonable stock of new lead covered cable for ordinary construction and maintenance purposes, and such second hand cable as the Telephone Company may return, on the following terms:
- (1,2) Actual loss on short lengths of new or returned cable caused by the Telephone Company's orders for less than full reels shall be borne by the Telephone Company.
- (1.3) Empty reels and lags may be returned to the Electric Company's warehouse or direct from the Telephone Company to the Electric Company's factory at Hawthorne.

New Cable.

(1.4) Instead of billing new cable shipped from local warehouse stock at 10% and 15% above factory cost, the Electric Company will bill all new cable shipped from its warehouses at the direct shipment rate of 8% above factory cost, plus transportation charges from the factory and cartage charges to the Electric Company's warehouse.

Emergency Stock of Cable.

(1.5) Stocks of cable authorized by the Telephone Company to be held for emergency purposes or unusual stocks, shall be carried under the terms of the 4 (b) supplementary agreement.

Returned Cable.

- (1.6) Cable fit for re-use returned by the Telephone Company shall be placed in stock and credit given the Telephone Company at current prices of new cable of corresponding type. It shall be billed the Telephone Company when shipped at the price credited.
- (1.7) Returned cable which has been on hand for one year shall be subject to a carrying charge until it has been shipped to, or otherwise disposed of, by the Telephone Company.

2. Remuneration.

- (2.1) For performing the services described in Section 1, the Electric Company will charge the Telephone Company as follows:
- (2.2) 3% of the billing price of all new and returned cable shipped from warehouse stock, including emergency and unusual stocks and including the value of reels and lags.

- (2.3) 3% of the credit price of cable returned to the warehouse, including the value of reels and lags.
- (2.4) For carrying returned cable which has been on hand for one year, the Electric Company shall charge the Telephone Company monthly at the rate of 8% per annum on the average investment in such cable, including the value of reels and lags.
- (2.5) Empty reels returned to the warehouse shall be subject to the rates of remuneration specified in paragraphs 2.2, 2.3 and 2.4 of this Agreement.
- (2.6) To cover the clerical expense in connection with 1637 empty reels and lags returned from the Telephone Company direct to Hawthorne, the Electric Company shall charge the Telephone Company ½ of 1% of the amount of the credit for such reels and lags.
 - (2.7) The remuneration specified in paragraphs 2.2, 2.3, 2.4 and 2.5 of this Agreement, may be applied on each bill or credit rendered by the Electric Company for such material or included in a monthly special service bill, at the discretion of the Telephone Company.

3. Termination.

This agreement may be altered by mutual agreement or terminated upon three months' notice in writing from either party to the other.

Yours truly,

WESTERN ELECTRIC COMPANY, INC., By R. W. VAN VALKENBURGH.

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

1638 This letter is to outline the conditions under which, beginning August 1, 1913, we (hereinafter referred to as the Electric Company) will prepay transportation charges on shipments made your Company (hereinafter referred to as the Telephone Company), and take up and adjust claims with carriers.

Service.

The Electric Company will prepay transportation charges on shipments to the Telephone Company, and adjust claims with carriers.

Remuneration.

For performing this service the Electric Company will make a monthly charge of \$80.00, representing approximately its cost of

doing the work and interest for a period of forty-five days on the total amount of money advanced each month.

Yours truly,

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

1639 DEAR SIR:

This letter is to outline the conditions under which, beginning August 1, 1913, we (hereinafter referred to as the Electric Company) will supervise cartage, except that covering the hauling of new material to the Electric Company's warehouse, as requested by your Company (hereinafter referred to as the Telephone Company).

Service.

The Electric Company agrees to handle the trucking of outgoing material from its warehouse to the proper freight terminal or other points designated by the Telephone Company, and incoming returned material from the freight terminals or other points to its warehouses.

Remuneration.

The Electric Company will render a monthly bill covering its actual cost of truck hire, plus 6% to cover the cost of supervision of trucks and necessary clerical work.

Yours truly,

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

1640

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which, beginning August 1, 1913, we (hereinafter referred to as the Electric Company) will receive, store and deliver telephone and transmitters for your Company (hereinafter referred to as the Telephone Company).

Service.

The Electric Company agrees to receive, store, deliver and keep records of American Bell instruments on the following terms:

Receiving.

The expense of receiving and delivering returned instruments to the American Bell Distributing Station shall be included in the charge for special service covering returned goods, classified as "A," "B" and "C."

Storing, Receiving, and Keeping Records.

From the time returned instruments are delivered to the Distributing Station, all expense incidental to storing, shipping and keeping records shall be borne by the American Bell Tele1641 phone Company, and no further charge shall be made against the Telephone Company. All expenses incurred by the Electric Company in connection with the handling of new American Bell instruments shall be borne by the American Bell Telephone Company.

Yours truly.

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

Mr. A. B. Elias, General Manager,
Southwestern Telegraph & Telephone Co.,
Dallas, Texas.

May 1, 1918.

DEAR SIR:

This letter is to outline the conditions under which, beginning May 1, 1918, we (hereinafter referred to as the Electric Company) will warehouse and distribute stationery and office supplies for your Company (hereinafter referred to as the Telephone Company).

- To simplify the accounting for stationery and office supplies, it is agreed that they shall be billed to the Telephone Company when they are received in the Electric Company's warehouse
 and that no bills shall be rendered when shipment is made from the warehouse to the Telephone Company.
- 2. Under this arrangement the Telephone Company carries the investment in this class of material while it is in the Electric Company's warehouse; the remuneration rate of 6% contemplates that the Electric Company shall carry an investment in warehouse stocks equal to sixty days' requirements. It is therefore agreed that stationery and office supplies handled under this routine shall be billed to the Telephone Company as specified, except that the percentage over cost shall be five (5) instead of six (6).
- 3. This Agreement may be altered by mutual consent or cancelled. upon three months' notice in writing from either party to the other.

Yours truly, WESTERN ELECTRIC COMPANY, INC., By R. W. VAN VALKENBURGH.

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which, be ginning August 1, 1913, we (hereinafter referred to as the Electric Company) will inspect articles not made by the Western Electric Company as requested by your Company (hereinafter referred to as the Telephone Company).

Service.

The Electric Company agrees to inspect such material of Not W. E. manufacture as the Telephone Company may designate,—a list of such material to Form Supplement (B) to this letter.

Remuneration.

Supplement (A) to this letter is a list of the standard inspection charges in force at present. These prices represent actual cost to the Electric Company and are subject to revision.

Where standard inspection charges are available, they shall be included in the price of the material. Where there are no standard charges, inspection shall be billed as a separate item at actual cost to the Electric Company, plus a reasonable loading for supervision.

Yours truly.

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

1644 Note.—New Supplement ("A") became effective June 1, 1919.

May 28, 1919.

Supply Agreement-Inspection Charges.

Supv. of Supplies, The S. W. T. & T. Co.:

We are enclosing details of a new method for handling the cost of inspecting not WE material purchased for telephone customers.

Effective June 1, 1919, and continuing until further notice, inspection of all material for "A" and "B" customers will be charged at standard percentage rates as listed in Appendix "C" of this supplement. It will be observed that items on which inspection is required have been divided into fourteen groups, representing various classes of apparatus, material, tools and supplies.

Standard percentage rates have been established for each group which, when applied to the value of the material, will represent the Western Electric Company's charge against the Telephone Company for inspection. Rates are subject to change when warranted by change in cost.

Under the present system, the old system, a tremendous amount of clerical work is involved in order to accumulate data necessary for the revision of standard inspection rates to meet continually changing conditions, and often by the time the new

rates are established, conditions are again changed, resulting in a heavy loss or excessive profit in the particular account affected.

Furthermore, the heavy expense incurred in keeping actual cost records on standard rate accounts and on individual items billed at cost, has to be absorbed and is reflected in the standard rate established and on inspection charges at actual cost.

Under the new method the clerical work involved in keeping records of cost and changing standard percentage rates will be relatively light, and changes may be made much more easily and promptly to meet existing conditions, with the result that our billing will be

more nearly representative of the actual cost.

When making comparisons by applying the same percentage rate to items which are of a similar character but which vary considerably in price, you will doubtless notice certain inconsistencies, but it should be borne in mind that this plan is based on averages and that it is simply a method of assessing against the various telephone companies the Western Electric Company's cost of inspecting not WE material.

(Signed)

L. A. DAVIES, Stores Manager W. E. Company.

1646

Effective June 1, 1919.

Supplement "A."

Effective June 1, 1919, and until further notice, inspection of all material for "A" and "B" customers will be charged to them at standard percentage rates as listed in Appendix "C" of this Supple-All active items on which inspection is required have been divided into fourteen groups representing various classes of apparatus, materials, tools and supplies.

Standard percentage rates have been established for each group, which when applied by the distributing houses to the value of the material, will represent our charge against the customer for inspection. These rates are based on the Engineering Department's records of cost of inspection and are subject to revision when warranted

by changes in cost.

Appendix "A" of this Supplement is an alphabetical list of active items, showing the number of the group to which each has been assigned.

Appendix "B" contains the same items as Appendix "A" classified into groups.

Appendix "C" is a description of the various groups, the standard percentage rate of inspection to become effective June 1st being shown, opposite the respective group numbers.

1647 The fact that an item appears in Appendices "A" and "B" does not necessarily mean that inspection of that item is called for by all companies, and each house should call for inspection only on the basis of instructions from the companies for whom they buy.

When inspections are waived a report to that effect will be mailed immediately by the Inspection Department to the distributing house concerned, in order that inspection charges shall not be billed to the customer. If the distributing house calls for inspection of an item which is not included in any of the fourteen groups covered in Appendices "A" and "B", they should communicate immediately with the Assistant Contract Sales Manager, who will advise at once under

what group the item should be placed.

This new method of handling inspection expense eliminates all billing of inspection charges to the distributing house by the supplier, the Inspection Department and the Broadway Accounting Division; the distributing houses are, therefore, responsible for seeing that inspection at the standard percentage rate is included in their bills to customers on all items inspected, and it is important that the local routine be such that it will prevent failure to bill for inspection expense.

Suppliers' bills covering shipments made on or after June 1, 1919, which include inspection charges, should be returned for correction. Upon receipt of an invoice from a supplier covering in-

spected material shipped either direct or into stock the distributing house clerk handling inspection charges, shall refer to either Appendix "A" or "B" of this supplement and determine into which group the material in question has been classified. After determining the group number, Appendix "C" should be referred to and the standard percentage rate for that group should be applied to the net cost of the material, after deducting all discounts,

but not including freight, cartage, packing, etc.

When inspection charges on either direct shipments or shipments into stock have been determined on the basis outlined, the invoices should be backed up showing the total amount of inspection to be charged and the group number under which the item has been classified. Inspection costs which form a part of the unit price on stock items must be shown as a separate item on the back of the suppliers' invoice.

The distributing house clerk handling inspection charges should keep a daily record of the amount of inspection billed under each group and make a monthly summary of all such charges, which should be credited to the Broadway Accounting Division each month. Only one credit form is necessary; the amount credited

to each group, however, must be shown separately.

As the distributing houses must render credit covering inspection charges in the same month in which the material is billed to them by the supplier, it will not be possible for the voucher clerk to make up the monthly credit summary from the daily pay-

1649 ments as credit would not be received during the proper month on invoices payable in 30, 60 or 90 days. It is, therefore, recommended that this work be assigned to the buyer or clerk who terms invoices and checks prices, as the inspection charges can be added at the same time and it would involve but little εxtra work for this clerk to keep a daily record of these charges, which

could be summarized at the end of the month.

It is further recommended that the clerk figuring inspection charges be required to indicate on the back of the supplier's invoice by a symbol that inspection charges have been posted to the monthly credit summary, and the voucher clerk be required to check all invoices showing inspection charges for this symbol, to insure that proper credit is rendered.

November 25th, 1919.

Effective December 1st, 1919.

Change Appendix "C" to Supplement "A" of the Supplementary Agreement as follows:

Group 6-Creosoted Pine Poles and Stubs.

4% rate to apply to Western Union Teleg. Company and South Western Tel. & Tel. Company only.

New rate of 8% effective on all bills rendered on and after De-

cember 1, 1919, to apply to all other Companies.

This increase due to new inspection specifications issued by the A. T. & T. Co.

E. C. ESTEP,
Assistant Contract Sales Manager,
Western Electric Company.

1678

August 1, 1913.

Southwestern Tel. & Tel. Company, C. A. Gates, General Manager, Dallas, Texas.

DEAR SIR:

This letter is to outline the conditions under which we (hereinafter referred to as the Electric Company) will purchase poles as required by you (hereinafter referred to as the Telephone Company).

Service.

The Electric Company agrees to purchase and deliver such poles as the Telephone Company may require; it being understood that all shipments will be made direct and that the Telephone Company will maintain such stocks of poles as are necessary.

Remuneration.

For furnishing chestnut poles which are bought in the field, the Electric Company will charge cost to it plus \$.35 per pole to cover salaries and expenses to buyers and inspectors and the expense of the Electric Company's General Pole Department plus 4%.

For furnishing poles other than chestnut, which are ordinarily bought from dealers, the Electric Company will charge cost to it plus 4% for inspection. Cost in this case means the

net price that the Electric Company is obligated to pay the suppliers. When the transportation charges are treated by suppliers as part of the net price to the Electric Company, they shall be included in cost as defined in above paragraphs. All other trans-

portation charges will be paid by Telephone Company, or if paid by the Electric Company, charged to the Telephone Company, but without the addition of above mentioned percentage.

Yours truly,

WESTERN ELECTRIC COMPANY, By R. W. VAN VALKENBURGH.

1680

No. 143.

This Exhibit shows (1) that during the rise of prices incident to the War the Western Electric Company increased its prices of telephone supplies only 52% to the Associated Companies as against 82% to independent companies, and as against an increase by other companies manufacturing telephone supplies of 121%; (2) that the Western Electric Company sells telephone supplies of its own manufacture to independent companies at prices substantially higher than to the Associated Bell Companies; and (3) that the sales of telephone supplies by the Western Electric Company to independent companies are made in a competitive market.

The exhibit consists of eleven pages. The first two pages give a summary of the data contained in the Exhibit and the remaining ten pages detail the data. The first two pages are as follows:

Memorandum.

Increase in Costs of Telephone Supplies, 1914 to 1919.

Attached are five statements dealing with the costs of certain items of telephone supplies in the years 1914 and 1919. The items shown were selected by the Engineering Department of the American Telephone and Telegraph Company to represent a range of important items of equipment and outside plant.

These statements make certain price comparisons which may be

summarized as follows:

Increase in Costs for Year 1919 Over 1914.

Western Electric Apparatus:	Per cent increase.
Prices to Associated Companies (Exhibit A). Prices to Independent Companies (Exhibit B)	52
Non-Western Electric Apparatus: Prices to Associated Companies (Exhibit C).	121
1681 Sales of Western Electric Apparatus Figured at Pr Companies in Comparison with Prices to Associated	rices to Independent d Companies.

Year.	Cost at associated Co. price.	Cost at independent Co. price.	Increase to independent companies.	Per cent increase.	Exhibit
1914	\$5,275,443	\$6,362,535	\$1,087,091	21	D
1919	7,973,278	10,999,897	3,026,619	38	

These summaries indicate:

(1) That the Western Electric Company during the rise of costs consequent to the War increased its prices only 52% to the Associated Companies as against 82% to the Independent Companies; and as against an average increase of 121% by other manufacturers of telephone supplies.

(2) That the Western Company sells apparatus of its own manufacture at prices being substantially higher to Independent Com-

panies than to Associated Companies.

If the Western Electric Company had sold its factory output of the items listed at the Independent Company prices instead of the Associated prices it would have increased its return 21% in 1914 and 38% in 1919 (taking 1919 output at 1918 figures).

(3) That the sales at the higher prices to Independent Companies are made in a competitive market which establishes the worth of the goods. The sales of the Western Electric apparatus to Independent Telephone and other non-contract companies amounted in 1914 to \$2,300,000 and in 1918 to over \$3,300,000.

No. 144.

This Exhibit shows the cost of telephone supplies to the Utica Home Telephone Company when said Company was independently owned as compared with the cost of the same kind of supplies to the Utica Home Telephone Company considered as a part of the Bell system and as purchasing its supplies through the Western Electric Company. The Exhibit shows that the cost of central office and sub-station equipment to said Utica Company during the years 1905 to 1912, when purchased from Independent Manufacturing Companies was 18.69% higher than the cost

1682 of such equipment when purchased from the Western Electric Company; and that the cost to said Company of lead cable when purchased from independent manufacturing companies during the same period was 8.08% higher than if purchased through the Western Electric Company. The exhibit consists of six pages, pages two (2) and five (5) being as follows:

Utica Home Telephone Company.

Utica, New York.

Actual Cost of Central Office and Substation Equipment Versus Cost of Equivalent Western Electric Items under Licensee Contract.

		Cost of equivalent	Actual cost higher by	higher by

98,786 feet of Cable included in Study.

^{*}Red in copy.

No. 145.

This Exhibit is a copy of letter dated Feb. 25, 1920, from E. V. Cox, Supply Contract Auditor to C. A. Heiss, Assistant Comptroller, stating that the prices charged by the Western Electric Company for telephone supplies manufactured by it are standard and uniform to all Associated Bell Companies. The first two pages of the Exhibit follow:

Mr. C. A. Heiss, Assistant Comptroller;

DEAR SIR:

Section 3 (a) of the General Supply Contract between the Associated Companies and the Western Electric Company requires that the prices charged by the Western Electric Company for telephonic appliances manufactured by it shall be standard and uniform to all licensees of the American Bell Telephone Company.

A study has been in process to check the operations of this requirement for the 10 years 1910 to 1919, inclusive, and findings can

now be made from the reports for ten companies.

In making this study, advantage was taken of the copies (on file at New York) of the replies by Bell System Companies to the Interstate Commerce Commission under Valuation Order 18. This order required the companies to file price data for the maximum purchases of certain classes of items during each half

year from 1910 to 1915, inclusive.

Fifty-three of the most important items of apparatus covered by the Valuation Order were selected, thus assuring the impartiality of the study, and the standard prices to the Associated Companies for them (or items superseding them) were obtained for the years 1910 to 1919, inclusive. These items and prices are shown on the attached photostat chart.

For the years 1910-1915 each item for each year was checked against the prices reported in the replies under valuation Order 18. Discrepancies, if any, were traced back for verification to the original

paid bills in the files of the telephone company.

For the years 1916-1919 each item for each year was checked directly against the paid bills in the files of the Associated Company or against records developed therefrom. Discrepancies, if any, were traced back to the original bills.

The results of the study were as follows:

Company.	Number of items checked.	Number of errors in pric- ing.
Southern New England Tel. Co	400	0
New York Telephone Company	482	0
Bell Tel. Co. of Pennsylvania	611	0
Diamond State Tel. Co	376	0
Chesapeake and Potomac Tel. Co	297	0
Southern Bel. Tel. and Tel. Co	560	0
Cumberland Tel. and Tel. Co	524	3
Central Union Telephone Company	624	4
Mountain States Tel. and Tel. Co	825	1
Pacific Tel. and Tel. Co	594	1
		_
Total	5,293	9
Number of errors per 1,000 items checked		1.7

The above percentage of error in pricing is, in my opinion, very low, and in no case was there anything to indicate that the incorrect price was other than a clerical error. The investigation to

date, therefore, indicates that the Western Electric Company has for the last ten years complied with the section of the contract requiring uniform prices to licensees of the American Bell Telephone Company.

Yours truly,

E. V. COX, Supply Contract Auditor.

1687 PLAINTIFF'S EXHIBITS Nos. 146 to 162, INCLUSIVE.

W. O. Pennell, Witness.

No. 146.

"Licensee Contract Between American Telephone & Telegraph Company and Southwestern Telegraph & Telephone Company (Texas) Up to February 10, 1920.

This exhibit consists of 112 pages of type-written matter, being copies of the original Lisensee Contract entered into between The American Telephone & Telegraph Company and The Southwestern Telegraph & Telephone Company, together with all letters and memoranda supplementing the original agreement, the last letter being dated December 19, 1917.

On pages 48 to 53 inclusive are copies of letters issued by the American Bell Telephone Company between the dates of June 30, 1885 and July 1, 1887, outlining the terms under which the Licensee companies could then obtain instruments from the American Company. This was prior to the organization of The Southwestern Telegraph & Telephone Company. At this time a company,

known as the Erie Company operated in the State of Texas.

On pages 1 to 45 inclusive is a copy of the original agreement entered into on July 27, 1889 between the American Bell Telephone Company and The Southwestern Telegraph & Telephone Company, which latter company took over the operation of the Bell properties in Texas in 1889. By virtue of this contract the American Company acquired 30% of the stock of The Southwestern Company. The contract provided that the Southwestern Company should pay the American Company for the use of such Telephone instruments as were furnished by the American Company. Payment was to be made in accordance with the class of subscribers by whom the Telephone instruments were used as follows:

Form 109-D-Contract for Exchanges, shown on pages 8 to 21 inclusive of the exhibit.

Form 113-D-Contract for Extra-territorial connecting lines,

shown on pages 22 to 34 inclusive of the exhibit.

Form 116-C—Contract for Private Lines and Other Purposes, shown on pages 35 to 45 inclusive of the Exhibit.

Inasmuch as most of the instruments were used in exchanges, attention is called to pages 13 and 14 of the exhibit outlining the method of payment for such instruments which was figured as follows .

Rental for transmitter for year. . \$10.00 Rental of Receiver (called magneto telephone) per year... 10.00

Total per year \$20.00

The Southwestern Company paid The American Company 70% of \$20,00 or a total per set per year of \$14.00.

On pages 54 to 71 of the exhibit are copies of letters outlining new terms of payment, being reductions made in 1894 and 1895 in the payment. Under the terms then put into effect, the payment was made dependent upon the rates paid by the telephone subscribers. At this time the American Company owned 30% of the stock of the Southwestern Company.

On pages 72 to 78 of the exhibit are copies of letters, outlining a further reduction in the payment made effective in 1898. At this time the American Company owned 30% of

the stock of the Southwestern Company.

On pages 79 to 103 of the exhibit and on pages 46 to 47 are copies of letters and agreements covering the method of payment put into effect January 1, 1902, according to which the payment was figured as 41/2% of certain gross revenues. This method brought about another reduction in the amount paid by the Southwestern Company to the American Company. The following quotation from page 99 shows what revenues are considered in determining the payment: "The Total gross earnings, for the purpose of determining the

amount of which you pay us 41/2%, shall comprise the accounts described and defined in our Accounting Circular #8 as follows:

Account 500-Subscribers' Station Revenues.

Account 501—Public Pay Station Revenues.
Account 504—Private Exchange Lines.
Account 510—Message Tolls.

From the total of the foregoing shall be deducted

Account 304—Uncollectible Operating Revenues."

On pages 104 to 109 are copies of letters covering the agreement on the part of the American Company to furnish the Southwestern Company vacuum tube repeaters without specific charge therefor in addition to the regular 41/2 % payment.

The following is an exact copy of this exhibit:

This agreement made this twenty-seventh day of July 1889 1690 by and between the American Bell Telephone Company, a corporation created under the laws of the Commonwealth of Massachusetts of the first part, and The Southwestern Telegraph and Telephone Company, a corporation created under the laws of the State of New York, of the second part. Witnesseth:

Whereas the second party has certain license contracts issued by said The American Bell Telephone Company (a schedule of which

contracts is hereto annexed marked "A") and

Whereas said second party desires to surrender said several license contracts and to have certain other license contracts as hereinafter set forth, and the first party has agreed to accept such surrender and to enter into such other license contracts as hereinafter set forth.

· Now, therefore, it is agreed as follows, that is to say:

1. Conditional upon said second party owning and controlling all and singular any plants, properties, franchises and rights of every name and nature built, acquired or used, under or by virtue of or for any use in conducting any business done or to be done under said license contracts so to be surrendered, or any of them, and standing in the name of said second party or any other name, or operated by said second party or by other parties, and all income and revenues therefrom and thereunder, and

Conditional upon said second party forthwith surrendering and giving up to said first party said several license contracts named in schedule A, and all and singular the rights of it, said second party,

or of other parties in, to and under the same.

2. Said first party agrees that it will accept such surrender and that it will thereupon enter into the following described agreements with said second party, that is to say:

(a) license contract for exchange purposes—Form 109-D, hereto annexed marked "B."

- (b) license contract for extra-territorial connecting lines, Form 113-D, hereto annexed marked "C,"
- (c) license contract for the supply of telephones for private lines and other purposes, Form 116-C, hereto annexed marked "D."

But said second party shall assume and perform any and all contracts with subscribers made under said license contracts or any or either of them so to be surrendered and existing at the time of such surrender and shall hold all telephones furnished thereunder by said The American Bell Telephone Company (schedules of which said telephones are hereto annexed marked "E"), as the property of said The American Bell Telephone Company and each under the license contract for like purposes as that under which it was originally furnished, so to be made with it said second party and with like effect as if actually furnished thereunder, except that rental and royalty thereon shall begin at the date of such new license contracts.

3. Whereas it has been and is agreed that said first party in consideration of the premises shall be entitled to and have thirty hundredths (30-100) interest in all and singular the property, rights, business and property of said second party, as the same stood on July 1, 1889, to be paid as hereinafter specified, and that such interest shall not be required to contribute to the expense of developing the territory of said second party nor to the payment of liabilities incurred on account thereof before the first day of June 1891.

Now therefore, for the accomplishment of said purpose and in consideration of the premises, the second party shall forthwith upon

the execution of said license contracts furnish and pay to said
The American Bell Telephone Company thirty hundredths
(30-100) of its capital stock as the same shall stand fixed at
the date of such payment, all such stock to be lawfully issued, full

paid and not subject to any assessment or contribution.

4. Said The American Bell Telephone Company agrees that it will release to said second party from time to time its claim as holder of such stock to dividends which may be declared thereon before the first day of June 1891 of net earnings actually received before that date.

In computing net earnings out of which dividends may be declared before said first day of June 1891 there shall be deducted besides all sums necessary for the current expenses of the business, all sums necessary for the maintenance and extention of said second party's lines, instruments, plant and business in the best condition, which sums shall not at any time become the subject of dividends, but this stipulation and such release shall not impair or affect in any manner any other of the rights of said The American Bell Telephone Company as a stockholder, and on said first day of June 1891, the second party shall be free from debt or liability without said The American Bell Telephone Company contributing in any manner to the payment thereof.

- 5. From time to time, if and whenever a further issue shall be made, whether or the present authorized capital of it, said second party, or of any increase thereof, except as provided in Article 11, the first party shall have the right and option to call for and take an amount of such stock proportionate to that which may have been subscribed for, taken by or issued to other stockholders or others, in the ratio of its then holdings to the holdings of other stockholders before such increase or issue and upon the same terms and at the same prices.
- Said second party shall not borrow money for extension of its business nor for any other purpose without the consent of said The American Bell Telephone Company.
- 7. Said second party shall assume and pay any and all taxes, whether municipal, county, state or other, on or on account 1693 of or by reason of the instrument leased or business done under said license contracts to whomsoever assessed, but this stipulation shall not be held to include the tax assessed by the State of Massachusetts on the corporate franchise of said The American Bell Telephone Company.
- 8. Said second party shall keep books and accounts of its business according to forms furnished by said The American Bell Telephone Company, which books and accounts shall be open to inspection at all reasonable times by any authorized agent of said company, and shall make reports to it embodying such information as and in such form as it may from time to time desire.
- Said The American Bell Telephone Company shall have two representatives on the Board of Directors and one representative on the Executive Committee of said second party.
- 10. Touching certain telephones on which the second party during a certain period paid the first party royalty, but during such period received no compensation for their use by certain subscribers at certain exchanges, respecting which the second party has, from time to time, presented to the first party certain claims, the first party will, if this agreement be ratified as herein provided, allow the second party a rebate on such royalty to an amount not exceeding fifteen thousand dollars, which amount shall be a full and final settlement of all such claims.
- 11. The first party consents that the exchange sub-licenses made by the second party (a schedule of which is hereto annexed marked "F") may continue in force until their expiration or earlier termination, on condition that each of such sub-licenses shall, before December 31, 1889, be in such form and so executed as the first party shall approve, and that a certified copy of each shall be furnished to the first party before said date; but the second party agrees to acquire and own at or before the expiration of each of such sub-licenses, all and singular the property, plant, rights and business owned or

operated thereunder, without the first party contributing in any manner to the payment thereof, but if they or either of 1694 them shall be acquired by increase or issue of capital stock above two million (\$2,000,000) dollars, the second party shall furnish and pay to the first party an amount of such stock equal to thirty seventieths (30-70) of such increase or issue, lawfully issued, full paid and not subject to any assessment or contribution.

12. The second party shall submit this agreement to its stockholders for ratification at a meeting to be duly called and held on or before September 7, 1889, and if such ratification shall not be procured at such meeting and a properly certified transcript of the records of such meeting delivered to the first party within five days following the date of such meeting and all acts and things necessary to qualify the second party to claim in full the benefits of this agreement done on or before September 30, 1889, in a manner satisfactory to the first party, then at the election of the first party, made at any time after said date, this agreement shall be void.

In witness whereof the parties hereto have caused their respective corporate seals to be hereto affixed and these presents to be signed in duplicate in their names and behalf by their respective officers thereto duly authorized.

1695 Form 109-D.

Contract for Exchanges.

This agreement, made this Twenty Seventh day of July A. D. 1889, by and between the American Bell Telephone Company, a corporation created under the laws of the State of Massachusetts, Lessor and Licensor, party of the first part, and The Southwestern Telegraph and Telephone Company, a corporation created under the laws of the State of New York, Lessee and Licensee, party of the second part, Witnesseth:

(1) Whereas, the Lessor owns the Letters Patent of the United States granted to Alexander Graham Bell, March 7, 1876, and January, 30, 1877, numbered 174,465, 186,787 respectively, and owns or has the right to use, and may hereafter own or have the right to use, sundry other inventions, which are or may be embodied in electric speaking telephones, and desires to extend the use of telephones licensed by it in every manner in which the public may wish to use the same, and for that purpose to provide for the construction and use of the apparatus and lines necessary to be used in connection therewith; and whereas the Lessee desires to obtain the use of telephones under lease and license from the party of the first part to be used with the lines of telephonic district or exchanges systems established and owned by it in the territory hereinafter described under the provisions hereinafter set forth; now it is agreed as follows:

(2) The rights hereby granted shall be perpetual unless determined as hereinafter provided, and shall extend to all Exchanges established and owned by the Licensee, and wholly within the following described territory, namely: The States of Arkansas and Texas.

(3) For the purpose of this contract on "Exchange," or "a district or exchange system" means a system in which different stations on the same or different circuits, and either within any city or town, or within a radius of fifteen miles of a central office, are

1696 connected with such central office or branch offices, for the purpose of placing subscribers or other parties by such circuits in communication with such central or branch offices, or with each other, either directly or through the agents of the system. No office or line of an Exchange can be connected with any point outside of its territory, nor with any telegraph company's office or line, except by lines of the Licensor or parties specially designated by it for this purpose, nor, except in connection with such lines, can the lines of an Exchange be used for performing any part of the work of transmitting messages by telephone to points outside its territory, and no telegraph company, unless specially permitted by the Licensor, can be a subscriber or use the system to collect and deliver messages from and to its customers, nor shall any person use the same telephone in connection with different exchange systems.

(4) The Licensor, at its general office or factory, will deliver to the second party, as needed, electric speaking telephones, made and to be used under its patents, during the existence of the rights hereby granted and as herein set forth and permitted, and all telephones delivered to the second party during the continuance hereof shall be deemed to be furnished hereunder, unless otherwise specially designated by the Licensor. They will be of such character and pattern and bear such marks as the Lessor shall from time to time determine, but the second party may choose from among such standard patterns. Each of said telephones shall remain the property of the Licensor, and is hereby leased, and the use of it licensed under said patents and all others under which the Lessor has or may have a right to license, so far as applicable thereto, for the purposes herein declared for the term of one year from the day when rent and royalty begin to accrue on it as provided in Article 8, but the due payment thereof to the Licensor, and the due performance of the stipulations hereof during said year, by the second party and those using the telephone under it, shall ipso facto operate to renew the lease and license for another year, and so on until the expiration or other determination hereof; the second party is

hereby licensed to use said telephones for any purpose, upon circuits exclusively composed of the lines of any such exchange system, and to use them in connection with the trunk lines reserved to the licensor by Article 9, for the purposes and to the extent therein limited, during the term hereby created, upon condition and so long as the rental therefor shall be duly paid to the Licensor and as the provisions hereof are not violated, but not longer or otherwise; and it may grant said right to its customers by contracts as provided in Article 7.

The Lessor will not license any telephones to be used by others upon an exchange system within said territory while the rights of the second party hereunder exist, except telephone to be used on the lines of Exchanges having their central offices outside said territory by persons within said territory who are or may be subscribers to or customers of such Exchanges; but the second party shall, by general or special exchanges, supply (so far as it is authorized so to do by this contract) all reasonable demands of the public, and shall be diligent to increase the number of telephones used on its exchanges. All rights not hereby specifically granted remain to the Licensor.

(5) The Lessor will license to be used with such telephones, the inventions in call-bells, switches, switch-boards, and other apparatus needed for such telephone lines, which it can so license, upon such royalties as it may from time to time establish, not greater than those fixed for others under similar circumstances; but such callbells, switches, switch-boards and other apparatus shall be used only with telephones licensed by the Lessor, and the second party agrees not to use them otherwise nor to dispose of them to any one except those so licensed, or to the licensed manufacturers of the Lessor. The second party may enjoy any rights of way and similar franchises

to maintain said lines which the Lessor can permit it to use, 1698 when and so long as, in the judgment of the Lessor, it shall not interfere with the Lessor's enjoyment thereof, and shall pay whatever may be due to third persons, if anything, growing out

of or in connection with such use by it.

For trunk lines from the several exchange offices to points outside of the respective exchange District and to telegraph offices, the Lessor may, without further compensation, enjoy all rights of the Licensee to erect and maintain lines, and may use its poles and fixtures, but shall pay a pro rata share of the cost of erecting and maintaining them

(6) The Lessee admits the validity of all patents relating to tele-phony and telephonic appliances now or hereafter held by the Licensor or under which it may hold licenses exclusive in their character, and the validity of its title thereto, and will not dispute the same, nor make, use, or be interested in any telephones or telephonic lines or business not licensed by the Licensor or its assigns.

(7) The contract between the second party and these who are to use telephones under it, as herein provided, shall express in such form as the Lessor shall from time to time approve, that the telephone is the property of the Licensor; that it is leased and licensed by it only as herein expressed; that all use of it otherwise is an injury to and invasion of the rights of the Licensor as owner thereof and of the patent rights used therein and thereby, entitling it to all the remedies herein provided and to an injunction, and other legal redress, in a suit by it in its name and behalf. party shall require every person using said telephones for communications or messages sent or to be sent over other telephone or telegraph lines, to provide for payment of tolls thereon, and to make every such message subject to such stipulations, regulations, and conditions respecting the liability of such lines for errors and mistakes as the Licensor may from time to time require, and for that purpose will incorporate into its subscription contracts and

1699 message blanks such provisions and contracts, to be agreed to
by the subscriber and customer, as the Licensor may from
time to time approve, and will hold the Lessor harmless from all

loss and expense consequent upon its failure so to do.

(8) The second party shall charge subscribers to its Exchanges such rental and royalty for the telephones as the Licensor may fix from time to time, for these and other like exchanges, and also in addition a sum not exorbitant nor unusual for the use of call-bells batteries, wires, and other appliances, and for services furnished or performed, and may collect both of said sums for a period not exceeding one year in advance. It will make such reports, giving such information regarding the operations of its Exchanges and the prices charged as the Licensor may from time to time request. It shall pay to the Licensor a rental and royalty at the rate per instrument of Seventy (70) per cent, of the telephone rental and royalty fixed as above (being a discount of Thirty (30) per cent) to commence on each telephone on the first day of the second calendar month after its shipment by the Licensor, to continue until the instrument shall be put into the possession of the Licensor, or proved to be destroyed, and to be paid in equal monthly payments in advance, at the Licensor's office, on the tenth day of each month up to the last day of the same month. Until otherwise fixed, the rates shall be as follows:

Battery transmitter, each instrument per year..... \$10.00 Magneto-telephone, each instrument " " \$10.00

Upon each instrument unlawfully detained from the Lessor, the second party shall pay ten dollars per month until satisfactory proof of its destruction be furnished; shall pay five dollars for each lost or destroyed otherwise than by fire or inevitable accident, and shall pay the expenses of ordinary repairs; but said payments shall not confer any right to the instrument, nor to its use, nor satisfy any other breach of covenant, nor impair the right of the Licensor to obtain possession of any instrument or lines.

(9) The Licensor may enter the offices and connect with the exchange systems of the second party any lines to points without the territories of such Exchanges respectively, and to telegraph offices, in order to establish communication between customers of the Exchanges and telegraph companies or parties reached by said lines, and may there operate said lines with suitable appliances; the second party will permit and encourage its customers to use such lines, and by its own operators will receive and transmit such messages to and from its customers and subscribers, or make the proper switch-board or other connections for direct communication, as may be requested, and in such manner, not inconsistent with the proper conduct of its office, as the Licensor shall direct. But if the Licensor is not satisfied with the manner in which it is performed, it may establish its own offices and trunk and radiating lines for this purpose. The second party will not, without special leave of the licensor, so far as it can lawfully prevent it, permit the transmission over such connecting lines of general business messages, market quotations, or news for sale or publication, nor any communications in behalf of other parties than those who directly communicate by the telephone by themselves or their servants or agents personally present at the instruments, and no person engaged in the business of transmitting messages for other parties shall be authorized or knowingly allowed by the second party to transmit such messages over such lines. The second party will cause each of its Exchanges to turn over and deliver to the Licensor and such parties as it may from time to time appoint, exclusively, all messages for electrical transmission to points outside the territory of such Exchange collected by or coming on the wires or within the control of the Exchange, where the Licensor or such party has wires and will transmit the same so far as the second party can lawfully control the same, and unless otherwise specially directed by its customers; but will not solicit such special directions, nor receive and pay tolls for transmission over other lines, unless compellable by law so to do. It shall keep and furnish an account of each such message transmitted or received, and of connections made therefore, and shall collect and on demand pay over to the Licensor or its 1701 said appointees, respectively, the tolls for transmission beyond the exchange system, according to such rates and rules as each shall establish, and shall exhibit its accounts and the tickets from which they are made, so far as may be proper to verify the Each Exchange shall, if and when so requested by the licensor, make proper switch-board or other connection between the lines of the Licensor or its Licensees from points without its exchange district and terminating in such exchange office, for the purpose thereby of making up a through line between points without such exchange district. In respect of all the business provided for by this section, the second party shall make no charge to its own subscriber or customer, but shall make the following charges and none others: the second party shall receive upon communications originating within an Exchange and passing over the lines of the Exchange and the extra-territorial lines by direct connection, fifteen

per cent of the gross tolls on the extra-territorial line not to exceed five cents for any one message or communication occupying not more than five minutes; in case an Exchange shall be required to make a switch-board connection for the purpose of making up a through line between points without its exchange district, then the Exchange shall receive as compensation for making such connection, such share of the through toll (terminal expenses being first deducted) as may be agreed upon, not however a greater share thereof than ten miles is of the whole length of the through lines so made up, and not in any event to exceed five cents for any one communication occupying not more than five minutes; upon messages collected by an Exchange over its lines or otherwise and forwarded by telegraph, the Exchange shall receive fifty per cent of the commission paid to the Lessor by the telegraph company, and the whole of the compensation for messenger service paid by the telegraph company; for delivering telegraph messages by telephone to subscribers, and Exchange may have free use of the Lessor's line to the telegraph office,

when such use does not interfere with the proper despatch of outgoing business, and may receive from the telegraph company the whole of such compensation as it and the telegraph company may agree upon; for messages delivered by messenger for the telegraph company, it may receive the whole compensation. The Licensor now appoints the Western Union Telegraph Company to perform all telegraphic transmission under this article.

(10) If the second party shall fail to pay any sums due hereunder for thirty days after the same shall become payable, or shall violate any other terms or conditions of this cont-act, or of a contract preliminary hereto between the same parties dated July 27th, 1889, and shall persist in such default, violation, or neglect, or fail to remedy or repair the same for sixty days after written notice thereof from the Licensor, or shall become bankrupt or insolvent, the Licensor may, if it shall so elect, by written notice to the second party (or those in charge of any of its offices), terminate all rights granted by the Lecensor hereunder, and thereupon may by its agents sever the circuit on which any telephone is placed, and take possession of and remove the telephone, and for that purpose may enter the premises of the second party and all persons claiming under it; or it may collect, from any sub-lessee or subscriber, all sums then or thereafter due to it or to the second party for the use of any instruments, circuits, and appliances, or under any subscription contract; or it may, so long as it shall see fit, leave in the enjoyment and use of the telephones any subscriber or other person in actual possession, and collect from him such sums as may then and thereafter be or become due for the use of the telephone and exchange lines, appliances, and services, and for that purpose shall be entitled to and may take possession of all the lines, fixtures, apparatus, appliances, and premises of the second party used for carrying on its business, and occupy and operate the same in connection with said telephones and those of additional customers as exchange system,

or connect such lines with offices of its own for that purpose; the Licensor shall have the like right upon and within three months after the termination of the rights of the second party hereunder by efflux of time or otherwise; and may enforce these provisions by an entry, without being deemed guilty of any trespass, or by legal process, including an injunction to prevent any interference with the Licensor (and others permitted by it) in the use of said telephones, lines, switch-boards, and appliances. property as taken, and which does not belong to the Lessor or revert to it hereunder, may be returned within three months from the taking, in which case it shall pay to the second party a reasonable compensation for its use, or the Lessor may retain the same as it own property and shall pay therefor a reasonable price (not exceeding the actual cost) within four months after the taking, and shall account to thes second party for all sums collected, which accrued before the Licensor became so entitled to possession, deducting all expenses incident thereto and all that may be due it. The Lessor also reserves all its right and remedies in law and in equity, under the patent laws or otherwise, including the remedy by injunction against the second party or those claiming under it, for the use of any of its patented inventions or instruments not justified by a subsisting license hereunder, or for the violation of any other of its rights. These rights and remedies of the Lessor shall, in case of any default, if the Lessor shall so elect, apply only to the Exchange or Exchanges in which such default has occurred. The Lessor may also use the name of the second party to protect its interests and to enforce its rights hereunder, and the second party shall execute assignments in accordance herewith.

(11) This contract is personal to the second party herein named, and any assignment or attempt to assign it, or the rights granted or lines established hereunder or any or either of them, by act of the party or operation of law, without the written consent of the Licensor, will be violation hereof, and a good ground for a cancellation hereof by the Licensor; The party of the second part promises that it will keep and observe all the stipulations herein contained on its part to be kept and performed. Whenever the Licenson is the stipulation of the second part promises that it will keep and observe all the stipulations herein contained on its

part to be kept and performed. Whenever the Licensor grants to others the rights for connecting lines or any other rights remaining to it, the stipulations hereof relating hereto shall be binding upon and enure to the benefit of such grantees, and the Licensor shall not be responsible for their acts or defaults. If the Licensor shall transfer to any party who shall agree to perform the stipulations hereof its title to the telephones hereby leased and the patent rights under which they are licensed, and its then existing interests hereunder, it is agreed that the provisions hereof enure to the benefit of and are binding upon such party in respect of all things done or to be done after such assignment, as if it were named a party hereto, and this said American Bell Telephone Company shall no longer be responsible hereunder.

The Licensee also agrees that it will not allow any telegraph company to use or to have any rights, or poles or other structures leased

or put up by or belonging to or under the control of said Licensee without the written assent of the said American Bell Telephone

Company.

Touching the lines which the first party may desire and direct to be built connecting the Exchanges of the second party with the Telegraph Offices of the Company or Companies which the first party may appoint to receive the telegraph messages to be turned over by said second party.

Whereas the first party has at the request of the second party in consideration of its undertaking hereinafter in this paragraph contained consented to increase the part to be paid the Exchange of the commission paid the first party by the Telegraph Company upon messages turned over from Twenty-five (25) per cent to Fifty (50)

per cent thereof:

Now the second party in consideration thereof agrees that it will at its own cost and without charge or expense to said first party build, equip and maintain such lines and furnish all instruments necessary to be used for the operation thereof, except telephones to

be used in the telegraph office, but that such lines when 1705 built shall become and remain the property of said first

party.

Discount on telephones as given in surrendered contract (as per

Exhibit A) to continue until June 1st, 1891.

*The following erasures viz: eight(8) words on line 22, two (2) letters two (2) figures and one (1) word on line 23, ten (10) words and one (1) figure on line 56, one (1) word on line 170, four (4) words on line 217, all the words on lines 218 and 219, and six (6) words on line 220, and the following interlineations viz: "fifty" on line 170 and "or of a contract preliminary hereto between the same parties dated July 27th 1889" on line 179, were made before signature by either party.

Form 113 D.

Contract for Extraterritorial Connecting Lines.

This agreement, made this Twenty Seventh day of July, A. D. 1889, by and between the American Bell Telephone Company, a corporation duly formed under the laws of Massachusetts, Lessor and Licensor, of the first part, and the Southwestern Telegraph and Telephone Company, a corporation created under the laws of the State of New York, Lessee and Licensee, of the second part, witnesseth .

1. Said Licensee desires to obtain the right to use upon lines between telephonic exchange districts established or which may be

established in the following described territory, viz:

The State- of Arkansas and Texas, telephones to be obtained from from the Lessor and under lease- and license from it, under its two patents granted Alexander Graham Bell, No. 174,465, dated 1706 March 7, 1876, and 186,787, dated January 30, 1877, and

under other patents which it may hereafter own or have the right to use, applicable thereto; and also to avail itself of and enjoy the right of connecting with the exchange systems established within said territory, as provided and stipulated in favor of the Lessor in its exchange contracts for these systems, (copies of which stipulations have been furnished to the Licensee, and the terms of which he is to conform to so far as they relate to business to be done hereunder) and of connecting with exchange systems which may hereafter be established in exchange districts in said territory, under contracts to be made by the Lessor therefor, to contain stipulations substantially like those in the Lessor's Standard Form 109 C, a copy of which has been furnished to the Lessee, and wishes to use, and allow others to use, said lines for personal communication between persons in different exchange districts in said territory; now it is agreed :

(2) Said second party shall by the establishment of such lines. so far as it is authorized so to do by this contract, satisfy all reasonable demands of the public therefor, and shall be diligent to increase the number of its said lines.

The rights hereby granted to the Lessee shall be perpetual unless

determined as hereinafter provided:

3. The Lessee may construct lines between exchanges in said territory, and may use such lines for telephonic personal communication between a customer in one such exchange district and a customer in another such exchange district, and not otherwise, except in connection with lines mentioned in Article 6 hereof owned or specially licensed by the Lessor, and by it designated for that purpose, and then only as and for the purposes expressed in said Article 6. The Lessee shall not directly or indirectly connect its lines with any telephone or telegraph line or telephone exchange, except lines

with which it has been by the Lessor specially authorized to connect; nor deliver messages to be forwarded to designation by telegraph to any telegraph company, except such as may be specially

designated by the Lessor for that purpose, so far as it can 1707 lawfully control the same, or unless specially directed by a customer so to do (but it will not solicit such special direction nor receive and pay tolls over other lines unless compellable by law so For the purpose of establishing telephonic personal communication between customers as aforesaid, the Lessee may have and exercise all the right to construct and operate telephone lines in said districts, and there maintain suitable offices and connect with exchange systems established or to be established, as aforesaid, which the Lessor has reserved and is or may be entitled to grant for extraterritorial connecting lines under licenses to exchanges made or to be made as aforesaid; but the Lessee shall connect with each local exchange and do its business so far as the same can, in the opinion of the Lessor, conveniently be so done, with the customers thereof through said exchange, unless the American Bell Telephone Com-

pany, or its successors, shall decide that the exchange fails to furnish proper facilities, for the purpose of this contract an exchange district means a territory, not to cover more than a single town or city, or a circle of fifteen miles radius measured from a central point, which the Licen or has included and covered or may hereafter

include and cover in and by an exchange license.

4. The Licenser, at its general office or factory, will deliver to the Lessee, as called for, electric speaking telephones, made and to be used under its patents during the existence of the rights hereby granted and as herein set forth and permitted, and all telephones delivered to the Lessee during the continuance hereof shall be deemed to be furnished hereunder, unless otherwise specially designated by the Licensor. They will be of such character and pattern and bear such marks as the Lessor shall from time to time determine, but the Lessee may choose from among such standard patterns. Each of said telephones shall remain the property of the Licensor, and is hereby leased, and the use of it is hereby licensed for the purposes herein declared for the term of one year from the day when rent and royalty begins to accrue on it, as herein provided:

but the due payment thereof to the Licensor, and the due performance of the stipulations hereof during said year by the Lessee and those using the telephone under it, shall ipso facto operate to renew the lease and license for another year, and so on until the determination hereof. The licensee shall pay to the Licensor seventy (70) per cent of the telephone rental and royalty which shall be fixed from time to time by the Licensor (being a discount of Thirty (30) per cent), to commence on each instrument on the first day of the second calendar month after its shipment by the Licensor, to continue until the instrument shall be put into the possession of the Licensor, or proved to be destroyed, and to be paid in equal monthly payments in advance at the Licensor's office, on the tenth day of each month up to the last day of the same month. Until otherwise fixed, the rates shall be as follows:

Battery transmitter, each instrument per year. \$10.00 Magneto-telephone, each instrument " " \$10.00

Upon each instrument unlawfully detained from the Lessor, the Lessee shall pay five dollars per month until satisfactory proof of its destruction be furnished, and five dollars for each lost or destroyed otherwise than by fire or inevitable accident, and shall also bear the expense of ordinary repairs; but said payments shall not confer any right to the instrument, nor to its use, nor satisfy any other breach of covenant, nor impair the right of the Licensor to

obtain possession of any instrument or lines.

5. The right and license hereby granted is the right and license to use said telephones to carry on personal communication, upon their own business, by and between customers, and their employes personally present at instruments in different exchange districts within the territory above described, over circuits composed exclusively of said authorized lines owned by the Lessee and the lines of the exchange licensed by the Licensor, and with which the Licensee is authorized to connect as aforesaid, and between any such customer and a customer so using the telephone in a place

with which the second party is not hereby authorized to con-

nect, by means of such lines of the Lessee, and other lines and instruments specially licensed by the Licensor therefor; but the telephones furnished hereunder are not to be used to connect parties in the same exchange district, nor for the transmission of general business messages, market quotations, or nows for sale or publication, in competition with the business of any telegraph company; and the Lessee, so far as it can lawfully and properly prevent it, will not permit the same to be so used. The term "general business messages" is defined to mean all communications in behalf of other parties than those who directly communicate by the telephone by themselves or their servants or agents personally present at the instruments, and no person engaged in the business of transmitting messages for other parties shall be authorized or knowingly allowed by the Lessee, its servants or agents, to transmit such messages through the telephone. The Lessor will not furnish or license telephones to any other party to establish such personal communication between persons in different exchange districts, both of which are within said territory, while the rights of the Lessee hereunder exist, except so far as the Lessor's existing contracts with the Western Union Telegraph Company, and with others, may require it so to do, or as it may see fit so to do under contracts hereafter to be made for private, club, social, and other lines substantially as defined in its Standard Form No. 116 B, but the Lessee shall furnish sufficient general lines for general customers, and special lines for individual or associated customers, between exchange districts throughout said territory, and for the purposes aforesaid, at prices which shall be reasonable under the circumstances hereunder.

6. The Lessor will license to be used with such telephones the inventions in call bells, switches, switch-board, and other apparatus needed for such telephone lines, which it can so license, upon such

royalties as it may from time to time establish, not greater

than these fixed for others under similar circumstances, but such call bells, switches, switch-boards, and other apparatus shall be used only with telephones licensed by the Lessor, and the Lessee agrees not to use them otherwise, nor to dispose of them to any one except to those so licensed, or to the licensed manufacturers of the Lessor. The Licensee may enjoy any rights of way and similar franchises to maintain said lines which the Lessor can permit him to use, when and so long as, in the judgment of the Lessor, it shall not interfere with the enjoyment thereof by the Lessor or its other grantees, and shall pay whatever may be due to third persons, if anything, growing out of or in connection with such use by it. The Lessor reserves the right to use telephones on lines passing over the routes or any or either of them of the lines hereby licensed, and connecting, with each other or with said exchanges, places with which the Lessee is not hereby authorized to connect, for the purpose of establishing personal communication or transmitting messages between such places and between such places and said exchanges. and, to establish lines for that purpose, may enjoy any rights of the Lessee to erect and maintain lines, and may string its wires on the poles of the Lessee, paying therefor a pole rental of \$4.00 per mile per annum for each wire. The Lessee will also allow the Lessor to connect the wires of any such lines with its said lines in order to constitute thereby a through line, of which the Lessee's lines or any or either of them or any part of either of them can form a portion or link, in order to forward through messages, will make or permit to be made convenient switchboard or other connections for that purpose, and as compensation therefor will take a share of the through toll (terminal expenses being first deducted) pro rata according to distance, not greater than that customarily charged by it for like distance, and will also allow any telephone exchange to be designated by the Lessor to connect with its lines for the purpose and substantially in the manner described in said Standard Form In respect of all communications originating on its lines and which are to be forwarded over any other lines, the Lessee shall require the customer or subscriber to bind himself by and make every message subject to such contracts, stipula-

and make every message subject to such contracts, stipulations and limitations of liability of such other lines as the Licensor may from time to time require, in such form as it may from time to time prescribe, and will hold the Lessor harmless from all loss or expense consequent upon its failure so to do.

7. The Lessee admits the validity of all patents relating to telephony and telephonic appliances, now or hereafter held by the Licensor, or under which it may hold licenses exclusive in their character and the validity of its title thereto, and will not dispute the same nor make, use, or be interested in any telephones or telephonic lines or business not licensed by the Licensor or its assigns.

8. The Lessee will pay to the exchanges established, or which may hereafter be established, and with which it shall connect as aforesaid, such sums as such exchanges are or shall be entitled to receive under their exchange contracts, made or to be made, for making connections with extra-territorial lines. And the Lessee will also pay to the Lessor, in addition to said telephone rental and royalty, and in consideration of the further rights and privileges hereby granted, fifteen (15) per cent of the Lessee's gross receipts from subscriptions and tolls (which tolls shall not be less than at the rate of fifteen cents for the first ten miles or fraction thereof and five cents for each additional ten miles or fraction thereof for a communication occupying not more than five minutes), and from other sources, after deducting for terminal expenses such sums as it may have to pay to the terminal exchange not exceeding those chargeable under exchange contracts made or to be made by the Licensor as aforesaid. Said payments are to be made to the Lessor at its office on the tenth day of each month, upon all receipts up to the first day thereof. The Lessee shall keep full accounts of such receipts and payments, furnish copies thereof to the Licensor upon request, and exhibit its original accounts and youchers so far as may be proper to verify the same.

- 9. The lines to be built hereunder shall be sufficient and suitable for the purposes contemplated hereby.
- 1712 10. The Lessee may place the telephones furnished hereunder in its own offices, for use, by general customers, as herein stated and limited, or may place them under subleases and licenses in connection with its lines, on the premises of subscribers or special customers for such use. Such subleases and licenses shall, in such form as the Licensor shall from time to time approve, express the title of the Licensor to the Telephone and the patents, the extent of the license hereby granted, the purposes for which the telephone may be used, that any other use of any telephone by any person, or non-payment of the rental and royalty to the Licensor, is an injury to and invasion of its rights as owner thereof and of the patent rights used therein and thereby, and entitling it to all rights and remedies in law and in equity, under the patent laws and as herein expressed otherwise, including the remedy by injunction against the person in possession thereof, and all others who have misused the same as aforesaid for any use not justified by a subsisting license, or for the violation of any other of its rights. It may also enforce against such sub-licenses all rights and pursue all remedies given by and under such sub-license, and may use the name of the Lessee for such purpose, or may require the Lessee, at his own expense, to enforce the terms of such contract.
- 11. If the Lessee shall fail to make any of the payments herein stipulated when due, or shall fail to keep any of the terms hereof, or of a contract preliminary hereto between the same parties dated July 27th, 1889, and such default shall continue during a period of sixty days after written notice thereof from the Lessor, or shall become bankrupt or insolvent, the Licensor may, if it shall so elect, by a written notice to the Lessee (or those in charge of any of its principal offices) terminate all rights granted by the Licensor hereunder, and by itself or those designated by it for the purpose, by

due process of law or by actual entry, may and shall be entitled to repossess itself of the rights and privileges herein granted, and thereafter use and enjoy the same; and especially may take possession of and remove said telephones, or sever the wires to which they are connected, and connect its own wires to said severed wires, telephones, and apparatus, and use the same by itself and by

those whom it may permit; or it may, so long as it shall see fit, leave in the enjoyment and use of the telephones any person in actual possession, and collect from him such sums as are or may become due for the use of the telephones, wires and appliances, used therewith, and for that purpose shall be entitled to and may take possession of all the lines, fixtures, apparatus, appliances and premises of the Lessee used for carrying on this business, and occupy and operate the same in connection with said telephones and other telephones connected or to be connected therewith, or connect such lines with offices of its own for that purpose. The Licensor shall have the like right upon or within three months after the termination of the rights of the Licensee hereunder by efflux of time or otherwise; and may enforce this provision by an entry without being deemed guilty of any trespass, or by legal process, including an injunction to prevent any interference with the Licensor and others permitted by it in the use of said telephones, lines and apparatus. The property so taken and which does not belong to the Lessor or revert to it hereunder may be returned within three months from the taking, in which case the Lessor shall pay to the Lessee a reasonable compensation for the use thereof, or the Lessor may retain the same as its own property, and shall pay therefore a reasonable price, in no case exceeding the actual cost, within four months after the taking and shall account to the Lessee for all sums collected which accrued before the Licensor became so entitled to possession, first deducting all expenses incident thereto, and all that may be due from the Lessee to it. The Lessor also reserves all its rights and remedies in law and in equity under the patent laws or otherwise, including the remedy by injunction against the Lessee or those claiming under it, for the use of any of its patented inventions or instruments not justified by a subsisting license hereunder, or for the violation of any other of its rights. The Lessor may also use the name of the Lessee to protect its interests and enforce its rights hereunder, and the Lessee shall execute assignments in accordance herewith.

1714 12. This contract is personal to the Lessee herein named, and any assignment or attempt to assign the same or the lines established hereunder, or any or either of them, by act of the party or operation of law, without the written consent of the Licensor, shall be violation hereof, and good ground for a cancellation hereof by the Licensor; The party of the second party covenants that he will keep and observe all the stipulations herein contained on his part to be kept and performed. Whenever the Licensor grants to others the rights for exchange or any of its rights under Article 6 hereof or any other rights remaining to it, the stipulations hereof relating

thereto shall be binding upon and enure to the benefit of such grantees, and the Licensor shall not be responsible for their acts or defaults. If the Licensor shall transfer to any party who shall agree to perform the stipulations thereof, its title to the telephones hereby leased, and the patent rights under which they are licensed, and its then existing rights hereunder, it is agreed that the provisions hereof enure to the benefit of and are binding upon such party in respect of all things done or to be done after such assignment, as if it were named a party, and that said American Bell Telephone Company shall no longer be responsible hereunder. Words herein referring to the party of the second party shall be taken to be of such number and gender as may be required.

Discount on telephones and proportion of extra-territorial receipts as given in surrendered contract (as per Exhibit A) to continue

until June 1st, 1891.

* The following erasures, viz: six (6) words on line 32, three (3) figures and one (1) word on line 33, four (4) words on line 67, nine (9) words and one (1) figure on line 68, nine (9) words on line 69, two (2) words on line 149, eight (8) words on line 159, all the words on lines 160, 161 and 162, nine (9) words on line 215, all the words on lines 216 and 217, and (1) word on line 218, and all the words on line 229, and the following interlineations, viz: "Seventy (70) per cent of the telephone rental and royalty which

shall be fixed from time to time by the Licensor (being a

discount of Thirty (30) per cent)," on line 69, "fifteen (15) per cent" on line 149, "or fraction thereof" and "from other sources" on line 152, and "or of a contract preliminary hereto between the same parties dated July 27th, 1889" on line 181, were made before signature by either party.

^{*}This paragraph refers to interlineations in the printed form on which the original agreement was made.

Form 116-C.

This agreement, by and between the American Bell Telephone Company of Boston, Massachusetts, a corporation established under the laws of said State, Lessor and Licensor, of the first part, and The Southwestern Telegraph and Telephone Company, a corporation created under the laws of the State of New York, of the second part, witnesseth:

1. Whereas, the Lessor owns the patents of the United States granted to Alexander Graham Bell, March 7, 1876, and January 30, 1877, numbered 174, 465 and 186,787, respectively, and owns or has the right to use, and may hereafter own or have the right to use, sundry other inventions, which are or may be embodied in electric speaking telephones, now, for the purpose of supplying and placing telephones to be used for the purposes, and as hereinafter set forth, upon private lines, club lines, social lines, and lines for speaking-tube purposes, which are entirely within the following described territory, viz:

The States of Arkansas and Texas; it is agreed:

2. The private line referred to in this contract is a line consisting of only a single circuit which shall not be permanently nor temporarily connected with any other circuit, and the telephones on the private business of the principal business of the private business of the private business o

which shall be used only for the individual and private busi-1716 ness of the Lessees, and only by them and their employees;

and which line shall not extend more than twenty-five miles beyond the municipal limits of the city or town in which one end of the line is situated, and which shall not be used for more than four individuals, firms or corporations, and which shall not have more than eight stations, and upon which no business shall be transacted for any consideration or toll to be paid by other persons than the Lessees, or other parties named in the leuse of telephones, not exceeding said number, and over which shall be transmitted no business messages, market quotations or news for scale or publication, or messages in respect of which, or of the transmission, collection, delivery, publication, sale or use of which any consideration or toll is to be paid by any other person.

- 3. A club line is a line consisting of only a single circuit, connecting not less than five individuals, firms or corporations, without regard to the number of stations, or having not less than nine stations, without regard to the number of parties connected, all the stations of which are within the same municipality, or within five miles of its principal post office, and which is used by not more than one party at each station. In other respects, the use is limited as above stated for private lines.
- 4. A social line is a line consisting of a single circuit only, which shall not be permanently or temporarily connected with any other circuit, all the stations of which are within the same municipality and the telephones on which are to be used only for connecting

persons and families for social and household purposes, and by not

more than one party at each station.

But no one of the stations of a private line or of a club line or of a social line shall be used as an exchange office, or be provided with a switch-board or equivalent apparatus to be used in connection with said line, nor can said line be permanently or temporarily connected with a telephone exchange system, or with another circuit, nor with a telegraph office, without special leave of the Lessor. In case any

station shall, by such special leave, be located at a telegraph office, customers may be allowed to use the line to receive and

transmit their telegraphic messages, so far as may be expressly permitted by a written license which they shall agree to, and which shall conform to the following terms, viz: Each person so using said lines makes and constitutes the operator at the telegraph office his agent, without pay and without liability, to write upon the ordinary message blanks of the telegraph company all messages to be sent, to send them at the rate for unrepeated mesages, to receive and receipt for all messages received for him, and to sign his name to the contracts limiting the liability of such telegraph company set forth on such blanks; and will pay to said telegraph company all tolls on messages so sent, and all tolls on unpaid messages received for him; and he assumes all risk of error or mistake in the reception, repetition, delivery, non-delivery or misdelivery of messages sent or intended to be sent over said telephone line.

5. Speaking-tube telephones are telephones of the kind especially constructed and designated for that purpose, and which are allowed to be used only to connect stations, all of which shall be on the same premises of one individual, firm or corporation, without passing over the land of any other person (except a road or water-course); or they may be allowed to be used for connecting a licensee's house, stable and other domestic or farm buildings by passing over intervening land, provided that all stations connected by a speaking-tube line are to be within one circle of less than half a mile in di-

ameter.

6. If telephones are desired for uses and upon lines other than herein defined, special application must be made to and special leases and licenses obtained therefore from the American Bell Telephone Company; and the provisions hereof shall apply to such other telephones furnished to the second party so far as they can be applied, subject to the provisions of such special licenses By special leave of the Lessor, one station of a club line or of a private line or of a

social line may be maintained in a telegraph office by consent 1718 of the telegraph company; but they are only licensed for

this purpose so far as and upon the terms and conditions expressed in Article 4 hereof; and when so licensed or used, such station and the business done by and from it shall be under such regulations as the Lessor shall from time to time prescribe; and the party of the second part shall receive twenty-five per cent, and the party of the first part seventy-five per cent of whatever the Western Union Telegraph Company (or any other company specially designated by the Lessor) may pay for the collection and delivery of, and as com-

mission upon the telegraphic messages collected or delivered through such telephone line.

7. The Licensor, at its general office or factory, will from time to time deliver to the second party as needed, but not exclusively, electric speaking telephones, during the existence of this contract. to be used upon such lines for such purposes; they shall be of such standard character and pattern and bear such marks as the Licensor shall from time to time determine, but the second party may select which it prefers among said patterns (except for speaking-tube purposes as aforesaid): the Licensor will also license, to be used with such telephones, the inventions in call-bells, switches and other apparatus needed for such telephone lines, which it can so license, upon such royalties as it may from time to time establish, not greater than those fixed for others under similar circumstances: but such call-bells, switches and other apparatus shall be used only with telephones licensed by the Lessor, and shall not be disposed of to any one except those so licensed or to the licensed manufacturers of the Each telephone shall remain the property of the licensor, and may be used by suitable customers to be selected by the second party upon such lines for the purposes herein set forth, under lease and license from the licensor and lessor to such customers such lease and license to be furnished by it for each customer, in such forms and upon such terms, conditions and rental, and for such periods as

the Licensor may from time to time determine; each lease and license to be countersigned by the said second party, and

to be signed by each customer upon whose premises telephones are to be placed. Said telephone rentals and royalties shall belong to and may be collected by said American Bell Telephone Company in its own name; non-payment thereof to the said company, or any use of the telephones otherwise than is herein permitted, is an injury to and invasion of its rights as owner of the instrument and of the patent rights used therein and thereby, and entitling it to all rights and remedies in law and in equity, under the patent laws and as expressed herein and in licenses to be granted in pursuance hereof and otherwise, including the remedy by injunction, against the person in possession thereof and all others who have misused the same as aforesaid for the use of any of its patented inventions or instruments not justified by a subsisting license hereunder, or for the violation of any other of its rights.

If the said lines belong to the second party, it may also charge to the customer a sum not exorbitant nor unusual for the use of such lines and the apparatus and appliances other than telephones used therewith. The second party shall, on each pay-day, report the names and locations of each new customer, all licenses issued and all removals of instruments, and give such other information respecting the business as the Licensor may call for, all in such form as it may request, and shall transmit to the Licensor the leases signed by customers as aforesaid. The lessor reserves the right to refuse to furnish telephones to any party who in its opinion is likely to use them in a manner contrary to the provisions hereof, or to the

obligations of the Lessor to other parties.

8. The party of the second pary shall pay, or cause to be paid, to the Licensor a rental and royalty at the rate per instrument of the following percentages of the telephone rental and royalty fixed by the Licensor in accordance with this contract:

Telephones for private lines Seventy (70) per cent (being a discount of Thirty (30) per cent):

Telephones for club lines Seventy (70) per cent (being a discount

of Thirty (30) per cent):

1720 Telephones for social lines Seventy (70) per cent (being a discount of Thirty (30) per cent):

Telephones for speaking-tube lines Seventy (70) per cent (being

a discount of Thirty (30) per cent):

to commence on each telephone on the first day of the second calendar months after its shipment by the Licensor, to continue until the instrument shall be put into the possession of the Licensor, or proved to be destroyed, and to be paid in equal monthly payments in advance at the Licensor's office, on the tenth day of each month up to the last day of the same month. Until otherwise fixed the rates shall be as follows:

For private lines:

Battery transmitter, each instrument.....per year \$10.00 Magneto-telephone, each instrument....per year \$10.00

For club lines:

\$10 per year for each battery transmitter, and \$10 per year for each magneto-telephone, where only one instrument is used at a terminal or station; where a pair of instruments, composed of a battery transmitter and a magneto-telephone, are used at one terminal or station, \$15 per year for each pair so used.

For social lines:

Battery transmitter, each instrumentper	year	\$7.50
Magneto-telephone, each instrumentper	year	7.50

For speaking-tube purposes:

Speaking-tube	telephone	\$5.00	each	for	one	year
Speaking-tube	transmitter	\$5.00	each	for	one	year

Upon each telephone unlawfully detained from the Lessor the second party shall pay, or cause to be paid, ten dollars per month, until satisfactory proof of its destruction be furnished, and five dollars for each lost or destroyed otherwise than by fire or unavoidable accident, and the second party shall bear the expense of ordinary repairs; but neither of said payments shall confer any right to the instrument, nor to its use, nor satisfy any other breach of covenant, nor impair the right of the Licensor to obtain possession by act of the

party or legal process. Said second party, so long as it makes, or causes to be made, the payments herein stipulated, and keeps all the terms hereof, and of a contract preliminary hereto between the same parties dated July 27th, 1889, may collect the rentals and royalties from the customers hereunder for a period in advance not exceeding one year. Upon any default on its part which shall con-

tinue for more than thirty days after written notice thereof, the Licensor may, by written notice to it or by publication in some newspaper in the City of Austin, Texas, revoke said authority to collect, and revoke and cancel all the right and interest of every kind hereunder of the second party, and may, in its own name, or in the name of the second party if it shall deem such course more convenient, collect all rentals for telephones and lines furnished hereunder or in accordance herewith, whether then due or thereafter to become due, and take possession and remove all telephones furnished hereunder, subject to such rights as such customers may lawfully have under licenses to be granted by it in accordance with the terms hereof. For all rentals and royalties, so collected by the Licensor, and which accrued before the Licensor gave notice as aforesaid, it shall account to the second party, first deducting all that may be due from said second party to it, and expenses incident thereto.

9. In case any customer hereunder shall fail to pay the rental and royalty for the instruments delivered to him or shall use them otherwise than as provided in this license contract, or fail to return them when bound so to do, the American Bell Telephone Company may, if it sees fit, in its own name, or in that of the party of the second part, as it may deem most convenient, have and exercise against said customer all the rights for redress and protection by act of the party or by process of law, which belong to it, as owner of the telephone and of patent rights to the inventions embodied therein or used thereby, or provided hereby or by any contract of such customer; or may require the second party to pursue all said last named contract rights and remedies to final judgment and execution, or other most advantageous process of the court, at his own expense.

10. The second party admits the validity of all patents relating to telephony and telephonic appliances now or hereafter held by the Licensor, or under which it may hold licenses exclusive in their character, and the validity of its title thereto, and will not make, use or be interested in any telephones or telephonic lines or business not licensed by the Licensor or its assigns.

11. The second party shall, without charge, promptly notify the Lessor of any parties using telephones not leased by the second party or the American Bell Telephone Company, giving name of party, description of instrument, and place where same is used, and any other information possible to obtain.

13. The second party covenants that it will be absolutely responsible for the acts and omissions of itself, its agents and servants, and that it will use good diligence and care to select sublicensees of a

proper character, and to compel them to conform to the terms hereof. Whenever the Licensor grants to others any right remaining to it hereunder, the stipulations hereof relating thereto shall be binding upon and enure to the benefit of such grantees, and the Licensor shall not be responsible for their acts of defaults. If the Licensor shall transfer to any party, who shall agree to perform the stipulations hereof, its title to the telephones hereby leased and the patent rights under which they are licensed, and its then existing interests hereunder, it is agreed that the provisions hereof enure to the benefit of, and are binding upon such party in respect of all things done or to be done after such assignment as if it were named a party hereto, and that said American Bell Telephone Company shall no longer be responsible hereunder. All words herein relating to the second party shall be deemed to be of such number and gender as may be required.

14. The rights of the second party hereunder shall be perpetual unless determined as provided in Article 8 hereof.

Discount on telephones as given in surrendered contract (as per

exhibit A) to continue until June 1st, 1891.

*All the words on lines 172, 173, 174, 175, 176, 177, 178 and 179 erased, and the words "and of a contract preliminary hereto between the same parties dated July 27th, 1889" on line 142, were made before signature by either party.

Memorandum of an agreement, made this first day of November, 1907, by and between The American Bell Telephone Company, incorporated under the laws of Massachusetts, of the first part, and The Southwestern Telegraph and Telephone Company, incorporated under the laws of New York, of the second part,

^{*}This paragraph refers to interlineationus in the printed form on which the original agreement was made.

Witnesseth:

Whereas, said Companies entered into certain contracts dated July 27, 1889, in Forms 109–D, 113–D and 116–C, respectively, and also a contract preliminary thereto, bearing the same date, under which said The American Bell Telephone Company agreed to lease and license to said The Southwestern Telegraph and Telephone Company telephone instruments and to furnish to said Company certain other services and things, as expressed in said contracts and in certain contracts in Form 113–C, made subsequent to said date, and

Whereas said contracts have in certain respects become obsolete, and it is desired by the parties hereto to cancel the same and to

make a new agreement in place thereof,

Now it is agreed:

That all contracts now existing between said Companies in Forms 109–D, 113–C, 113–D and 116–C, respectively, and said preliminary agreement, are hereby cancelled as of this date, but said The American Bell Telephone Company shall continue to furnish said The Southwestern Telegraph and Telephone Company telephone instru-

ments, license their use, and the use of telephone appliances, so long as this agreement remains in force, under all patents

now or hereafter owned or controlled by it, said The American Bell Telephone Company, and furnish other services and things as heretofore, and said The Southwestern Telegraph and Telephone Company shall pay to said The American Bell Telephone Company the same consideration in money which it has heretofore paid under the terms of the letter of said The American Bell Telephone Company, dated November 21, 1902.

Said The Southwestern Telegraph and Telephone Company shall assume and pay any and all taxes, whether municipal, county, state or other, assessed on or on account of or by reason of the telephone

instruments furnished hereunder.

Signed on the day first above written, in duplicate.

Copy.

The American Bell Telephone Company.

No. 95 Milk Street.

P. O. Drawer 2.

Boston, June 30th, 1885.

To our licensees for exchange purposes.

GENTLEMEN:

The American Bell Telephone Company hereby proposes to provide, (either by an adjustment of the commission allowed you on the gross rental for Telephones used by certain Exchange Subscribers, hereinafter specified, or by a reduction of the gross rental fixed for telephones for such subscribers, The American Bell Telephone Company reserving to itself the full and unqualified right to adopt either or both of said modes), for a change in the net rental from you on such Telephones, as follows:

-	-	^	-
-1	7	٠,	2

	Net rental for each telephone and for each transmitter per year.
Exchange subscribers paying \$24 per annum, or less, for exchange service	\$3.00
Exchange subscribers paying exceeding \$24, and not exceeding \$27 per annum, for exchange service	$3.12\frac{1}{2}$
Exchange subscribers paying exceeding \$27, and not exceeding \$30 per annum, for exchange service	$3.37\frac{1}{2}$
Exchange subscribers paying exceeding \$30, and not exceeding \$33 per annum, for exchange service	$3.87\frac{1}{2}$
Exchange subscribers paying exceeding \$33, and not exceeding \$36 per annum, for exchange service	4.50
Exchange subscribers paying exceeding \$36, and not exceeding \$39 per annum, for exchange service	5.25
Exchange subscribers paying exceeding \$39, and not exceeding \$42 per annum, for exchange service	6.00
Exchange subscribers paying exceeding \$42, and not exceeding \$45 per annum, for exchange service	6.75

Where subscribers pay above \$45 per annum, the present net rentals will stand.

Where the present contract relations and discounts give a less net rental than the net rental herein named, the contract will be followed:

The monthly rental bills will be rendered from this office in the

form hitherto used, at the rates and upon the terms of rental, dis-

count and payment fixed by the contract.

You are asked to send to the Treasurer, on the last business day of each month, beginning with July, 1885, a statement over the signature of your Treasurer, or other official having the best knowledge of the facts, showing the number of stations in each Exchange for which the rates per station named herein were charged during the month, the number of stations at each rate, the number of Telephones at each such station, and the number of days during the month for which such charge was made.

The amount which, under the terms of this circular is to be returned to you, will be calculated from the statement as rendered, and notified to you, and placed to your credit in account with this

Company.

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully, (Sgd.)

THEO. N. VAIL, General Manager.

1726

Boston, July 30th, 1885.

To our licensees for exchange purposes.

GENTLEMEN:

From July 1st, 1885, instruments used for Exchange purposes, and for which your Company receives no consideration to a number not greater than three (3 per cent) per cent. of the total instruments charged to your Company for exchange purposes, will be furnished free of rental.

Yours respectfully,

(Sd.)

THEO. N. VAIL, Genl. Manager.

The American Bell Telephone Company.

Boston, August 4th, 1885.

To holders of contracts for exchanges:

Referring to the General Manager's circular of July 30, 1885, relating to instruments used for Exchange purposes and for which your company receives no consideration, and to carry out the purposes of that circular, the following method will be adopted.

Rental will be charged on all instruments as heretofore, and you are requested to add to the statement which by the Company's circular of June 30th, 1885, you are asked to make monthly, a statement of the number of instruments upon which rental has been charged to you for that month and which have been used for exchange purposes but for which no consideration has been received.

From the information so furnished the proper amount will be calculated and placed to your credit after notice of the same has

been sent to you.

WM. R. DRIVER, Treasurer.

Form 387-A.

Subject: Special Long Distance Transmitter.

The American Bell Telephone Co.

Boston, July 1, 1887.

To our licensees:

Certain question- which we have had to consider are not yet in such shape as will enable us to adopt and furnish the special long distance transmitter as a standard instrument, but to supply what seems to be a demand, as shown by the frequent applications

1727 we have received for these transmitters, we have decided to make and furnish them as a special instrument, to such of our licensees as desire to obtain them, charging in addition to the annual rental and royalty as per extra-territorial contracts, three dollars on each, of the excess in cost of manufacture over that of the Blake transmitter.

These instruments are intended for use, and are to be used only on such lines as are operated under our extra-territorial contracts,

and not for any other purpose.

With ordinary usage they are not liable to get out of order, and as they will be carefully examined and tested before shipment, should not be opened or taken apart except in case of absolute necessity. When placed in position for use, they should be firmly secured and in such position as to keep the top of the carbon chamber in a horizontal position.

The connections are made by the use of the binding posts, in the

same manner as the Blake transmitter.

The best results are obtained by using three cells of Fuller battery of four cells of La Clanche battery. With Gravity battery at least six cells should be used.

The primary circuit resistance should be kept as low as possible; care must therefore be taken to keep the battery and connections clean. The battery connecting wires should be large as convenient.

When first set up the carbon should be brought into place by shouting loudly into the transmitter some uniform note, at the same

time gently rapping the adjustable arm.

If after thoroughly shaking down the carbon (which if properly done should half fill the side holes) the instrument appears not to work well, see if the battery resistance is not too high.

It is in good condition when it transmits the voice with perfect distinctness when spoken into in a moderate tone with the lips close

to but not touching the mouth piece.

In ordering these special long distance transmitters, Form 199 must be used, giving thereon the station at, and the line on which the instrument ought to be used.

Yours respectfully,

(Sd.)

JOHN E. HUDSON; General Manager.

The American Bell Telephone Company.

Boston, January 31, 1894.

To our licensees:

The American Bell Telephone Company proposes to reduce the rental for magneto telephones, and to that end announces that the gross annual rental for each magneto telephone is fixed at five dollars; and that the discount thereon and the net annual rental payable by you, beginning with February 1, 1894, will be as follows:

Exhange Purposes. On Each Magneto Telephone.

On Each Magneto Telephon	в.	Net rental
	Discount.	per annum.
Exchange subscribers paying \$24 per annum or less for exchange service	85%	\$0.75
and not exceeding \$30 per annum for exchange service Exchange subscribers paying exceeding \$30	80%	1.00
and not exceeding \$36 per annum for exchange service	75%	1.25
and not exceeding \$42 per annum for exchange service Exchange subscribers paying exceeding \$42	70%	1.50
and not exceeding \$48 per annum for exchange service Exchange subscribers paying exceeding \$48	65%	1.75
and not exceeding \$54 per annum for exchange service Exchange subscribers paying exceeding \$54	60%	2.00
and not exceeding \$60 per annum for exchange service Exchange subscribers paying exceeding \$60	55%	2.25
per annum for exchange service	50%	2.50
Toll Station Purposes.		
Magneto telephone used at toll stations, and all magneto telephones used for extra-territorial purposes		2.50
Private Line Purposes.		
Magneto telephones used for private lines and other similar purpose	85%	0.75

The monthly rental bills will be rendered from this office in the form hitherto used, and for convenience of accounting, at the rate of two dollars and fifty cents per annum for each magneto telephone.

You are asked to send to the treasurer on the last business day of each month, beginning with February, 1894, a statement over the signature of the official having the best knowledge of the facts, showing the number of stations in each exchange for which the rates per station named herein were charged during the month, the number of stations at each rate, the number of magneto telephones at each such station, and the number of days during the month for which such charge was made.

The amount, which under the terms of this circular is to be returned to you, will be calculated from the statement so rendered, and notified to you and placed to your credit in ac-

count with this company.

The amount, which under the terms of this circular is to be returned to you on account of magneto telephones used for private lines and other similar purposes, will be adjusted upon receipt of a bill of statement similar to that which you send for rebate for fire and police service.

As to magneto telephones, this letter will supersede the circular of June 30, 1885 (Form 347), but such circular shall remain in force

for all other telephones.

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully,

(Sd.)

C. JAY FRENCH, General Manager.

The Southwestern Telegraph and Telephone Company.

Extract from the Minutes of a Meeting of the Directors of This Company Held on February 2, 1894.

"Voted: That the liberal concession offered by the American Bell Telephone Company in their circular letter of January 31, 1894, on the royalty charged for the use of magneto telephones be accepted with thanks."

Rates for Instruments for Private Lines and Other Purposes.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, March 7, 1894.

To licensees for the "Supply of Telephones for Private Lines and Other Purposes":

Until further notice instruments can be leased for the following purposes at the rates given below.

For a Set Consisting of a Magneto Telephone and a Battery Transmitter.

Annual rental.

For private lines ...

\$10.00 per set.

A private line is a line consisting of only a single circuit, which shall not be permanently not temporarily connected with any other circuit, and the telephones on which are to be used only for the individual and private business of the lessees, and only by them and their employees. Such private line shall not extend more than twenty-five miles beyond the municipal limits of the city or town in which one end of the line is situated, nor shall any such line or circuit be used for more than four individuals, firms or corporations, nor have more than eight stations. No business is to be transacted by or through them for any consideration or toll to be paid by other persons than the lessees or other parties named: nor shall business messages, market quotations, or news for sale or publication, or messages in respect of the transmission, collection, delivery, publication, sale or use of which any consideration or toll is to be paid by any other person, be transmitted over such line.

For club lines

\$10.00 per set.

A Club Line is a line consisting of only a single circuit, connecting not less than five individuals, firms or corporations, without regard to the number of stations, or having not less than nine stations, without regard to the number of parties connected, all of the stations of which are within the same municipality, or within five miles of its principal post-office, to be used by not more than one party at each station. In other respects the use is to be the same as that above stated for private lines.

For social lines

\$3.00 per set.

A Social Line is a line consisting of a single circuit only, which shall not be permanently or temporarily connected with any other circuit, all the stations of which are within the same municipality, and the telephone- on which are to be used only for connecting persons and families for social and household purposes, and by not more than one party at each station.

1731

Annual rental.

For speaking tube purposes (above-described set).

\$3.00 per set.

Speaking Tube Telephones are to be of the kind especially constructed and designated for that purpose, and are to be used only to connect stations, all of which are to be on the same promises of one individual, firm or corporation, without passing over the land of any other person (except a road or watercourse); or they may be used for connecting a Licensee's house, stable, and other domestic or farm buildings, by passing over intervening land; but all stations connected by a speaking-tube line are to be within one circle or half a mile diameter.

Special Speaking Tube Set, Consisting of Magneto Telephone and Battery Transmitter.

For "Hotel" purposes (includes call-bell)......
For "Office" or "Factory" purposes (does not include call-bell)

\$3.50 per set.

\$3.00 per set.

Licensees will be allowed a discount of fifty per cent on the above rates.

A magneto receiver or a magneto transmitter can be rented at \$1.00 each or at \$2.00 per pair for either of the above purposes, per annum.

This circular will take effect from February 1, 1894, and cancels

circular (Form 191-B) dated June 15, 1881.

No magneto telephone or magneto transmitters other than those furnished by this Company to its licensees and rented by them, can be used in connection with battery transmitters or other apparatus covered by patents owned or controlled by this Company.

Licensees are asked to examine the prices which they at present charge for whatever they do, lease or furnish to this class of subscribers, other than the instruments, to see if any change in such prices should be made, with the view of supplying all demands for this class of business.

"Long distance" or "solid back" battery transmitters will not be furnished for use on private lines, except where such lines are me-

tallic circuit owned, maintained and leased by the licensees.

Yours respectfully, (Sd.)

C. JAY FRENCH, General Manager. Rates for Instruments for Fire, Police, and Branch Lines Purposes.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, March 15, 1894.

To licensees for the "Supply of Telephones for Private Lines and Other Purposes:"

Until further notice instruments can be leased for the following purposes at the rates given below:

For Fire Alarm, Police, or Police Patrol Purposes.

On Condition that the instruments are to be used only on lines owned and operated by a city, town or other municipal corporation upon its own business, and that none of such lines or stations connect with, or in any sense form a part of the telephone exchange, licensees can furnish instruments, under our usual private line lease (Form 186-E), for use by such city, town or other municipal corporation, for either of the above purposes.

For each set of instruments, consisting of a magneto telephone and

a battery transmitter, \$10.00 per annum.

For Branch Line Purposes.

A branch line is a line connecting cities, towns, or places, in which no telephone exchange is established, with each other, and, except as hereinafter provided, used only for personal communication, as hereinafter defined, between customers and one such city, town or place, and customers in another such city, town or place. Such lines are not to be used to connect with each other parties in the same town, city or place: nor are they to be used to connect any two or more such cities towns or places, if and after same shall have been included in an exchange district; nor without special leave of the lessor to connect with any such city, town or place, after an exchange shall have been established therein; nor directly or indirectly to connect any two or more exchanges with each other. (Extract from branch line contract. (Form 251-C).

For each set of instruments, consisting of a magneto telephone and

a battery transmitter, \$10.00 per annum.

(Branch line contracts are made only by this company and upon special application for each line.)

Licensees will be allowed a discount of fifty per cent on the above

rates.

A magneto receiver or a magneto transmitter can be rented at

\$1.00 each or at \$2.00 per pair for either of the above purposes, per annum.

This circular will take effect from Feb. 1, 1894, and cancels all previous letters, giving special rates for instruments for any of the

above named purposes.

No magneto telephones or magneto transmitters other than those furnished by this Company to its licensees and rented by them, can be used in connection with the battery transmitters or other apparatus covered by patents owned or controlled by this company.

Licensees are asked to examine prices which they at present charge for whatever they do, lease or furnish for any of these purposes, other than the instruments, to see if any change in such prices

should be made, with the view of supplying all demands for these classes of business.

"Long distance" or "solid back" battery transmitters will not be furnished for any of the foregoing purposes except where the lines are metallic circuit, owned, maintained and operated or leased by the licensee.

Yours respectfully,

(Sd.)

C. JAY FRENCH. General Manager.

Copy.

Subject: Sample Instruments.

Boston, April 6th, 1894.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

DEAR SIR:

We shall send you by express in due course of business, on loan account, a new form of magneto telephone (called the "Watch" form) and a magneto transmitter No. 3 (called the spoon form).

These are sent that you may have more definite information respecting them than could be obtained from a printed or written

description.

These magneto instruments will be furnished to licensees under the usual contracts held by them, at the same rate as the ordinary magneto telephone (hand) is furnished, and can be rented at the rates specified in our circulars of January 31, 1894 (Form 457) and March 7, 1894 (Form 465A).

We shall also send with these instruments and on the same account a sample of the Western Electric Co's new call-bell, style No.

14, designed more especially for private line service.

The Western Electric Co. advise us that this call-bell will be furnished to our licensees at \$4.50 each and with backboard and battery box at \$5.50 each.

The attached drawing No. IV-A-49 shows the method of connecting when the call-bell is used with the magneto transmitter and drawing number XI-A-17 when it is used with a battery transmitter.

Our usual receipt for these will be sent you, which kindly sign, when the articles are received, and return to us.

Yours truly,

(Sd.)

C. JAY FRENCH, Gen. Manager.

Special Long Distance Transmitter.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, July 20, 1894.

To our licensees:

Referring to our circular dated July 1, 1887 (Form 387A) relating to the "special long-distance transmitter, "this company will bear the entire cost of manufacture of instruments of this pattern, and also of "solid-back" transmitters, and of Blake transmitters fitted with the grandular carbon button, which may be furnished after this date.

The purposes for and the conditions under which licensees have heretofore been authorized to rent or use these special instruments

remain unchanged.

(Sd.)

No magneto-telephone or magneto-transmitters other than those furnished by this company to its licensees, and rented by them, can be used in connection with battery transmitters or other apparatus covered by patents owned or controlled by this company.

Yours respectfully,

C. JAY FRENCH, General Manager.

Battery transmitters used for private line and other similar purposes		1.75

The monthly rental bills will be rendered from this office in the form hitherto used, and for convenience of accounting, at the rate

of five dollars per annum for each battery transmitter.

You are asked to send to the Treasurer on the last business day of each month, beginning with February 1895, a statement over the signature of the official having the best knowledge of the facts, showing the number of stations in each exchange for which the rates per stations at each rate, the number of battery transmitters at each such station, and the number of days during the month for which such charge was made.

The amount, which under the terms of this circular is to be returned to you, will be calculated from the statement so rendered and notified to you and placed to your credit in account with this company. The amount, which under the terms of this circular is to be returned to you on account of battery transmitters used for private lines and other similar purposes, will be adjusted upon receipt of a bill or statement similar to that which you send for rebate for fire and police service.

As to battery transmitters this circular suspends the circular of

June 30, 1885. (Form 347.)

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully, (Sd.)

C. JAY FRENCH, General Manager. Extract from the minutes of a meeting of the Directors held on April 5, 1895.

"Voted: That the schedule of rates presented be adopted with such modifications as may be made by a committee consisting of the President, Treasurer and Gen. Sherwin, after a conference with the American Bell Telephone Company."

Rates for Instruments for Private Lines and Other Purposes.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, February 15, 1895.

To Licensees for the "Supply of Telephone- for Private Lines and other purposes:"

Until further notice instruments can be leased for the following purposes at the rates given below:

For a Set Consisting of a Magneto Telephone and a Battery Transmitter.

Annual rental.

A private line is a line consisting of only a single circuit, which shall not be permanently or temporarily connected with any other circuit, and the telephones on which are to be used only for the individual and private business of the lessees, and only by them and their employees. Such private line shall not extend more than twenty-five miles beyond the municipal limits of the city or town in which one end of the line is situated, nor shall any such line or circuit be used for more than four individuals, firms, or corporations, nor have more than eight stations. No business is to be transacted by or through them for any consideration or toll to be paid by other persons than the lessees or other parties named; nor shall business messages, market quotations or news for sale or publication, or messages in respect of the transmission, collection, delivery, publication, sale or use of which any consideration or toll is to be paid by any other person, be transmitted over such lines.

Annual rental.

For club lines

\$5.00 per set.

A Club Line is a line consisting of only a single circuit connecting not less than five individuals, firms or corporations without regard to the number of stations, or having not less than nine stations without regard to the number of parties connected, all of the stations of which are within the same municipality. or within five miles or its principal post-office, to be used by not more than one party at each station. On other respects the use is to be the same as that above stated for private lines.

For social lines

. \$3.00 per set.

A Social Line is a line consisting of a single circuit only which shall not be permanently or temporarily connected with any other circuit, all the stations of which are within the same municipality. and the telephones on which are to be used only for connecting persons and families for social and household purposes and by not more than one party at each station.

For speaking-tube purposes (above-described

\$3.00 per set.

Speaking-tube Telephones are to be of the kind especially constructed and designated for that purpose, and are to be used only to connect stations all of which are to be on the same premises of one individual, firm or corporation without passing over the land of any other person (except a road or watercourse): or they may be used for connecting a Licensee's house, stable, and other domestic or farm buildings, by passing over intervening land; but all stations connected by a speaking-tube line are to be within one circle of half a mile diameter.

Special Speaking-tube Set, Consisting of Magneto Telephone and Battery Transmitter.

For "Hotel" purposes (includes call-bell)....... \$3.50 per set. For "Office" or "Factory" purposes (does not include call-bell)

... \$3.00 per set.

Licensees will be allowed a discount of fifty per cent on the above rates.

A magneto receiver or a magneto transmitter can be rented at \$1.00 each or at \$2.00 per pair for either of the above purposes, per annum.

This circular will take effect from February 1, 1895, and suspends

circular (Form 465A) dated March 7, 1894.

No magneto telephone or magneto transmitter other than those furnished by this company to its licensees and rented by them, can be used in connection with battery transmitters or other apparatus covered by patents owned or controlled by this company.

Licensees are asked to examine the prices which they at present charge for whatever they do, lease or furnish this class of subscribers, other than the instruments, to see if any change is such prices should be made, with the view of supplying all demands for this class of

business.

"Long distance" or "solid back" battery transmitters will not be furnished for use on private lines, except where such lines, are metallic circuits, owned, maintained and leased by the licensee.

Yours respectfully,

(Sd.)

C. JAY FRENCH, General Manager.

Rates for Instruments for Fire, Police and Branch Line Purposes.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

1739

Boston, February 15, 1895.

To Licensees for the "Supply of Telephones for Private Lines and Other Purposes":

Until further notice, instruments can be leased for the following purposes at the rates given below:

For Fire Alarm, Police, or Police Patrol Purposes.

On condition that the instruments are to be used only on lines owned and operated by a city, town or other municipal corporation upon its own business, and that none of such lines or stations connect with, or in any sense form a part of the telephone exchange. Licensees can furnish instruments, under our usual private line lease (Form 186E), for use by such city, town or other municipal corporation, for either of the above purposes.

For each set of instruments, consisting of a magneto telephone and

a battery transmitter, \$5.00 per annum.

For Branch Line Purposes.

A Branch line is a line connecting cities, towns or places, in which no telephone exchange is established, with each other, and, except as hereinafter provided, used only for personal communication, as hereinafter defined, between customers in one such city, town or place, and customers in another such city, town or place. Such lines are not to be used to connect with each other parties in the same city, town or place: nor are they to be used to connect any two or more such cities, towns or places, if and after the same shall have been included in an exchange district; nor without special leave of the lessor to connect with any such city, town or place, after an exchange shall have been established therein; nor directly nor indirectly to connect any two or more exchanges with each other. (Extract from Branch Line contract Form 251C.)

For each set of instruments, consisting of a magneto telephone and

a battery transmitter, \$5.00 per annum.

(Branch line contracts are made only by this company and upon special application for each line.)

Licensees will be allowed a discount of fifty per cent on the above

rates.

A magneto receiver or a magneto transmitter can be rented at \$1.00 each or at \$2.00 per pair for either of the above purposes, per annum.

This circular will take effect from February 1, 1895 and suspends

circular dated March 15, 1894 (Form 466).

No magneto telephones or magneto transmitters other than those furnished by this company to its licensees and rented by them, can be used in connection with battery transmitters or other apparatus covered by patents owned or controlled by this company.

Licensees are asked to examine the prices which they at present charge for whatever they do, lease or furnish for any of these

40 purposes other than the instruments, to see if any change in such prices should be made, with the view of supplying all

demands for these classes of business.

"Long distance" or "solid back" battery transmitters will not be furnished for any of the foregoing purposes except where the lines are metallic circuit, owned, maintained and operated or leased by the licensee.

Yours respectfully,

(Sd.)

C. JAY FRENCH, General Manager.

Copy.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, May 2, 1898.

To our licensees:

The American Bell Telephone Company proposes to extend the provisions of the circular of January 31, 1894 (Form 457), and of February 15, 1895 (Form 477), (as of January 1, 1898), to the cases below named, and as follows:

First. Instruments used at toll stations within the limits of an exchange, or used at toll stations on extra-territorial lines shall come under said circulars as if used for exchange purposes by subscribers paying yearly amounts equal to the gross annual tolls actually received at said several stations.

Second. On instruments on hand subject to rental, but not in use,—that is, instruments in stock,—the net rate shall be that fixed in said circulars upon instruments furnished for exchange service at \$24.00 or less per annum: that is to say, 75 cents yearly for each in-

strument.

And, referring to our circular letter of July 30, 1885 which provides that "instruments used for exchange purposes and for which your company receives no consideration, to a number not greater than three per cent of the total instruments charged to your company for exchange purposes, will be furnished free of rental," the net rate

for such instruments in excess of said three per cent shall be that above fixed for instruments in stock, namely, 75 cents per annum each. Monthly bills will be rendered as hitherto

at the rates named in said circulars, Forms 457 and 477.

At the end of the current month please send to the Treasurer an official statement from January 1, 1898, to that date, and thereafter at the end of each month a statement for that month, showing the number of instruments furnished you by this company, both magneto telephones and battery transmitters to which this circular applies, and the facts in relation thereto sufficient to show in detail the amount of abatement upon each such instrument under the terms hereof.

From the statement so rendered the allowance coming to you under the terms of this circular will be computed and the amount thereof placed to your credit.

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully.

(Sd.)

C. JAY FRENCH, General Manager.

Copy.

The American Bell Telephone Company,

No. 125 Milk Street.

P. O. Drawer 2.

Boston, May 2, 1898.

Licensees of the American Bell Telephone Company:

Referring to the licenses for extra territorial connecting lines granted you by this Company, and to your agreement therein contained to pay this Company a portion or fraction of the gross receipts from business done on such lines, this Company proposes to release you and does hereby release you upon your acceptance hereof, from

your obligation to make such payment from business done after

April 30, 1898.

Referring to the right reserved to this Company in the licenses for exchanges granted you by this company, to connect 1742 such exchanges with telegraph offices, and referring also to the arrangement made between us by which you receive one half of the commissions payable to this Company by telegraph companies upon messages turned over to such telegraph companies by said exchanges (such arrangement having been made on the condition that at your own cost, and without charge or expense to this Company. you bill, equip and maintain the lines connecting such exchanges and telegraph offices and furnish all instruments necessary for the operation thereof except telephones and transmitters to be used in the telegraph offices, and that such lines when built become and remain the property of this Company). This Company now proposes. until further notice, to give you the full amount of such commission instead of one half thereof, provided you also furnish the telephones and transmitters to be used in the telegraph offices.

The net rate to be paid by you for each such telephone and transmitter shall be the lowest rate named in the circulars of January 31, 1894 (Form 457), and of February 15, 1895 (Form 477): that is, seventy-five cents per annum for each instrument. Such instruments will be included in the regular monthly bills at the gross

rates named in said circulars.

Application for connection with telegraph offices must be made to this Company as heretofore.

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully, (Sd.)

P. O. Drawer 2.

Boston, March 25, 1899.

The Southwestern Telegraph and Telephone Company, Dallas, Texas, licensee of the American Bell Telephone Company:

Referring to the circulars Form 478 and 479, dated February 15, 1895, this Company fixes the net rate to be paid by you, beginning with April 1, 1899, for magneto telephones and battery transmitters used for any and all of the purposes therein named, except branch line purposes, at seventy-five cents yearly for each instrument, being the lowest rate named in said circulars.

Referring to the contract between us (in most cases Form 1160) for the supply of telephones for private lines and other purposes, it is agreed that said contract shall be modified as hereinafter set forth.

- a. The licensee, party of the second part to such contract, shall make and sign, in its own name directly, the leases to customers therein referred to.
- b. It shall be excused, except upon special requests, from transmitting to us such leases and from reporting the names and locations of its customers thereunder.
- c. And further, the provisions of the contract between us (in most cases Form 113D) for lines connecting exchanges with each other shall be extended to include all lines (except private lines) connecting cities, towns and places, in which an exchange is not established, with other or with an exchange, for which branch line contracts, so called, have heretofore been issued, and the first section of our circular Form 502, dated May 2, 1898, shall apply to instruments used on such lines. All branch line contracts now held by you covering lines wholly within your territory, are hereby cancelled, and are to be returned to this office. All licenses for branch lines now held by third parties shall, until other and special pro-

now held by third parties shall, until other and special provision is made therefor, be continued as heretofore, and for instruments used thereunder our Licensees shall continue to pay the net rates fixed by our circular Form 479, dated Feb. 15, 1895.

This shall not be taken to authorize you to grant sub-licenses for toll lines without special permission. Instruments used for above-named purposes will be included in the monthly bills and proper rebate will be made on receipt of monthly statements showing the number of instruments so used.

Please give us early notice of your receipt and acceptance hereof.

Yours respectfully,

(Sd.)

C. JAY FRENCH, General Manager.

American Telephone and Telegraph Company.

November 29, 1902.

The Southwestern Telegraph & Telephone Company, Dallas, Texas.

GENTLEMEN:

Enclosed herewith is a communication from The American Bell Telephone Company offering to accept, in lieu of the payments now made by you under your contracts with that Company by way of rental upon telephone instruments, a percentage of the total gross earnings of your Company, as defined in the circular.

This plan has been submitted to officers of practically all of the operating companies throughout the United States and seems to meet with general approval. It involves a substantial reduction in

the amounts paid by the operating companies.

While I believe that the plan and the details as set out in the enclosed letter are entirely clear, I take the liberty of calling attention to some of the clauses in the letter, that their intent and purpose may be readily understood.

The second clause, as to the way in which the gross earnings of a sub-licensee company is which a Bell operating company is

1745 interested shall be dealt with, applies only to a few cases throughout the country in which an operating company has acquired an interest in a sub-licensee company. It is not impossible that other such cases may from time to time arise, and a rule should be established for dealing with them.

The methods of return and payment under this plan are as-

similated as far as may be with those now in force.

The memorandum appended to the letter is for the sole purpose of securing uniformity of accounts and of methods of making up the gross earnings. The underlying principle on which the memorandum is based is, that the actual earnings of all telephones shall form part of the gross earnings, but that a telephone which is in fact free shall not be treated as if it contributed anything to the gross earnings.

It is only necessary to call attention to one provision of the memo-

randum, which is in the nature of a compromise.

It is easy to deal with the subjects-matter of clauses (a), (b), (d), (e), (f), (g), (h), and (i), for it is clear that the uses referred to in (a) and (b) involve the actual earnings, while those referred to

in (d) to (i), inclusive, do not involve actual earnings of such a

character as to be counted into the gross earnings.

The matter referred to in (c), however, are incapable of accurate analysis. In some such cases telephones are furnished to municipal or other public corporations for an actual value received, and in other cases there is no direct actual value received, although the importance and necessity of giving the corporation telephones for which no cash payment is made may be just as great as in the former case. In some cases the corporation has the right by law to exact free telephones as a condition of the grant of a franchise, in which case the telephone is leased for the actual value received; while in other cases the corporation has no such right, and therefore the furnishing of a telephone free or at a discount is a voluntary act on the part

of the operating company, for which technically it cannot be said to receive real value. It seems clear, therefore, that

it is better to adopt an arbitrary rule covering all cases in which telephones are supplied to municipal or other public corporations without payment or at a discount, and the plan adopted, as stated in the memorandum, is that in all such cases, whatever may be the circumstances or conditions, such telephones shall be counted as contributing to the gross earnings of the operating company at the rate of nine dollars a year unless a larger sum is actually received in cash.

This compromise meets with the approval of the operating companies to whom it has been submitted. The matter is of small moment, and it is dealt with only that there may be a uniform basis upon which the returns and payments shall be made by all companies.

It is believed that the advantages of the new plan, over and above the reduction involved, will be apparent. It is fair and simple and will result in the elimination of a great amount of bookkeeping that is now necessary in order to determine the telephone rentals and rebates.

I will add that it is our expectation to relieve the operating companies from the obligations of keeping a record of each telephone instrument by its serial number as is required at present. This, however, will form the subject-matter of a subsequent communication.

For convenience, I enclose also a form of vote that would be a proper form by which to indicate your assent to the plan set out in the letter.

Very truly yours, (Sd.)

F. P. FISH, President.

Copy.

Resolution to be Passed by the Board of Directors of the Southwestern Telegraph and Telephone Company as to Letter from the American Bell Telephone Company Dated November 21, 1902.

A letter dated November 21, 1902, from the American Bell Telephone Company, was presented, offering to substitute for the 1747 amount payable by this Company under its license contracts by way of rental upon telephone instruments, four and one-half per cent (4½%) of the total gross earnings of this company, as defined by said letter and the memorandum appended thereto, and thereupon it was

Voted: that such offer be accepted and that the President be authorized in the name and behalf of this Company to notify The American Bell Telephone Company of the acceptance thereof.

Copy.

The American Bell Telephone Company.

November 21, 1902.

The Southwestern Telegraph and Telephone Company, Dallas, Texas:

The American Bell Telephone Company hereby offers, until further notice, to substitute for the rental upon telephone instruments (magneto telephones and battery transmitters) payable by you under its license contracts held by you and circulars in modification thereof, four and one-half per cent (4½%) of the total grose earnings of your company, and of any sub-companies through which you may operate, from exchange, toll and private line business and from all other business done in your territory in the operation of which telephones are now or may hereafter be used, including your receipts from sub-licensees.

If in any case you have acquired, or shall hereafter acquire, any interest in a sub-licensee company operating in your territory, a portion of the total gross earnings of such company proportionate to your said interest shall be treated as a part of your total gross earnings in lieu of a like proportion of your actual receipts from that company.

The amount due for each month will be determined by the total gross earnings of the second preceding month computed as herein provided.

Said percentage will cover all instruments in use by you or under your authority in your territory, including instruments used on switchboards or for other operating purposes and those for which

no consideration is received by you, and also will cover those in stock, which last are not to exceed three per cent (3%) of the total number charged to you. It is understood that

you will use your best endeavors to limit the number of instruments

to the needs of the service.

All instruments charged to you on the last day of any month in excess of the number in use and such three per cent in stock will be rates as earnings seventy-five cents per month each instrument, and the amount of such rated earnings will be included in your total gross earnings for that month in determining the amount to be

paid by you.

A statement, over the signature of the proper accounting officer of your total gross earnings for each calendar month, computed as herein provided, with the number of instruments in use and in stock in your territory on the last day of that month, must be sent to the Treasurer of this company on or before the last day of the next succeeding month, and payment in Boston or New York funds be made on or before the tenth day of the following month, that

being the month for which such payment is due.

Further statements of instruments will be made by you at such times and in detail as this company may from time to time require. You are requested to give us early notice of your receipt and acceptance hereof, with a certified copy of the vote of your directors

authorizing such acceptance.

This offer when accepted will not become binding until this company shall declare the plan effective, and upon such declaration shall take effect as of January 1, 1902. It shall not be construed to interfere with any adjustments of rental to which you may be entitled for periods previous to said date.

In order that the method of computing total gross earnings may be uniform, the memorandum hereto appended is to be read as part

of this letter.

Yours respectively, (Sd.)

C. J. FRENCH, General Manager.

Copy.

Memorandum.

1749 In determining the total gross earnings hereinbefore referred to, the following special cases shall be treated as hereinafter indicated and methods of accounting for this purpose should be arranged accordingly.

There shall be included in such total gross earnings the value

of service, rebates or discounts allowed:

- (a) To corporations, other than public corporations, or to firms or persons, in return for pay station privileges, transportation, pole locations, attachments, rights of way, advertising, retainers and services, and generally in consideration of rights of value of any kind.
- (b) "Municipal or other public corporations, in satisfaction of taxes, assessments of rates legally imposed.

(c) "Municipal or other public corporations in return for franchise, rights of way, pole locations, and generally for rights and privileges of any kind, or as a matter of courtesy or required by municipal or public regulation, except as provided above in (b).

Instruments furnished as indicated in (a) and (b) above are to be rated as earning your standard rates for like equipment and service. Instruments furnished as indicated in (c) are to be rated as earning seventy five cents per month per instrument for local service except in cases where an amount in excess of said sum is received in cash.

There shall not be included in such total gross earnings free serv-

ice, rebates or discounts allowed:

- (d) As a matter of courtesy, except as provided above in (c).
- (e) To charitable, religious or educational institutions.
- (f) "Officers and employees of the company but not allowed as full or part compensation for services.
- (g) On toll charges, either by deductions from bills or by discount on coupons regularly issued when given under rules of the company.
 - (h) On account of defective service.
 - (i) On uncollectible accounts.

The Southwestern Telegraph and Telephone Company.

Extract from the Minutes of a Meeting of the Executive Committee of this Company Held on December 17, 1902.

"Referring to a letter dated November 21, 1902, from The American Bell Telephone Company, a copy here present, offering to substitute for the amount payable by this Company under its license

contracts by way of rental upon telephone instruments, four and one-half per cent (4½%) of the total gross earnings of this Company, as defined by said letter and the memorandum

appended thereto, and thereupon it was

Voted: That such offer be accepted and that the President be authorized in the name and behalf of this Company to notify The American Bell Telephone Company of the acceptance thereof."

The Southwestern Telegraph and Telephone Company, Dallas, Texas:

Referring to the letter of this company dated November 21, 1902 offering until further notice to substitute for the rental upon tele-

phone instruments (magneto telephones and battery transmitters) payable by your company under its license contracts and circulars in modification thereof, four and one-half (4½%) per cent of the total gross earnings of your company computed as therein provided, and to the clause in said letter "This offer when accepted will not become binding until this company shall declare the plan effective and upon such declaration shall take effect as of January 1, 1902."

You are advised that said plan is hereby declared effective as

of and from January one, nineteen hundred and two.

Our Treasurer will send to you at early date a request for the necessary information to enable him to determine the amount to be credited to your company for the year 1902 under the above offer.

Yours respectfully,

(Sd.)

C. JAY FRENCH, General Manager.

Discontinuance of Individual Numbers on Instruments.

Copy.

American Bell Telephone Company.

December 11, 1906.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

Gentlemen:

For the greater convenience of the operating companies in accounting for telephone transmitters and receivers, it has been decided to discontinue the practice of placing special

individual numbers upon such instruments.

In the future, therefore, it will be necessary for operating companies to keep such records only as will enable them to report by code number the quantity of each style of instrument that may be returned, lost, stolen or destroyed, or in any way subject to credit.

Owing to the large stock of new instruments in hand or in process of manufacture which have already been numbered, it will be impossible to eliminate the numbers from the individual instruments for some time to come. In reporting instruments, however, these numbers may be disregarded.

Yours truly,

R. W. DEVONSHIRE, General Manager.

Copy.

American Bell Telephone Company.

Boston, Mass., July 25, 1907.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

GENTLEMEN:

In order to facilitate the delivery and return of instruments, we have arranged that hereafter telephones, transmitters and parts of instruments may be ordered direct from the Western Electric Com-

pany by the following method:

Beginning August 1, 1907, orders for new instruments may be sent to the house of the Western Electric Company from which you are now buying telephonic apparatus. For this purpose you may use either our form No. 152H (changing the address to Western Electric Company) or your own regular requisition blanks. All orders must be made in the name of the company holding contract with the American Bell Telephone Company.

Receipt Forms.

The present receipt forms or similar forms to be furnished by the Western Electric Company will be required, and should be promptly signed by you and returned to the Western Electric house which takes your order.

Parts.

Parts of instruments for ordinary repairs now sold by this Company will, after August 1, 1907, be furnished and billed you by the Western Electric Company.

Returned Instruments.

Defective instruments may be returned by you to the nearest Western Electric warehouse. In this connection Form 159J will be used, the original being sent you by mail to Western Electric Company, and the duplicate with the instruments. Any missing parts will be charged to you by Western Electric Company, and any excess parts will be credited to you by that company.

Carriage Charges.

The Western Electric Company will pay the carriage charges from its factory to its warehouse nearest your territory, or, when instruments are shipped from factory, will make the same freight allowances as on telephonic apparatus. In the case of instruments returned, carriage charges to nearest Western Electric warehouse will be borne by you.

You will note that under this arrangement you will have some carriage charges, and, by reason of the proximity of a stock of instruments at the Western Electric warehouses, will find it possible to carry a smaller stock.

Yours very truly, (Sd.)

R. W. DEVONSHIRE, General Manager.

Boston, October 3, 1907.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

GENTLEMEN:

Referring to the vote of your Executive Committee passed September 17, 1907, touching the sale of telephones and transmitters in the open market to all buyers, I am authorized to accept for The American Bell Telephone Company the construction of a license contract expressed in said vote and to inform you that this Company will act in accordance therewith.

Yours very truly, (Sd.)

THEO. N. VAIL, President.

Copy.

American Telephone and Telegraph Company.

October 9th, 1920.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

GENTLEMEN:

Your system of lines and exchanges has heretofore been operated solely with instruments furnished by this Company. Even in the case of a sublicense, sublicensee has been required to use such instruments upon all lines connecting with your

system. As the Western Electric Company is about to sell telephone instruments and appliances, it seems to us that this is an appropriate time to revise and extend somewhat rules which have heretofore been followed with regard to the telephone instruments to be used upon connecting lines. We suggest, therefore, that hereafter in making sublicenses and contracts for the interchange of business you do not limit yourself solely to those who use telephones furnished by us or sold by the Western Electric Company but that, in appropriate cases, you make such contracts with companies and individuals even when they use other telephones, provided first class instruments are used and the lines are maintained and operated at such a standard of efficiency as not to impair the quality of service furnished over the joint lines.

This connection with such companies and individuals should be limited to farmers' lines, so-called, or lines of a similar character, to lines operated by railroad, and to all exchanges located wholly within your territory and not connected with lines and exchanges

in the territory of any other of our licensees.

It is important in making such contracts that great care be taken, in order that no system may be built up that will impair the value to the public of your own system or interfere with the system established by your neighbors.

Yours very truly, (Sd.)

THEO. N. VAIL, President.

American Bell Telephone Company.

Delivery of Telegraph Messages.

March 25, 1910.

The Southwestern Telegraph and Telephone Company, Dallas, Texas.

GENTLEMEN:

Referring to the provisions in our License Contract for the delivery to this Company or its appointees of telegraph messages and particularly to our circular letter of May 2nd, 1898 under which you receive the entire commission payable to this Company by telegraph companies on messages turned over to such companies, this company believes that it will be for the advantage not only of telephone subscribers but also of the public that no distinction be made between the collection and delivery by telephone of such messages and other communications by telephone and that the telegraph companies be permitted to receive and deliver telegraph messages by any exchange telephone installed at the usual business rate. This Company, therefore, releases you from any obligation to keep an account of such messages and recommends that

the practice of furnishing telephones to telegraph companies especially for the receipt and delivery of telegrams be discontinued and that telegraph companies be permitted to use therefor any exchange telephone that is furnished at the usual business rate.

Yours respectfully,

R. W. DEVONSHIRE, General Manager.

Copy.

The American Bell Telephone Company.

December 16, 1912.

Mr. H. J. Pettengill, President

The Southwestern Telegraph and Telephone Company, St. Louis, Mo.

DEAR SIR:

The American Bell Telephone Company hereby offers to substitute the following method of computing total gross earnings in place of the method described in our letter of November 21, 1902, and subsequent interpretations thereof.

The total gross earnings, for the purpose of determining the amount, of which you pay us $4\frac{1}{2}\%$, shall comprise the accounts described and defined in our Accounting Circular No. 8 as follows:

Account 500 Subscriber's Station Revenues.

501 Public Pay Station Revenues. 504 Private Exchange Lines.

510 Message Tolls.

1757 From the total of the foregoing shall be deducted—Account 304 Uncollectible Operating Revenues.

To the difference between the aforesaid revenues and the aforesaid deductions therefrom shall be added:

- a) The sum of seventy-five cents per instrument per month for all instruments not in use in excess of 3% of the total number standing charged to you on the last day of such month (the 3% representing the maximum number believed to be necessary for stock). This is the present basis as to excess stock.
- b) For sublicensed or other operating telephone companies not directly licensed by this Company in which you own a majority of the stock and which are in effect operated as a part of your telephone system the same proportion of their gross revenues (computed as aforesaid) as the proportion of their stock which you own.

Note.—On application for the exclusion of such gross revenues of any such subsidiary company the question will be carefully considered and determined on the facts in each case.

The purpose of this offer is to simplify the method of computation and to bring it closely into conformity with the accounting

system established by the Interstate Commerce Commission.

This method of computation will take effect January 1, 1913, for those licensees which accept it prior to January 31, 1913. first bills on the new method of computation will be those rendered early in March 1913.

A suggested form of resolution for the purpose is enclosed herewith. If adopted by your company kindly have the Secretary send

to me a certified copy of such action.

Yours truly.

(Sd.)

C. C. DU BOIS, Comptroller.

Copy.

A letter, dated December 16, 1912, from The American Bell Telephone Company was presented, offering, for the purpose of determining the amount of gross earnings of which this Company pays Four and a Half Per Cent, to substitute in place of the method now in use the method set forth in said letter and thereupon it was

Voted: that such offer be accepted and the President be authorized in the name and behalf of this Company to notify The American

Bell Telephone Company of its acceptance thereof.

"A letter dated December 16, 1912, from The American Bell Telephone Company was presented, offering, for the purpose of determining the amount of gross earnings of which this Company pays Four and a Half Per Cent, to substitute in place of the method now in use the method set forth in said letter, and thereupon it was

Voted that such offer be accepted and the President be authorized in the name and behalf of this Company to notify The American

Bell Telephone Company of its acceptance thereof.'

Copy.

Shreeve and Vacuum Tube Repeaters.

The American Bell Telephone Company,

125 Milk Street.

P. O. Drawer 2.

1759

Boston, March 28, 1916.

Southwestern Telegraph & Telephone Co. (N. Y.), St. Louis, Missouri,

Mr. H. J. Pettengill, President.

DEAR SIR:

I enclose a copy of two resolutions adopted by the Executive Committee of the American Telephone and Telegraph Company on March 15, 1916, relative to furnishing to the associated companies Shreeve and vacuum tube repeaters. A copy of our General Coursel's opinion upon this matter is also enclosed, as perhaps of interest.

If your company's construction of the License contract as amended, agrees with that set forth in these resolutions, will you please ask your Board of Directors or Executive Committee to pass

a resolution assenting to this construction?

At your convenience please advise me of your company's action.

Yours truly,

(Sd.)

R. W. DEVONSHIRE, General Manager.

Resolved: that the officers of this Company be and they are hereby directed to advise each of the associated companies that the license contracts, as amended, existing between this Company and each of its associated companies do not, as construed by this Company, require this Company to furnish to the associated companies what are

known as Shreeve and vaccum tube repeaters without a specific charge therefore in addition to the Four and One half per cent,

(4½%) payments under said contracts.

Resolved further: that the officers of this Company be permitted to furnish said repeaters without specific charge therefor in addition to said four and one-half per cent $(4\frac{1}{2}\%)$ payment, to such of the associated companies as accept this construction of the said license contracts, upon the definite agreement by said companies that this

Company shall at any time have the right to discontinue said practice and to make reasonable charges, in addition to said four and one-half per cent (41/2%) payment, for all such

repeaters thereafter ffurnished.

Copy.

New York, February 17, 1916 (M. R.).

Memorandum for U. N. Bethell, Esq., Senior Vice-President.

The Shreeve and Vacuum tube repeaters are devices for extending the radius for communication by telephone. When used in connection with telephonic communication, each of these devices accomplishes this purpose by reproducing in the relatively strong electric current passing through a second circuit the electrical undulations which characterize a much diminished current passing through the preceding circuit, the preceding circuit being connected with the second circuit through the repeater. The variations to be effected in the current in the second circuit are in each instance identical, this being accomplished in the case of the Shreeve repeater through mechanical means and in the case of the vacuum tube repeater through electrical means. So far as the question under consideration is concerned, it is unnecessary to make any distinction between the two classes of repeaters.

The question which is presented to me is whether these repeaters are telephones which the terms of the license contracts require this company to furnish to its associated companies as a part of the consideration for which the four and one-half per cent $(4\frac{1}{2}\%)$ payment is made. In my opinion, this question should be answered in

the negative.

I think it clear that each of these repeaters in a telephone in the sense that if the Bell patents had not expired, it could not legally be manufactured and sold except by license under them. This,

however, is not the question.

The license payment did not pay for everything which the licensor was bound to furnish under the contracts. It paid the rental for the telephones which were leased but did not pay for "the inventions and call bells, switches, switchboards and other apparatus needed for such telephones lines which it (the licensor) can so license."

Giving due weight to all of the provisions of these original contracts, it is my conclusion that by the telephones to be

furnished under them were meant the instruments which were to be furnished to the subscribers for their use and for which the licensees were to charge subscribers such rentals and royalty as might be fixed

from time to time by the licensor.

If there was any doubt under the original contracts, I think it is removed by the modification of these contracts by which four and one-half per cent $(4\frac{1}{2}\%)$ of the gross earnings was fixed as the measure of the payments under them. This modification was made by letter, sent to each of the licensee companies under date of November 21, 1902, and accepted by each of these companies. This letter contains the following language:

"The American Bell Telephone Company hereby offers, until further notice to substitute for the rental upon telephone instruments (magneto telephones and battery transmitters) payable by you under its license contracts held by you and circulars in modification thereof, four and one-half per cent $(4\frac{1}{2}\%)$ of the total gross earnings of your company."

What has been underscored definitely describes the telephone instruments which the associated companies are entitled to have furnished in consideration of this payment. They are magneto telephones and battery transmitters. This language had at the date of said letter, and has now, a well defined meaning which does not include repeaters. Moreover, no repeater available for commercial use had been developed at the time these letters were written.

The number of repeaters now in use is very small, and no charge is being made for them. I think it desirable that this practice be continued so long as there is no extension in their use, but it should be with the definite understanding that the Company is not under obligation to continue it, and that it is without prejudice to the right of the Company to require payment for the repeaters at any time

that it may wish to do so.

Yours very truly,

(Sd:)

New York, December 5, 1917.

Mr. H. J. Pettengill, President, Southwestern Bell Telephone System, St. Louis, Mo.

DEAR MR. PETTENGILL:

The Executive Committee of this Company, in view of the extraordinary conditions due to the state of war now existing, today adopted a resolution authorizing the computation of the originating commissions payable under existing contracts by this Company to your companies, upon the following basis, beginning January 1, 1918:

- (a) Where the "L" operator of the associated company as defined by this Company's operating rules is in charge of the communication, 25% of the cash receipts from each single connection upon which the associated company is entitled to a commission, not exceeding 30¢ for any single connection.
- (b) Where the "L" operator of this Company as defined by this Company's operating rules is in charge of the communication, 25% of the cash receipts from each single connection upon which the associated company is entitled to a commission, not exceeding 12¢ for any single connection.
- (c) On business originating at pay stations upon which the associated company is entitled to a commission if in class (a) twice the commission above provided for class (a) business, and if in class (b), twice the commission above provided for class (b) business.

This is upon the condition that this Company reserves the right at any time to discontinue the payment of said commissions upon the terms stated in this letter, and to resume their payment upon the terms of said contract. Please advise me at your convenience whether or not this temporary modification of these contracts is acceptable to you and your Executive Committee or Board of Directors.

Very truly yours,

(Sd.)

Mr. U. N. Bethell, Senior Vice President, American Telephone and Telegraph Company, 195 Broadway, New York.

DEAR MR. BETHELL:

On behalf of The Southwestern Telegraph and Telephone Company, I accept the offer increasing the rates of originating commissions, as outlined in your letter of December 5th.

Extract from the minutes of the Board of Directors' Meeting, giv-

ing me authority to accept the offer is enclosed herewith.

Yours very truly,

THE SOUTHWESTERN TELEGRAPH AND TELEPHONE COMPANY.

(Sd.) H. J. PETTENGILL, President.

The Southwestern Telegraph and Telephone Company.

Extract from the Minutes of a Meeting of the Board of Directors Held on December 18, 1917.

The President submitted the following letter (set out on page 110) from the Vice President of the American Telephone and Telegraph Company:

"Voted: That the President be and he hereby is authorized to accept the offer as outlined in above letter, and to notify the American Telephone and Telegraph Company in writing of said acceptance."

No. 148.

"Photograph of Inductive Vacuum Tube Telephone Repeater Cord Circuit for Non-Loaded Lines."

This exhibit shows a type of telephone repeater furnished the Southwestern Company by the American Company under the terms of the Licensee Contract. A repeater of this type was installed in Houston in June 1917.

No. 149.

"Map of United States Showing Range of Transmission from Houtton with and Without the Use of Telephone Repeaters."

This exhibit is a map of the United States showing the 1766 area of satisfactory telephone transmission radiating from Houston before the introduction of the telephone repeater and the area of such transmission after the introduction of the repeater. The exhibit shows that before the repeater was installed in the Houston Exchange a person in Houston could carry on a satisfactory communication by telephone with persons in Louisians, Mississippi and Arkansas, the Western half of Alabama, Tennesse and Kentucky, the extreme southern part of Illinois, the southern part of Missouri, the eastern half of Kansas and Oklahoma, and the greater part of Texas, excepting the extreme western part. After the repeater was installed the exhibit shows that a person in Houston

may satisfactorily communicate over the telephone with another person at any point anywhere in the United States.

No. 150 & 151.

"Photographs of 'Cable Bug' or Scobicia Declivis."

These exhibits present illustrations of the details to which the Research & Development Engineering Department of the American Company assists the Southwestern Company with problems arising in its territory. The caule bug attacked the aerial cables in Texas and the Southwestern Company submitted the matter to the American Company for study of methods to prevent such destruction.

No. 152.

"Estimate of Savings Resulting from a Few of the Services Other Than Instrument Service."

1767 The following is an exact copy of this exhibit.

The Southwestern Telegraph & Telephone Co.,

Houston, Texas.

Oct. 1, 1919.

is Angener

ar it is

Conservative Estimate of Savings Resulting from a Few of the Services Other Than Instrument Services.

	Annual savings.
 Improvement in cables by use of fine wire. Duct Saving due to improvement in Cables. New alloy for Cable Sheaths. Improvement in Switchboards Cords. 	17,300
Total	\$138,100
Number of stations Houston, Oct. 1, 1919 Evaluated saving per year per station for certain en	26,693
neering services other than instrument service Actual 4½% payment per station per year for all se	5.18
ices other than instrument services	55
In the 1	

In the above table nothing has been put down for the value of many other engineering services or the services of the

- 1. Legal Department.
- 2. Patent Department.
- 3. Value of Patent Protection.

1768 4. Comptrollers Department.

- 5. Insurance Department.
- 6. Financial and Administration Departments.

The service of these departments is of very great value to the Southwestern Telegraph & Telephone Company. It will be seen that the evaluated saving of a few of the engineering improvements due to the work of the General Engineering Staff of The American Telephone & Telegraph Company are nearly ten times as great as the payment to the American Telephone & Telegraph Company for services other than instrument services.

No. 153.

"American Telephone & Telegraph Company Specification #3850, Covering Substation Protector Installation."

This exhibit consists of a hand-book specification of 31 pages prepared by the Engineering Department of the American Company and consists of written matter and numerous diagrams and illustrations showing what it considers to be the most improved method for installing substation protectors.

No. 154.

"Photographs of Construction Work in the Houston Exchange Conforming to American Telephone & Telegraph Company Specifications."

This exhibit consists of nine photographs of construction work in different parts of Houston and diagrams taken from American Telephone & Telegraph Company hand-book construction 1769 specifications, showing where these specifications have actually been used in building the Telephone plant at Houston as follows:

Photograph Λ.—Construction at the corner of McGowan and Louisiana Streets, illustrating the use of Diagram 70 of American Telephone & Telegraph Company Specifications #3235.

Photograph B.—Construction work on Mt. Vernon Street east of West Main Street, illustrating the use of Diagram 75 of American Telephone & Telegraph Specifications #3235.

Photograph C.—Construction work on West Main Street, illustrating the use of diagram- Nos. 34 and 56 of American Telephone & Telegraph Specifications #3235.

Photograph D.—Cable construction on Dumble Avenue south of Harrisburg Blvd., illustrating the use of Diagrams 37 & 85 of American Telephone and Telegraph Specifications #3235.

Photograph E.—Construction work at the corner of Adams Street and Harrisburg Road, illustrating the use of Diagram 81 of the American Telephone & Telegraph Specification #3235.

1770 Photograph F.—Construction work on West Alabama Street east of Travis Street, illustrating the use of Diagrams 35 and 65 of American Telephone & Telegraph Specification #3235.

Photograph G.—Construction work between Walker & McKinney Avenues, Maplewood and Linwood, illustrating the use of Diagram 1 of American Telephone and Telegraph Specification #3235.

Photograph H.—Block Cable at the corner of Webster and Bagby Streets, illustrating the use of Diagrams 93 and 95 of American Telephone & Telegraph Specifications #3235.

Photograph I.—Block Cable work between Main and Fannin Streets, Texas and Capitol Avenues, illustrating the use of Diagram 93 of American Telephone & Telegraph Specification #3235.

No. 155.

"American Telephone & Telegraph Company Engineering Department Local Operating Text Book, Traffic Circular #113."

This exhibit consists of 147 pages of printed matter covering all features of local operating. It shows the details with which traffic problems have been studied by the American Company and the form in which the American Company presents the results of its studies. The following is a copy of the Table of Contents in this exhibit:

No. 156.

"Titles of some of the Circular Letters and Specifications which the American Telephone and Telegraph Company Have Prepared for the Associated Companies, Copies of which have been Received by the Southwestern Company."

This exhibit is a pamplet of 29 pages showing the titles of various circular letters and specifications prepared by the American Com-

pany covering all phases of the Telephone plant construction, maintenance, and operation. On pages 1 to 18 inclusive is a list of 469 different circular letters each covering a different subject. On pages 19 to 29 inclusive is a list of 248 specifications, each covering a different subject. These circular letters and specifications relate to central office equipment, outside plant, substation apparatus, telephone buildings, underground construction, private branch exchanges, maintenance, transmission, operating methods, etc.

1774

5. 157.

"1918 National Electrical Code Published by the National Board of Fire Underwriters."

This exhibit gives the electrical code established by the National Board of Fire Underwriters, and is an example of a National problem affecting the Southwestern Company, in the consideration and solving of which problem the American Company's engineers represent the Southwestern Company under the terms of the licensee arrangement.

This exhibit was presented to show this type of work.

No. 158.

"Book, a Preliminary Report Prepared by the American Committee on Electrolysis."

This exhibit is a report on electrolysis submitted by a National Committee of engineers, on which committee the engineers of the American Company under the terms of the licensee arrangement represented the Southwestern Company.

No. 159.

"American Telephone & Telegraph Company Specifications, #3636, for Crossings of Telephone Circuits Over Steam Railroad Right of Way."

This exhibit, consisting of ten pages of printed matter, was prepared and issued by the American Company and deals with the subject mentioned in the title.

No. 160.

"United States Bureau of Standards' Circular #54, National Electrical Safety Code."

This exhibit is a circular of 323 pages giving the result of many conferences between experts representing the Bureau of Standards, various electric light interests, and various telephone and telegraph interests throughout the United States.

No. 161.

"Partial List of Specific Work Done on Problems for the Southwestern Telegraph & Telephone Company by the General Engineering Staff of the American Telephone & Telegraph Company."

This exhibit, consisting of 15 pages of typewritten matter presents a list of some of the engineering construction, maintenance and operating problems relating to the Houston Exchange and other exchanges of the Southwestern Company in which the American Company gave advice and assistance to the Southwestern Company. The following is a copy of pages 1, 2, 6, 8, 10 and 13 of this exhibit: These pages illustrate the nature and importance of some of the specific problems.

Fundamental Plans.

Houston.

A fundamental plan is a guide to future construction work. It is a carefully worked out forecast of what the telephone conditions will be in fifteen or twenty years. It is, therefore, important to secure high grade engineering talent in working out such plans. In this we have the assistance of the experts of the American Telephone & Telegraph Company. The foundation of a fundamental

plan is a commercial survey. Two commercial surveys have 1776 been made for the City of Houston, Texas, in recent years.

In 1911, a commercial survey was made for Houston and surrounding suburban territory to serve as the basis for a fundamental plan (ultimate 1926). The direction and character of development of Houston was peculiarly uncertain at this period on account of changing conditions affected by the Ship Canal. For this reason, when conditions became somewhat more clearly established, a new commercial survey was made in 1914 as a basis for another fundamental plan (ultimate 1929).

Engineers from the General Engineering Staff advised, co-operated and assisted in both of these commercial surveys. All told, the Staff engineers devoted the following number of days in Houston to this

work:

Mr. C. H. Arnold		days
Mr. C. Wallace		days
Mr. A. E. Plumer		days
Mr. W. G. Holt		days
Mr. R. R. Copp	43	days
-	308	days

In addition to this time actually spent at Houston, a considerable amount of time was devoted by the Staff engineers to the consideration, at New York and Dallas, of certain details of the Houston surveys.

The following fundamental plans have been made for Houston, Texas.

1777 Ultimate-Date of Date of study. ultimate. Lines. Stations. Population. 1904 1920 5,400 7.700 77,000 1906 1920 26,600 35,000 175,000 1912 1926 24,000 31,324 197,000 1915 1929 33,299 50,749 245,000

The 1904, 1906 and 1912 plans were made entirely by the General Engineering Staff. The 1915 plan was made by the Southwestern Company. The Staff engineers reviewed the results of this plan

and approved it.

Of the total telephone plant now in Houston, about 50% has been placed in accordance with fundamental plans or a total of about \$3,000,000.00. It is estimated that by 1929, we will have spent an additional \$2,500,000.00 for telephone plant in Houston in accordance with the fundamental plan.

Buildings and Central Office Equipment.

Houston.

When the Preston, Hadley and Taylor Buildings were built in Houston, the plans were submitted to the General Staff for their criticism and comment. They were carefully reviewed from every standpoint before the work was started. Inasmuch as these buildings represent an investment of some \$400,000.00, the importance of reviewing the plans before they were erected is apparent.

The General Staff worked with the Southwestern Company in the preparation of the Central Office equipment specifications for the Preston and Hadley exchanges. They furnished certain standards from which these specifications were prepared and were of asistance in engineering this equipment which represents an

investment of some \$800,000.00.

We have more or less trouble due to moisture in our Houston Central Office and have taken up with the General Staff, methods of remedying the trouble. They have advised regarding moistureproof plug shelves and moisture-proof switchboards cable at Houston.

On account of the large number of extremely long lines connected with the Houston Office, much difficulty was experienced with the operation of the circuits. At the request of the Southwestern Company, the General Staff made a careful study of the situation and designed long line equipment to overcome the difficulties and also a method of signalling on these long lines.

General.

The Southwestern Telegraph & Telephone Company has received assistance from the General Staff on a great many matters relating

to central office equipment and buildings. It is in this field of engineering work that the General Staff have made notable progress in the matter of standardization. Many circuits and types of switch-

boards have been tried out by the General Staff and the results of these investigations have been made available to the

Southwestern Company. There is a frequent interchange of correspondence between the companies on this subject and many personal conferences. Some of the typical subjects discussed from which some idea may be gained of their range and importance are listed below:

Gave specific advice as to the best method of lighting operating rooms and also a method of rear lighting for the switchboards.

Furnished handbook of telegraph circuits and information on printing telegraph apparatus.

Gave specific advice as to the wear permissible in switchboard jacks and advised regarding the sleeve gauge to be used in testing jacks. Advised regarding inspection and maintenance tools for switch-

board plugs and jacks.

Gave advice regarding gas engine troubles and advised regarding different types of gas engines and the handbooks issued for operating them.

Outside Plant.

General.

The files of the engineering department of the General Staff show that the Southwestern Company has requested advice from the General Staff in regard to very many specific matters relating to outside

plant. Many of them have to do with the proper construction to employ to meet the peculiar conditions of a specific 1780

case. In other instances the question involved concerned the application of standard arrangements to conditions more or less general to the Southwestern Company territory, and in such cases information given in regard to a specific case also applied to a considerable number of other similar cases. Below are given a few typical cases of advice in regard to outside plant matters given the Southwestern Company.

Gave specific advice with regard to the preservation of poles. Gave specific advise relative cypress poles and their treatment. Furnished information regarding inspection of creosoted material.

Gave specific advise regarding the samples of creosote for application to pole butts.

Inspected creosoted pole lines in Texas and advised concerning same.

Furnished complete information regarding analysis of dead oil of coal tar for treatment of poles.

Gave specific advice and information regarding open tank treat-

ment for poles.

Furnished specific advise regarding butt treatment of poles and the general results of such treatment.

1781 Advised concerning creosoted pine poles vs. Cedar poles.

Advised regarding samples of pothead wire.

Furnished information regarding life of galvanized iron wire on the Gulf Coast.

Advised concerning enameled distributing frame wire.

Gave specific advice regarding new type #22 gauge aerial cable. Furnished at various times, upon request, much detailed information regarding conditions under which joint use of poles could be record into with electric light companies.

entered into with electric light companies.

Advised regarding use of #8 soft copper wire in joint use con-

struction.

Protection of Life and Property.

Houston.

The Insurance Department of the General Staff has reviewed 35 of our semi-annual maintenance inspection reports of the three Central Office Buildings in Houston between 1911 and 1919, with a

view of reducing the fire risk.

The Insurance Department of the General Staff has recently succeeded in getting the State Insurance Commission of Texas to recognize the fairness of their request for substantial rate reduction in telephone properties in Texas. This has resulted in a saving of about 33% in insurance premiums for the three exchange buildings

in Houston.

1782 The Insurance Department of the General Staff has sent its own experts to Houston to inspect our Preston building three times, Hadley building four times and Taylor building three times during the years 1916, 1919 from an insurance standpoint, and made recommendations for improving the risk and further reducing the insurance rates.

Advised concerning a form of contract and concerning the type of protection where signaling lines of private power lines are connected

to our telephone plant at Houston.

General.

The General Staff has furnished the Southwestern Company a great deal of information on this important subject. They have made studies of protective devices and methods used throughout the United States and have made the results of these studies available to the Southwestern Company. A partial list of the subjects covered is as follows:

The Insurance Department of the General Staff has sent its experts over the territory of the Southwestern System to inspect the various Central Office Buildings and has made many written reports

and suggestions in regard thereto.

They have reviewed the semi-annual inspection reports we make with a view of reducing insurance premiums on all the central office buildings we own.

1783 They have studied proposed building plans with a view of designing the buildings so that a minimum fire risk would be run and the insurance kept to a minimum.

Gave specific advice on the question of installing tarpaulins for

switchboards in small offices.

Gave information regarding the National Electrical Safety Code, United States Bureau of Standards, discussed safety appliances and instructions for employees.

Analyzed accidents to operators and methods to avoid same.

Traffic and Operating.

Houston.

Mr. Christensen of the Generall Staff, visited Houston studying service observing. He is a specialist in this line of work and gave our people the benefit of his experience with respect to local conditions at Houston. The object of these studies is to give an exact and comprehensive picture of the grade of service being rendered so that we may observe from time to time exactly what grade of service we are rendering the public, with a view of taking steps to improving it whenever it shows a tendency to fall below standard.

Mr. Allen, a representative of the General Staff, visited
Houston going over the details of the method of making peg
counts and the equipment necessary for same, giving advice

and information to our people in regard to many points upon which questions had arisen. The peg count, which is a record of the number of calls handled by the operators, is taken about once a month and is important in that it is the foundation upon which our switchboards are engineered and is a means by which we determine the number of operators required at the switchboards to handle the calls.

Another representative, Mr. R. E. Walker, of the General Staff visited Houston, giving advice in regard to wages and working conditions of operating employees. Experience in this regard elsewhere is of valuable assistance to the Southwestern Company.

The General Staff has made a study of service standards for Houston and has made valuable suggestions in regard thereto, to the

Southwestern Company.

General.

It is quite important to develop uniform practices in operating methods in the various cities. The services of the General Staff have been particularly valuable in this respect in that they furnish the Southwestern Company the results of numerous studies of different methods throughout the United States and have made suggestions relative to changes that would improve the service

and also reduce operating cost. Some of the subjects on which they have advised the Southwestern Company are

given below:

Furnished complete information and data regarding proper operating loads which could be satisfactorily handled by operators of various degrees of experience.

Advised regarding "A" operator ticket forms.

Gave method of operating rural magneto lines on #1, #8 and #105 switchboards.

Advised regarding standard operation of #8 switchboards.

Outlined routine for handling service criticisms received at Central office.

Transmission.

Houston.

The Engineers of the General Staff in co-operation with the engineers of the Southwestern Company made a transmission study for Houston which demonstrated that it would be possible to extend the use of fine wires in trunk cables and subscribers' cables which resulted in considerable saving in annual costs.

The General Staff has furnished the Southwestern Company complete information on the transmission efficiency of various 1786 types of circuits and app-ratus. These data have been of

fundamental value in the design and construction of the telephone plant at Houston, so as to obtain satisfactory transmission in the best and most economical manner.

Furnish drawings and necessary information for the repeater in-

stallation at Houston.

General.

Under the heading of transmission comes all questions concerning the loudness and clearness of speech transmission. The study of the different parts of the Telephone plant with respect to their effect on the transmission of speech is a valuable service rendered by the General Staff to the Southwestern Company. This work has developed many things of importance. Some of these matters on which the General Staff has advised the Southwestern Company are cited below:

Advised regarding general type and use of coils, method of installation and general practice to be followed in loading open wire

and phantom circuits.

Experts of the Engineering Department of the General Staff have furnished a great deal of specific advice and information with regard to the loading of trunk cables in the larger cities. This advice cov-

ered every phase of the problem, such as specific coils to be used, proper spacing of coils, size of manholes, size of loading pots, methods and material to be used in installation, etc.

Furnished complete information with regard to the use, installation, maintenance, testing and termination of duplex cable; also as to the size and combinations of conductors and plans for its future use. Advised regarding trouble from lighting on high dielectric cables

entering through iron pipe.

Furnished detailed advice on the subject of inductive interference from power circuits and the design of transposition schemes to eliminate same. Several instruments for use in determining the amount of interference, its components, etc., have been designed and have been purchased by the Southwestern Company.

Furnished the Southwestern Company 6,000 to 8,000 transmitters, especially designed for use on long subscribers' lines where good

transmission is difficult to obtain.

PLAINTIFF'S EXHIBIT No. 163.

The S. W. T. & T. Co., Houston Exchange.

Houston Industries.

Study of Returns Earned.

C. A. Gates, Witness.

This exhibit is based on the 1915 report of the Bureau of the Census and shows the net per cent return earned by the various

industries in Houston.

The exhibit shows that the per cent return varies all the way from 8.08 per cent earned by the planing-mill products industry, to 157.28% earned by the newspaper and periodical publishing business. The average return to all the industries in Houston is shown to be 15.36 per cent.

The exhibit shows also the net earnings of the National Banks in the principal cities of Texas, the banks in Houston earning 9% and

the banks as a whole in Texas earning 14.41%.

1792 Mr. J. D. Frank: If your Honor please, there are two or three little matters that we want to straighten out this morning, called for by pleadings, First: I would like to offer in evidence Sections 990 and 991 of the Revised Code of Ordinances of the City of Houston. I will just read those and the Reporter can copy them in the records later on.

Sections 990 reads os follows:

"Sec. 990. Rates of charges.—Any person firm, corporation or receiver operating or owning telephone lines and exchanges within the City of Houston, Harris County, Texas, engaged in the business of furnishing telephone connections and services to the citizens of said City of Houston, shall charge not exceeding the following rates, to wit:

"Rate One: Telephone lines and exchanges having Three Thousand (3,000) or less paying subscribers within the limits of the City of Houston shall have the right to charge, for business or office connection, Three Dollars, (\$3.00) per month, for residence, Two Dollars (\$2.00) per month.

"Party Lines: Business or office, Two Dollars (\$2.00) per month: Residence, One Dollar (\$1.00) per month.

"Rate Two: Telephone lines and exchanges having in excess of Three Thousand (3,000) paying subscribers within the limits of the City of Houston shall have the right to charge, for business or office connections, Five Dollars (\$5.00) per month: For residence, Two Dollars (\$2.00) per month."

"Party Lines: Business or office, Three Dollars (\$3.00) per month: For residences, One & 50/100 Dollars (\$1.50) per month.

Provided that the rates above fixed are fixed for a reasonably efficient service, and in the event the service is not reasonably efficient, the subscriber or customer can satisfy his bill and the requirements of this section by paying or tendering to the person, firm, corporation or receiver operating or owning the telephone lines such proportion of the rate fixed by law for the service as the service actually furnished bears to a reasonably efficient service.

"In the event the service is not reasonably efficient, and the customer has paid in advance for the service at the rate fixed by this section, he can deduct an amount proportionate to the deficiency in the service from the rate for the next month, and the person, firm, corporation or receiver operating or owning the telephone lines shall be bound in all cases to receive said sum of money and continue to

furnish the service: provided that the amount of money paid by the customer is proportionate to the service rendered.

(Nov. 22, 1909, Ord. Bk. 3, p. 541, Sec 1.)"

Mr. J. D. Frank: Section 991 is as follows:

"Sec. 991. Penalty.—Any person, firm corporation or receiver, operating or owning telephone lines or exchanges within the limits of the City of Houston, Harris County, Texas, engaged in the business of furnishing telephonic connections and service to the Citizens of said City of Houston, or any agent, manager or superintendent thereof, who shall charge any greater rates or tolls for the services herein mentioned, than those hereinbefore fixed, or who shall refuse to continue to furnish the service because the customer fails to pay a greater amount for the telephone service than is fixed by Section 990, or than is payable under the next preceeding section for the character of service rendered in the particular case, shall be deemed guilty of a misdemeanor, and upon conviction shall be fined in any sum not less than Twenty-five dollars (\$25.00) and not exceeding One Hundred Dollars (\$100.00) for each offense, and in case of failure or refusal to further furnish telephone service to the customer or subscriber, it shall be a separate offense for each day that there is failure or refusal to furnish the service. (Id.)"

Mr. J. D. Frank: Those are the ordinances which we are attempting to enjoin.

1795 Mr. A. E. Scott, a witness for the complainant, was sworn and testified as follows:

Cross-examination.

(Questions by Mr. Howard:)

I do not set up the per cent value of the property, the engineer handles that part of it. That would not appear in the books. It is

my understanding that this item of \$318,367.54 was determined by the President and Auditor of the Company at that time, 1901. Just what their basis was for making this division on the books I don't know. I do not believe that it was an arbitrary amount, but so far as I am concerned it was given to me as an arbitrary amount, in 1901. The President may have been correct in naming that amount. That was undertaken to be made by dividing up the cost of all the exchanges prior to that time. I have not been able to find out exactly how they did it.

We start off with that value of \$318,356.54, and in 1902 we have a value of \$388,237.19. We arrived at that in this manner,—as the additions would be made at Houston they would be charged to Houston, all the gross additions. As the plant was taken down or

removed the plant account would be credited with the amount, 1796 and this \$388,000.00, the difference between it and the \$318,000.00 represents the additions to Houston during the prior year 1902. That represents gross additions during the year.

"Q. In speaking of additions, are you distinguishing between

additions and replacements and repairs?"

"A. Replacements are treated as "in and outs" as we describe them. That is, if you have a large property to replace, you will charge into your plant account the total cost of the new property which is put in, and remove from your plant account—"

"Q. I am trying not to theorize."

"A. That isn't theory."

"Q. Not to get into an argument. Take for the year 1902, do I understand you to say there were some repairs and replacements made, and also some extensions to the plant, do your books show that?"

"A. Yes, sir. The repairs would not be involved in this statement at all. That would be charged to maintenance. That is not included in this figure at all. Repair is a maintenance, or expense item and would be charged to expense and that is the last of it."

I have that item of \$70,000.00 divided showing so much added to each class of plant, so much central office, so much pole, so much wire and so on. I have no way of showing whether that \$70,-

new one, or whether it was used in making extensions, new extensions to the plant. I couldn't give that kind of information accurately prior to 1915. In 1914 we installed what we call "Departmental or Administrative Accounting." From that time on we could give that information very well. For instance, if along here on Fannin Street there were fifteen or twenty poles taken down and replaced with new poles that would be charged upon the books to the "Pole account." We would call that a gross addition. That might be either a new extension or a replacement, and our records would not indicate that. It would require an analysis to go back of that and find out whether we took down 15 poles at that place and put up new ones, or whether we actually extended—

"Q. (Interrupting.) If you took down 10 or 15 poles on Fannin and replaced them with new ones, so far as your books would show you couldn't tell whether that was a replacement, or whether those poles were used in extending the plant out to Brunner, or somewhere out that way?"

"A. Not in the early years."

Prior to 1914 we were not keeping the kind of records we now keep, by exchanges, and would not be able to get that information like we can now.

"Q. Then in this set up of \$4,810,000.00 that total that 1798 you arrive at, after having started in 1901 with only \$318,000.00 your books will not reflect whether or not, or to what extent, that money has been accumulating there, added to this account was used in replacing poles or equipment, and to what extent it was used in putting in additions to the plant which was intended to serve more people and enlarge the plant?"

"A. Well, the fact that the plant is increasing—the total cost is increasing from year to year would be a certain indication——"

"Q. We are assuming-

"A. I would not be able to give you how much each year."

"Q. What I want to get at is this, whether in this set up that you set up as the book value of this plant, whether from those books, not from this statement, whether or not it is possible to determine whether or not all the money that has been spent is additions to plant which enlarge the service, or whether some part of it has been used in replacing parts of the plant that have worn out?"

"A. If the property which was added to replace property taken down, was of greater cost than that which was taken down, there would be no amount included in these figures for that replacement. This would only take up additional cost due to changes in price, or a better class of plant put up to replace plant taken down.

1799 If we had a thirty foot pole at a corner and took that down,—suppose it was valued at \$15.00, and we replaced it with a twenty foot pole worth \$10.00, that would be reflected in this account as a reduction in our plant account \$5.00."

"Q. Then, in other words, you haven't charged into this anything

used in replacements?"

"A. Nothing for replacements, unless the property had a greater

cost than the property which it replaced."

"Q. Then you would carry into this set up only the additional cost?"

"A. That is right."

Redirect examination.

(Questions by Mr. J. D. Frank:)

I testified that the interest on this \$943,000.00 bonded indebtedness was paid out of operating expense. I do not mean that it is paid out of operating expenses in Houston each year, because you

can't pay interest out of operating expenses if your operating expenses are greater than your income, and that is the condition at Houston, where we are not making any return. Our operating expenses are greater than the gross income we have here. What I

meant was that after we had paid all of the operating ex-1800 penses for the State as a whole, we took out of what was left enough money to pay the interest on this bonded indebtedness. And that interest payment was not made out of the operating

revenue derived from the Houston Exchange.

Counsel has asked me about the reserve for depreciation in former years. If we had laid up an adequate reserve for depreciation we would not have been able to pay the dividende which have been paid, even though those dividends were only 2% or 2½%, whatever it was for the lowest year. If we had laid up an adequate reserve for depreciation we wouldn't have had that much dividend. The Company in the past has not been putting aside an adequate reserve for depreciation, it has not been able to lay aside any reserve in Houston for a number of years.

The Southwestern Telegraph & Telephone Company has been paying 6% interest on these notes issued by them, but the Southwestern could not go out into the open market and secure this money at 6%. It is able to borrow at 6% due to its connection with the American Telephone & Telegraph Company, and it borrows from them. With the exception of the \$943,000.00 bonded debt all the indebtedness of this company is owed to the American Telephone & Telephone

graph Company.

The reason the Southwestern Telegraph & Telephone Company can borrow money from the American Telephone & Tele1801 graph Company at 6% when it cannot go and get this money

in the open market from anyone else at that rate is because the Southwestern Telegraph & Telephone Company is simply one of many companies making up the Bell System The Bell system operated throughout the United States borrows from fifty to a hundred million dollars a year. It can probably do a better financing job than what a local company could do, and is able to get money at a per cent which the local company could not do. However, that does not enter into the proposition so very much as under the agreement that the Southwestern Company operates under the American Telephone & Telegraph Company has agreed to finance the local company, and that is why they are able to get the 6% money, even though they are not able to go out in the open market and borrow it. This company issues its notes payable to the American Telephone & Telegraph Company. It has done it in various ways. In some cases it has borrowed it by notes payable to the American Telephone & Telegraph Company, and in other cases by other means. The American Telephone & Telegraph Company does not discount the notes which have been given by the Southwestern Company to them. None of the notes have been discounted. They have gotten dollar for dollar on the face value of the notes. There is a contract existing between the Southwestern Telegraph & Telephone Company and

this parent company by which the parent company is to finance this company which operates this exchange in Houston. The parent company does not require any security, it has no security

other than the fact that they own the stock of the company.

Just simply notes which are signed by the officials of the
Southwestern Telegraph & Telephone Company.

In my position as statistician I have access to the books of the Company showing revenues and expenses. I have prepared an exhibit showing a summary of the revenues and expenses in connection with the operation of the Houston Exchange for the years 1915 to 1919 inclusive.

Mr. J. D. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 42.

Thereupon the document was received in evidence and marked Plaintiff's Exhibit No. 42, and is as follows:

(Continued.)

(See next page for Exhibit No. 42.)

PLAINTIFF'S EXHIBIT NO. 42.

1804

A. E. Scott, Witness. The Southwestern Telegraph & Telephone Company. Houston, Texas.

Total Expenses	542,122	592,599	704,942	866,313	819,374	980,062
Balance Net Income before deducting De-	040		000 011	000	000 000	10000
preciation	156,956 293,718	306,732	313,800	359,999	283,386 359,999	49,804* 359,999
Balance Net Loss	136,762*	132,281*	201,791*	*660,002	76,613*	409,803

The total revenues for the year 1916 were \$699,078.00.

The total expenses were, not including depreciation, \$542,122.00. By the term "not including depreciation," I mean the annual reserve for depreciation. Deducting the expenses from the revenues, we get a balance of net income for depreciation and return of \$156,956.00; deducting depreciation of \$293,718.00, we have a balance, net loss of \$136,762.00 for the year 1916. Now, with reference to the amount of depreciation I get that figure thus: The engineers gave me an estimate of the reproduction costs now of the property for the year 1916, and gave me an actuated rate of depreciation of 6.3 per cent; applying the 6.3 per cent to the estimate of reproduction less depreciation \$4,662,190.00 I get this depreciation figure, \$293,718.00. That is for the year 1916.

In 1917 our total revenues were \$767,050.00. That is an increase of about \$68,000.00. Total expenses for the year \$592,599.00, which is an increase of about \$50,000.00. Deducting the expenses from the revenues, we get a balance net income for depreciation and reserve of \$174,451.00. Deducting depreciation, the amount of \$306,732.00, we have a balance, net loss for the year 1917, of \$132,281.00. That depreciation figure for 1917 was on the basis of 6.5 plus per cent of \$4,694,000.00. That was also fur-

nished me by the engineers.

In the year 1918, the total revenues were \$816,951.00, and that is an increase of about \$117,000.00 over 1916. The total expenses were \$704,942.00, and that is an increase of about \$162,000.00 in expenses, over 1916. Deducting the expense were the property of the expense of t

penses from the revenue, we have a balance net income before deducting the depreciation of \$112,000.00. That is about 5% of the estimate of reproduction cost new, the depreciation \$313,800.00. That is based on the rate 6.533 per cent on the valuation of reproduc-

tion by the engineers of \$803,309.00.

The year 1919, the total revenues were \$1,024,213.00. During the year 1919 we had some rates higher than at other times, we had from Februray 1st to August 31st, we had the rates put in by the postmaster General; I have taken those increased rates and reve-Total expenses for the year were \$866,313 nues in those figures. leaving a balance before deducting depreciation of \$157,900. is about 21% of the reproduction cost new. Depreciation was \$359. 999.00; that is a figure determined by Mr. Hoag, he has an exhibit, I think, showing that, it is based on a rate of 6.334 per cent. leaves a balance, net loss for the year 1919, of \$202,099.00, that is, after I have set aside the proper amount of reserve for depreciation. During the seven months ending August 31st, they had the rates in effect which were put in by the postmaster general, that is, the \$3 and \$7.50 rate, I think those are the rates. That is the \$7.50 flat rate for business telephones and 3 for residence telephones, and then in addition to that we had measured service.

I have taken the actual results from those seven months of operation with the increased rates, and have worked that out on the annual basis. The rates which are in effect at the present time are \$5.00 for business telephones and \$2.00 for residence tele-

phones. These computations which I am about to take up now are based on the higher rates. This is the total revenue for the seven months on annual basis, that is, \$1,102,760.00. The way I got that was to take the actual revenues for seven months, divide by seven and multiply by twelve. The total expenses for those seven months on an annual basis, were \$819,374,00, and deducting expenses from the revenues, we have a balance, net income, for depreciation and return of \$283,386,00. That is about 5% of the estimate of reproduction cost new, less depreciation. We only have 5% there for depreciation and return. Deducting depreciation, the same amount we used in the previous column was \$359,999.00, and we have a balance net loss for the year, or for seven months on annual basis, of \$76,613.00. Subsequent to these seven months by some legal proceeding we had to go back to our old rate, but I made a study of what our revenues and expenses were during the four months at the lower rate and what the revenues and expenses actually were during the four months. That is, during the last four months of 1919, we were operating under rates described by City Ordinance, \$5.00 for business telephones and \$2.00 for residence telephones.

have made a computation of what the results would be on 1808 annual basis by taking the actual, effect of the last four months of 1919. I want to call your attention to the fact that the total exchange revenues were about 25% greater than the exchange revenue for 1916, I am making comparison there of the difference between what we are getting now and what we did get during those four months, then what we actually got in 1916. There was quite a considerable increase in revenue, and I want to show that the big part of it is not from our exchange revenue, but from toll revenue. The next item is toll revenue, \$129,008.00; that is an increase of about 80% from our tolls of 1916. Miscellaneous revenues, amounting to \$24.598.00; that compares with 1916, that is about 90% greater than 1916; so you will see that the big increase in revenue is not in exchange revenue, but in toll and miscellaneous, the percentage—the total revenues for the four months ending December 31st, are \$930,258.00 which is an increase of about 33%, from 1916. Maintenance expense on these last four months of 1919 was \$156,174.00. Now, I don't think I need to read all of these, but traffic expense I call particular attention to, was \$490,-037.00, that is an increase of 130% over what we had in 1916. Commercial expenses have increased about 33%; and our total expenses for these four months were \$980,062.00; that is an increase in expenses over 1916 of about 80%, as compared with an increase

in total revenue of 33%—shows where our money has gone. Deducting the expenses from the revenues, instead of having a balance income for depreciation and return or for anything else, we have a loss of \$49,804.00. The operating expenses exceeded the revenues by \$49,804.00, before we made any allowance for depreciation. Then, if we had deducted our annual reserve for depreciation, or set aside the annual reserve for depreciation that should have been set aside the result would have been that we would have had a balance, net loss, \$409,803,00,

1810 Mr. A. E. Scott, who, having been previously sworn, was recalled by the complainant and testified as follows:

Direct examination.

(Questions by Mr. J. D. Frank:)

Exhibit No. 42 which was put in in the eearly part of this case is a summary of the revenues and expenses for the years 1916, '17, '18 and '19, and for two periods in 1919, the seven months when the high rates were in effect, and the four months after the rates were reduced. Mr. Lyndon's Exhibit No. 7 purports to be a revenue and expense statement for the year 1919. I have prepared a comparison of my exhibit No. 42 and Mr. Lyndon's exhibit No. 7.

Mr. J. D. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 171.

(The statement was thereupon received in evidence, marked: "Plaintiff's Exhibit No. 171, witness A. E. Scott," which reads as follows:

(Here follows Plaintiff's Exhibit No. 171, marked page 1811.)

.46 A. T. & T. Co. Commissions in addition to the percentage of gross tolls.

In Mr. Lyndon's Exhibit No. 7 he set up five different 1812 propositions. The first proposition is to credit to the exchange the entire originating toll business at the exchange, and to deduct from our 41/2% the amount, and to eliminate from our taxes the income tax, and also to use for depreciation the amount of depreciation which he showed in the last column of Page 1 of his Exhibit No. 2. In his other proposition we are to take a per cent of the toll and to allow a percentage of the so-called, what he called, "allocated charges" to the exchange. He set up four different propositions on the basis of 95% of the tolls; 35% of the tolls; 50% of the tolls and 75%. The effect of his computation in this first column here on the basis of 100% of the tolls is to include the entire originating toll business and credit it to the exchange and not allow to the exchange any of the expenses incident,-additional expenses incident to furnishing that service. In my Exhibit No. 42, in determining the expenses chargeable to Houston, I only considered expenses in connection with the operations at Houston, and there are many toll expenses incurred all over the State which are strictly applicable to them, and no part of such expenses have been included in my expense statement. Mr. Lyndon has not allocated to Houston this toll expense outside of Houston since he set up his 100% of the tolls for Houston; he has included no additional expense while adding

all of the tolls to the credit of the exchange. Mr. Lyndon 1813 has added to the revenue for the local exchange \$320,854.00.

That is under the second item over to the left hand side there, toll service revenue. My Exhibit showed \$121,302.00 to the Houston Exchange and Mr. Lyndon put it in as \$442,156.00, by which he adds to the revenue for the local exchange \$320,854.00 and increases the total revenue for Houston by that amount.

The next item of charge is the amount allowed for the use of property rights, privileges, and so on. That is the amount we pay to the American Telephone & Telegraph Company under the license contract, the so-called 41/2% payment. I think Mr. Lyndon has explained in detail how he arrived at his amount of \$12,900.00. In other words, my Exhibit No. 42 showed a charge of \$43,528.00 for which he substituted \$12,900.00. That figure in red, \$30,628.00 represents the difference. That's the amount of expense which is not allowed in connection with the 41/2 % payment. The next item in that column is \$23,496.00. That is the income tax which I had allocated to the exchange. It isn't exactly the amount which I have used, but it is the amount which Mr. Lyndon-why, it is the difference between the amount which Mr. Lyndon allows as Taxes and the total amount which I have charged to the exchange as taxes.

That figure of \$54,124.00 is the total of the two red figures above, the \$30,628.00 and the \$23,496.00. Adding this \$54,124.00, because

that is a reduction in the expense, to the \$320,854.00 the in-1814 crease in revenue, we get a result of \$374,978.00 which Mr. Lyndon has added to the revenue.

The next red figure is \$223,680.00 and is the difference between the amount of depreciation which is used in my original expense statement, which has been determined by the engineers, and the amount which Mr. Lyndon said was proper on connection with his Exhibit No. 2. So, he cuts out \$223,680.00 of the annual reserve for

depreciation as found by Mr. Hoag.

Mr. Lyndon, in his set up, has not allocated any part of the toll property out of Houston: in using my book figures he would have included the toll central office equipment at Houston, but no other toll property, because no other toll property is allocated to the exchange or charged to the exchange on the books. One very large item of expense on toll property outside of Houston is toll maintenance; it amounts to \$211,109.00 for the year 1919. Mr. Lyndon has not allocated to Houston any portion of that expense. He apparently is under the impression that we do charge to the exchange maintenance, toll maintenance outside of the exchange, but we do not do that.

While Mr. Kelsey wqs on the stand he stated that the toll maintenance in the toll district here was charged to Houston and said that very often they had local linemen and repair men to

run out here 40 or 50 miles to repair toll lines, and their salaries and expenses charged up to the local exchange. That is not a fact; Mr. Kelsey apparently does not understand how we keep our books. If we have a man working here in Houston and he is sent out on a job of repairing toll lines, his salary and his expenses are not charged to the local exchange. The maintenance in connection with the toll lines is allocated to the toll district, or the toll line, or to the State as a whole, and no part is at any time charged to the exchange. I have records where a man has been sent out from Houston showing how his time was charged. I have some

copies of daily time reports.

In order to explain the daily time report I will have to tell you "T" in our business designates what our technical methods are. toll, or means repairs; and "T-R" would mean toll repairs; and "R" without the "T" would mean that it is exchange repairs. Now, I have a time report here which shows three men,-that's a gang; one of the men is E. Carroll. On the 13th of April of 1920, he shows that he worked 21/2 hours on 13-R work; that's repairs on lines. That was charged to Houston. He is a Houston man. He spent 21/2 hours which was charged to 18-R, that's repairs of substation equipment, and he spent three hours on a custom work order, taking out some telephones in Houston, which was also charged to Houston. On April 15th they had some trouble on a toll line and this man Carroll was sent out on the job and spent

his whole day soldering, I think, joints, starting in at Aldine and working up to 1 mile south of Westfield, toll circuit 390, That time was charged to Houston Division, Houston District. 13-T-R, and no part of that is chargeable to Houston. same plan is followed in connection with the toll maintenance expense; no part of any toll maintenance in connection with the toll lines being charged to an exchange. The toll, or the maintenance in connection with the Central Office equipment is charged to the exchange, and that is because of the fact that the work is so intimately connected with the work on the exchange switch board that it would be difficult to separate it, and we have made allowance for that in allowing the 25% of the toll business to the exchange. That would probably amount to about \$2,000.00 at Houston a year.

"Q. Now, come back to this exhibit, Mr. Scott, and taking up the first column, where Mr. Lyndon has allocated to Houston 100% of the tolls, and has cut down the payments under the license contract to the amount of \$30,628.00, and has eliminated the income taxes of \$23,495.00 and has cut down the annual reserve for depreciation in a sum amounting to \$223,680.00. Then how much do you find that it would be necessary to increase the revenue here in order to earn a return of 8% on Mr. Hoag's set up?"

"A. It would require an additional amount of \$240,-

383.00.

That is even including 100% of the tolls. The amount which Mr. Lyndon has arrived at after making the deduction of revenues, and the deductions from expenses, leaves a net revenue for the year of \$280,604.00, that is, just about 4% on Mr. Hoag's reproduction cost new, less depreciation value. That is without allocating any portion of the toll investment in Houston and putting in 100% of the toll

receipts.

be.

1817

We have other expenses outside of Houston with reference to the toll properties other than maintenance. In every department we have toll expense. I might take as one example, it's not a department exactly, but take the item of taxes; in determining the amount of the gross receipts tax to be charged to Houston I figured 1½% on the amount of revenue which I had credited to the exchange, and that left—Mr. Lyndon has added \$320,854.00 to the revenue and the tax on that would be about \$5,000.00. That has not been included by Mr. Lyndon, and in our method of accounting would be considered as a tax in connection with the toll property. That is the gross receipts tax which we have to pay to the State, we have to pay to the State a gross receipt tax. He has made no allocation of that item to Houston; the amount which I have determined was based upon the revenue which I had credited to the exchange, and the

balance of the tax was naturally in connection with the toll 1818 property.

We have to pay ad valorem taxes on toll property but Mr. Lyndon has not made any allocation to Houston for that, and when I made my set up I did not include any part of it. I will explain that by referring to my seven months' set up; take Harris County as an example,—the taxes, ad valorem taxes, for the year 1919 were \$22,114.00, and only 92%,—92.84% of the property in the State, or rather in Harris County, is in Houston, and therefore I only took 93% of the taxes paid in Harris County and charged it to Houston. That same thing prevails throughout the State of Texas and on toll property probably runs somewhere between one and two hundred thousand dollars. I haven't figured out just what it would

"Q. Now, take up Mr. Lyndon's exhibit No. 7, Mr. Scott, and tell us what he has excluded from the local exchange revenue?"

"A. You mean in connection with his later calculations?"

"Q. Yes."

"A. Mr. Lyndon, on Page 3, shows that he has considered as allocated items, or general expense items, \$119,357.00 which he has deducted from our expenses."

Mr. Howard: There is no comparison of that on this exhibit, is there, Mr. Scott,—on this exhibit that you just introduced in evidence?

1819 Mr. Scott: Yes, I show the application of it.

Mr. J. D. Frank: We will take that up further and we

will explain just what he has excluded.

Mr. Scott: He shows on page 2 of his exhibit the Direct Maintenance Account, excluding account 601; on Traffic Expenses, excluding Account, 621 and account 631; Commercial expenses, excluding accounts 640-10 and 642; on General Expense he has excluded, with the exception of accounts 668 and 674—

"Q. (Interrupting.) Now, take up those accounts, Mr. Scott, and tell us what they are, and just what it is that he has excluded here in Houston,—what part of the work that is being done that he has

excluded."

"A. The first item which he has excluded is Account 601, Supervision of maintenance,—that amounts to \$18,281.00. That is the amount which has been charged to Houston as supervision of Maintenance, being an allocation apportionment of the salaries and expenses of the Division, District and General Plant, whereas that is a Division Plant and Superintendence of the General Plant, Superintendence, and so forth, that has been allocated to Houston and all strictly in accordance with the Inter-State Commerce Commission's requirements."

The total expense incurred at Houston amounts to more than the amount which we have allocated to Houston. Of course, the expense at Houston is not all applicable to maintenance. The General Plant Superintendent and the Division Plant Superintendent and their forces are engaged not only on maintenance work, but also on construction work, and we divide between construction and maintenance this supervision item. The total payment at Houston was \$27,396.00, and as I say, I only allocated to Houston \$18,281.00. The amount allocated to the exchange is based directly upon the amount of maintenance labor which has been spent at the exchange. The local maintenance supervision is charged directly to the work as the work is done.

The next item which Mr. Lyndon has excluded is Account 621. Account 621 is Traffic Superintendence. The total amount is \$26,329.00. Traffic Superintendence covers the salaries and expenses of the division traffic superintendent and his forces, and the salaries and expenses of the General Traffic Superintendent. The amount of local supervision spent locally at Houston in connection

with local work was \$8,032.00. That is excluded here by Mr. Lyndon but he has later included part of the figures by taking 25% of them. The amount, total expenses and salaries of the Southeast-ern Division, that is, Mr. Kellogg's forces, that is, Division and

Traffic Superintendence, was \$13,785.00. That also was spent at Houston, but not in connection with the Houston exchange, Houston is the headquarters of the South-eastern Mr. Kellogg and his forces performed services for this local exchange as part of that division. The part of that which I have allocated to Houston was 61.9% or \$8,537.93. I took 61.9% because the amount charged to the exchange is determined by getting the total direct traffic expense in the South-eastern Division and finding what proportion of the total traffic expenses at Houston are to the total for the division and obtain the per cent and applying that

per cent to the total expenditures.

The next item we have is the item of Traffic Superintendence at the General Office, which, for the State, amounts to \$391,975.00. We proportion to Houston 16.4% of that in the same manner as we approxioned the division item. The total charge to Houston is \$26,329.00. Now, Mr. Lyndon proposes in his 25% basis to allow 25% of this Traffic Superintendence. That would give \$6,582.00. The direct expense here at Houston alone was \$8,032.00. So that, he has excluded more than the direct expense which you have here in Houston. On his 50% method he only has allocated \$13,165.00, and don't cover the direct at Houston, plus its share of the Division expense.

The next item which Mr. Lyndon has treated as a general item, or an allocated item is Account 631, Miscellaneous Central Office expenses. He has apparently gotten the wrong idea as to what that is. That is practically all spent at Houston

and is not an allocated item. There is possibly one hundred dollars in there of allocation. There is \$15,415.00 for this item which he has excluded, when that expense, with the exception of about \$100.00, is all incurred right here in Houston. That account covers janitor's service, light, heat, fuel, gas, toilet supplies and all other expenses incident to and in connection with the building,-it is building ex-

The next item is Account 640-10,—General Commeric-al Administration. That amounts to \$10,656.00. The total amount spent at Houston chargeable to this account was \$9,695.00. Part of that was local and chargeable to the exchange, and part of that was in connection with the Division office, this being a Division Office, the same as for the Traffic Department, and the amount of the local charge is \$2,094.00. That is in connection with the operation of the local exchange here. The total expenditures of the Division were \$6,972.00. We allocated to Houston 41.6% or \$2,903.00, and the general company charges were \$48,318.00; we allocated to Houston 11.7%, or \$5,659.00; the total charge to Houston for General Commercial Administration being \$10,657.00. These allocated charges here, in which is included a part of the expense of the General Superintendence, such as the General Plant Superintendence, the General Traffic Superintendence, and General Commercial Superintendence,—those officials all perform

services for the local exchange.

I might call attention to what the effect of taking only part of this expense would be; taking 25% of that would be charged to the exchange,—would be \$2,664.00 out of an expenditure at Houston of over \$9,000.00, and on the 50% basis there would only be \$5,328.00 charged to the Houston exchange, which is just about the amount of local charges, plus their pro rata of the Division expenses here.

The next item is a small item, account 642,—advertising, \$3,669.00. The bulk of that is a direct expenditure at Houston. I mean that the most of that is for advertising right here in Houston, the most of it being payments for Newspapers for ads which we have had here. Mr. Lyndon did not eliminate all of that. He only allows a per cent of it. You see, he has taken this all out in toto, but has put it back when he allows 25% of the total, he has put back 25% of this expense and it is not all eliminated, only part of it, but on that particular item the amount spent at Houston was.\$2,076.90. That was paid to newspapers and was for advertising. On the 25% method the only charge to Houston would be \$917.00, which would leave over a thousand dollars which I don't know what exchange would have to bear. It is not a general charge and could not be

have to bear. It is not a general charge and could not be charged to any other exchange. That money is spent right here in Houston. His 50% method does not allow sufficient

to cover the direct expenditures.

I will next take up the item of General expense. The General expense which I have allocated to Houston, a part being direct expenditures, and part based on prorate is \$48,640.61. That is a total of all the general expenses and includes a number of accounts. It is made up of accounts 662,-675 inclusive. Now, included in that \$48,000.00 are the following direct expenditures at Houston: insurance, \$2,317,00; accident and damages, \$11,60; law expense in connection with this accident and damages, \$71.91; the amount paid to the Telephone inspector, which is \$100.00 a month for 12 months, \$1,200.00. That is an inspector appointed by the City of Houston here and whose salary is paid by the Telephone Company. I have been looking for him since I have been down here and I have never seen him. The payment- in connection with our relief plan were \$15,139.00 at Houston, and other general expenses, miscellaneous items amounted to \$437.83. That gives the total direct general expenditures at Houston of \$20,177.00. There was allocated to Houston \$28,463.27. Included in that, of course, is the expense of the general Manager and the General officials of the Company.

I might call attention to the relief department item. The total payments at Houston were \$16,139.00 but we do not treat the relief department as a direct expense item. We consider that the fund is a general fund that any exchanges can draw on, and if in one year an exchange has a great deal of business, a number of accidents, and perhaps a death or two, if they were held to their exact quota we couldn't make the payment in accordance

with the plant, and therefore we consider and treat it as a general fund from which all exchanges can draw. One exchange may not get its full share, may not draw as much in proportion this year as it does the year before, and one exchange may draw more in proportion than the other. Mr. Lyndon has asked for the direct payments in connection with this plan and I told him that I didn't have it. Since then we have made the study and we have found the actual payments which have been made here at Houston. I did make the statement that I thought that, due to climatic conditions, things I had heard, that our sickness expenses were high here and that probably our plan of allocation was giving Houston the benefit of it. So that instead of charging Houston with its total payments, which we made here, we only charged to Houston \$12,278.00, which gives Houston the benefit,—they get the best of it by \$3,861.00 on the plan of allocation.

I will now take up the second column of this Exhibit No. 171 and explain that. I have explained in some detail the items which Mr. Lyndon considered allocated items and shown what the re-

1826 sults were as regards a comparison with certain percentages of that amount and the actual expenditures at Houston. In this second column I have simply shown in money what the aggregate results of these assumptions were. In other words, assuming that because we allowed only 25% of the tolls, only 25% of certain expenses should be allowed, and reducing the amount of 41/2% payments, and eliminating income taxes, Mr. Lyndon has taken out of our expenses \$138,645.00; that is, without considering the \$223,-680.00 reduction which we made in the amount of depreciation. Taking the total of these two items, made a reduction of \$362,325.00 in expense, or it resulted in increasing our revenues by that same amount. The net result, after making these assumptions, is to show, under Mr. Lyndon's method, that the net income wax \$44,271.00. That is allowing 25% of the tolls and eliminating much of the general expense. Then, in order to earn 8% on Mr. Hoag's reproduction figure, we would need \$476,716.00 more revenue under Mr. Lyndon's set up of the revenues and expenses. The next column is the same as the column I have just explained, except that 35% of the tolls were taken and 35% of this so-called allocated expense. The net result being that Mr. Lyndon decreased the expenses or increased the revenues by \$394,492.00, and his net results under this method are to show income of \$76,439.00. And to have made 8%

on Mr. Hoag's reproduction new, less depreciation, would 1827 require additional revenues of \$444,548,00.

The next column shows the computations, using 50% of the tolls and 50% of the so-called allocated items, and shows an increase in revenues under Mr. Lyndon's method, of \$442,749.00. His net revenue figure being \$124,694.00. We would need \$396,292.00 in revenue in order to get an 8% return upon Mr. Hoag's figure.

The last column is on the basis of taking 75% of the toll and 75% of the allocated expenses, which shows the elimination of \$523,169.00 of expenses and a return of \$205,115.00, and to have

made 8% on Hoag's reproduction valuation would require \$315,872.00.

I determined the amount of working capital in the Company's set up and did that by going to the books of the Company and determining from the books exactly the amount of working capital which we have been using. I used no estimates, except apportionments to the exchanges. The figures were actual figures. This same method of determining the working capital has been used by me in all cases that I presented to any of the Commissions, and was used by Mr. Benzel, my predecessor, in all of his cases, I used this set up in a recent case in the State of Missouri. The decision came out

November 29th, 1919. I figured the working capital in the manner which I set out in Exhibit No. 41, and the commission figured it from some other method. That was in a statewide case for the State of Missouri before the Missouri Public Service Commission. The commission figured it out in a different manner. They had in some previous case, the St. Louis case, determined what they thought was a fair amount of working capital. The difference in the amount of working capital found by the Commission, and the amount found by me was a difference of \$17,000.00, their figure was \$17,000.00 less than mine. The total amount involved was over a million dollars. In other words, in working out the amount of working capital as required for the whole state of Missouri, I used this scheme of setting it up and the commission used some other scheme, and the amount being something over a million dollars, the Commission adopted a figure which was about \$17,-000.00 less than the amount I had determined under my scheme.

This Company has money outstanding on the first of the month. Mr. Lyndon has stated that we collect a great deal of our money inadvance. Exhibit No. 41 shows that for the nine months ending September 30th, 1919, we had outstanding on an average nearly

\$70,000.00 at the end of every month. That is for the Southwestern Telegraph & Telephone Company, for Houston alone.

Something has been said about how the Company carried on its books the physical property which it purchased from the Houston Home Telephone Company. I have an exhibit showing the exact figures it was put on the books at.

Mr. J. D. Frank: We offer that exhibit in evidence, and ask that it be marked as Plaintiff's Exhibit No. 172.

(Thereupon the said exhibit was received in evidence and marked: "Plaintiff's Exhibit No. 172, which reads as follows:

	\$754,979.80

An appraisal of the property was made and its reproduction cost new at that time was determined, and its depreciated condition was determined, and the valuation placed on the property on the basis of its value in its condition at that time. This was in conformity with the rules of the Inter-State Commerce Commission with reference to such matters, strictly in accordance with the Inter-State Commerce Commission as set out in uniform systems of accounts on Page 33, paragraph No. 13. That system of accounts was introduced in this case as Exhibit No. 11. Those rules were complied with literally in placing this property on the books of the Company as shown in Exhibit No. 172.

"Q. Mr. Scott, on page 1 of Mr. Lyndon's Exhibit No. 2 he sets out what purports to be the additions to the Houston plant, that is, on the physical property from 1901 to and including December 31st, 1919, his figures being, \$3,663,432.00.

"A. I have prepared an exhibit showing what the net additions have been to the plant for the period 1901 to December 31st, 1919.

Mr. J. D. Frank: We offer that in evidence and ask that it be marked Plaintiff's Exhibit No. 173.

(Thereupon said exhibit was received in evidence and marked Plaintiff's Exhibit No. 173, which reads as follows:)

e end of the year. ansfer of Drop Wire, in the amount of \$28,883.72 from substation account to Aerial Wire Account. additions.

1833 There is some difference between this exhibit and the amount which Mr. Lyndon set up on page 1 of his exhibit. That is due to the fact that Mr. Lyndon, while accepting some of our book figures, did not accept them in their entirety, so that he arrived at a total of \$3,663,000.00, while our books showed \$3,861,693.00, a difference of something like \$200,000.00.

This exhibit showing net additions does not show anything for working capital, does not include working capital or cost of establishing business, and does not include the intangible items in connection with the purchase of the Houston Home Telephone Company. It includes interest during construction which has been charged on

the books.

We have not always charged interest during construction on our books but prior to 1908 no interest during construction was charged on the books. From 1908 to 1912 interest during construction was charged on the books, and included under the various elements of plant. In 1913, when the Inter-State Commerce Commission issued their accounting circular, that provided a separate account for interest during construction. Then from 1913 on you will see amounts under the heading of Interest During Construction.

Prior to 1910 supply expense, engineering expense, plant supervision and general expense was not charged to the plant actionation and there is nothing included for those years. From 1910 on, those items are included under the various elements

of plant.

On Page 10 of Mr. Lyndon's Exhibit No. 2 under the heading of sub-stations, P. B. X., pay station, and accessories, he said: "The book cost records for these items of equipment show that in 1912 the removals exceeded the additions by an amount equal to \$11,-257.00." Then he assumed the removals in 1912 were of a large portion of equipment existing in 1901; and after making further assumptions there, he arrives at an average age of seven and a half years for those portions of equipment. The removals in that year were not as great as he says they were. Mr. Lyndon took those red figures, which indicate the net removals, and assumes that is what it was. As a matter of fact, there was a change in the classification of drop-wiring. It had been carried as sub-station equipment up to 1912, and in 1912 it was decided that drop-wiring more properly came under the heading of aerial wires, and that transfer was made from the sub-station account to the aerial account. That transfer amounted to \$28,000.00, so that if that transfer had not been made, there would have been a net addition to sub-stations in 1912, and Mr. Lyndon's assumption would have been all shot to pieces,-would not have been borne out by the facts. It is simply a book-keeping item. It has no relation whatever to additions

or removals. The real facts are that the removals did not exceed the additions, but the additions exceeded the removals by some \$18,000.00 for that year. There is some difference in this

Exhibit No. 173 to the figures that Mr. Lyndon used.

I have prepared an exhibit showing the net additions from Jan-

uary 1st, 1914 to January 1st, 1920. I have it in two exhibits. On this exhibit No. 173 I have shown the figures as they are on the books, and I have another exhibit here showing the same figures which are contained in exhibit No. 173 compared with the figures which Mr. Lyndon used.

Mr. J. D. Frank: We offer that in evidence and ask that it be marked as Plaintiff's Exhibit No. 174.

(Thereupon said exhibit was received in evidence and marked "Plaintiff's Exhibit No. 174" which reads as follows:

1837 There are a great many differences, quite a number of differences between the figures which Mr. Lyndon used and the figures as shown by the books. The principal difference, of course, being due to the fact that in taking the automatic property here he used the figure for his inventory for appraisal,—the figures from the old Automatic Company books. Of course, we put the property on, as I have explained, in accordance with the Inter-State Commerce Commission, and the figures are different. There are some differences, some of them are clerical errors, and there is quite a difference in the item of land and buildings. Mr. Lyndon assumed an increase in the value of land of \$7,500.00 a year. course, that is not on the books and is not reflected there. There were net additions to land and buildings that actually did take place and which were placed on the books. The net result of that,-the net additions for the past six years, as shown by the books, exceeded Mr. Lyndon's figures by some \$35,978.00.

The red figures that I have under the various columns marked differences, show wherein Mr. Lyndon has failed to include enough property as shown by the books, and the black figures shown under those columns marked differences show where he has added too much.

and the final result is that he has failed to include all of the

1838 property to an amount of \$35,972.00.

In the lower left hand corner here is a statement reading: "See Sheet No. 2 for explanation of differences." That means that I had a Sheet No. 2 prepared intending to have it typed, but never did have it typed, and it is not a part of the exhibit. That should

be cut out,-that notation upon the exhibit.

I have made a study of what the payments have been for the last five years in Houston under the Employees' Benefit Plan. I made that quite recently, within the last two days. I have prepared an exhibit showing how much those payments have been, and how much has been charged to Houston.

Mr. J. D. Frank: We desire to offer that in evidence and ask that it be marked Plaintiff's Exhibit No. 175.

(Thereupon said Exhibit was received in evidence and marked: "Plaintiff's Exhibit No. 175" and reads as follows:

PLAINTIFF'S EXHIBIT #175.

Death Benefits in 1919:

†Red in copy.

December 31st, 1919, amounting to \$55,989.00. The amount charged to Houston under our method or prorating the expense, to Houston, rather than taking the actual charges, was \$51,423.00, or a difference of \$4,566.00 in favor of Houston. That is, the payment at Houston was \$4,566.00 in excess of the amount charged to it. Under the heading of death benefits, for the year 1919, there was a charge of \$4,224.00, and there was \$2,724.00 paid to William Bloxsom and \$1,500.00 to L. Sumbardo. That case of Bloxsom was where the negro fell against something and was killed. I do not remember the details, but it was an accident case. I don't know who Bloxsom was. In the case of Sumbardo he was one of the employees over here in the Preston Building, in the contract department, and he died from natural causes.

"Q. Now, Mr. Scott, at the bottom of page 2 and the top of page 3 of Mr. Lyndon's exhibit No. 1, in discussing the additions to the plant from 1914 to 1919, he says that during that period of time there was a gain of 4,608 telephones, and that during the average cost per telephone for these additions was \$310.00; he also says that the usual cost for such additions, under the general conditions such as obtained in Houston then, customarily vary from \$30.00 to

\$100.00 per station, the latter figure being considered as unusual and excessive. Now, is Mr. Lyndon correct in his estimate of the number of telephones which were gained during

that period of time?"

"A. No, sir, he took the wrong figure in determining the net gain."

He took his 1914 figures from his 1914 report and he took his 1919 figures from the statement of Mr. Baker. Neither of these figures were the figures which should have been used. The total number of stations on December 31st, 1919, was 27,775, and the total number of stations on January 1st, 1914, was 20,066, or a net gain for the six years of 7,709 stations. Dividing that number of stations into the net additions for that period of time gives \$188.00 per station cost of the additional physical property added to the exchange. That does not include any of the intangible property. That \$188.00 per station is the average cost instead of \$310.00 per station which Mr. Lyndon figured out.

"Q. Mr. Scott, does it mean anything when you draw a comparison, or attempt to make a comparison with reference to whether or not your investment is excessive under this method?"

"A. There can be, to my mind, very little association—there may be at some time an association between the net additions in money and the net additions in stations, but very often there is

1842 no association. I have made a recent study in Missouri of the net additions to stations and the net additions to plant, and got what appeared to me foolish figures, and I decided that you couldn't tell a thing about it."

I have a certified copy of the report of the Keystone Telephone Company to the Inter-State Commerce Commission for the year 1918. I will show you an illustration of the fallacy of attempting to determine whether or not an investment of this kind is excessive on this method. On page 204, Schedule 211-B, at the bottom of the page is shown a net addition to physical capital of \$249,077.00. That is addition to the plant account. Someone referred to that here a day or two ago as \$170,000.00. In explanation of that report, it appears that figure was erroneously taken. I believe this figure is the wrong one, it is the 1917 report. I think that \$170,000.00 was right, and it was in 1917 that they showed an excess of \$170,000.00 in the plant and a decrease of some sixteen hundred in stations. Regardless of whether it shows an increase or a decrease, it is not a very accurate way of determining whether or not the investment was excessive. There is no association between net additions to stations and net additions to money. Take what may happen in Houston if we change to the automatic board from the manual board. I understand that it is going to cost about \$750,000.00, that

the additional investment in Houston will be that. That is after we have made due allowance for the boards which are removed, not the junk value, but taking out the full value of the boards which are removed. I figure that we would have \$750,000.00 for net additions and probably no additions to stations. With reference to the statement which has been made in this case, that the Keystone Telephone Company set aside a reserve for depreciation of \$4.00 per station, and that it has been found sufficient. I have examined the records from the Inter-State Commerce Commission with reference to that. I have a certified copy of the Inter-State Commerce Commission's report from the Keystone Telephone Company for the year 1914. I will tell you why I couldn't get that other figure right a while ago, -because I got my wires crossed. talking from the 1914 report before. On page 313, of schedule No. 396, they show a transfer of \$534,516.00 from their surplus account to their depreciation reserve account. Now, on that other net addition proposition, instead of \$249,000.00 which I first mentioned, the net additions were \$172,173.00. That is the report for the year 1918, and their station loss in the year 1918 was 1,555 stations.

During the course of Mr. Lyndon's direct examination he testified that interest during construction and also taxes during the construction should be capitalized. The Southwestern Company capitalizes interest during construction, but does not capitalize taxes during construction. The Company has the authority and instructions of the Inter-State Commerce Commission for capitalizing this interest during construction.

Mr. Howard: We admit you have the right to do that.

I have made a study of this Keystone Telephone Company's 1918 report for the purpose of making a comparison between the calling rate of the Keystone Telephone Company in Philadelphia and the calling rate of the Southwestern Telegraph & Telephone Company in Houston and the result of my investigation was that I found the

Keystone Company for the year 1918 had 144 local exchange messages per month, ot about four per day per station; 114 per month per station or about four per day.

Mr. D. A. Frank: That is not four per day, that is less than three a day.

Mr. Scott: This is 114 per station per month.

Mr. D. A. Frank: I beg your pardon.

The calling rate at Houston is about nine per day, so that the calling rate for Houston is more than twice the calling rate of the Keystone Company in Philadelphia. Now, the Traffic expense for the Keystone Company for the year 1918 was \$268,000.00, and the Traffic expense for Houston for the year 1919 was \$418,000.00. That was less than one half.

I have a statement showing the realized depreciation. It was not

prepared by me but prepared by Mr. Hoag.

Mr. J. D. Frank: Well, we will put it in by Mr. Hoag.

Cross-examination.

(Questions by Mr. Howard:)

In this comparative total that I make here in my exhibit, 171, the first difference in the expenses is the four and a half per cent. I had one view of that and Mr. Lyndon had another. Then on the income tax my company has one view and Mr. Lyndon another. On depreciation I show a figure in red of \$223,680.00. That is

depreciation I show a figure in red of \$223,000.00. That is 1846 an expense that is just as real as paying the operators' wages and must be provided, just as much as they must be provided. It is not as definite of ascertaining as the operators' wages, but it must be determined on experience, and the amount is derived from the percentage. It was determined by Mr. Hoag from his inventory and I took it from his inventory and appraisal. The physical property was something like \$6,000,000.00 I think, and the rate was 6.33 and that produced \$360,000.00. I don't know what prices Mr. Hoag used to start off with. I understand he used prices based on a year or two years prior to the time of his appraisal. Now, as to whether they are high prices or low prices, that is a matter of judgment. Of course, if Mr. Hoag had used \$10,000,000.00, we would have had to figure the depreciation and I don't know what figure we would

have gotten.

All these things that I have gone over and pointed out in regard to Mr. Lyndon's set up of this expense indicates that I disagreed with Mr. Lyndon in the matter of how these items should be handled, and I think Mr. Lyndon agrees with us that his set-up in Exhibit No. 7 is wrong. He has not testified to that effect. I have talked to him. I think that he feels that the omission of part of the toll expenses naturally nullifies the effect of his exhibit. Of course that may not be right. (After conversation with Mr. Lyn-

don, witness testified as follows:) Mr. Lyndon thinks that 1847 I did not quite understand him. I withdraw that statement.

This Company has a reserve on hand for replacements. It is in the form of an investment in fixed capital. It amounts to five and a half million dollars. That is for the State as a whole. That is not kept as an exchange item itself. I understand by that that they set up a reserve and then take that money and spend it anywhere without regard to where it was earned. It saves borrowing money to use the reserve. You borrow it from the reserve a little at a time, until such time as you need a large amount of new capital. At that time you borrow sufficient money to replace that reserve which you have used up. In other words, you keep your reserve working all of the time. We do not keep any books to show what part of that reserve was earned in Houston or any other exchange, you can only tell that by going to the balance sheet for the company as a whole and the fact that you will find a reserve on hand in cash and you do have additional property it means that you have used your reserve to replace property.

"Q. Well, now, don't you allocate that fund to Houston upon the

basis of fourteen per cent?"

"A. Allocate the funds to Houston?"

"Q. Yes, here is what I mean exactly; Mr. Scott; that this fund, this replacement frund, is earned by the different communities from the people and paid by the different communities. Now, you gentlemen take all that and put it into a common pot and when you come to take it out, do you mean to say that you

take that fund and put it all in San Antonio, or put it all in Austin or some other town and not use any of it in Houston, that you don't keep any, that although you collect certain amounts, definite amounts from certain exchanges and localities that you put it all in a hotchpotch and never unscramble the eggs?"

"A. If you would not do that, it would be very uneconomical.

"Q. I did not ask you about that. It seems you and I can never agree upon economics because we don't look upon them at all from the same angle.

Mr. D. A. Frank: Upon Mr. Lyndon's theory, this fund would be \$28,000,000.00 in debt in Houston in the last ten years.

Mr. Howard: I don't know about that; somebody has been get-

tung the worth of it.

It makes no difference to the exchange what amount is collected from a particular exchange and the amount of that fund that is allo-

cated to it for replacement. There is no difference between the way we keep our books and the facts. If our replacements have eaten up our reserve at the particular exchange we have

no reserve in the pot, or anywhere else for the exchange.

"Q. But, if you collect this 6.33 from this community every year and you put it in a big pot and you get that money and you pull that down from all over the State, that is a nice big fund, then, now, does the money, does this local plant get back in the way of replace-

ment or upkeep of this plant or additions to this plant or the benefit of this plant all depends upon the whim of somebody."

"A. It depends on the needs of the community."

"Q. It depends on the need of the community, and if Galveston needs it worse than San Antonio, would you take our money and send it up to Dallas and if Houston needs it worse than Dallas you take Dallas money and send it down here?"

"A. Yes, but we have never taken any of Houston's money."

We have never taken any of Houston's money but that is the way the reserve is handled. That is the fact in the case. As long as Houston is getting all the replacement it needs, and the reserve is there to take care of them when they are required, Houston need not worry where the reserve is, whether it is in cash or whether it is invested in property. This community does not care anything

about how much money we have taken out of here and how

much was sent to Dallas of El Paso. You don't care if we take \$100.00 out of Houston and invest it in property at San Antonio, or we put it in the Bank. Does it make any difference to you whether we, when we need the \$100.00, we would have to get the \$100.00 from somewhere. It does not affect anybody at any time, as long as Houston gets all it needs all the time, what is the use of dividing the pot up, put some in one time and some in another. They are getting their additions just as fast as the needs of the company require it. The community is not entirely dependent upon the arbitrary determination of the Executives of the company as to where the money will be spent. If we did not handle it in this way I think you would accuse us of being very poor managers.

My exhibit No. 172 sets up the classifications of the property of The Home Telephone Company. There is no appraisal of that property. I worked that up to show how we now have \$754,000.00 in intangibles when we only had \$551,000.00 at the time we bought the property. The next to the last item in the statement shows \$551,222.00. That was the excess of the cost of the property, over its structural value put in Account 204, in accordance with the Inter-State Commerce Commission instructions. I have that intan-

gible item as \$551,222.00 and Mr. Lyndon got an item of something like \$700,000.00. That would depend on the valuation that was placed on the physical property.

"Q. You placed a somewhat higher value on the physical property than Mr. Lyndon, wherein he claims that there was about \$700,000.00 that was intangible that was represented by no assets, you claim there was only about \$551,000.00."

"A. No, that was simply the difference between the structural

value and the total amount paid at that time."

t since that time, we have taken down a considerable part of the old automatic property and determined that it had no structural value and have added to this \$551,222.00 the loss on that property. That is the way that developed to the \$754,000.00 which we now have on the books. So that, Mr. Lyndon, and ourselves at this time are pretty close together. We are pretty nearly agreed upon that

item of \$754,000.00. I think Mr. Lyndon's figures came from a previous exhibit of ours. At that time there had not been as much property taken down and thrown away. I claim that I set that item up in accordance with the rules of the Inter-State Commerce Commission. I did not say that the Inter-State Commerce Commission has ever determined that that must be considered as plant value in fixing the value of the property for the purpose of bearing a return,

I did not say anything like that. I was telling you exactly

what was on the books, I was not talking about rate matters. The purchase of the Telephone Company was financed in this manner: We assumed their bonded indebtedness of a million We paid certain floating indebtedness that they had, billed outstanding, I think the total of the two was the amount that we paid, almost equalling the total we paid. In addition to that we paid the City \$80,000.00, that making up the total purchase price of the property. That is part of the amount that Mr. Lyndon has thrown out, part of the \$700,000.00. I used the word "assumed" in the sense that I considered it a definite obligation to pay them and we have paid some of them. We have since bought \$70,000.00 and paid for them practically, paid them off. Nobody knows who owns those bonds, they are out in the hands of the public. We have never made any arrangement for adjusting them in any way but they are carried on our books at par and I said we have paid for \$50,000.00 of them at par. We are paying them off day by day.

Mr. Lyndon and myself substantially agree upon net additions since 1914 there being a difference of only about \$35,000.00 but that just simply happens to work out that way, Mr. Lyndon assuming certain things and eliminating other things and put-

ting some things in, comes to a net result of \$35,000.00, apart from mine. Of course, my figures are the actual figures of the books and his figures, some part from the books and others were not. I do not think he found the books wrong. I don't think there are any errors in the books. At any rate we came out only \$35,000.00 apart. The real estate will not make up that in four or five years. If he had not assumed that increase in value of real estate, our difference would have been \$70,000.00 instead of \$35,000.00. It would have just taken us that much further apart.

The Traffic Expense is less per call for us than for the Keystone Telephone Company. The Keystone had in 1918, 39,262 telephones, and the average calls per month were 114. This also shows the total per months for all stations, it is 4,483,461. That is the total number of local exchange messages during the month. I would have to figure it out to tell how many there were here. It was an average of 9 per station of 26,500 stations averaged about 26 days per month. Houston has more than twice as many calls per station as the Keystone Company does. The total cost of Traffic operation for the Keystone in 1918 was \$418,000.00,—that was for Houston, and for the Keystone \$268,000.00. Upon that showing the Keystone per

call would not be the cheaper. I think it figures out that the two are close together, but I think that Houston is somewhat greater.

The statement that has been furnished you of the value of the toll lines at \$8,602,000.00 is not correct, that is only the toll lines and does not include the toll right of way and does not include the toll switch-boards. The switch boards are carried in the local exchange, but you asked about the value of the toll property, and switch-boards are carried in the local exchange property account. That amount does not include the right of way. The right of way could have been included in that. It is carried as a total account, the right of way is, but there is a division on the books which could have been obtained. That is an ommission that could have been added to that.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I have referred to having appeared before the Missouri Public Service Commission with reference to working capital. I have appeared before the commission a number of times and have appeared before it in a case in which I put in this 25% toll allowance to local exchanges. They have accepted that in every case I

have appeared in, I understand. In fact, I know that in the St. Louis case, which was before them from 1913 to 1916,

St. Louis case, which was before them from 1913 to 1916, that they did not accept the 25%. They took the 25% as we have figured it and added to it approximately \$10,000.00. They did that because there are a great many toll calls out of St. Louis to the suburban districts the rate on such calls is 5 cents, and they felt that allowing only 25% of these 5 cent calls was not giving a sufficient credit to the local exchange, so therefore they added \$10,000.00 to the 25%. That was for the City of St. Louis.

The depreciation on the toll lines within the City limits and depreciation on toll central office equipment in the City of Houston is not charged to Houston. That \$360,000.00 which I used was determined by Mr. Hoag from his figures and his figures did not indicate the central office equipment and no part of the toll property.

With reference to the reserve for depreciation. In order to earn a reserve you must first have a certain amount over and above a fair return. Houston has not earned any reserve for depreciation; as far back as 1916 it has not made a fair return; therefore it has not made any reserve. Replacements have been made in Houston whenever

they were needed and therefore Houston has been getting the benefit of this common put fund that Mr. Howard has been talking about.

J. C. Kelsey, a witness for the defendant, being duly sworn, testified as follows:

Direct examination.

(Questions by Mr. W. A. Howard:)

I have made an investigation of the Houston Telephone property. With reference to the scope of my investigation, as soon as I came I

got in touch with Mr. Lyndon, read all of his reports, I especially wanted the Company's case in 1914. I prepared here a statement of what I found; Mr. Lyndon has got all of the stuff we based it on. It is the first sheet of a summary attached, and it is based on the 1919 report, the actual receipts.

"Mr. D. A. Frank: I don't see how he has laid the basis for the introduction of any such testimony in the absence of anything that is in the records so far. It will be hearsay on hearsay. Of

1858 course, I understand the Master will receive the testimony but I want to reserve a formal objection to the testimony coming in, which, on the face of it, nothing that this witness knows, of his own personal knowledge, and by his own admission, is nothing but hearsay based on hearsay. Mr. Kelsey, from whose figures did you make investigation, Mr. Lyndon's, or the Company's?"

"A. I based this calculation entirely on the Company's figures."

I got the Company's figures from a statement, I think Mr. Lyndon can give us that and show you an exact copy of it.

1859 Lamar Lyndon, a witness for the defendant, testified as follows:

Direct examination.

(Questions by Mr. W. J. Howard:)

"Mr. Howard: For the certain purpose of laying the predicate, I want to have this understanding with you. I am not putting Mr. Lyndon on the stand now about the valuation, or to go into details, except to verify the figures Mr. Kelsey took as the basis. Mr. Kelsey, will you just let Mr. Lyndon take the stand for a moment?"

This is my 1914 Report. I made a valuation of this for the Company in 1914, by the reproduction, less depreciation method. I took the Bell Company's inventory as of 1914, and I applied to that certain unit prices and material costs, unit cost and material prices. I am sure of that.

With reference to procuring the unit cost and material prices, in a number of instances, we accepted unit cost and a good many of the prices were submitted to us by the Bell Company as correct. In

other instances, where they seemed to be too high, we ob-1860 tained such quotations from various sources and used those quotations, properly loaded, as a substitute for the Bell figures in those particular instances.

"Mr. Duls: That is a 1914 Report made by Mr. Lyndon on the properties of the Telephone Company in Houston?"

"Mr. Howard: Yes."

"Mr. Duls: Submitted to the City Council."

"Mr. J. D. Frank: It is entitled: 'Report on Telephone Service and Rate, the City of Houston, Honorable Ben Cempbell, Mayor,' and the further mark (at the bottom), 'Lamar Lyndon, Consulting Engineer, New York, Henry E. Elrod, Consulting Engineer, Dallas.'"

"Mr. Howard: To qualify this, I don't care to put it in evidence

at this time."

I did not make any valuation based upon the Company's costs and material prices, but the Company submitted to us a valuation of its own at the time, based upon its own unit price and unit cost.

"Q. Own unit prices, and own inventories. Do you know what figure that they arrived at?"

"Mr. D. A. Frank: I object to that on the ground that it is immaterial and irrelevant what may have been tendered to Mr. Lyndon in an investigation of that kind in 1914, would throw no light to this Court on the question before this Court at this time, which is the present valuation of this property at the present

time, and I object to it on that grounds."

It is one step in the-

"The Master (interrupting): The objection is overruled." "Mr. D. A. Frank: Your Honor will note our exception." "The Master: Yes."

"Q. The valuation was placed upon that property, upon the reproduction method at that time?"

(Mr. D. A. Frank:)

"Q. Before you answer that question I want to ask you: Did the Company make a valuation at all upon the reproduction method?"

"A. The very complete record that was handed to us indicates to

my mind that they certainly did."
"Q. The record of what?"

"A. The record of the books, the record of unit prices and costs, which were handed to us by somebody, I don't know his name, but some accredited official of the Bell Company."

1862 "Mr. D. A. Frank (interrupting): I object to the words "accredited official."

"A. Well, some person who claimed to be connected with the Bell Company, and who claimed to have the inside of the Bell Com-

pany."

"Q. Now, Mr. Lyndon, you have been on the stand often enough to know that the Company would not be bound by such a statement as you are making. Please confine yourself exactly to the facts and don't be telling what a person said."

"A. From 1914, to 1920, my memory doesn't carry the specific

individual."

"Q. Tell the Court the report that you made."

(By Mr. Howard, interrupting:)

"Q. Just a moment, Mr. Lyndon, do you know that the official, or man, who handed you those figures, was at the time in the employ and acting for the Southwestern Telephone and Telegraph Company?"

"A. I was surely under that impression or I wouldn't have put in some fifty pages as the valuation of the Bell Company, as a portion

of a period report."

"Q. You got that information from the Company used by them at that time, after obtaining the data for your report?"

"A. Yes, sir."

(By Mr. D. A. Frank:)

"Q. Did it have a full set up of a reproduction case just like we have got in the present suit?"

1863 "A. It has, and that's from a portion of this record which

you have just inquired about."

It has a full set up, going value, working capital, tools, and things of that kind. I believe there is no intangible set up. As to what I mean by "intangible," I think there is no going value, or cost of establishing business; neither of these. It is a complete valuation of the physical properties; there is very little imaginary in it, mostly all physical property. The total reproduction value in 1914, as we found it, \$2,480,935.00; as we found it. As the Southwestern Telegraph and Telephone Company set it up and gave it to us, and have repeatedly referred to this valuation in their allocation, we assumed the allocation of annual charges, we assumed that what they meant was \$2,326,940.00. This was the value new and undepreciated up to the end of 1913. It included no 1914 values. The report was made during 1914, and therefore, our records terminate on December 31st, 1913. It was the reproduction value of the property new.

The Company, at that time, used the same addition charges; they said that in addition there were certain overhead charges that were necessary to be added, which their method of construction required, amounting to \$345,271.00. I did not misquote the Company just now when I said this figure of \$2,326,940.00 was reproduction.

1864 "Mr. D. A. Frank: I think in fairness, Mr. Lyndon ought to confine himself to the facts, and not conclusions."

"Mr. Howard: He has taken the reproduction method of applying your unit cost and unit prices as you set them up and then later on he says that he arrives at a certain figure. Then he says later you asserted a certain overhead charge and then added and given you credit for that."

"Mr. D. A. Frank: You know enough about a rate case to know that the Bell Company never in this world set up a figure for the physical value, the total reproduction of the physical value, of the property new, without the overhead. If Mr. Lyndon doesn't know

it, you knew it."

"A. (continued). May I read the last quotation from this report made in 1914, when we had no quarrel with the Bell Company, and when I suggested at the time that the rates were proper and should not be changed?"

"Q. Yes, read it."

"Mr. D. A. Frank: I think the report speaks for itself. It is in evidence."

"A. The Company's inventory shows the total cost of the physical properties, including real estate to be \$3,326,940.00, exclusive of these addition charges."

(By Mr. D. A. Frank:)

"Q. \$3,000,000.00?

1865 "A. \$2,000,000.00, I beg your pardon, \$2,326,940.00. Let me start above that quotation. 'All the foregoing figures are meant to represent actual physical cost of Purchase of Properties, Purchase of Apparatus and Supplies, Labor and Overhead Expense, but they do not include the items of Engineering, Errors and Omissions, Interest, Taxes and Insurance, during construction, and other minor charges. The Company's inventory shows the total cost of the physical properties, including Real Estate and Buildings, to be \$2,226,940.00 exclusive of the addition charges. According to the Company's computations, the total amount of all the addition charges, properly applied to the different items, amount to \$345,271.00, giving as the total physical value of the plant \$2,672,211.00. The complete tabulated statement of these additions to cost or file."

That did not include part of what was known as the "Old Home Telephone Company" in use. That was prior to the purchase of

the Old Home Company.

At the time this report was made, a report was made on the property of the Home Company, which was then a going concern, at least, it was then in operation and the property was valued and the valuation was based on a series of agreed figures between the Home Company and ourselves. We practically agreed upon every figure at

the time and the figures were mostly made up of actual cost, plus overhead. We found the total cost of the property, or rather the total value of the property, exclusive of intangibles,

which is to say, the total physical value of the property new, \$725,-123.00, at that time, with an accrued depreciation of \$59,950.00, which left as the then value in 1914, \$665,173.00. This is the 1914 report on all the Telephone properties in Houston, including the Home Telephone Company.

"Mr. D. A. Frank: We renew our objection to his testimony about his finding with the Home Telephone Company, because we cannot be bound by any agreement he made with the Home Telephone Company."

"The Master: Certainly not. Objection is overruled, however."

"Mr. D. A. Frank: Note our exception."

I do not mean to say that there was an agreement that I made with the Home Telephone Company. Whenever we arrived at figures, we discussed them with the engineer of the Home Telephone Company, at that time, Gngh,—G-n-g-h, and with possibly one or two other officials. Of course, these details are cloudy, after six years, but I remember that we went over the subject with proper officials of the Home Telephone Company and there was no objection on their part to the figures we reached. Some time there would be suggestions from two sides, and what I meant, when I

said "we reached an agreement" was there was no differences

1867 between us of a substantial nature on the value of each item
of the property. In that we made no agreement with the

Telephone Company.

"Mr. D. A. Frank: Your Honor can see how remote that is."

"The Master: Yes, sir."

"Mr. D. A. Frank: Are you making this witness a general witness?"

"Mr. Howard: No, I just wanted to see what data he turned over

to Mr. Kelsev."

"Mr. D. A. Frank: Why not have him state what data he turned over to Mr. Kelsey and assume that that is the data that he turned over to him and let him go on?"

"Mr. Howard: I just wanted to get this."

"Q. From those statements and the way you arrived at that opinion, did you determine the value of the entire physical properties of this company, including the Old Home Telephone Company's properties?"

"Mr. D. A. Frank: I object to that without this witness being qualified, and laying the proper predicate for it, because we wouldn't want to be bound by that sort of testimony. If he wants to state

what he told Mr. Kelsey, and what he turned over to him, I

1868 have no objection to that at all."

"Mr. Howard: If The Court please, these hearings are necessarily not conducted on the same line as a trespass to try title suit where you have to file your suit and give notice and if you don't do it—"

"Mr. D. A. Frank (interrupting): I am not going to be technical

at all, Mr. Howard."

"Mr. Howard: He speaks about the remoteness of this character of testimony. We are trying to get primarily at these values. We have a witness here that valued these properties even prior to the time the Southwestern Telephone Company bought it, and he ascertained from the owners of the Company at that time what they considered and treated as a value of the reproduction. That is very strong evidence of value. While they are not bound by any agreement, they are bound by evidentiary facts. This is the way to get values, by going and talking to the owners of the properties at that time. This man, together with the owners of the property, are not objecting to the values placed on it."

"Mr. D. A. Frank: You overlooked the fact that you are merely

laying the predicate for some other testimony."

"Mr. Howard: That is all."

"Mr. D. A. Frank: At the same time, you are arguing to have this evidence in here on valuation. Now, if you could confine your testimony to laying a predicate for Mr. Kelsey to testify, I haven't any objection, but if you are trying to make a valuation witness out of this man, I want you to qualify him. Just show by him what he turned over to Mr. Kelsey, I

haven't any objection to that,—no objection to him saying it."
"Q. Now, Mr. Lyndon, you did at a later period obtain from the
Company the actual plant investment and additional capital from

1914 up to date, did you not?"

"A. I had Ernst & Ernst request it and some papers came which

purported to be that."

"Q. Well, you requested it and it was delivered to you and it was delivered by Ernst & Ernst as a statement of their addition?"

"A. I assume so. It was done at some other place."

Yes, I got it and worked on it; I accepted it. I know it is true but I cannot testify that it is true because I didn't see them hand it to Ernst & Ernst. I turned that data over to Mr. Kelsey and he examined that.

(By the plaintiff:) That is, I turned the data over to Mr. Kelsey that I had had turned over to me by Ernst & Ernst, and told him

that it had been furnished me by Ernst & Ernst.

"Mr. Howard: Are you gentlemen going to take the stand that these were not proper figures?"

1870 "Mr. D. A. Frank: Not at all. I merely wanted to know

what it is you are putting in there."

"Mr. Howard: Will you question the authority of Ernst & Ernst?"
"Mr. D. A. Frank: I have not; I merely asked him how he got it."

1871 J. C. Kelsey, a witness for the defendant, testified as follows:

Cross-examination.

(Questions by Mr. D. A. Frank:)

I did not testify in the Enid case that \$5.50 per station was about right for the depreciation reserve in that case, it was \$4.00, Mr. Frank. In those days the operating expenses were about \$13.00 and I added to it \$4.00, which made \$17.00 and at that time we agreed on about 10% on the \$100.00 valuation at that time, that made \$1,700.00.

I remember the Chairman come right out, he said, "How much does it cost to feed a steer a month?" In other words, what does it cost to run this telephone a month?" I said, two twenty-five. That surprised Mr. Chipley, if you recall the details. I did not tell Mr. Chipley anything in that case. Chipley wouldn't let me go on the stand. I got on the train before I come to Guthrie. Mr. Chipley

was afraid I might spill the rate-making beans, or something. We went over to the hotel and made a study of the property. I said, "It is costing you about \$13,000,000.00 to maintain this plant, but it is hidden reserve in here. I think you are entitled to \$4.00." So that made \$17.00.

I did not, in that case, agree that 7% for depreciationnever in my life agreed on an elemental proposition,-never

agreed on the 7% proposition in the Enid Case.

By the way, that testimony, I would like to read it. My report was \$13.00 for the expenses, actually had, plus \$4.00, plus 10% on the actual cost of building that property at that time, which was

\$100.00 per station by some curious prank.

"Q. The official report of it shows that the question was asked you: "Mr. Kelsey, this Company has prepared its rate of depreciation at seven per cent per year. Should lines live fourteen or fifteen years, would that be a fair figure? A. I think, in view of having so much property exposed to the elements of the prairies of Oklahoma, that a basis of fourteen or fifteen years is just about fair and equitable to both parties.' Do you recall that?"

"A. Yes, sir, I also recall that was 1909, wasn't it? We have

had fourteen years since that time."

"Q. I am only talking about that."

"A. I am very glad to have this. I understand there wasn't any record of my testimony down there. I am glad to know it exists.

"Q. It exists."

"A. Now, let's have it all. We all learn something in 14

1873 years' telephone operation."

- "Q. The next question asked you: 'Mr. Kelsey, it is the evidence before this Commission that the limits of the depreciation which must be provided for in consideration of the wear and tear and calamities and other conditions. I would like to know if you concur in that?' And your answer: 'If you add the word 'rust,' I would agree with you thoroughly.' That's is on page 468 of your testimony in that case?"
 - "A. That was, and the date was what, Mr. Frank?"

"Q. The date was-"

"A. (Interrupting.) 1906, wasn't it?"

"Q. No, sir, it was July, 1908."

"A. Yes, 1908,—that is 12 years ago."

"Q. July, 1908, was the date of the appeal."

"A. Oh, yes, before that, it was. My impression was it was 1906." "Q. The suspending bond was made May 25, 1908. The case was filed on February 4, 1908."

"A. Yes, it might have been about that time. I don't remember."

1874 "Q. It was between February 4th, and sometime in May. Do you remember this question, also, Mr. Kelsey, asked by Mr. Chipley? 'Mr. Kelsey, what would you consider the average life of a telephone plant in this section of the country?' A. So far there seems to be two general changes, I do not refer particularly to Oklahoma. There seems to be two general changes in twenty-five years. On that basis, it looks like our general depreciation fund would be eight per cent but there is always something to be saved out of the wreck, and eight per cent is rather high, in fact, we have quit going on percentages altogether. We like to fix a definite sum per station, which simplifies matters, it is easy to explain to bankers, it is easy to explain to stockholders; it is a detailed matter so that at any time you may know the exact cost of any month or quarter or year.'

A. That sounds familiar.

Q. That sounds familiar, does it?

A. Yes, sir.

Q. That is on page 467 of your testimony.

A. Now, how long,—by the way, there has been no change in 35 years. Now, we have had two cycles in thirty-seven and one-half years.

Q. Now, on page 466 of the same record, you say: "We put a safe average upon each station per year. In the Keystone Telephone Company we decided that \$4.00 per station per year was sufficient

and reasonable reserve to take care of all maintenance and 5 take care of the plant. That was completely underground.

Now, we have determined that a plant that is underground down town and all cable overhead in the outer part should set aside \$4.50 per station per year. For the plant that is wholly overhead and all cable, we have determined from averages that it should be \$5.00 per year. A plant of loose and careless construction, lines and wires, open and indifferently constructed, \$5.50 per year."

A. We allow you \$5.62.

Q. Well, I am just taking your record here.

A. That is fine. I am awful glad to have that read. Q. You said you only allowed \$4.00 in the Enid case?

A. Yes.

Q. You actually allowed \$5.50? A. Where is the table I filed?

Q. Your table is not here.

A. Well, it ought to be, \$13.00 plus \$4.00. Come across with my exhibit there.

Q. Your exhibit is not in here, Mr. Kelsey.

A. Oh well then, I would love to see that old exhibit again. \$13.00 was the average cost of everything and I gave them \$4.00 on top of it. Then I gave them 10% on the property in Oklahoma at that time.

Q. But you agreed with your counsel that 7% was a fair figure.

A. Well, it might have been at that time, yes. In the light of information that we have since had—that's the trouble what might happen. I would much rather be in a position of knowing what will happen than to say what has happened.

We were all experimenting there.

Q. It is possible, Mr. Kelsey, for you as an engineer to take some life tables and calculate what a possible life would be for the plant?

A. It is possible to make any study of figures. You can make a study. You can give opinions. I am sick and tired of opinions. I

have had engineers say that a pole lasted so and so. He doesn't know. He doesn't know, but I do know what it cost.

Q. But you are undertaking here to give an opinion without

anv-

A. (Interrupting.) I haven't given any opinion.

Q. Haven't you given an opinion about the reserve depreciation? A. No, no, I give you the difference. I am assuming that the

total average is \$11,00 and whatever is left is yours. We don't want to cheat you on that. We come in here and say that is all it cost you

to run but you are doing so well, I said there must be \$5.62.

Q. You have got \$11.00 that you arrived at about 15 years ago? A. No, no, this morning, we were going through this thing and find it is, gosh, it is getting less,—I am so used to this informal business. I have been ruined by this informal business, and I don't want to be disrespectful.

The Master: Go ahead

1877 The Witness: I love to talk about this proposition.

Q. Now, you arrive at the figure as you said, 15 years ago.

A. And I see no reason to change it the way the thing looks. I am going to lower it some day.

Q. You arrived at that from the experience of the Bell Company?

A. Oh, I took a summation of everybody. I took everybody's figures added them up.

Q. Didn't you state that the Bell Company had used \$11.00?

A. I think so, that is in there.

Q. And for that reason you had used four?

A. Oh, no, I am studying the Bell Reports, in my studies and their performances,-I found a long time ago that this \$11.00 was a magic figure. That magic \$11.00 I never found a plant anywhere in the world that was running any higher than that. When you get underground, get all these modern substantial buildings and everything up, it is going to be less.

Q. Mr. Kelsey, the \$11.00 that you speak of is an average figure

for the entire United States, isn't it?

A. Oh, it is an average figure based on my study of every plant that I have ever tackled. If you will look there you will find that one year, I wrote the story of about forty or fifty independent tele-phone companies. You don't like that \$4.00. Your com-

1878 pany never did. When I say "you" I am talking about your

boss.

Q. Well, I have no "boss." That is a matter of opinion. Now, that is an average figure for the entire United States, isn't it?

A. At that time I made up my mind that there was a maximum for any telephone subscriber in the United States. It was an average based on experience and all of my studies and analyses of a telephone system, accounting of expenses, up to date. I never found a greater thing than \$11.00. Not necessarily an average. It might be called an average but when I applied this to any property in the United States you can't show me more than \$11.00 and I will give you a medal if you can.

Q. Mr. Kelsey, I notice in your set up you didn't have anything for the cost of establishing business.

A. Oh, yes.

Q. Do you believe in cost of establishing business?

A. I accepted your figures as a maximum, and your \$2,600,000.00 includes everything. These are 1914 figures.

Q. August 1st, 1914, have you something there to show what those

figures are?

A. I got them from the City Engineer's Report.

Q. And what figure did you use?

A. Why, you have got it in my exhibit. Two million.

Q. Well, have you a detail of it there?

A. Mr. Lyndon, I suppose, will come along and give you the details there.

1879 Q. You have a statement here.

The Master: I think that is a copy of it.

Q. Yes, sir, you have a statement here on the first page of your

exhibit "Value of property, 1914" \$2,672,211.00."

A. That was given to me as your reproduction value at that time. It was my understanding that contained something for cost of establishing business, included all your overhead. If that did not include anything for the cost of establishing business, I would not necessarily want to take that in. I do not believe that there necessarily ought to be something for cost of establishing business; I believe that is about the fair average. In a growing concern, such as you have here, it does not cost anything to attach business,—not very much. It costs about \$5.00 to get the average subscriber.

Q. How much does it cost, \$5.00?

A. Oh, you have a training school that is charged in your regular bills.

Q. Does it cost anything?

A. Yes.

Q. Does it cost \$68.00 to operate it?

A. That is a continuous performance. That is another immortal idea. You are always educating your girls in a school.

Q. Just answer the question: Does it cost anything? Never mind

how it is paid.

1880 A. Of course, there is some expense in getting a girl up to the board, yes.

Q. Does it cost anything for the rest of the Organization?

A. Oh, a little, yes.

- Q. If you had a brand new plant here and started out without an Organization,—
 - A. (Interrupting.) Oh, you can't conceive that proposition.
 Q. Would you have to spend any money for an Organization?

A. Oh, no.

Q. You wouldn't have to spend money for that at all?

A. There would be some, of course, but you far fetch the proposition.

Q. Would you have to spend any money for subscribers that came to your office to subscribe?

A. That is in your historical study. If we approach this propo-

sition around through the other way, you will have all that.

I saw Mr. Lyndon's version of your 1914 Report. In other words, I take the version given to me by Mr. Lyndon; I have no time to take anything else, and didn't even look at the 1914 report.

Mr. Howard: Are you disputing this report prepared in 1914? Mr. D. A. Frank: It is very apparent that I am disputing it. This

is a fair inference, from what I have said.

1881 Mr. Howard: Are you disputing the material prices and unit costs they set up in 1914, and are you disputing the inventory that they set up in 1914, and are you now asking for going concerns to be added where you have paid those very charges out of operating exenses? Is that what you are getting at?

Mr. D. A. Frank: If you will just be patient, I will have this wit-

ness answer the question before I answer your question.

As far as attaching an Organization, you would not have over \$130,000.00 in that to save your life. But there is the wrong construction, man. I am making a composite study of it. That is one instance. We could even concede you cost of establishing business, but yet on the other hand, we have this historical study in here. I have got the historical study since 1914.

Q. Is that the historical study, this figure you just referred to? A. That is supposed to be your figure for reproduction new.

There is no depreciation in that.

Q. You have just told me that that figure includes cost of establishing business.

A. That is my understanding, and I got it from the City's expert.

Q. And is that what you were told? A. I got it from his report.

1882 Q. If our Appraisal showed the following items: "Physical Telephone Plant, \$2,672,211.00; Miscellaneous Property, \$64,789.00; Working Capital, \$73,556.00; Cost of Establishing Business, \$562,111.00, a total of \$3,372,667.00" as shown by our Report, to which you have referred, made August 1st, 1914; if that is a fact, then you haven't been furnished with the correct figures, have you?

A. Finish your statement; what is your depreciated condition

there? Tell me that first.

Q. I am merely taking the figures that you use.

A. I know but-

Q. (Interrupting.) You weren't furnished with the other figures?

A. I didn't put those in my figures, my starting figures, and comparative figures. They are not without depreciation.

Q. I haven't that here.

A. Well, get it.

Q. But you have left out \$700,000.00?

A. Yes, and I have left out of my figures all your depreciation value, new.

Q. You have just made a statement that this figure included the

Cost of Establishing business?

A. That is my understanding,—the Two Million,—what is it?
Q. Two Million, Six Hundred Seventy-Two Thousand, Two Hundred and Eleven.

A. It is my understanding

Q. (Interrupting.) And you went on that assumption in fixing this Exhibit?

1883 A. Why certainly I did.

Q. You thought you were getting say, something for Cost of Establishing Business?

A. Not necessarily.

Q. You thought that figures was in there?

A. There is a lot of bunk in these exhibits. That is a very clever invention.

Q. I am not talking about the theory. I am talking about your figures.

A. I don't concede anything until we get to it.

Q. What do you mean when you stated you had included the Cost of Establishing business?

A. I didn't say that. I said that was the Company's valuation

given to me by the City's Engineer.

Q. But you said it included the cost of establishing business?
A. I take it back then; I assumed that it contained all the reason-

A. I take it back then; I assumed that it contained all the reasonable items. I am taking your figures to show a maximum range in this proposition.

Q. But you didn't take our figures?

A. No, apparently not. In that first exhibit that I used, you said it wasn't yours at all. You said there were original marks on it that showed to have been yours but yet you agreed it was yours. Give me the depreciated per cent of your plant.

Q. I haven't got it.
A. Well, I want it.

Q. Didn't you state yesterday that no Telephone Plant was under 92% condition?

A. Well, you don't need an expert in this case. I came in 1884 here as an outsider, and I found—You had already and I ac-

cepted an Inventory of 1914, and accepted your figures, and then added what you put in, and I thought, well, this certainly is a nice composite.

Q. But you thought that you had a real composite, didn't you?

A. And if I wanted to come in here, I wouldn't have taken your figures, if I wanted to come down here and deceive the Court and Commission I could have taken a lower figure, but in order to be fair, I came in here and took your figures, but you don't mention that depreciated condition of your plant. Tell me what that is.

Q. I am discussing your figures,—the figures that you set up.

A. I didn't try to mislead the Court, and I am giving them to you as your figures.

Q. You thought they contained the figures but they didn't.

A. And they looked pretty close to the truth. Bring in your full Company Report, less depreciation, and we will-

Q. (Interrupting.) Did you have any idea that this contained

"Miscellaneous Property" and "Working Capital"?

A. That is no question at all. I asked for the Company's figures for 1914, by their own inventory.

Q. And knowing the Bell System of setting up such things, you

thought everything was in?

A. No, I didn't think anything about it. I merely asked for the Company's figures for 1914. You are putting in things today that you didn't put in fourteen years ago.

Q. We are learning all the time.

A. You bet you are. When I come in here, I merely 1885 asked the City Expert what was the Company's figures in 1914. He handed them to me. I said, I am in a hurry. I said, "What have they spent since that time?"

Q. Well Lyndon evidently thought-

Mr. Howard (interrupting): You can prove that by Mr. Lyndon. Mr. D. A. Frank: Never mind now. This man is on Cross-examination.

Mr. Howard: Mr. Lyndon testified yesterday as to what the base was that Mr. Kelsey picked up and added these additions to, and he testified to Physical Property only. Now, if you have got Going Concern and Cost of Establishing Business, and things of that kind that you want to add-

Mr. D. A. Frank (interrupting): Mr. Howard, I call your attention to the fact that this gentleman is an Expert, and as an Expert, he, of course, knows that his opinion carries weight with the Court. His opinion, if relied upon, might be the means of cutting down several hundred thousand dollars off the valuation of the Company.

Mr. Howard (interrupting): He could not for this reason: He says that he has taken it from company figures. Mr. Lyndon testified that he got those figures of the Physical Property from figures furnished him by the Company, and that they amounted to so much.

Then Mr. Kelsey says that he took those, of course, as found by Mr. Lyndon and has supplemented those figures by the additions to Plant since 1914, and that those things combined

shows certain values.

Mr. D. A. Frank: This witness has stated several times that he took the Company's own reproduction figures as of August 1, 1914, and didn't even subtract anything for depreciation.

A. I believe that.

Q. You believe that, and you are honest in it, and we admit that you are. Therefore, the figures that you set up here need to be corrected by the addition of something for Cost of Establishing Business?

A. It may be partially.

Q. And Miscellaneous Property. You didn't allow anything for Teams and Tools?

A. Oh, yes, unquestionably. Prove that by the other witness. You know I came into this case in a hurry. I didn't have monthly reports.

Q. Now, the monthly reports would have been of the entire Com-

pany?

A. I know, but if I had seen those, I would have tried-

Q. (Interrupting.) You know you weren't under any compul-

sion to go on the stand when you did?

A. I know, but I can go on long enough to lay the foundation.

What we are after is the truth. Now, put all your Cost of Establishing business in there and then tell me what the engineers found by inspection was the value of your property at that time.

Q. Your figures, if the figures given you by Mr. Lyndon included nothing except the Physical Telephone Plant and didn't have anything for Office Furniture & Fixtures, didn't have anything for General Store Equipment, or Teams and Vehicles, Tools, or Supplies, or Working Capital, or Cost of Establishing Business, oughtn't there be some change in your figures to account for those items?

A. I would love to have that complete statement of your valua-

tion less depreciation, and I will tell you the fact.

Q. Just answer my question.

A. I have answered it.

Q. Should there or should there not be a correction in your figures on that account?

A. Oh, I expect to make a correction in two or three figures, before I get done.

Q. I want the question answered.

The Master: Just answer the question.

Q. Oughtn't those figures to be corrected by the addition of those items?

A. Every figure is subject to correction.

Q. You haven't answered my question. Wouldn't it be easier for you to say that this figure ought to be corrected?

A. Well, I don't know, from some of your questions.

Q. You haven't answered my question yet. I hate to be insistent.

1888 A. An Irishman don't know how to answer the question.

Q. The question is simply this: If certain items which I have detailed were not included by Mr. Lyndon in giving you the Appraisal of the property as of August 1, 1914, and you have based your figures on the bare physical plant, shouldn't your figures be corrected to show that?

A. Why, yes.

(By Mr. Howard:)

Q. And these were erroneously admitted, you don't claim they should be added unless they were properly—

A. (Interrupting.) Why no, I want to study those figures.

The Master: He said yes.

Q. He said yes.

Mr. Howard: Now, Mr. Frank, just so we won't be proceeding along wrong theories, to get at that, we should know that he has taken for the base of his computations certain figures which he says were furnished to him as figures of the Company, showing the Physical Values of this plant, and you say it has omitted Office Furniture and Equipment, Tools, and things like that, we ought to know it.

Mr. D. A. Frank: Mr. Lyndon knows it.

Mr. Howard: Did you omit Office Furniture & Fixtures and Tools? I thought you made that clear that you based your reproduction upon figures furnished to you by them in 1914.

Mr. D. A. Frank: We will go on while Mr. Lyndon looks

1889 at it.

Mr. Kelsey: Can I excuse the witness and suggest to you, Judge, that we ought to have that total sheet that entire exhibit, less depreciation. I am not trying to deceive the Court, or deceive the

ease. We have to have what we have. I want all that,

Mr. Howard: Now, Mr. Frank, we found this list here that Mr. Kelsey used and furnished by Mr. Lyndon. We would like to have it in the record. (Reading): Real Estate Buildings, Central Office Equipment, Substations, Pole-Lines, Aerial Cables, Aerial Wires, Underground Conduits, Underground Cables, Furniture & Fixtures, Supplies in Stock, Tools, Teams & Vehicles.

Mr. D. A. Frank: What are you reading from, Mr. Howard?
Mr. Howard: I am reading from the statement of the Physical
Properties upon this Reproduction of 1914.

Mr. D. A. Frank: Whose statement is it?

Mr. Howard: I understand were these furnished to you, were they?

Mr. Lyndon: Those were the reproduction figures which I made at the time, and the reproduction figures which the Company submitted covered these same items.

(By Mr. D. A. Frank:)

Q. Then this entire statement is founded on Mr. Lyndon's report, then, Mr. Kelsey?

A. Well, I am not a judge of that matter at all. You give

me your report and I-

Q. (Interrupting.) You have worked only on the figures which Mr. Lyndon gave you—

A. (Interrupting.) Merely from information—my information was this was the Company's report for the 1914 inventory.

Q. So that this is not as happy a situation as you have assumed?
A. I am not at all discouraged about it. I have granted you that, that we had a happy situation in this town—

(By Mr. Howard:)

Q. Just a moment, Mr. Kelsey, these figures that were got in there—did you get those figures?

A. No, I left them there with you, Judge.

Q. Well, I don't want them, Mr. Kelsey. If you will let Mr. Kelsey know what the figures are that you have got, and what they included, just state what page that is on in that report, because that has been offered in evidence.

Mr. Lyndon: The list of items is on page 183, of the 1914 Report of Lyndon & Elrod, on Telephone Service and Rates in the City of Houston; also the Lyndon and Elrod valuation of those items is given on Page 183; the Company's valuation of those same items is given on Page 183.

(By Mr. D. A. Frank:)

Q. Is that a Company Report?

A. No, it is-

Mr. Howard (interrupting): It was testified by Mr. Lyndon yesterday that he is showing in there the the figures that he spelied, that he got from competitive prices, and there is also a set up on the prices furnished by the company on that date and he shows both those things.

Mr. D. A. Frank: We are not talking about any of those things

at all, Mr. Kelsey.

Mr. Howard: You are asking the witness; you are trying to make it appear that the basis of this witness' computations are incorrect.

Mr. D. A. Frank: They are incorrect.

Mr. Howard: Now, we are saying that they include only the Physical Properties, but they do include all the Physical Properties, and as shown by your figures furnished to the engineer, Lyndon, at that time. Now, we want to get that statement as a basis of this computation, that the Company's inventory shows the total cost.

Mr. D. A. Frank: Now, you are reading from-

Mr. Howard: I am reading from page 299 of Mr. Lyndon's Report furnished this witness, upon which he bases his figures.

M. D. A. Frank: That's the idea.

Mr. Howard: 299 of the Lyndon Report of 1914, isn't it, Mr. Lyndon?

Mr. Lyndon: Yes.

1892 Mr. Howard: The Company's inventory shows the total cost of Physical Properties, including Real Estate and Buildings, to be Two Million, Three Hundred and Twenty-six Thousand Nine Hundred and Forty Follars, exclusive of these additional charges. Now, the additional charges are referred to in the preceding paragraph, and they consist of the Actual Physical Cost of the Purchased Property, Purchase of Apparatus and Supplies, and Labor and Overhead Expenses, but they don't include the items of Engineering, Errors and Omissions, Interest and Taxes, Interest dur-

ing construction and other minor charges. Now, according to the Company's computations, the total amount of all these additional charges properly applied to the different items amounts to \$345, 271.00, giving as the total Physical Value of the plant, \$2,672, 211.00.

Mr. D. A. Frank: Just exactly what I said.

Mr. Howard: All right.

Mr. D. A. Frank: Nothing for the Cost of Establishing Business?

Mr. Howard: Nothing for the Cost of Establishing Business, that is conceded.

Mr. D. A. Frank: Nothing for Miscellaneous Property and nothing for Working Capital?

Mr. Howard: Nothing for what?

Mr. D. A. Frank: Miscellaneous Property.

1893 Mr. Howard: I don't know whether you have got any of that or not.

Mr. D. A. Frank: That is just Physical Telephone Property.

(By Mr. D. A. Frank:)

Q. So that, if that Report shows Seven Hundred Thousand Dollars more, at least, Mr. Kelsey, it was a Report that wasn't submitted to you?

A. I would like to see the Report.

Q. Well, it wasn't submitted to you.

A. I haven't seen, as you say, your Company's Report. I want to

see it with your deductions for depreciations.

Q. That is a different proposition. We have your Exhibit here that you are dealing with and the Court has the right not to be experimented with.

A. That may be true, but when you haven't the weapons to work

with-

1894

Mr. Howard: We are not experimenting. We put in the figures in a segregated manner. We are not contending that they include a lot of intangibles that you are claiming.

Q. Mr. Kelsey, a reproduction figure for plant would have to be a reproduction of the plant and attached business, wouldn't it?

A. Well, assumed for the moment, yes.

Q. Well, let's not assume it; isn't it a fact?

A. Yes, the reproduction figure is quite true.

Q. You have added to that for some-

A. (Interrupting.) Oh, yes, for some of the cost.

Q. You answered Colonel Chipley, in the Enid Case, on page 469, where he says: "I will ask you, Mr. Kelsey, whether or not you speak of a reproduction which would include the reproduction value of the plant as a going concern?" And you answered that is correct.

A. Going concerns are worth more than standing concerns.

Q. You would answer yes, to that question now, wouldn't you?

A. Yes, as a reasonable Cost of the Business.

Q. So that the figure that you have for total of the property on page 1 of your Exhibit, would have to be revised, wouldn't it, Mr. Kelsey?

A. I expected to. I told you there were some items in that that I only temporarily used in the first place, I warned you and the

Court too, that there were temporary figures in there.

Mr. Howard: He has allowed that $4\frac{1}{2}\%$ that he says too that he thinks should be revised.

A. Yes, temporarily.

Mr. Howard: That hasn't got anything to do with that, but it has something to do with his figures.

A. I can straighten this situation out very readily and

1895 quickly.

Q. Do you know where you got these figures? Do you know what figures these are that you have at the top of the page, of page 1, of your Exhibit, where you say "Exchange Rental, \$880,-439.28?"

A. That is in your Exhibit.

Q. You are trying to find out something by this set-up, aren't you?

A. Yes, what the Company took in during the year,-what they

spent during the year.

Q. You are trying to find out what the Company spent and what it took in during 1919, so that you could tell what it would take in and what it would spend in 1920, aren't you?

A. No, I am not interested at all in what happens in 1920.

Q. Aren't you interested at all in what the Company's income would be under the present rates?

A. I am not considering that at all.

I had this set-up, because it was the only one within my reach to analyze. The Court would be interested in hearing what the Company took in last year, because that is what they took in under the rates, under the existing conditions. As to why the Court would be interested in it unless it wanted to find out what would be produced in the coming year isn't the issue at all. It is reasonable to assume that if the Company made a profit, that the next year they would. I was not informed that the conditions were the same; there

has been a change. I would not assume that the conditions 1896 have been the same in 1919 that they would be in 1920,—

not at all. I know that this \$880,000.00 of Exchange Rental was produced by a rate which was in effect which was materially higher than the rate that is now in effect; that is subject to correction in there.

If the deduction would amount to something like \$250,000.00 per year, my total net down here under Receipts Applicable to Dividends would not also have to be cut down, you could average that out; it would not have to be changed in that respect. I don't think your rate would amount to \$250,000.00. I do not know how much it would amount to, in the light of information—we have got to come in here and ask you for it. I did not undertake to enlighten

the Court; I said these were temporary figures, and warned this Court

and you of that, because I didn't have the books.

All of my testimony is not temporary testimony, it is leading to the facts; all we ask you for is the facts. When I get different facts, my testimony would not be different, facts is facts. If you were denied a rate the latter part of the year and you don't get it, this year, of course, that is subject to adjustment. I was not told what the rates are. I don't know anything about the rates. I didn't even inquire into the rates. I analyzed this sheet when it was given to me. I am perfectly satisfied that those figures are just about right.

Q. Even though the Exchange Rental here may be too high?

A. Oh, no, I am not talking about the earnings, Mr. Frank, 1897 I am talking about the Value of the Plant. There is a question mark about your earnings in there.

Q. What is your idea about confiscation?

Mr. Howard: I would like at this time, so that the Court will understand the purposes of this exhibit; Your Honor will recall it was stated by Mr. Kelsey it was put in here merely as illustrative. Now, he has got a certain thing in here 41/2%. He said he thought that was subject to change. Now, it may appear here in adding up the revenue for 1919 that the revenues are somewhat out of the ordinary on account of the fact that the Company collected a higher rate for the part of the year. Now, this is put in as illustrative largely of his manner of handling the proposition and carries it on down to certain computations there for the purpose of showing that they had the knowledge that he thought he was entitled to have as to what the entire earnings of the Company were, not the entire earnings, but entire investment and plant values, so that he could make the proper apportionment in regard to the Long Distance toll'lines. A part of this should be added to the Plant value that he set up and illustrates how it would be arrived at upon that basis. with the statement that individual items here, many of them and perhaps all of them, may be subject to change, but only illustrative of the contention that he is making, that this toll situation should be handled in a different way than the Company is undertaking to handle.

Mr. J. D. Frank: He is not undertaking to testify as to 1898

the value of the property then.

Mr. Howard: Oh, yes, this thing Mr. Frank is talking about now, has nothing to do with the value of the property. He is talking to him about the rate, and about the operating expenses, and about the gross income. He had told you all he knows about the value, that he took certain figures that were set up as Company figures, so stated to him to be Company figures, in 1914, showing a certain Physical Value of this Plant, including Stores & Supplies, and many other things, and that he has added to that the additions since that time, and he said that is a good composite,-a fair evidence of the value of the Plant. That part is very clear.

Mr. Duls: He admits he hasn't got all the figures in there.

· Mr. Howard: He states that he has all the Physical Plant Values. Now, as to whether you all can come on and tack on a Million or Two Million of intangibles and things that are distinguishable from Physical Values, is a further question that is not undertaken to be covered by this illustration, illustrative set-up that he has set up here.

Mr. D. A. Frank: This is just an experiment?

Mr. Howard: It is just what I said it is. If you followed me---

1899 Mr. D. A. Frank (interrupting): It is not necessary to state it over.

Mr. Howard: That is illustrative of the manner in which this proposition should be handled, that in addition to the Plant Values, as they exist here and what you term the Loal Exchange, there should be added the proportionate part of the toll investment, which would swell the values. He don't undertake to give you a value there complete. It is only the value that has been set up by you and he proposes to add more to that in the way of Physical Property, in the way of Toll Lines, and he proposes further that he should receive the earnings of that Toll Line in their proper proportion and he has put that in as merely illustrative of the manner of handling and as many of these items here, like the $4\frac{1}{2}\%$ he says that is questionable whether you should be allowed that

Mr. Howard: I haven't talked to you with any idea of arousing your antagonism. I am talking to you with the thought that maybe you would pursue this inquiry when it is told to you that this illustrative exhibit is not, and does not, purport to be sustained as an actual proven fact.

Mr. D. A. Frank: Are you through?

Mr. Howard: Well, you may go on for two hours, but I don't think it should be followed up.

Q. Mr. Kelsey, you are on the stand, did you at that time think this was a temporary exhibit?

A. Yes, I propose to have a final exhibit.

Q. You didn't state that on Direct Examination?

A. I made it plain all the way through in this case that I had certain things lacking in this case that I missed, and when I get done my last Exhibit will be——

Q. (Interrupting.) You have only one blank on this page.

A. Two blanks.

Q. Well, you have got two blanks. One is the total or a toll value?
A. Toll value and the percentage, the only question applied is whether the value of Four Million, that is confiscation or not.

Q. That is the question I want to repeat, just tell me your idea of how confiscation enters into it, what is your idea of confiscation?

A. If a valuation of anything under Four Million is put on your property, I would be inclined to think you are losing something.

Q. Well, Mr. Kelsey, I just wanted to get your idea for the record.

Is it your idea that the question of confiscation depends on the question of valuation put on it by the Court?

A. My idea of confiscation is whether or not you lose a nickle in

the transaction of your actual investment.

Q. But, Mr. Kelsey, we are not going to lose the place, 1901 are we?

A. No. no.

Q. Then the real question of confiscation is the question of how

much we get for rates?

- A. No, no, that comes in later, when I give you my final in this proposition. I can't give you a final proposition until I get all the stuff to analyze it with. You come at me and try to show that your production value of 1919 was higher than it was after I got it, less depreciation. I am willing to answer it.
- Q. (Interrupting.) I just wanted your opinion. You are acting as a lawyer and I wanted to know your opinion. Now, your Exchange Rental of \$880,000.00, as you say, is the figure for 1919?

A. You kept that money didn't you? That is the money you

took in.

Q. I am not arguing with you.

A. I am not arguing. That is a question. Did they keep the money that was the Income for that year?

Q. That was the Income for the year 1919? A. Yes.

Q. Now, in order to assist this Court to find what the present rates would produce, you couldn't use that figure, could you?

1902 A. I propose before I get through with this case to have a figure in here that will show the Court what I think.

Q. Answer the question.

A. I have.

Q. It wouldn't be fair to use that figure, would it?

A. What is the question?

Q. (The question was thereupon read to the witness.)

A. No.

Q. If this amount is incorrect, then you are going to assume-A. (Interrupting.) You and I can talk a week on this.

Q. I think we can, but we wont. Now, the second item is \$441,

029.60 that is the Commissions?

A. That is your Receipts of going into the Southwestern points. If you have got any Tolls in there that don't go to the Southwestern points, or go to Texas, you have got a right to deduct those. How could we tell?

Q. How could we tell?

A. You keep the books and you have got the momey in your pockets all the time.

Q. You took the total figures?

A. No. no. I have the 25% of course.

Q. You know how much of this went to the Telephone Companies with which we connected in the State of Texas?

A. I can soon find out. That is the money that you got and when

I get to your books-

Q. (Interrupting.) Do you know how much has gone?
A. (Interrupting.) I don't know anything about it. How 1903 can I tell this Court, or anybody else? Guess at your books? The Southwestern business you originate in this town belongs to this

Q. How does it belong to this town, Mr. Kelsev.

A. Because all the business which originates in Dallas Exchange belongs to Dallas.

Q. Well, now, give us the authority for that statement. A. That is my authority.

Q. You are the authority? A. Yes, what else?

Q. Is there any Court or Commission in the world that has ever decided with you on that proposition?

A. I don't know.

Q. Now, Mr. Kelsey, let's assume, let's make another assumption here. Let's assume that this \$880,000.00 is a correct figure for Exchange Rental and that \$440,000.00 of toll, that would be just half as much, wouldn't it, for toll, as for Exchange?

A. Yes.

Q. And you want to put the two together and say that that is the amount of money that is applicable to the Houston Exchange?

A. Yes, that's the receipts of Houston.

Q. That's the receipts of Houston. Now, in order to find the property that this is applicable to, you would have to take all of the Exchange property in the City of Houston and a 1904 certain proportion of the Toll Property in the entire state?

A. Yes.

Q. That is true, isn't it?

A. That is.

Q. How would you proportion the toll property in the State?

A. Well, I am going to have composite—I have got to study your pro rata of the expense you have got loaded in Houston. You have got Houston loaded with practically \$120,000.00 of expenses here that I don't know what it is.

Q. Are you going to divide it on the basis of Expense?

A. Not yet. I am going to wait and see. Not until I see the books.

Q. Are you going to wait and see what result you are going to get before you decide?

A. No, I haven't yet. I never fool myself that way.

Q. Name some of the ways in which you might divide the Toll Property of the State. A. You show me the books. You don't know how, I don't know

64 - 219

how I am going to take care of the proportion until I make a study

of this situation.

Q. Now, let's see, Mr. Kelsey, you could divide the toll property of the State on the basis of the proportionate part of the entire property as found by loading the Houston Exchange property with all the property in the State, couldn't you?

A. Oh, I presume so.

Q. Now, you could divide it on the basis of the proportion of the entire expenses in the State as compared with the entire expenses in the City of Houston, could you?

A. Well, it could be, I suppose.

Q. Now, there are four different ways of dividing and allocating the Toll Property in this State, to the City of Houston, which one of those do you intend to follow?

A. I don't know.

Mr. Howard: Why don't you get him those Reports that he asked for?

Mr. D. A. Frank: He doesn't have to have a Report to answer a question.

Mr. Howard: I think he is entitled to it. He has asked for them.

A. (continued). Show me the books.

Q. Does your answer depend,—does your system depend on what the answer would be?

A. I want to know on what basis you do all your allocating. Then I am going to—I don't propose at this time to say what I am going to do about that allocation.

Q. Can you tell the Court at this time what would be a fair

way of-

A. (Interrupting.) No.

Q. Now, Mr. Kelsey, have you ever done this anywhere else?

A. I presume so; I don't remember.

Q. Why, Mr. Kelsey, is it possible that an Expert like you wouldn't remember having done so important a thing as this 1906 in another case?

A. Well, it may be. I am pretty busy, you know, and I don't keep all those things in my mind. You dig up records here that I had forgotten,—that I didn't know existed. I wish you would refresh me on those things.

Q. As a matter of fact, you have seen 25% of the total Tolls allowed to the Exchange, that has been customary everywhere?

A. Oh, yes, they make a contract between themselves, you know. Q. That has been customary for twenty years, hasn't it?

A. Not necessarily. Here's the theory, as I told you before: When we first went into the Telephone Business, the man who originized took 25%, the man who terminated took 10, and the fellow between, they had the mileage division.

Q. The 35% that you are talking about was where one or both

owned some of the tolls?

A. It doesn't matter who owns it. Q. Some owned some toll lines?

A. Not necessarily. Pretty nearly everybody wanted their own

toll lines.

Q. Well, let's take a parallel case to this, and take a case where a company operating a local exchange is doing a long distance business with another line; now 25% to the exchange is a usual and customary thing?

A. 10% of the incoming would be the old arrangement.

Q. 10% of the incoming and 25—

A. (Interrupting.) No, no, the Bell Company began to connect up with these Companies and they were so glad to do it—

Q. (Interrupting.) What do you mean by saying they

907 were so glad to connect with them?

A. Getting the long distance connection. They thought

Q. (Interrupting.) Does it make any difference anyway?

A. No.

Q. Is it worth anything at all to a local exchange?

A. No, it is a liability, almost.

Q. A liability?

A. Yes, sir.

Q. Have you always been of that opinion?

A. Absolutely.

Q. How many lines are there around Houston, do you know?

A. No.

Q. Would you be surprised if I were to say that there were fifty lines going out of Houston?

A. I wouldn't be surprised. Judging from the pay-roll, you have

got a number of lines here.

Q. Suppose there were one hundred and forty, would that be about right?

A. I don't know.

Q. There are 17 railroads, and there are usually lines running out the railroads. It wouldn't be out of reason to say there are 30 lines running out of Houston?

A. I can't give you any idea until I know. I don't know your

business at all.

Q. Let's assume that there were 30 lines running out of Houston would it hurt the Local Exchange to have one of those lines cut out?

A. Well, not on the 25% basis. They are losing money

1908 on that proposition as it stands.

Q. Would it hurt the exchange to have half of them cut out?

A. They would probably make more money by losing them under those contracts. You are speaking now of the benefits of the toll, are you? Are you going to argue that long distance is a—

Q. (Interrupting.) Would it hurt the Local Exchange to have

all the long distance lines cut?

A. Well, I don't think it would hurt it materially, because 97% of the calls, as a rule, are handled around right in center.

Q. Don't you know that a lot of people wouldn't take local service unless they had long distance lines?

A. No.

Q. Don't you know that in building up an exchange of 27,000 stations that necessarily a great many people wouldn't have taken-

A. (Interrupting.) You can't conceive of a situation whereby a man wants the long distance telephone and not the local connections. Look here, communities with a thousand grew up without any toll lines. The Duluth Telephone Company got along well without the long distance lines, and Minneapolis and Saint Paul.

Q. Mr. Kelsey, suppose we had some lines out of here, from here to Beaumont,-you know where Beaumont is, don't you,-pretty

good little town over in East Texas?

A. I suppose so.

Q. Now, suppose that was owned by the Texas Long Distance Company, and they were to cut off connection entirely with our exchange here, and we had a contract, wouldn't we be damaged by cutting off those lines?

A. Well, you got many a toll line which is an independent com-

Q. That don't answer my question: Wouldn't we be damaged?

Q. Probably save money on the basis of 25%?

A. Yes, it is costing this property, the time you count every item that goes into it, a good deal more.

Q. Couldn't you undertake to valuate what we would lose on a contract of that kind?

A. No.

Q. Wouldn't you undertake to say what the line to Beaumont would be worth from this exchange?

A. You are not dealing with a philanthropic proposition. You

are dealing with actual figures.

Q. I am asking you as a telephone expert, you couldn't undertake to valuate the services that we would lose by having the lines cut

from here to Beaumont?

A. You wouldn't lose anything. It would be convenient to some people. They use the telegraph. It is better sometimes. The cry of no toll lines has been one of the factors of independent life, and I never did find that it hurts any.

Q. Have you always been of the opinion that the long distance lines wouldn't add anything to the value of the local exchange?

A. Why certainly not. Why would they?

1910 Q. Well, I am asking you, Mr. Kelsey.

A. It is the local exchange that add value to the toll lines What toll lines would be worth 5 cents that terminate at a jack rabbit hole, or what is Houston worth as a terminal,-what is Dallas worth as a terminal? Your terminals make the toll lines. Your toll lines don't make the terminals.

Q. I want to be fair with you, Mr. Kelsev.

A. You have got to be.

Q. Haven't you been of the opinion that the toll line was worth a great deal to the local exchange?

A. No, I never knew that you were philanthropic in your Charter.

Q. I am not talking about me. I am talking about the Telephone Plants.

A. I am talking about your company.

Q. Havec't you been of the opinion that the connection with the long distance lines is very valuable to your local exchange?

A. Take the Peoples; licked the life out of us and we had all the

toll lines and they didn't have any.

Q. What year was that?

A. That was 1898. You will find an awful story. Minneapolis Tri-State licked the Northwestern Indianapolis and didn't have any long distance lines to Chicago.

Q. You are perfectly sure of that?

A. Yes, the only reason I had to build a long distance line from Fargo to Glendive was to connect up and make our terminals worth something, that make the toll lines as much as it does.

Q. If there were competing exchanges and the two exchanges were trying to get as many toll subscribers as possible, wouldn't the one that had the long distance connections get the greatest amount of business?

A. That has never been demonstrated.

Q. Haven't you ever attempted to demonstrate it?

A. Oh, yes.

Q. Have you ever testified to it in any case?

- A. I don't know. You seem to have a lot of records here. Spring them.
- Q. Mr. Kelsey, you stated positively that you have never testified that it was worth anything to a local exchange to have a long distance connection?

A. Oh, not positively. I insist that that is my opinion.

Q. That is your opinion. You remember the case of the Memphis Telephone Company against the Southwestern Telegraph and Telephone Company?

A. Yes, where they cut the lines. Q. You remember that case?

- Q. Just to refresh your memory, in order to keep from reading some from the record to get the facts before you, that was a case in which the Memphis Telephone Company built a line 28 miles long out of Memphis for a connection with a little independent telephone company that operated up in Arkansas,-up into the Mississippi River Bottoms?
 - A. That was the Osceola? Q. Osceola Company?

A. Yes.

Q. The line cost \$8,800.00, and a contract was made between the Memphis Telephone Company and the Osceola Company, and the Southwestern Company,-this same Company that's here in this present case?

A. Oh, no, no, the Cumberland.

Q. No, sir, I beg your pardon, it was the Southwestern Telegraph and Telephone Company.

A. It was Leland Hume that cut the wires,-Leland Hume's people.

Q. But the Southwestern Company purchased the Osceola?

A. From a man named Ross.

Q. The line cost \$8,800.00, the line was cut, it consisted of one circuit of copper wire and one circuit of iron wire. You testified as a witness for the Memphis Telephone Company, the contract provided for a twenty-five year connection, and provided that for the use of this twenty-eight miles of long distance circuit and the operating of the local in Memphis, the Memphis Telephone Company would get 17½% of the total tolls out of Memphis. You testified in that case on behalf of the Memphis Telephone Company that the gross business that would be done over that line for a period of twenty-five years would be \$883,500.00 and that 17½% of that would amount to \$154,612.50, and that the business could be handled for one-third, which would leave a profit to the Memphis Telephone Company of \$111,875.00?

A. That is the Memphis Long Distance, isn't it?

Q. No, the Memphis Telephone Company.

A. No, that was a separate—

Q. It was a local telephone company.

A. I remember the case, but that was a separate line, jointly owned by Ross and by Short, they called the Memphis Long Distance.

Q. This particular Plaintiff in this case was a local telephone com-

pany and not the Memphis Long Distance Company.

A. Yes, I think they owned the stock in that little concern, though. Q. You remember the case, do you?

A. Not clearly, what year was it?

Q. This was July 23, 1912. Now, Mr. Kelsey, while you were testifying you made this statement:

"I feel that there is another item here that is more or less just; it isn't so large. It's the loss in revenue due to subscribers that this company can't get owing to that loss of service. It's possible that the Home Company can get a telephone in a business house, but it gives the Bell Company the advantage of all the P. B. X Service and makes the travelingmen and their representatives more or less lean to the Bell Company or companies that they—

Q. What do you mean by P. B. X service?

A. That's the telephone scattered throughout the business houses.

Mr. Chipley: Private Branch Exchange.

Witness: Private Branch Exchange. It gives them that advantage. I have estimated that on a more or less progressive scale, based on growth of telephone business. The growth has been tremendous all the way through, and I have divided that into five periods. The first period of five years, a loss of business service average 50 telephones at \$54.00; 50 residence telephones at \$30.00;

making a total the first five years—I mean the—making a total per year of \$4,200.00. Now, then, from my experience, and from the experience here, they can operate their rental

stations for about 50%. That leaves a net loss to this Company of \$2,100.00 a year, for the first five years, or, \$10,500.00. The second epoch, five to ten years, I figure on an average 75 business telephones and 75 residence telephones. That totals \$6,275.00. Half of that is net, \$3, 1—let's see. Five years (figures) that would be a loss the second epoch of \$15,637.00. The third period I figure 100 business telephones—the equivalent of 100, and 100 residences, making a total of \$8,400.00; 50% would be \$4,200; for a period of five years would be \$21,000. The fourth period, I figure 125,—the equivalent of 125 business phones, and 125 residence, making a total actual loss of \$10,500.00. That would be a net loss of \$5,250.00 a year or, for the period, \$26,150.00. I have made no change for the fifth period, leaving it \$26,150.00. That makes a total of \$99,487.00.

Q. That is for the whole 25 year period?

A. Yes, for rental losses."

Now, Mr. Kelsey, that was your testimony in the Memphis case, was it?

A. Read further Mr. Chipley's suggestion there that the figures don't lie, but liars can figure.

Q. Just find it.

A. Well, it probably didn't go in the record. Well, what was the decision in that case? What was the damage finally given? Enlighten the Court, clear on through.

Q. That was your answer. That was your testimony in that case?

A. In that case, yes, that was a local issue.

1915 Q. And there you testified to \$250,000.00 damages for cutting off that particular line.

A. A very bitter fight on at that time. There's a local condition that aggravated that thing clear through.

Q. This was your testimony in the case, was it?

A. All this based on local issue.

Q. Do you change your testimony on account of the issue in the case?

A. Well, every telephone problem has its local issues.

Q. You change your opinion-

A. Not opinion at all. Here was a little town where these two companies jointly owned those lines. The Cumberland Company cut those wires. This was uncalled for. There was a reason for that. The Southwestern was not in that case so much.

Q. You testified and the Plaintiff testified that the Company was

damaged \$250,000.00 by cutting off two of the toll lines?

A. That's all right. Suppose you cut off Beaumont. You lose your tolls, don't you?

Q. That would average \$10,000.00 per year, wouldn't it?

A. Yes.

Q. And that would be \$5,000.00 per line?

A. Yes.

Q. Now, if there are 30 lines entering or coming into Houston on your testimony in the Memphis case, the local exchange would be damaged \$600,000.00 a year?

A. You go on the 100% theory?

Q. No, on the 17½% theory, weren't they?

A. That is on mileage. There is no question but what if 1916 we cut out the Beaumont and additional lines, you would lose the total revenue that you have got there.

Q. The Memphis Telephone Company in that case had 3,000 tele-

phones in Memphis, didn't they ?

A. Yes.

Q. It also owned 28 miles out?

A. Of this important line.

Q. Of this important line. The cutting of that line deprived the Memphis Telephone Company of two things?

A. The revenue. It deprived you in this town.

Q. Of the toll revenue, and also the additional local revenue that they would get in order to talk to that part of Arkansas?

A. Yes, that is true.
Q. That is what you testified?
A. That looks reasonable.

Q. That looks reasonable. Now, a little line to a sparsely settled portion of Arkansas-

A. (Interrupting.) No, that was a profitable line. That was one

of the most miraculous-

Q. (Interrupting.) You didn't know it, but I tried the case and I carried the case up?

A. Yes, it went on up.

Q. Have you a curiosity to know what the Court found?

A. Yes, that is what I would like to know.

Q. You testified that the damage would be \$250,000.00?

A. Yes, and what did the Court find?

Q. The Court found \$3,300.00. That was about 1% right. 1917 Your figures were about 98% wrong.

Mr. Howard: The Court practically held just the opposite of what you are contending here.

A. If you cut the long distance lines out of this town, you certainly would lose the revenue, and you would make less of local You are not charged for anything you lost. Are you trying to ascribe that the long distance lines, of course, threw a loss to the town; and it wouldn't appear in your statement either, would it?

Mr. Howard: If you would continue to cut these long distance lines, it would destroy the exchange.

Mr. D. A. Frank: I am not on the stand. This gentleman is on the stand and he is an expert.

Q. You testified there in a little exchange of 3,000 stations that the cutting of two long distance lines coming in there would damage that property at the rate of Four Thousand Dollars a year?

A. There was a line that was shooting through messages awful swift and fast. Why not enlighten us completely on how much that

was. It is a loss.

Q. Your statement was it would produce \$880,000.00 in the 25 years, and that 171/2% of that would go to the local exchange?

A. I knew, but all that is reflected in your annual reports and in your books, and what you take in and what you don't take in.

Q. \$883,500.00. 1918

A. If you didn't take that in, you wouldn't take it in, Mr. What's that got to do with this case?

Q. You divided the damages between the loss of tolls, loss of local

exchange revenue, didn't you?

A. Yes, that was a very natural thing to do, they were losing.

Q. In the course of 25 years, you contended that there would be

\$250,000.00 damages?

A. There would be that much deflection in earning. If you didn't have any long distance lines here you wouldn't have any earnings in your sheet at all.

Q. You did divide the damages in that case, didn't you?

A. That was 8 years ago. You know I have learned a lot about terminal values since then. We all have.

Q. You are prepared to change your ideas now?

A. We changed our ideas about warfare about 30 days after the German warfare, didn't we?

Q. I have no quarrel with anybody.

A. That bears on this proposition. Of course, if you did cut the toll lines, you would lose the revenue.

Q. You would lose what revenue?

A. The toll revenue.

Mr. Howard: Just a minute. I want to understand what we are talking about. Is the contention here that all this loss came from toll revenues? Is there any testimony in here that any subscriber would discontinue because they couldn't get the long distance lines?

Mr. D. A. Frank: Mr. Kelsey is testifying, and he said it wasn't worth a dollar to the local exchange to be connected 1919

with long distance lines.

Mr. Howard: After you read all that stuff into the record, then it turns out that they are testifying entirely about toll lines.

Mr. D. A. Frank: Not only is your statement inaccurate but it has a very vital applicability to the facts in this case.

Q. Didn't you get that about the loss of those stations?

A. Well, if they lost those stations, they would lose the revenue and-

Q. (Interrupting.) You testified in that case?

A. Well, I presume I did. You seem to have the goods on me. Q. Your lost subscribers and your lost revenue, what has that got to do with this case?

Q. You testified in that case-

A. (Interrupting.) If you are trying to make out that the toll

lines are of value, you are creating an opinion proposition.

Q. You testified in that case that it was worth \$95,000.00 deflection of local earnings of toll, because of the fact that they didn't have connection with some sparsely settled towns in Arkansas. There was two of those lines, and you allocated \$99,000.00 in 25 years. That would be Two Thousand Dollars.

A. For what?

1920 Q. For loss of exchange revenue.

A. Well, that appears in their annual statement, doesn't it? Why don't you—what you don't earn, you don't put on your books.

Q. Your testimony was that the local exchange would lose that

much local revenue?

A. Why certainly. We might lose it. What has that got to do with this case. We have got an actual record of the money taken in and if we lost the Beaumont line and the Galveston line, and the chances are that next year these fellows might take their line out, and we might lose the revenue. If you don't take it in, I don't know how the dickens you can be credited with it.

Q. Has this city a high development rate?

A. I understand 10% is very good.

Q. It is more than 10% here.

A. Up North, those towns have one-fourth, between one-fourth and one-fifth.

Q. If they have 27,000 subscribers and there is 160,000 people, that would be pretty good development?

A. Well, you have a lot of colored people here.

Q. That would tend to cut it down.

Q. Well, suppose we wanted to hire a man and he made us 1921 a price of engineering a plant, and we made it six per cent, would you say that is reasonable?

A. You are not making the witness a proposition?

Q. No, you-

A. (Interrupting.) It all depends on how large the engineer was, how much he needed the business. Those prices are competitive, just like anything else.

Q. If he made a price of six per cent, would you consider that rea-

sonable?

A. Well, he would do pretty well on that.

(By the Master:)

Q. What is the answer, Mr. Kelsey, is it, or is it not reasonable?

A. Well. I presume it is, Judge. The intent of his question is this: All these engineering conditions are taken on what the engineer is willing to do it for.

Q. I understand, but in your judgment it's reasonable or unreason-

able?

A. If he could get six per cent he would have a nice contract. If you want to follow that down according to size, if it is not a large plant, he would have to scale down his percentage, if he has a large plant, he would have——

Q. (Interrupting.) It is owing to the size of the job?

A. What is the use of arguing? Not with you, Judge, but six per cent, is what they all like to get, if they can.

Q. Well, you referred to your testimony in the Birmingham case, and I just noticed in there a question was asked you, "What about engineering?" And you answered, "Six per cent engineering is put on there, on the basis that the average engineer's fee is six per cent."

Q. That is fair isn't it? That's fair, isn't it?

A. It looks all right.

Q. Now, what would a consulting engineer on a plant, if you were starting a plant and had to have a consulting engineer, what fee would be proper?

A. I don't know. I have never charged any fee. In our business we had to help all these fellows for nothing in order to sell them

the switch-board.

Q. Well, now, you have known as high as fifteen per cent being paid?

A. I never heard of it.

Q. Well, Mr. Kelsey, you be sure now.

A. Well, you have got the record. You remind me if I am wrong

and I will admit it if I am.

Q. You say you never heard of a fee of fifteen per cent, being charged?

A. Not that I know of.

Q. Have you ever testified there was a fee of 15% charged? A. I don't recall. Let me have it and see what it was. I didn't know I was in a memory contest.

Q. You aren't, Mr. Kelsey.

Mr. Howard: Are you contending here, Mr. Frank, that you paid any such prices or that you paid six per cent outside?

Mr. D. A. Frank: I want to show the reasonableness of our engineering fees, and this gentleman is an expert on it.

Q. In the Enid Case, you testified to 10% for an engineering fee and on cross-examination, when you were asked by the Attorney General of Oklahoma, how much was that consulting Engineer's work, didn't you answer: "Mr. Ledley, St. Louis, charged 15% for engineer's services?"

A. In what?

Q. I don't know.

A. I don't know myself. I heard that Ledley was in the concern. Q. So that you have heard of some engineer charging 15%?

A. Is there anything in this record that I have disputed any six per cent?

Q. Well, I just asked you if you had heard of as high as 15%? A. Well, to be sure I have heard, but I had forgotten that I had heard.

Q. Are you contending that on large plants it would be larger than on small plants?

A. Certainly. Mr. Ledley is so great an engineer that he can command his own price. Mr. Ledley served a kind of German interest there, the Annheuser-Busch outfit, and he is a very lordly engineer. I must admit that he has no monuments left that 1924 are a great credit to him that I know of.

Q. What was the matter, the prices too high?

A. I don't know. In this case, I haven't laid the foundation for six per cent.

Q. You think six per cent would be reasonable?

A. I don't know. According to the size and the condition of the plant, I think it would be pretty high, pretty fat fee, especially of your reproduction value, that would be \$48,000.00, that would be pretty nice.

Q. In the Memphis Telephone Company case you testified and it was borne out by all the witnesses' testimony in the case, that the average call was 50 cents that were passing over that line, and that the Memphis Telephone Company would get $17\frac{1}{2}\%$ for the use of its local exchange, and 28 miles of long distance wire. Now, that would be $8\frac{3}{4}$ ¢ per call, would it?

A. Yes.

Q. Now, you testified also that the cost of handling long distance business would be a third of that?

A. 33 1/3% for originating expense that would make it 2 11/12 cents. I am glad you referred to this because in the North Dakota Independent Telephone Company, after a few years we found

out for the first time in history that in the long distance business it costs about 1/3 to operate and the rest of it—now

here is where we own both ends of it, and our operating expense at that time locally was about 50%,—it was the first light I had ever had on that particular cost and since that time by some coincidence, or something these Western Coast Commissioners have said, well, it does look like 35% represents the cost of handling a toll call.

Q. All right; let's get on to this. Now, you testified in that case that one-third of that would be all it would cost to operate, which would be 2 11/12¢ per call, but in order to be fair, of course, that was an in and out call and it would be twice that much on an origi-

nating basis, wouldn't it, or 5 5/6 cents?

A. Your mathematical ability is good beyond question.

Q. Now, you testified in that case that 5.5/6¢ would, on the basis of originating calls, pay for all the cost for handling the long distance calls that went over those lines didn't you?

A. Yes, the Minnesota Commission has gone further and allowed

the little companies 5¢ in and 5¢ out on calls.

Q. Now, would you be surprised to know that when you divide up the number of calls going in and out of Houston, you—a different percentage is being allowed?

A. I wouldn't be surprised at anything, because after all these charges are made, and it goes into the Treasury, whose is it!

1926 Q. Would you be surprised to find that the amount that

was allocated to the exchange was 14 9/10 cents per call?

A. I am not surprised at anything.

Q. And you would think, though, that that would not be a suffi-

cient amount to allocate to the Houston Exchange?

A. Oh, yes, I don't care what you allocate to the Houston Exchange, the fact remains there is so much money put through the toll business in this community.

Q. Let's stick to this question, now, Mr. Kelsey in the Arkansas

A. That was an externally owned line that we had nothing to do with.

Q. No, sir, it was internally owned.

A. Oh, I don't believe it.

Q. Your testimony here was that one-third of that 83/4 cents was sufficient to pay the cost of handling the business?

A. It might have been in that case. You know the cost of operation in Houston and in Memphis are entirely two different items.

Q. That would be 5 5/6 cents per massage?

Q. And here it is nearly 15¢ per message. That is 14 and 1927 some cents, 14 9/10é.

Q. Mr. Kelsey, in your examination of Keystone property, did you find a per cent, condition for that property?

A. At that time it was 90 per cent good.

Mr. Howard: You have been over all that, Mr. Frank. Why should we go over it again? I don't care how far you go, but we have a right to suggest that you don't go over it two or three times.

Q. How did you determine the per cent condition of it?

. A. By inspection, the same as you folks.

Q. The same as we do?

A. Why yes, you do it by inspection.

Q. Did you go out and inspect that property and find it in ninety

per cent condition?

A. I went out and fooled around and looked it over and I determined that it was 90% good, as a matter of fact, it is awful hard to conceive of a telephone company property that carries on these delicate, minute, currents, with all their difficulties that can be-in fact, I don't see how you can keep a plant, and I don't think the Bell Company ever keeps a plant under 90% efficiency.

Q. You think the Bell Company's plants are usually in

good condition, do you?

A. Why they are always in good condtion.

Q. You testified with respect to the calling rates in Cleveland: do you remember what was the lowest?

A. 3 8/10, Mr. Frank.

Q. Well, I didn't mean on that basis. How many calls were handled per operator per day?

A. I don't know. You have it there, about 340 or something like that.

Q. Your testimony was that in May it was 268 and in July it was 217?

A. Well, we made a study clear back.

Q. The lowest was 217?

A. Yes, I think that is true.

Q. Now, the figure that you gave here was found by dividing the number of calls per month by 27 working days and that by the total number of operators?

A. In service, ves.

Q. In the service. That was 580. If you hadn't used the average number of operators, it would have reduced the number of operators?

A. I don't know with the scarcity of girls, every girl worked full time, how are you going to have an average? Every girl being used

works 10 hours per day.

1929 Q. There would be something like 100 operators working

as Long Distance Operators?

A. Thank you for calling attention to the facts, one hundred operators on Tolls in Houston.

Q. I am asking you?

A. No, I am going to investigate it as soon as I get your figures.

Q. Oh, you are?

A. Yes.

Q. Now, there would be somewhere between 400 and 600 calls per day here?

A. I don't know; that is a matter of computation. I am not criti-

cising it.

Q. Well, at any rate, the number of calls per day here is satis-

factory in some respects, is it not?

A. No, it is seriously under. It seems to me that the Common Battery system ought to maintain a standard. One girl can handle 225 calls, or my girls in Minneapolis, even in the first year of operation, handled 250 calls per hour without any fatigue.

Q. Do you know of any place now where that is done?
A. It ought to be done. Isn't the girl the same height, and same weight, and same length of arm, that she was in '98?

Q. Do you know of any place where that is being done?

A. Why they ought to do it. Is there any reason why they can't? Same system, same methods, with improved methods, they ought to be swifter.

1930 Q. I am asking you if there is any place where it is being

done? A. Yes.

Q. Where?
A. There must be lots of places. I can't understand why a girl can't do work in this same system that she did when it was new. What in the world has happened in this evolutionary method?

Q. Just where was it you saw 250 calls per hour handled by a girl? A. Oh, some time, in the busy hours, between 10 and 11, they

would handle 260 calls.

Q. What years was that?

A. From 1898 on up.

Q. How did you determine the number of calls?

A. Peg Counts.

Q. You determined that they handled 260 calls per hour?

A. We watched them, of course. We were all interested in this system. That peg system was put in with considerable misgivings. We all feared it, it was a painful thing for a long time.

Q. You don't know of any place anywhere where that has been

done?

A. Oh, but I could find out for you.

Q. In Cleveland you made the same observations, you didn't after-

wards investigate and found out?

A. It never come to me to find that out. I will find out if I go to—I can go to the United States Independent Telephone Association Headquarters and get all the peg counts, if you want that.

Q. Do you know that we don't have functional systems in the small towns of Texas?

A. I should think you would not have.

Q. Well, you are criticising something that doesn't exist. They all combined in one. Now, Mr. Kelsey, suppose you tell me you denied the other day as I understand you, that in the Cleveland case, you allocated all the tolls to Cleveland. Now, suppose you tell me exactly what you did in the Cleveland case?

A. You are trying to find out what that case is but I will be very

glad to tell you.

Mr. Howard: Tell him again.

Q. Tell me. Judge Howard understands, but I don't. I say, will you tell me?

A. Mr. Frank, is this a physical endurance contest or not?

Q. I supposed it was mental.

A. Well, I am perfectly satisfied to go on a mental test for 30 years, but you know I am not as used to sitting in a chair 1932 as you are.

Q. I am trying to get the views, but I really have no levity

in this matter at all.

Mr. Howard: It is no levity, when you put a man on here and ask him to detail a thing, then you ask him——-

A. You use all this stuff you know. I will be very glad to tell him the theory in the Cleveland case. Apparently you haven't got it yet.

Q. Well?

A. If you have got it, what is the use of giving it to you?

Q. Well, tell me your theory of it, let's go on with the question. A. When you ask me for the theory of the Cleveland case, what are you asking me for?

Q. I am asking you if it is not a fact that in the Cleveland case in your computation you added in all the tolls originating in the Cleveland territory and claimed that they were properly chargeable and properly creditable to the Cleveland Exchange?

A. You don't understand yet. Q. Didn't you testify that?

A. No, I did not.

Q. Well, go ahead and explain it.

A. The Cleveland people invited me down to make a study of the Cleveland Telephone Company. I very firmly told them that 1933 the Cleveland Telephone Company wasn't making money.

Q. You told whom?

A. The City Council.

Q. Go ahead.

: A. Is that a wonderful confession to make?

Q. Just go and-

A. Oh, well, I am getting tired of this "bunk" I tell you very frankly and I am going to give you a sample of the fire-works I can use. You come down here and ask me to expose my hand in another case. We are going to the Supreme Court in that case, and we are going to make you jump.

Q. I don't want to make you expose your hand. All I want you to do is to tell me what you have already done in the Cleveland case?

A. I said, here the situation is a great deal like the Packers. Now, we know that the Armours are very well-off people. Somehow or other they always make money on meat. But they are always losing money. I said, here the A. T. & T. is a good deal like the Packer in this case. Here is a butcher shop which can be compared to the Cleveland Telephone Company, and they are losing money in that butcher shop, but this same owner, he has a long distance telephone company and he uses butcher shop as a terminal which takes a certain amount of money out of Cleveland. He has a little service charge, he takes a little more out of Cleveland, mind

you, they are both owned by the same thing, then they have another company that takes another amount of money out of

the terminal and then they have a great big bunch of unused reserve which they apply to their own capital account, of course, and use it. I said, this case is simply this: The owner of all these properties in Cleveland is making this amount of money which I showed you on the sheet. You remember it?

Q. I remember it.

A. Now, it is a question of how much in the absence of information, he is making on his investment in Cleveland.

Q. Did you arrive at any figures?

A. No, I can't find out yet.

Q. But you left that in expense like you are doing in this case?

A. Well, what else can you do? We are going to make you come clean and bring the books. That is the greatest weakness of the City's case, and always will be, is the lack of facilities, the lack of

information. We have got to compel certain information.

Q. So that in that case, although you started out with the proposition that the Cleveland Company was making a little over 1%

when you got through with your figures you had something like 15%?

A. I am not talking about the Cleveland Company. I am talking

about the owner, Mr. Frank,-the owner.

Q. All right, the owner, then.

A. The owner had 100% of the stock of the Cleveland Telephone Company, The Western Electric, Central Union, 1935 100% of the Long Line Company and he used all the reserves himself.

Q. In order to get the 15% gross profits-

A. (Interrupting.) That is what I called it,—the gross profits.

Q. In order to get that you added together-

A. (Interrupting.) The gross income from all the outlying concerns. Not the gross income of the Cleveland.

Q. Mr. Kelsey, in that statement you did state that all these tolls from all the Cleveland District was all profit until the telephone

company showed otherwise?

A. Why, I don't know what else it could be. That was perfectly fair to the Company. They could come back and show that there was a profit, or there wasn't. And I would have to abide by it. They wouldn't come across. If the owners are losing money in Cleveland it is up to them to show it. We get to the point where they have a profit in Cleveland,-a gross.

Q. Mr. Kelsey, in general, how many stations must be added to

a plant in order to have one?

A. Oh, 4 or 5, some times.

Mr. Howard: In order to have what?

Q. In order to have-1936 A. (Interrupting.) I might tell you that the cost of removals all over the United States will average about \$1.00 a station.

Q. I understood you to say that you had never made a study of

depreciation?

A. Oh, Mr. Frank, say, you are the limit. I didn't study depreciation, for the benefit of financial institutions and bankers in this business for 15 years, and I have written more about that than any man in the world. I have always studied the actual conditions and I am trying to make you come into Court with your actual conditions; come in here with your hands and show us what you actually That is the point. I could go along surmising and talking in percentages but say what has the Company done?

Q. What have you done to study actual traffic conditions?

A. Oh, I don't care about that. That got out of my hands. I am no traffic expert. I have a great deal of admiration for a fellow that will fool with it. It is a hard job. It is making girls work and listening to complaints. It is the most disagreeable part of the telephone system and I think the Traffic Manager ought to get more salary than his neighbor.

Q. That would increase the traffic expense, wouldn't it? A. It might.

Mr. Howard: It might decrease it. A good Traffic Manager might decrease it. We are inclined to think so anyway.

Q. Going back to the exhibit that you put in in the form of City's Exhibit No. 1, this figure that you call Local property value here is

not really total local property value?

A. Well, it is from what we know now. You said yesterday we had left out certain costs in our reproduction theory and I want to know what they are when I get down and put my final report in here.

Q. These figures in here are not final, are they?

A. They can't be anything else. I had to come into this Court and lay the foundation for getting something from you by force.

Q. Will you please tell me whether this figure that you have here

on your own theory, is a cost figure or reproduction?

A. It is a combination of both, Mr. Frank. You set down an inventory in 1914, and you claim certain values. Since that time the Auditors find that you put in a certain amount of money on top of that.

Q. But you actually have a hybrid without having either?

A. Anything is a hybrid where you have a composite figure. We

have a historical value of things which is a hybrid.

Q. If you were undertaking to value this plant as an independent engineer and taking your time for it, Mr. Kelsey, would you or would you not want to see an inventory?

A. Why, I did want to see it and I asked you for it and I got it,

the 1914 inventory, and accepted your proposition.

1938 Q. But would you value a piece of property in 1920 on a 1914 inventory?

A. Yes, and so will every Commission in the United States do the same thing. You don't have repeated reproduction.

Q. Does that figure that you give here represent your best judgment of what the fair value of reproducing the property is?

A. Pretty nearly it would, and when I see your figures, then I will

come in here and absolutely say what it is.

Q. That is, you think that the present value of the property can be obtained by getting a reproduction figure?

A. At some times in the history of its life.

Q. And adding its addition from that time on?

A. Yes, since.

Q. Since that time? You think that gives you a fair value of the property?

A. That shows pretty nearly all the money you have got in it

Q. Mr. Kelsey, would it be interesting to you to know that the book cost of this property here is \$4,800,000.00 and some odd hundred thousand dollars?

A. Well, if it is here, it is here. I would like to see it.

Q. Would it be interesting to you to know that four other engi-

neers have testified in this case that the present value of this property is around \$8,000,000.00?

A. There is not one of the engineers that has testified in this case

that I would give \$1.00 for their opinions.

1939 Q. They are not competent?

A. Competent for your purpose, but not for mine. You wouldn't have had them here if they hadn't appeared for you.

Q. But this is your idea of what the property costs?

A. And what your investment is. That is, what we are trying to find out in a confiscation suit. You can't take away from a fellow something that he hasn't put into it.

Q. So that when the figures here are finally amended by you it

will be what the property finally cost?

A. In justice to you, it takes in all the money you put in since '14, and all the additional money that you might have put in.

Q. Can you define value?

A. No, I am talking to you about the money you have got in this property.

Q. I am talking about value.

A. You might call it value if you are selling. You are not a selling concern.

Q. Do you have to sell anything to have value?

A. You pretty nearly have to.

1940 Q. Is a sale necessary in order to have value, Mr. Kelsey?
A. Yes. It is, yes. The only way we determine market value is by the sales, transfers of property on the Exchange.

Q. How are we trying to determine market values here?

A. We are trying to do something here.

Q. You are trying to determine value, but not market value?

A. You are trying, in other words, to realize your profits in this case?

Q. No, sir, we are trying to find the value of this property.

A. Well, if you were a private concern and not subject to-

Mr. Howard (interrupting): What do you want to find it for?
Mr. D. A. Frank: I am not on the stand, Mr. Howard. I have argued this case with you so much, I don't want to argue it with you now.

Q. We are trying to find the value of the property, Mr. Kelsey.

A. Well, I am trying to find what you actually and reasonably put into it.

Q. So that if the Court is interested in finding the value, you don't concern yourself with that?

A. I am not trying to influence the Court at all.

Q. You are not trying to find the value but you are trying to find the cost?

Mr. Howard: If Your Honor please, he has stated about 25 times that he has taken the inventory of 1914 and has added since what the additions cost him. Now he can ask him that same question, go back over it 100 times, and that is all there is

to it.
Mr. D. A. Frank: All he would have to do is to answer it frankly

one time. This is all that would be necessary.

Mr. Howard: He has told you a number of times what he has done. Now, you keep asking him that same thing. He has told you that he is trying to find out what the investment in this plant was and he has told you that he has not approached this thing from a reproduction stand-point, or from the stand-point of taking an inventory of the property and applying the unit prices and material cost and overhead charges. He has told you he has not done that. He has told you just what he has done.

Q. You put down your statement here, Mr. Kelsey, total local property value when you meant total local property cost, didn't you?

A. Well, I put all synonyms down. There is nothing fixed.

Q. You see, Mr. Kelsey, what drags this out is that you never answer a question until you—will you please answer the question as to whether or not within this figure you undertook to set out the present property value here, or whether you merely attempted

1942 to set out the cost?

A. I am telling you that I put a value there that was all correctly written and dictated without a thorough study of all the synonyms and derivatives of the English language. We might go back and prove that that was something else.

Q. You haven't yet answered my question?

A. I intend, eventually, to put down the reasonable amount of money that you folks have put into this property.

Q. So that you haven't undertaken to show what the total value

is?

A. The money you put in since 1914, is certainly entitled to some consideration. I think you have a very happy combination of circumstances there myself.

Q. Is it your idea of applying judgment to all the relevant facts to give a figure of reproduction some time and put the additions on

there from that time on?

A. Every Commission in the United States has practically ruled that way because you can't expect a company to make a reproduction inventory every 5 years. It would be absurd. When you once set a thing—as long as your system stays standard, why not adopt the theory of once having an inventory and then having your additions, and after that, if the conditions change—

Q. (Interrupting.) Then, as I understand you, your whole exhibit it is an exhibit that is not in any sense final?

A. Well, it couldn't be. I suppose it will be after you let

1943 me have your books.

Q. Now, on page 2 of your Exhibit?

A. (Interrupting.) That is no Exhibit. I put that in there to give you something to shoot at.

Q. It was introduced in evidence.

Mr. Howard: I introduced it in there as illustrative.

A. I wrote that for you, Judge Howard, not necessarily for the case, and for the Judge, if he wants it.

Mr. Howard: As illustrative of the way that he would handle the property but necessarily inaccurate because you haven't furnished information that you say you will furnish.

A. (continued). How in the world could a man come down here, reach here Thursday and come in here in a few days with all the details in this case? Passed through Houston at high speed, it is very evident—

Q. (Interrupting.) 1 think it is very evident,-very evident that

you made these figures on high speed.

Mr. Howard: Just so you don't mislead yourself, if you are honest about it, and so that our minds will meet, this was put in here as an ordinary exhibit of the way Mr. Kelsey claims these propositions

should be handled. First, the matter of valuation. He takes your inventory of 1914, and adds your additions since that

time as his method of valuing the plant, as a very proper method of getting at what your real investment is. Then in regard to your receipts, he illustrates just how he would handle the question of your long distance tolls, and which he will complete when he get the books that will bear upon that question. That is the next principal thing that he brings in issue with you upon. The next thing is the matter of Depreciation Reserve. Those are the things which he has upon the \$11.00 per station instead of upon your percentage basis. Now, this illustrates his contention and shows you will notice, at the bottom of the paper, that you call the Exhibit he has stated there "Total Local Property Value" which in the light of his testimony indicates that he means it largely as an investment, but that owing to your receipts you can understand that.

Mr. D. A. Frank: I de understand it now, but I did not under-

stand it until the witness told me.

Mr. Howard: Now, he intends to add to these Local Property Values here, inasmuch as he says the tolls should be handled in the manner he has indicated, the total tolls chargeable to Houston, and that illustrates the method of arriving at the final result, which is

inaccurate and temporary only. Another thing that is subject to change there is that $4\frac{1}{2}\%$ that he says you are not entitled to, but which he has allowed. Now, that is all those figures indicate. They illustrate the proposition but it is necessary, before they can be checked and the final computations made, that he should have this information which you have promised to give him.

Mr. D. A. Frank: The words "inaccurate, temporary and illustrative" were not used with reference to these figures until after this witness had been on the stand a day and a half.

Mr. Howard: I thought you grasped that.

Mr. D. A. Frank: We have urged the objection to all this testimony on the ground that it is purely hearsay and based on assumption.

(By Mr. D. A. Frank:)

Q. Mr. Kelsey, at the bottom of page two of this exhibit you say item—the depreciable figure allowable to the Houston district, it covers both local and toll conditions chargeable to Houston—it is \$146,-120.00. Now, I don't care to go over that because you have explained how you arrived at it here; that is, you take \$11.00 per station and take out maintenance and it left this figure.

A. Take out maintenance—take out all maintenance and I would find that you show more. You just read in the record the reconstruction figures, that I overlooked, and I am going to put in there—it is deferred maintenance,—present maintenance.

nance and deferred maintenance are all the same.

Q. The Interstate Commerce Commission makes us call it depreciation.

A. It don't make any difference; it is maintenance in one case

and deferred maintenance in the other case.

Q. Now, Mr. Kelsey, this figure of depreciation here is intended by you to cover all the depreciation that will take place in the city of Houston and on the portion of the long distance lines that you intend to allocate to Houston?

A. The reserve part; that has nothing to do with reconstruction

that is going on; you have got to charge that it.

Q. Now, Mr. Kelsey, that figure would have been the same if this had not been owned by the same company,—that is, the long distance business, had not been owned by the same company, wouldn't it?

A. Not necessarily.

Q. Wouldn't it have been the same?

A. Not necessarily, because the maintenance figures wouldn't have been the same,—you have got a charge right here for maintaining the toll lines—I know you don't think you have, but when I get your books I will find out how you have got the operators here charges to Houston. That's what I want your books for, Mr. Frank. I think your books are wonderful, but I want to see them.

Q. You had in mind this, without having a sufficient 1947 amount to cover this depreciation in this city and all long

distance lines?

A. (Interrupting.) Yes, and applied to the company as a whole.

Q. But you don't know how much the total is going to add?

A. I don't know, but I hope to spend the first day at Dallas trying to find out. I know what was found in the Birmingham case.

Q. Mr. Kelsey, in the city of Dallas, the property is now owned by the Dallas Telephone Company-it does not own any long distance

A. (Interrupting.) Who is the Telephone Company?

Q. Well, it's probably owned in proportion of the stockholders of the original company by the independent company and the Southwestern Telephone & Telegraph Company.

A. I didn't know that there was such a company in existence.

Q. Now, that company has no long distance lines so that in making a computation of this account you couldn't allocate any part of the long distance lines to it, could you?

A. Well, you are not charged with any, yet, Mr. Frank. Q. Now, under your system of setting aside \$11.00 per station you would set aside \$11.00 per station at Dallas just the same as in Houston?

A. Yes, and give you the differ .ce between the actual cost of

maintaining that plant and that amount.

Q. And that would be just enough to maintain it and replace it at the proper time?

A. Yes, and always have money. Q. On Page 4 of your statement, referring to the Keystone 1948 Company that pride-

That's chestnuts. A. (Interrupting.)

Q. —that pride of your life, you say that last year the company decided to change to automatic telephone service and it is a matter of interest to say that the company has enough reserve money to pay all charges and have some left.

A. Even a new plant.

Q. Now, Mr. Kelsey, please give us your authority for that state-

ment.

A. You can get that by getting Mr. Stockwell here as a witness in this case and ask him. It is a matter of common knowledge in the telephone business, and in discussion among telephone men, among manufacturers and my clients, that the Keystone was a very unusual concern that could pay its bills.

Q. When you say that company had enough reserve money to pay all charges and have some left over, it is a matter of common knowl-

edge, you say?

A. I mean that, just as I expressed it, exactly.

Q. But, Mr. Kelsey, you have made the statement here, and it is supposed to be sworn to; do you know whether or not it is true?

A. Why, have I committed perjury here? I hope I get out of Texas sometime—before I get 20 years.

Q. I asked you if you know.

A. I told you, and have just said what I know about it. 1949 Q. How much did they have in their reserve for depreciation?

A. I don't know.

Q. How many stations have they?

A. I don't know.

Q. You stated between thirty and forty thousand?

A. I think that's all.

Q. And you say it takes \$60.00 per station?

A. Get Mr. Stockwell, of the Keystone Telephone Company, in this case, and he will supply all missing links in this proposition. If I had known I was to be in this case I might have stopped in Philadelphia a few weeks ago and read up on it.

Q. You haven't seen the books at all?

A. No, it would take a Court order for me to see them-I am only a minority stockholder.

Q. And still you make the statement?

A. From common knowledge among men in the telephone business.

Q. Although it cost a million eight hundred thousand.

A. I think it is a matter of common knowledge among manufacturers - each company-the manufacturers want to know about the credit of each company, some companies are rated good, and some bad, and the Keystone is the best A-1 risk in the business, because they have got the money.

Q. Suppose your statement is accurate and they have just got enough in the reserve to take care of the switchboard and change it

to automatic, and there would be a difference between the actual amount and the amount replaced—if they should happen to have to take down some poles and lines after they had exhausted the fund where would they get the money?

A. Borrow the money, charge it to reserve and pay for it.

Q. Your idea is-

A. (Interrupting.) Sometimes the reserve fund is empty and you create some indebtedness; you never keep the height of the reserves

Q. Your idea is to borrow the money and then amortize it?
A. That is pretty safe as long as conditions are as good as they

are here in Houston.

Q. On top of page 5 you have this statement: "But the company has claimed a loss of \$1,274,249.00 for the past four years and has specially asked for \$359,999.00 for 1919." Where did you get that?

A. Apparently from your own figures. Q. Is that on these figures used here? Who gave you these figures and what do they mean?

A. I guess the city engineer gave me these figures and you gave them to him.

Q. Mr. Lyndon gave them to you?

A. Yes, sir.

Mr. D. A. Frank: I think that's all I have. Just a minute.

1951 (By Mr. D. A. Frank:)

Q. I want to ask you one more question about the automatic. What would be your estimate as to when the automatic switchboard ought to be put in?

A. As soon as you can get it.

Q. On what ground?

A. \$16.00 operating charges only; it ought to worry you more that it does the city.

Q. I suppose it does.
A. I know it does.

Q. What does the automatic save?

A. Saves operatives.

Q. Does it cost more to install in the beginning?

A. Why I think so.

Q. Does it cost more to maintain it?

A. Not necessarily.

Q. Now, Mr. Kelsey, you have testified that it does, haven't you?

A. No.

- Q. Haven't you ever testified that it costs more to maintain it?
- A. Get the goods on me, I will be glad to know. I will be glad to have anything in my past life exposed. I haven't done anything—haven't even deserted a wife in Russia, as you pulled on a witness a short time ago.

Mr. Duls: What case is that?

A. Mr. Russell's. I might state incidentally it was dis-1952 covered that it was the witness' second union, and the poor expert left a wife in Russia,—Mr. Duls was there. I still love my wife, and I want that in the record, too.

Q. But it is a fact, however, Mr. Kelsey, that an automatic switchboard requires more attention and more money to maintain it than

a manual switchboard?

- A. No, that isn't true, Mr. Frank. We could easily demonstrate that by the suit of the Citizens Telephone Company of Grand Rapids, with something like 20,000 telephones. The Bell Company put it into Norfolk, Virginia, and we will soon have some of their records on the cost.
- Q. Mr. Kelsey, to refresh your memory about what you say about the automatic switchboard?

A. What was the date of that?

Q. I recall to you that in the Enid case in i 36-

A. We had no automatics then to amount to anything. The automatic was experimental and fighting against every odd.

Q. Well, well wasn't it actually installed in about 40 places there?

A. Good Heavens! You can't any more compare the automatics of today with the automatics of that Enid case than you could compare the battleship of the main line of today with one of the Spanish War. They went through an awful struggle,—now be fair.

Q. I am going to be perfectly fair with you, but do you say that

you did not have a good opinion of them at that time?

A. A rotten opinion of them at that time.

Q. Didn't you at that time say that you wouldn't, if you installed a switchboard of 2,000 put in anything else?

A. Not intentionally. If I said that I ought to have been

discharged,-canned.

Q. (Reading:) "Q. Were they to perfect this automatic switchboard, you would save above the operating expense to install it, would you not? A. I will have to differ. I analyzed every Automatic Telephone in existence and I have not saved a five-cent piece. Q. Then the Automatic System up to the present time had not reached perfection—that telephone companies can afford to install it at this time. A. Automatic systems will affect the girls. Your girls are about one-fifth the total expense and run from \$2.00 to \$5.00 per station. You may save on your girls, but you lose on the first installation. Q. You are dealing with Automatic as it is now being tried? A. Yes, sir. Q. How many places? A. About forty. Q. What places? A. Grand Rapids; San Francisco; Los Angeles; Sioux City, Iowa; Portland, Maine; Decatur."

A. Los Angeles and San Francisco and Decatur have disappeared

by the Bell.

Q. (Reading:) "Q. How long have these automatic systems been installed? A. About four years, probably five years. Q. As a matter of fact, they are not proving a success, are they? A. I reached the stage of engineering, that if I were going to install anything above 2,000 station, I would not put in anything else."

A. Well, what has that got to do with that per cent?

Q. (Reading:) "Q. You are aware of the fact that these Exchanges that now have them installed are trying to get rid of them? A. No, sir, they are very well satisfied. Q. If there is such a report current, it is without foundation? A. In my experience, Sioux City is well satisfied and Portland is well pleased."

A. Sioux City is very ready to do it over, Mr. Frank.

Q. (Reading:) "Q. When they have this automatic system in operation, they have no operating girls? A. They have to have a few. You can not eliminate the one-fifth entirely. You have to have a few information girls. Q. So far as the practical operation of the Exchange you don't need any girls? A. Not in city work. Q. The elimination of that expense today you say is counter-balanced to some extent by the maintenance account? A. Tolls and additional service, plus interest on additional investment. You have two items, Q. What are the elements of additional cost in these various switchboards, I mean from the manufacturers standpoint?" And then the rest is not responsive.

A. All right, at that time your maintenances was just about what it is today. It costs from \$2.00 to \$5.00 to hire girls per station.

Q. Girls don't maintain the switchboard?

A. I am not talking about your maintenance being about the same, but the cost of the girls has mounted up to such a point that that has made all the difference in the world. It must be 1955 valuable because the Bell Company has set out to buy—

(By Mr. Howard, interrupting:)

Q. What proportion does the traffic bear to the maintenance in this plant?

A. The traffic expense of this plant is three times what the main-

tenance expenses are. They used to be even.

Q. I just want to ask you a few questions on that. The traffic is now three times the maintenance?

A. It is now; \$16.00 as opposed to \$5.38. It has gotten clearly

out of proportion.

Q. The traffic is largely made by operating?

A. Oh, yes, that is the big bill.

Q. Roughly, what proportion would the operating bear to the traffic?

A. About 80%.

Q. What extent would the installation of the automatic reduce the operators?

A. Why in this town is absolutely and practically wiped them out

Q. There would have to be some operators?

A. Well, information operators and things of that kind, to take care of information, but since it has been rebuilt and developed it does not require-

Q. (Interrup-ing.) It would reduce the operators 75%, con-

servatively speaking?

Yes, easy, but the maintenance of the Automatic Sys-1956 tem today is no greater than the maintenance of a common battery switchboard. Why, they have made battery systems,-the Automatic Systems, made today do not any more resemble the ones-

Q. (Interrupting.) The more they perfected the systems, why

that would bear directly on the cost of maintenance?

A. Yes, absolutely true.

Q. Now, Mr. Kelsey, those are about the only methods we want to go into with you at this time. Now, I understand that you will procure these books that they promised to let you have this informa-tion, that will relate to the handling of these long distance tolls, and to the apportioning of a certain part of the long distance tolls?

A. The pro rate, the actual reconstruction cost of the Houston

Exchange back as far as 1900 anyway.

Q. Then you will check the figures on the basis of 1919 of the 1919 revenue, allowing for the increased rate that was put in in 1919?

A. Well, I can begin the study of it, just as soon as they turn over to me their 1920 report, that is their January report which is due on January 20th, and then that bears directly on the five and two I haven't arrived at any conclusion yet about this rate being too high or too low. I may decide that this rate ought to be raised considerably, I don't know, yet.

Q. But you will take into consideration revenues as they

actually occur?

1957

A. Oh, as they actually exist.

Q. As they actually exist and which may not be accurately set up

in this little statement?

A. I don't think it is fair to take any 1919 statements in connection with Houston, when the Company has this January report. which is a typical month, and I can almost create the skeleton, or we can go back four months to where this began and create a five months period.

Q. Back to the period when it went out of Government control?

A. Yes.
Q. Then you can make a study of whatever the cost of establishing business was from their books, and from their records?

· A. Oh, sure, I want the copy of their report to the city on re-

production new.

Q. Then you have adopted the value of 1914 plus additions?

A. Yes.

Q. And then plus stores and supplies and their working capital, if they are entitled to any, and any intangibles that they are entitled to?

A. Subject to depreciation, Judge.

Cross-examination.

1958 (Questions by Mr. D. A. Frank:)

Q. Mr. Kelsey, the automatic switchboard is much more intricate than the manual switchboard?

A. Not now, it is really a beautiful thing.

Q. Is it simpler? A. I think it is.

(By Mr. Frank:)

Q. Well, while we are on the 41/2% that reminds me. After you finished testifying in the Cleveland case and they criticized the 41/2%, did you hear the Chairman of the Board say that he had already investigated it, and it was correct?

A. And he said the matter of the contract didn't concern them.

Q. Is that what he said?

A. Yes, that is my interpretation of it. I am not disputing the 41/2%. I didn't in that case.

Q. Where do you dispute it at all?

A. Why no, I am going to present a proposition on that 41/2%. It is no dispute.

Q. You know that the Ohio Commission remarked at the time

that it approved it?

A. Say, when the Ohio Commission has a young man that has been raised with the Bell Telephone Company, they are liable to approve it.

1959 J. C. Kelsey, a witness for defendant, was recalled and testified as follows:

Direct examination.

(Questions by Mr. W. J. Howard:)

When I was here some weeks ago and testified, I submitted what I called a tentative statement, with the statement that I would get further data from the Company and put in a final or corrected statement. Since that time I have received no further information from the company, or from the Company's books, except that I got while in Dallas. I made an inspection in Dallas the day after leaving here. I had access to the Company's Balance Sheet, Income and Expenses for the Company as a whole.

I did not get the inventory of 1914. With reference to the effort I made to get that, I asked for it, but I haven't seen it yet. I asked Mr. Frank for it, I think, or Mr. Gates, someone. We talked a great deal about that reproduction value in 1914. I tried to get it, but I haven't got it yet. The answer, or information that I got in regard to it was that I would get it, sometime, I guess, but I have

not seen it yet. I have not received any satisfaction par-1960 ticularly with reference to it; they said that somebody had it, it, at least, wasn't there, when I was. It wasn't accessible at the time. They did not furnish it, and have not furnished it as yet.

Mr. Howard: Now, Your Honor, we introduce here in evidence a paper. We introduce this copy and you gentlemen can use that. We just hand it to the stenographer and let him identify it, it will be Kelsey's Exhibit No. 2.

(The paper referred to was marked "Kelsey's Exhibit No. 2," and is transmitted herewith in the exhibit file.)

Q. At the bottom of Page I, Mr. Kelsey, of this exhibit, you check up here what purports to be the value of this property and you say on the top line of that subject "Reproduction Value, 1914 (company figures)." As I understand it, it was the 1914 inventory showing these figures that you sought from the company and was unable to get?

A. Yes.

Q. Then how did you arrive at this figure of \$2,672,211.00?

A. From Mr. Lyndon's report here on the company's figures.

Mr. D. A. Frank: If Your Honor please, at this time I want to renew the objection that I made at the start of this and incidentally will say that it is entirely new to me, that this witness has 1961 ever made any demands for any 1914 inventory. In fact, I don't know of any such inventory, but I do know positively that he made no demand on me for any such inventory.

Mr. J. D. Frank: He made none on me.

Mr. D. A. Frank: I want to renew my objection to any hearsay testimony based on Mr. Lyndon's figures and this testimony has been shown to be incorrect and he is proceeding eith it, assuming

some figures. I imagine Your Honor will want to rule some way that we want to reserve our exception to the testimony based on it as we think it is entirely useless.

The Master: This Lyndon estimate, I don't recall just exactly

what the testimony was.

Mr. Howard: It showed that he furnished them figures that were made from this statement, from their own figures on their inventory valuations made in 1914, upon an inventory of reproduction cost showing the property to be worth this much money and Mr. Kelsey's testimony is that he accepted those figures as company figures, having tried to get the inventory of 1914 and not having been successful,

The Master: I am going to over-rule your objection all right, but I want to know: Your contention is that the inventory was erroneous

testimony.

I haven't seen the inventory. I don't know anything about inventory. I haven't seen the inventory. I don't know exactly what he is talking about, and I don't think the witness does, but my objection to it is, for the very good reason, that on the witness' own statement, it is pure hearsay. He is merely taking a statement handed to him by Mr. Lyndon, that on the face of it, is wrong.

Mr. Howard: It is not necessarily hearsay, Your Honor, because Lyndon testified that these figures were furnished him by the Com-

pany, himself.

Mr. D. A. Frank: Lyndon has not testified to that. The Master: I will give you your bill on it, Mr. Frank. Mr. D. A. Frank: Yes, the assumption is meaningless.

As shown by this exhibit or statement, I accepted a reproduction value based upon Company figures as of the year 1914, amounting to \$2,276,211.00; the total value of the property at that time.

Mr. D. A. Frank: I object to the question because it is leading and because it clearly draws a conclusion of this witness on an erroneous assumption as to how valuations can be arrived at.

Mr. Howard: He stated how, Your Honor.

that your Honor is going to be mislead by the statement that this is a valuation, but at the same time I don't believe we ought to concede even when Mr. Howard asks the question, if valuations can be arrived at by taking some figures that were prepared six or seven years ago and adding certain additions to it, calling it a valuation, and I have merely stated that, more to get the matter before Your Honor than for anything else.

Mr. Howard: You are proving what the reproduction value was

in 1914.

Mr. D. A. Frank: I say we have not.

(Mr. Kelsey:) I say this was the value at that time as arrived at by that method. It seems that at one time in the history of the company there was an inventory taken. The public utility law is

Mr. D. A. Frank: I object to this witness stating what the public utility law is. I think he ought to just answer the question.

The Master: I think you should just state the facts.

In that manner I arrived at the inventory, at the cost price, at the cost of reproducing the property at that time, in 1914.

1964 With reference as to what else from my investigation enters into the value of this property since that time, we merely take a record of the actual money put into the Plant. I got that from the same report, Mr. Lyndon's. I didn't have time to go into these things. It wasn't understood that I was. Mr. Lyndon heard all this.

Those things things are all subject to being refuted by the company's books; they are a matter of record. I have added to the reproduction value of 1914, the additions to the plant since that time. Those additions, as shown by my statement, which purports to be taken from the company's books, amounts to \$1,374,560.00,

up to December 31st, 1919.

In adopting that method of taking the reproduction value of 1914, and adding to it the additions to capital and plant since that date, I arrived at \$12,046,771.00 as the present value of the property, local, as of date December 31st, 1919.

Under subdivision 4 of that heading, I have an item of "Toll

Investments Chargeable to Houston," of \$808,621.00.

Q. How did you arrive at that amount of \$808,621.00?

Mr. D. A. Frank: Wait just a minute. Now I want to add to my former objection at this time, to the consideration of 1965 any toll property at all for anything else in connection with toll, other than a bare statement of expenses and income in the City of Houston, for the reason that Your Honor has no jurisdiction to pass upon property outside of Houston. It is not involved in this case. The whole theory of taking a portion of the toll plant of this State and allocating it to the City of Houston, is wrong. As stated heretofore, if you go ahead on this witness' theory, what you obtain when you get through is the valuation of the plant in Houston, plus a percentage of the toll plant of the entire State and then take the expenses and revenues for the City of Houston on the local exchange plant, plus a proportion of the revenues and expenses of the toll plant of the entire State, and I guess when you got through you would have a nondescript, you would not have the thing that Your Honor is trying. Now it is futile to proceed with that testimony and have this witness on the stand for two or three days on cross examination on the theory that Your Honor is not going to follow. I can't conceive of a sound thinking, thorough minded Court proceeding on the theory that Kelsey is attempting to put over in this case. What Your Honor is trying here is not the value of the toll plant in the State of Texas, but what Your Honor is trying here is whether or not the property in the City of Houston is being con-

fiscated. Now, if Your Honor wants to go further or wants to listen to it, or think that time will be saved by listening to the testimony, of course, that is Your Honor's own affair,

but I prefer at this time to raise the objection so that Your Honor

will see the position we take.

Mr. Howard: Of course, Your Honor, these objections are not made with the idea that any positions will be sustained, but are made for the purpose of arguing the case, instead of arguing it at the case, instead of arguing it at the end of the trial.

The Court: Just a minute. I will over-rule objections at this

time.

Mr. D. A. Frank: Note our exceptions.

Mr. Howard (continuing): With the idea though Your Honor, of following this theory, he makes this assertion to the Court and brands it as something we are tying to put over, and something that is for the purpose of misleading the Court. I don't think the Court is going to be mislead even though I tried to.

Mr. D. A. Frank: I didn't use the word "mislead" at all.

Mr. Howard: But this is a sound theory and we have no doubt that it is one that is the key of what might be called the mystery of going along in the red all the time, and not making money.

Mr. D. A. Frank: I think, Your Honor has ruled on the question.

Mr. Howard: I wanted the Court, if you can do it, to get the relation upon which we are proceeding. Now, he made the suggestion that you have no jurisdiction or power over property outside of the City; that might be admitted to be true, but this is an equity case, whereby they are seeking the applicable rating. Now, they have property here in this Exchange that they come here and try to make the Court believe is very limited in its earnings, that the revenue derived from it is small, that it amounts to something over \$400,000.00, by the way of local tolls from subscribers. Now, that is not a fact. The fact is that they are originating here this property and earning here \$441,000.00 tolls, that is nearly double the amount that they say should be looked upon as revenues.

Mr. D. A. Frank: Four times as much, Mr. Howard.

Mr. Howard: Four times as much as what?

Mr. D. A. Frank: Four times as much as we allocate.

1968 Mr. Howard: I was not talking about that. I am talking about it was just as much again more than you say your entire earnings in your local exchange were. You earned about \$800,-000.00, in your local exchange and about \$400,000 is all the local exchange is given credit for. Now, as Mr. Frank well put it, this is a question of confiscation; that is what Your Honor is concerned with. Now, when is the line of confiscation going to be reached? They have a property here they say, is worth a great many thousands of dollars and if you won't let us earn more than that, you are confiscating our property. But we tell them, your property is engaged in other enterprises, you haven't got this property here that is limited to the use of this local exchange, but this property is bringing into your treasury another \$441,000.00. Now, you can take it either way you want, you can either add to this property here, the fair part of the total property and put it in as this valuation. In other words, it can be done that way. Or, the value of the property useful and used for the local exchange here could be reduced accordingly because they can't say, 'we have got a property here that is serving a twofold purpose and while it is true our revenue out of this alone is only \$800,000,00, and you are therefore confusing it.' If they had by products or another source of revenue that is derived from this property, it has got to be a fair adjustment of the other. You can either add to the property and make it pay a return here or the value of the

property should be reduced in proportion of the amount of 1969 They can't have this property here bringing them the tolls. in big revenues outside of the local Exchange and at the same time limit or say our earnings are limited to this Local Exchange, or hand this Company here the very insignificant part of the earnings and say you must be satisfied with that. Now, Your Honor, will understand that all these expenses are allocated to these exchanges so that the effect of this, the way this thing is operated, they have all these different exchanges over the State and they allocate these Exchanges the prorata part of the expense of operating all these toll lines. Now, that expense is taken care of by all these different exchanges and there is twenty-five per cent taken out of the earnings of the initiating calls and the result is that they have seventy five per cent of these tolls free from any burdens of operations whatever, but absolutely in the language of A. Baker, ("pure velvet") that goes to the Treasury of this Company.

Mr. D. A. Frank: Of course, there isn't a particle of evidence to

that effect.

Mr. Howard: Now, that is true, there is property invested between these different points but the operating expense is all allocated to the Exchanges, Local Exchanges so we say to you that to make it fair, a fair an equitable return so these people are not losing their money we say, that is all right as to these local exchanges the apportionment of the profits, that you are charging them and make near a fair return.

An Independent Company, in getting its supplies does not have to have some Purchasing Agent to purchase on a percentage basis for it; they are all in the open market; they buy direct from the Western Electric Company, the same as the Bell Companies do. They have had Western Electric Company Salesmen standing in line asking for their orders for years and years.

The Independent Telephone buyer has a big, powerful purchasing agent for it, but he gets his stuff from the Western Electric Com-

pany, at market prices, and he needs nobody.

Q. Welî, is the same benefit to be derived from this four and a half per cent upon purchases by the Western Electric Company for these associated companies, these American Telephone and Telegraph Companies?

A. You mean they get a better price?

Q. Yes.

A. They claim they do. I don't know that they do. I know when the Western Electric whipped us in competition, their prices have been absurdly low. The first switchboard job they ever took

away from me was in Columbia, Missouri, and then we fought all along the line. Probably sixteen switchboards they took away from They went into the game with only a top cost. They had an

idea there wouldn't be any selling cost connected with the Western Electric Company, but they found out it took three 1971

hundred salesmen to sell their goods as against our seventyfive or eighty and they finally quit, but they are still in the open market and they sell a man anything and they go out and buy it for him, if he can't get it. They are the most accommodating concern in the world. If I was a customer I would rather deal with the Western Electric Company than deal with my own Kellog Com-. pany, because they do more for them than I do.

Mr. D. A. Frank: I thank you for your kind words for the Western Electric Company.

A. (Continuing:) Well, I owned stock in them and lost money in the investment, too.

Cross-examintion.

(Questions by Mr. D. A. Frank:)

Q. You went off and did just what I said you were going to do when you were here before in finding a valuation or the proportionate part of the valuation of the toll property allocated to Houston, didn't you?

A. No.

Q. You did not?

A. No, you tried to find out what I was going to do, you 1972 know and you didn't.

Q. I told you that there were four different ways you could allocate the toll property in the city?

A. Oh, no.

Q. To the local exchange?

A. North, south, east and west?

Q. Well, you can call it North, South, East and West, but one of them was the total revenue of Houston compared to the total revenue of the Company; another was the total at Houston compared to the total plant of the Company, and another was the total plant at Houston to the total exchange plant of the company, and another was the expenses at Houston compared with the total expenses of the Company and I pointed out to you that it would make a difference which basis you used and that necessarily some would be higher and I asked you the question, if you were going to take the lowest percentage that was shown by those figures, didn't I? Didn't I ask you that?

A. Well, I suppose you asked me that. You probably did. I

don't remember.

I didn't have any idea at that time: I hadn't studied it,-which one I was going to use. I used nine and four tenths per cent, which shows in that third page there.

Q. Now, I have had an estimate made myself to see what

these figures would show and the total revenue at Houston compared with the total revenue of the Company is nine and four tenths per cent; the expenses at Houston compared with the total expense of the company is ten and eighty-five one hundredths per cent; the plant at Houston compared with the total plant of the company is fourteen and eight one hundredths per cent and the plant at Houston compared to the total exchange plant of the company is twenty and fifty nine one hundredths per cent, and I notice that you selected the lowest percentage.

A. Oh because the others had nothing to do with the case. Q. Because the others had nothing to do with the case?

A. Yes, because here the amount of hours and the time used on these lines are the only basis.

Q. Are you acquainted with what your answer was, before you

went away from here and got your figures up?

A. Well, I wanted to leave something for you to think about until I met you again.

Q. I have been thinking for quite a while.

A. So have I.

Q. And I just wondered ahead of time why you selected the lowest figure.

1974 A. I don't know, I didn't know you were as foxy as that. You Bell attorneys have a wonderful memory to remember things that never happen sometimes.

Q. Do you say that that is not true-A. I have gone into the proposition-

A. Everyone of those figures, I rejected as not being the proper basis. Houston people don't use those lines as much as other people, why should they pay for it?
Q. Why, didn't you tell us that before? I asked you then on

what basis you allocated it.

A. Well, I didn't tell you Mr. Frank, because-

Q. (Interrupting.) The reason you didn't tell me was because you didn't have to tell me?

A. Probably that, and then if I had-

Q. If you had found out it was twenty and fifty-nine one hundredths per cent instead of nine and four tenths per cent, you would have used it just the same?

A. I told Judge Howard when I was here before, I said it all de-

pends on what that figures.

My objection to taking the entire exchange plant in the State and allocating your toll on the basis on the propor-

tionate part of your plant is because that is not the unit that The unit you use is the time you use the lines. There is nothing to do with so many feet of underground, and so many vards of cable here; there is only one unit. You have got to deal in the hours that you use the lines. Supposing that, the time that you use the lines in Houston this year, happens to be 9 per cent and next year happens to be twenty per cent and then you get the twenty. Your local rate absolutely ought to change. Some years my business loses money and some years it doesn't. You apparently want profit all the time. If it is twenty you get it. If the Local Exchange plant of Houston is twenty per cent of the local exchange plant of the company, it means that the city of Houston has one fifth of the plant of the State.

Q. Doesn't it? Now, if it has one fifth of the local exchange plants and you allocate only-less than one tenth of the toll property to the local exchange, then you have taken one tenth of the property

and allocated it to other exchanges, haven't you?

A. No, you have got nothing to do with that. I haven't considered that proposition at all. It may have been that if Houston did not use any long distance business at all, they wouldn't have

1976 had anything to pay for.

You have got my theory there; it is the use of the lines. I could not tell that until I found out what percentage it was going to be; I can prove it by the Judge that we rise and fall on that proposition. I told him that that afternoon when we went over that proposition and I was most curious to find out that when I got to Dallas. I was amazed by your earning power on these tolls. I went into this thing, took my chances, if you get twenty, you are entitled to twenty. There is only one way to make a dozen eggs and that is by the number. You can't go and measure them by the box car or by the hen you have got in the copp.

The total figure of \$4,855,392.00 at the bottom of page 1 of my exhibit is just your investment that you are entitled to earn on in the vicinity of Houston; that is what you are entitled to earn on in Houston. I think that without that \$800,000.00 it is an excellent

value of your property what it cost you.

Q. I didn't ask you about cost, I am asking you about the fair value of it.

A. Well, you and I will have to agree on what "fair" value means, then.

1977 Q. Well, just tell us what you think the value of a piece of property is.

A. Well, are you referring to public utilities and public-the houses and lots?

Q. Anything, I don't care what.

A. The value of a property for rate making purposes is the money you put in it, and you are entitled to a return on the money invested.

In the case of a public utility, my idea of the fair value of a piece of property is the investment that you put in it. If I were employed to come here by the City and value the piece of property in Houston, I think that the figures which I found here are remarkably near right. I have been going over property for sixteen years and I don't think we are doing you any injustice by those figures. As to where I got my reproduction value of 1914,—company figures, I think we brought that out pretty well last time. Mr. Lyndon, the City Expert, and the Company furnished him those figures and

I asked for them, and I couldn't get them. I think I did look at

Mr. Lyndon's 1914 report.

With reference to what the figure \$2,672,211.00 covers, we identified that at one time; I don't remember now I think there was something left out, cost of the product of business, as you claimed it, was left out. You never have fixed a cost in this town, you know.

Q. So that the figures that you have here of \$2,672,211.00 that

you start with, is not a complete valuation of the plant?

A. Yes, that suits me, that is where I start.

Q. Mr. Kelsey, do you know that the figures that you start with were merely the figures for the physical telephone plant for the city of Houston?

A. Plus some little charges there.

Q. Do you know that it wasn't plus any charges at all?

- A. I think Mr. Lyndon came up here and sat in the chair and explained that, that it took into account everything you had except this fictitious cost of establishing the business, which this company
- never had.

 Q. Did you know that Mr. Lyndon made a report in 1914, in which he uses this language: "And the proper appraisal value of the Houston properties of The Southwestern Telephone and Telegraph Company is \$3,372,657.00 of which \$552,111.00 is an intangible value set up under the title 'Cost of Establishing Business,'

Now did you know that?

A. What I wanted was for you to give me the figures which you

agreed to do.

1979 Q. Well, those are the figures I am giving to you now.

A. Well, all those figures, I don't care whether it is \$650,-000.00 or \$1.650.000.00—

Mr. Howard: Mr. Frank, Mr. Kelsey doesn't claim to have gone over these figures and he has accepted them from the Lyndon report and from information that he has gotten from Mr. Lyndon. Now, Mr. Lyndon will be here, I expect him here Friday morning, and anything in that report and how he got at those figures, if he can't sustain them, why that voids that part of Mr. Kelsey's testimony because he has accepted an analysis of those figures.

Mr. D. A. Frank: But Mr. Kelsey has written down in plain letters on the first page of his Exhibit "Reproduction value, 1914 (company figures) \$2,672,211.00." Haven't you, Mr. Kelsey?

A. Those are all company figures, every one of them.

Q. Company figures?

A. Yes.

Q. Do you know that? There was miscellaneous property amounting to \$64,789.00?

A. I think that that is included in there.

Q. It is not included. Did you know there was working capital of \$73,555.00?

A. My impression is, that is in there.

1980 Q. It is not in there, I assure you. And that the cost of establishing business was \$552,111.00?

A. You don't call that cost, you call that good will too, don't

you, or growing value?

Q. It is cost of establishing business.

A. Growing value corresponds with it. It is a fictitious value.

You never had any cost of establishing business in Houston.

Q. I am not arguing with you, Mr. Kelsey. The total appraisal made August 1st, 1914, if you are going to use the Company's figures, would be \$3,372,657.00. So that your figures ought to be changed, oughtn't they, Mr. Kelsey?

A. No, my figures suit me wonderfully well.

The Master: Give me that total you just read.

Mr. D. A. Frank: \$3,372,657.00.

Mr. Howard: What is that?

Mr. D. A. Frank: That appears on page 3, of Mr. Lyndon's 1914 report.

Mr. Howard: But he accounts for that in other ways; he gives

you a cut up there, doesn't he?

The Witness: We identified this set up in the last hearing. Mr.

Lyndon came on the stand and identified it.

1981 Mr. Howard: All that, Your Honor, is a matter that is up to Mr. Lyndon. Now, Mr. Kelsey has largely accepted them from Mr. Lyndon's statements to him. Now, if Mr. Lyndon can't sustain them, Mr. Frank is right about it, but Mr. Kelsey, in the mean—

The Witness: I asked for those figures.

Q. Whom did you ask for them?

A. You.

Q. When did you ask me for them?

A. On the train. That's a habit you Bell lawyers have and its a bad one.

Q. Mr. Kelsey, I hate to dispute your word, but if you made any

such statement as that, I never heard it.

A. Look here, I never had that habit of repeating private conversations, but you said if those things didn't come to write you, or wire you.

Q. You didn't ask me, you might have asked Mr. Gates.

A. I don't think I ought to repeat that, I hate to introduce a miserable, contemptible thing like that. When the time came, I didn't get it.

Q. You were told when you were on the stand before that miscellaneous property amounting to \$54,789.00 had been left off, weren't you?

A. Well, what is the use of guarreling over \$54,000,00? What else?

1982 Q. Working capital amounting to \$73,555.00.

A. I think that is in there, because Mr. Lyndon verified that.

Q. But Mr. Lyndon didn't have it.

A. He covered everything except the cost of establishing business or good will.

Q. There isn't a penny here for good will.

A. Cost of establishing business.

Q. There isn't a penny here for cost of establishing business.

A. There ought not to be.

Q. There ought not to be and we know that. We didn't put it If those items set out, your report ought to be changed.

A. No, I don't change the report. Mr. Lyndon came on the stand

and fastened the record and I abide by it.

Q. Well, do you agree with anybody that the reproduction cost

of a piece of property has anything to do with the value?

A. That is one of the factors leading to an approximation of its value.

Q. What is the reproduction cost of this property here?

A. Well, you have got it down here in your books, your idea of it, you have George Player's opinion and all these opinions as to what it is.

Q. Did you look at any of them?

A. Yes, but you took an inventory in 1914 and the public utility law says that after one inventory the amount of money put in the property shall be added and the expense of making another 1983 inventory shall never be incurred and charged to the public.

Q. What one says that?

A. No. all of them.

Q. Is there one in Houston says that?

A. No.

Q. What is the use of quoting what they say somewhere else?

A. You are always quoting them.

Q. Just name one place where that is the law.

A. Mr. Wilson spoke of that very thing in Columbus, when the proposition came up of taking a new inventory. He said, "Oh, that has been fixed."

Q. Name one of the places.

A. Cleveland, Ohio, was fixed in 1914, and what money added in there, goes in there under your wonderful system of bookkeeping.

Q. Does that have anything to do with a confiscation case in

Texas?

1984

A. Well, if this is a confiscation case, I wish my property was in such danger of confiscation as yours.

Q. Answer the question about confiscation. A. Yes, the cases are confiscation cases.

Q. I didn't ask you that; I asked you whether the laws of Cleveland controlled in Houston, Texas.

A. But you have State's rights, you fellows all have State's right-down here.

Q. State whether or not it does.

A. I don't know whether it does, but the general practice in about

forty States and when those States adopt the law-

Mr. Howard (interrupting): Don't you know that the reason the Court gives for adopting cost as value is because it is difficult to ascertain reproduction value and that once you take cost value, obtain it, the rule doesn't obtain for adopting reproduction cost.

A. (Interrupting:) You fellows had a lot of hard work and hard

luck in that inventory of 1914. That fixed the record.

Q. We are talking about Houston, Texas.

A. I am, too.

Q. Just tell me why the reproduction cost of 1914 has any place in the City of Houston-

A. (Interrupting:) You have got it here, you took the reasonable value and applied that to it.

Q. Have you used it here?

A. I accepted it. I checked over your figures.

Q. Now, Mr. Kelsev, I want to ask you something else, if you know. On the same page in Mr. Lyndon's report, in which he says that the Southwestern claims that its property was worth \$3,372,-667.00, at the top of the page, he says that he finds that the present

value of the Houston Home Telephone Company's property amounts to \$797,173.00, did you know that the valuation that Mr. Lyndon is talking about here is prior to the time that

these properties were put together?

A. Yes, and it is in this other addition. I said in my other testimony that if this City ever admitted any other telephone system that they ought to pay for it, and they ought to pay for it, but it is in there.

Q. Are you sure it is in there?

A. You fight that out with Mr. Lyndon. Q. You are taking the figures here?

A. Yes, and if it wasn't included in this figure, we would have some awful high costs in there-

The Witness: This extension money, \$1,374,000 resulted in a gain of four thousand telephones.

Q. Did you know, Mr. Kelsey, that in addition to the \$1,374,000 that there was something like \$750,000.00 that is charged on the books as an intangible item, which is the difference between what was paid for the Home Telephone branch and what was actually taken on the books?

A. If you expend \$1,374,000.00 during all these years and 1986 only gain four thousand telephones, somebody-it is unquestionably in there, something is in there, something abnormal

is in that figure.

Q. When did we gain four thousand telephones? A. During that period.

Q. Between what years?

A. About 1914, from twenty one thousand to twenty-six thousand five hundred, I think.

Q. From twenty-one thousand to twenty-six thousand five hundred?

A. Just think now, an additional telephone oughtn't to cost as much as a full fledged fundamental telephone.

Q. Even when you have consolidation?

A. Yes, but that is in there.

Q. Even when you have a consolidation, you say you ought to do it for less money?

A. Oh, the expense of the consolidation in this town wasn't enough

to bother you along that line?

Q. Do you know that it costs us nearly \$300,000.00 to consolidate?

A. You paid some awful prices for independent companies. I ought to put that in the record, if I could. You paid something that you didn't have to pay for it, it was a wreck, it was a ruin, and somebody got paid for something that they had no business to get a cent out of. Why didn't you let it die?

1987 Q. I think I remember you saying that is the way you expected to get some money out of Philadelphia by our paying

a foolish price for it?

A. Yes, you would pay a foolish price for it.

Q. Just by waiting a little longer, we could get it for less money?

A. You tried every method to kill them. Why not let it go.

If you paid that much for this concededly miserable dying plant here, you are a bunch of suckers.

Q. We paid \$1,300,000.00.

A. It was too much. Then the public ought to be protected from such folly. There ought to be somebody responsible in a case like this, to deliberately throw away the \$1,300,000 on a concededly broken down plant.

Q. Just now you said if we purchased independent properties and saved the public from having such competition, the public ought

to pay for it.

A. Ought to pay a reasonable consideration, not an extravagant amount. The public are heedless. They will all vote for a bond issue or vote for an additional thing without realizing what they are doing, they ought to be penalized, but you have no right to give them a penitentiary sentence, when you get right down to brass tacks, if you haven't got something to show for it, you have been gold bricked.

Q. But where we have actually paid \$1,300.000.00 and \$600,-000.00 has been added to our plant and the other \$700,-1988 000.00 carried as an intangible, at least you haven't got the

intangible in this figure, have you?

Mr. Howard: It is admitted that that \$700,000 is not in this statement. Now, what more explicit and definite statement can you get than that?

Mr. Kelsey: I won't admit it. It seems to me there is something

must be there.

Mr. Howard: He says you have got it in there

The Witness: If the last forty five hundred telephones since 1914, have cost \$300.00 a station, somebody——

Mr. Howard: Well, it might be that they have got something in there that they shouldn't have.

The Witness: I am inclined to think it is in there myself. Let Lyndon settle that.

Q. Mr. Lyndon testified on page 1864 of the record, when Mr. Howard asked him the question, "Q. Now, Mr. Lyndon, that included part of what was known as the Old Home Telephone Company in use? A. No, that was prior to the purchase of the old Home Telephone Company." So that these figures-

The inventory values did not include A. (Interrupting.) that, naturally, but the money paid in since, of course, con-1989

templated that proposition, every dollar you spent on it. Q. Mr. Howard has just made the statement to you, which is correct, that the figures which you have here of \$4,046,771 don't include anything for the intangible and don't include anything for the cost of establishing business.

Mr. Howard: I didn't say that, I said that they don't include all of the Home Telephone properties, all that is carried into it, is the actual property that was in use, and that about \$700,000.00 which was a loss upon this value, is probably not in there.

The Witness: What could be more absurd than having a cost to establish business, since 1914? What has it cost to establish busi-

ness?

Q. The 1914 figure which you have used contains nothing at all for the cost of establishing business. Do you believe in using anything at all for the cost of establishing business?

A. No, not in this case.

Q. Do you believe in using anything at all for desks and auto-· mobiles

A. Oh, that is in your furniture and fixtures.

Q. Well, the figure that you use for the physical telephone 1990 plant was \$2,672,211.00?

A. No, he had all those figures.

Q. Now, the miscellaneous property, in addition to that was \$64,000.00 and the working capital was \$73,000.00. Do you be lieve in having working capital?

A. Absolutely, you have to have working capital.

Q. That was the working capital in 1914. Would the same amount of working capital be sufficient now?

A. Oh, yes, you have only four thousand five hundred more telephones than you had then. You are collecting in advance.

Q. Don't need any more working capital than we had then and it would go just as far now as it would then?

You don't have to A. Well, so far as you are concerned, yes. pay the Western Electric Company until they call for your money.

Q. Now, Mr. Kelsey, you have taken \$808,621.00 and added to the local property, making a total of \$4,855,392.00?

A. Yes. Q. Now, your idea of that is that that is the company's investment in the City of Houston?

A. No, I think that is about what they are entitled to earn in and around Houston and ever if your company is not only a local concern but a long distance concern and a banker, as well, they are in the investment business along with other things.

very versatile concern but it is a burden that the City hadn't ought to carry. The citizens of this town ought to arry a burden of \$4,000,000.00, and if they re-imburse you on that basis,

they will do you no injustice.

Q. In what capacity are you speaking when you say it ought? Are you talking as an invester, a banker, a telephone expart, an officer of the City, or an officer of the telephone company, or in what capacity?

A. Mr. Frank, have mercy.

Q. Well, just answer the question.

A. Now, read that question.

Q. (The question was thereupon read to the witness.)

A. I would take chances on a composite of all of them. them up and-

Q. (Interrupting.) You will take chances on a composite of all

of them?

A. Yes, I will figure them and give you a nice drawing of what you ought to get.

Q. Now, Mr. Kelsey, your idea is that the first cost of reproducing this property is immaterial?

A. You haven't had any cost of reproducing this concern.

Q. Answer my question.

A. You have never lost any money in this town

Q. Just answer my question. A. What was your question?

Q. My question is that your idea is that the cost of reproduction of property at the present time is immaterial?

A. Why, absolutely, never was material in the life of this com-

pany.

1992

Q. Does it make any difference at all in the trial of a case like this,

what it would cost to reproduce it?

A. No, sir. It is only one of the issues leading to it. It has no bearing at all. If you were talking about the Independent Home Telephone Company, you might have thought that those fellows made a hopeless struggle to establish business and loss. In other words, the successful company is always penalized for its success and the unsuccessful company-

Q. (Interrupting.) Reproducing the property at the present

time?

A. Oh, I am not talking about that at all That would not be any more, maybe, than it would in 1914, because in this particular case, an established business like this, running back to 1882, never had a factor of establishing business in it.

The reproduction cost theory is just another fine scheme on the part of the company to hook her up a little bit. It is not a conclusion at all, it is trying to find out something. 1993

know not as many companies have been as well run as yours for twenty-five or thirty years, but what they always make money. When a man subscribes for a telephone in our company, he would take it out for a year and we collected \$50.00 after the first of Jan-

We never have collections but once a year. Do you suppose a concern like that had any expense of establishing business?

Q. Now, Mr. Kelsey, I can't understand what connection there is between what collection for a telephone has to do with a reproduction theory.

A. Expenses that you lost and can't recover. You didn't lose anything. Now, you are trying to come back to the subscribers in Houston and ask them to recover something which was not lost.

Q. Mr. Kelsey, at one time you testified for the Memphis Tele-

phone Company, some old friends of yours, didnt you?

A. Yes.
Q. Now, assume for the minute that it would be possible that you were called to enter conference by them and asked to find a reproduction figure for their property. Just tell us what you would do?

A. They would pretty near have something because they lost money from the time they organized. Get back to your deficit theory again. They lost money from the start.

1994 Q. Go ahead and tell us what you would do.

A. If I was to, I would go into the deficit theory from the start.

Q. I haven't asked you anything about the deficit theory, or the

historical value.

A. I know, but that is the only way of getting about it. In this particular case, we don't need that.

Q. I am asking you about the reproduction theory.

A. Do you understand it yourself?Q. I absolutely understand it myself.

A. I said it was a fine scheme at this time to get a good value on your property.

Q. But assuming that the Memphis Telephone Company asked

you to find the reproduction value?

A. I would go over the historical value at once.

Q. To find the reproduction value on that property?

A. You betcha, because I would get better value on it than on the other.

Q. Just tell us exactly what you would do. A. I would go and capitalize their deficits.

Q. When you had the first reproduction value of the property?

A. Oh, no, the man that put the money into the plant, is entitled to a return on his investment.

Q. Can't you understand that question, Mr. Kelsey?

A. No, you are too abstruse for me sometimes, Mr. Frank. 1995 You wander off into transcendental things. I can't follow vou.

Q. I think I am rather practical. At least I am practical enough to keep on asking you to tell me you can or can't answer.

A. I will tell you that in the morning.

Q. Do you know what the reproduction theory is?

A. You bet, I have attended all the conferences with all these scientists.

Q. Just tell us how you go about finding the reproduction cost.

A. I will tell you in the morning.

Q. Don't you know now? A. Oh, I have reproduced; I have valued lots of them. years these fellows tracked into my office to get them.

Q. How would you go about finding the reproduction cost of the

Memphis Telephone property?

A. Why is that necessary? Q. But, Mr. Kelsey, we think that is necessary.

A. It is not though, it is only one of the ways to get at what these poor fish that went into the Memphis Telephone Company and put their money into it, lost. Now, we want to protect your investment.

Q. Won't you let me assume that it is necessary?

A. I won't in that case. Get away from Memphis. They lost

money from the day they were born.

1996 Q. Take the Houston case, or Dallas, or any other place.
A. Which one. The Bell or the Independent? You can't deal with one, the same as you do with the other. You fellows have always had a cinch.

Q. Do you know how to find the reproduction value of the prop-

erty?

A. You bet your life. Q. Well, tell us.

A. I will do that in the morning.

I would take a detailed inventory of the plant at Houston just as you have done here. The man who made the inventory would not apply the cost price; he has a man that brings him the physical apparatus and the cost unit men apply the prices. I apply my own unit brought in by my field men.

I say that I have made three hundred, probably so, yes, sir.

I was making these inventories for different Companies, all through Ohio and Indiana; principally for bankers and the getting my customers ready for the commission rule. You see, prior to 1910

everybody in Ohio and Indiana, and all through there, were 1997 getting ready for the commission. We got ourselves ready to

meet the commission.

Q. Then when you got through with these three hundred cases that you made appraisals of,-did you merely apply your unit cost and tell your clients that was what their property was worth?

A. Well, applied the unit cost—yes, about but you know most of my clients, Mr. Frank-I tried to tell you yesterday, that when you dealt with an Independent Telephone Company and a Bell Company, you have an entirely different condition. You can't es-Company, you have an entirely different condition. cape that proposition.

As a valuation expert it would make quite a bit of difference to me whether I was valuing a plant just exactly like this Houston plant—

a Bell plant, or an Independent plant.

If I were valuing a plant just exactly like this Houston plant for an independent company it would make quite a difference to me as to the conditions, and I will tell you why: The Independent Plant would be less valuable for this reason, because most of the Indepedent Plants were built by promoters and by construction companies, and as a result an independent plant has about a million dollars worth of property to about two million dollars worth of securities against it. Your Bell properties never were built by promoters. They were built honestly and come up from the

998 bottom with everything there and as a result the inventory

of a Bell property always shows more than the amount actually put in and the inventory of an independent plant always shows less than what they put in. But, if I were trying to find the value of the plant, irrespective of the money put in, if the plants were identical, it would make no difference whether it was built by an independent company or by the Bell Company, but that enters into the composition. We always try to find out what money went into the property.

Q. I am asking you nerely for the-

A. Oh, yes, you want to come in here and value this property, your plan is to apply the unit based on the last five years' prices, you would apply the unit to this town, based on a fourteen, fifteen, sixteen and seventeen price on an average.

Q. Well, now, let's get right back to where we were. When you prepare a proper inventory and have fixed upon your unit cost and material prices, and apply them, what would you call the result?

A. Well, that was one of the results, Mr. Frank. You see, that is only one way you arrive at—here is my problem and always has been, protecting the investor that put his money into this property. As I say, most of my clients have been independent investors, who

have invested money in property in Texas. Built by pro-1999 moters, fifty cents on the dollar and with that result. We found this reproduction value never would come up and fill the bill. We were then forced to go into the deficit or historical, because my clients always lost money in the ten years of their

existence.

Q. I am trying to find out, after you had applied your costs, and material prices to your inventory—

A. Well? But you would have practically your plant.

Q. (Continuing:) Well, would that be the value of the plant?
A. I don't know. We used that method to find out if that was the money that you put into it. You know you are trying to do something entirely different.

Q. We are not talking about money now. We are talking about reproduction cost of a piece of property. I'm trying to see if I can get you to tell me just what you have when you get through with

those figures.

A. We would have a property about what money was put into it. That would be the reproduction cost of the property, providing you didn't have years of loss in getting started; the loss wouldn't have anything to do with reproduction cost of the property—it would cost so much.

Q. Well, let's stick to reproduction cost. Now, wouldn't you take into consideration the fact that some property was slightly worn, or

rotted, or rusty, something like that? Would you take depreciation into consideration? 2000

A. Oh, if you really carry out the true theory of reproduc-

tion you would ignore that depreciation entirely.

Q. But the Supreme Court of the United States in Knoxville Water case, said that you couldn't ignore it, Mr. Kelsey.

A. Oh, they brought that in, yes, and I think it is a sensible view, but let's get back again, that removes all your happy consideration

of the case and gets you back to what the plant is worth.

- But in order to find out what the first reproduction cost of the property would be, you would have to take into consideration the depreciation. I would find out what the depreciation is by inspection, as my boys made these studies of the different properties, they would determine about what loss had taken place. They can take a brace and bit and tell what the condition of the core of a telephone pole is. They can take a spade and dig the dirt away from the pole and see if the pole is all right. You know I fell off a loose cross arm once,—fell forty feet. A man can examine a telephone pole and tell what condition it is in. He can examine a switchboard and tell what condition it is in; the only thing about a switchboard that would wear out would be your spring and jack and plug, otherwise, your switchboard would never wear out.

2001 A. No, no, no, I would not say that a man would have to tear a plant all to pieces in order to inspect it. If he took a bit or a shovel and removed the dirt around the pole that would be

a bare inspection.

Yes, I found out in the last fifteen or sixteen years most plants generally find themselves between ninety to one hundred per cent

Q. As a practical man, you could determine a good deal about the efficiency of a telephone pole, merely by making a little bore, you wouldn't have to saw all the way through the pole, in order to determine that?

A. Oh, no, I wouldn't do that, you have enough history of the reconstruction work about the telephones poles, you know. You have enough old poles laying in the yard which you have taken down, you don't have to-

Q. So that it is entirely feasible for an engineer by inspection to

determine the present condition of the property.

A. That is the only way that he can do it.

Q. Every other way would be wrong?

A. Oh, no, every way is useful. You can't eliminate any bit of information about it.

Q. Could a man stand in St. Louis, for instance, and never see the plant in Houston and be given some life and age tables and the amount of gross additions each year and net additions and determine the present condition of the plant in

Houston?

A. That wouldn't have a thing to do with the present condition of the plant, the life and age tables, because you are maintaining your plant all the time. A man sitting in St. Louis could know, maybe, one hundred years from now, that Houston was ninety per cent good, by the way you keep it up.

Some of the reasons for that are because your activity each year

in maintaining and reconstructing your property.

The junk value of the property is about 100%. When I left here and went to Jacksonville, I wanted to buy about five hundred telephones that I had sold to the Jacksonville Company for something like \$5.98. I found they were selling them for \$10.00. There was a new turn on this depreciation. It was worth more as junk than it was new.

A pole is the smallest part of your investment. Switchboards don't become inadequate, you put additions to them; they do not become

obsolescent, they haven't yet.

Supposing the time has come when you have to have an automatic switchboard and have to take out the switchboards here, it would

not then be obsolescent; you would move it out to some smaller town and use it again. These parts never wear out; 2003

they can't wear out. You cannot move a switchboard intact; you take it down and box up the cables. I have done it. You know your old Bell switchboard at Waco was nicely boxed and sent to Cleveland and it looked just as good as new. I couldn't tell it from the old; there is some labor lost, but it looks just as good as new; those soldered connections are a very small thing. On a switchboard, something like the size of the one in Houston, I wouldn't be surprised if there wasn't more than a million solders on it. I have soldered them by the millions.

When you got through and got back to the inventory and had applied your unit cost and material prices, you would have your repro-

Q. Now, if you had taken into consideration anything for depreciation, that is, for instance, if you state the plant was in ninety three per cent condition-

A. That is the usual condition of the Bell Plants.

You would have to take off about 7% off of it; I think you have taken it off,-you have a better plant than usual. I think the plant here is unusually good and I think Mr. Hoag's report shows it 94% good.

2004

Q. Ninety-two and something, not quite ninety-three.
A. That isn't possible. You have got to keep the plant

good in order to keep talking over it.

Q. Have you got the figures for the reproduction new, less depreciation? That would merely be the physical plant, wouldn't it?

A. Yes, that is about all you have.

Q. Now, if you were trying to find all the elements of value in the plant, there would be something else besides that, wouldn't there?

That is the only thing costs you money.

Q. The only thing costing money?

-. Oh, my, yes, you would need some working capital, you haw to have a little money, of course. That isn't denied. I think that is in here. Thirty per cent of all business fails for lack of capital, oh, it is quite reasonable that you would have to have some money.

Q. Then you would have to make an addition to the figure that

you found in order to have some working capital?

A. Oh, I think that is in there. I think that can be proven later on by Mr. Lyndon. At least, I asked Mr. Lyndon if that was in there and he said it was.

Q. Do you recognize an element of value in a plant that is in operation, that has an organization and is paying some

dividends, known as "going value"?

A. Well, you have no right to penalize the people of this town because you are successful enough to pay a dividend.

Q. Mr. Kelsey, I am not talking about penalizing the people. A. That is what you are doing.

I do not recognize that there is such a thing as "going value"; I don't recognize that at all, that is a substitute to fill up balance sheets

quite a lot, and good will and going value.

Q. Mr. Kelsey, if you as a purchaser, would start to buy this plant, or any plant, and had agreed to pay a round sum for this plant, and had gone through the operation of finding what the reproduction cost was, less depreciation, would amount to——
A. (Interrupting.) That wouldn't be enough history for me; if I

bought it, I would want to look into the history of the plant from

year to year.

Q. And in addition, you had accounted for a sufficient amount to cover the working capital and the deeds were ready to pass, you had agreed upon the price, was satisfied with the price, and just as you were ready to hand over your check, the man who is to sell this prop-

erty to you had told you, Mr. Kelsey, you have figured only on the physical property, and I need all my employees some-2006

where else and need all of my books somewhere else, and I have moved every employee out of this own to another town where I need them and I have notified every subscriber in town that his contract is cancelled and I have accumulated the instruments and put them in a warehouse and you have all the physical property which you have appraised, would you take the property?

A. That is a very far fetched proposition. No, I would have at least thirty days and I could replace the whole bunch.

Q. Why wouldn't you take it?

A. I would be very foolish to come into a property where you took all the instruments away.

Q. Well, we put the instruments in the warehouse for you.
A. I would want the instruments in. No man buys a dead plant,

he buys a live one.

Q. In other words, you would think that having a credit manager, and having some prices and having a stock of goods, that the people are familiar with, and having a reputation for fair dealing, and having proper location, you would think that all those things would be worth something over and above the mere physical goods on the shelves would be worth?

A. Not necessarily. I have noticed that whenever a new owner takes over a property, he fires about se-nty-five per cent anyhow.

does that, even the Bell Telephone Company.

67 - 219

2007 Q. But still he would have the going value of the concern?

A. Oh there is some sense to that, of course. As long as any business runs and operates and makes a living, it has a value to the owner, not to the public. Not to the public. You know you are dealing with the public. This is a public service corporation. You can't apply this dry-goods proposition to it.

Q. Now, Mr. Kelsey, take a town like Chicago, your own home town. If a man had a franchise to do business as a telephone com-

pany--

A. He would be ruined.

Q. (Continuing:) And went into Chicago and established a plant in one section of the town, whatever he desired to serve, equal to the Houston plant in every way, but had no subscribers, would the plant be worth as much as the Houston plant is worth?

A. Yes.

2008

Q. Without a single subscriber?

A. Yes, because they would be begging for service.

Q. They would be begging for service?

A. Your only problem would be to get the telephones to them, Mr. Frank. The problem today everywhere in the United States is, to give them service.

Q. Don't you have to educate some telephone girls?

A. On no, that was twenty or thirty years ago. That is why I wanted to go into the history of this plant.

Q. Don't the telephone girls have to be trained?

A. A bright, average American girl can operate an exchange on twenty-four hours' instruction.

Q. Can a girl get on a big telephone board like the Preston Exchange and operate it twenty-four hours after she had seen it?

A. Oh, yes, you bet. It isn't a wise thing to do it, but she could do it, in a pinch.

Q. We ought to get a slave driver for them?

A. That's just the thing. The Bell Company needs a slave driver from President, down, the laziest organization in America.

Q. How many calls ought a girl to handle in a day?

A. She ought to handle a thousand, average a thousand and you oughtn't to have to carry her out to a hospital either, when she does it.

Q. How many do they handle in Cleveland?

A. About two hundred and thirty-one.

Q. Would it surprise you to know, Mr. Kelsey, that in the City of Houston, they are handling an average of over a thousand?

A. They are not.

Q. Are you swearing now, or just guessing?

2009 A. I am swearing, because from the records I have seen there, you run about five hundred calls.

Q. How did you get your figures?

A. From the number of girls you have on your pay roll and your peg counts.

Q. But you know that while we might have five hundred girls

employed, some would be sick, some on absence-

A. We all of us know how much a girl is sick and they are all working, in the scarcity of girls, you crowd as many working days in as you can. The girls are working girls. There has been no change in the construction of a girl operator since 1898.

If I were employed by the Memphis Telephone Company, or some other telephone company that I am friendly with, I would not allow anything for going value, in all probability, it would not be necessary unless you had losses in your youth.

Q. Suppose there had been no losses at all, Mr. Kelsey, and the President of the Company was trying to find the fair value of his property, merely so he could acquaint his stockholders with the value of his property, he asked you if there wasn't some element of value known as "going value," what would you say to him?

A. The only element of value that I possibly could show to 2010 him would be some way of getting his subscribers dividends,

that is, what they want.

Q. He is not talking about dividends, he is trying to find out what the property is worth?

I do not know if the Supreme Court of the United States is wrong when it says there is an element known as "going value." You know I have all the respect in the world for the Supreme Court, but when one crowd votes five for and four against, it kind of puzzles me a little bit.

Q. But these opinions are reached-

A. (Interrupting.) In that case—every case in America is a legal

Q. But is a question, an engineering question, like a question as to whether or not a plant has "going value"? Is that a legal question?

A. Practically yes, according to how much money you lost trying

to start this service and give people service.

Q. Just analyze that statement a little bit, assume that in two cities, A and B, they are about the same size, and one of them has been operating for twenty-five years and from the very beginning, after the preliminary two or three years, when no company makes

money, that from the beginning, after it got established, it 2011 ran a dividend of say eight per cent, sometimes ten and some-

times six, it averaged for twenty-five years averaged eight per cent, that is the town "A," in town B, a town of the same size a plant of the same history practically, the same length of time, for twenty-five years, say, people didn't like the service, or the rates were not properly adjusted, and year after year after year, the company that operated in town B, lost money so that over a period of twenty-five years it made an average of only about three per cent. Now, is this your idea, that the plant in town B, would have a higher

going value than the plant in town A?

A. Neither of them would have it. As a matter of fact, under the law, that B town would have the right to capitalize its deficits for the twenty-five years and put it on the same footing with the successful company; in other words, the law penalizes the successful company and praises the unsuccessful company?

Q. What law does that?

A. The utility law. Q. Which utility law?

A. Oh, all over.

Q. In what State? A. All States.

2012 Q. Name one State.

A. Every State in the United States, Ohio and all, I have worked on the deficit theory.

Q. Wisconsin?

A. No, Wisconsin-

Q. Does Missouri work on that?

A. Yes

I don't know about Arkansas. We had the deficit theory in the Emporia case and the Columbus case: they needed this deficit theory. With reference to Kansas, I say that we worked on the deficit theory in the Emporia case. I was assisted by Jim Noble, one of the best engineers in the world, and he worked for you folks; or I assisted James, I don't know which.

Under the law, my idea is, that a plant that loses money for twenty-five years is worth more than one that has made money, because one can capitalize its deficits and get a higher rate, really,

than a successful company can.

Q. Now, I want to call your attention, Mr. Kelsey, to the fact

that you are swearing.

A. I understand that I am under oath, absolutely under 2013 oath, and I have every respect for this Court, I am telling exactly what is what.

Q. Now, just tell me one single State where you have ever seen in the law, such a law that authorizes you to capitalize your deficits.

A. My goodness, that has been done time and time again in Wisconsin. It is one of the factors-

Q. That isn't the question that I asked you.

A. I am not a lawyer, you know. I know nothing of the law, but I know of the law's practice, that when I went into this case in Indiana, in the telephone company case in ——, we capitalized all those deficits, and showed that for ten years we lost money every year, and we capitalized that deficit and added that to the capital account.

Q. I am not asking you about any of that.

A. I say, I am familiar with the practice of the law, and my construction of it, Mr. Frank.

Q. I am asking you about what State has such a law?

A. I don't know, I never had time to look into the law; I have been busy with other things.

Q. So far as you know, there is no law that authorizes a capitaliza-

tion of deficits?

A. Well, there must be in Illinois, because time and again
2014 I appeared as attorney myself, and took my client's case on
the basis that he lost money from year to year.

Q. Well, that was merely an argument to the Commission?

A. Oh, yes, but I know they adopted it.

Q. Did you look at the law and see if there was a law to that effect?

A. I never had time to look at the law; I think there is twelve thousand—new laws appeared on our books in the last few years.

Q. So that your statement is, that every State in the Union had that law, except the State of Texas?

A. Except Texas.

Q. (Continuing:) Was slightly in error.

A. No, I think that the spirit of my answer was absolutely right.

Q. Do you know of a single State that has that law? I would like for you to mention it.

A. I have always worked on that theory in the States, I mean Ohio, Illinois and Minnesota, these conditions were always accepted, because these independent companies would be absolutely ruined.

Q. (Interrupting.) You mean they have present- an argument?

Judge Powell: He didn't say it is a statutory law, he said that is a utility law.

2015 Mr. D. A. Frank: There is no such law in the United

States.

Judge Powell: There are a good many laws that allow them to capitalize their deficits.

A. (Continuing:) And they have - by this method; this repro-

duction theory would never get them anywhere.

Q. Now, Mr. Kelsey, just tell us what the deficit theory is.

A. Well, a man starts business with \$100,000.00; at the end of the year, he loses doesn't he? Then he is entitled to eight per cent, so the losses and his dividends he adds to the one hundred thousand, and he begins his second year with probably \$115,000.00; then he operates during that year and the losses he has plus the income for that year, he adds it and so on.

Q. On down?

A. To the hearing.

Q. Well, now, if these two plants that I have assumed in towns A and B, they each one of them cost \$2,000,000.00 and one of them has made money for its stockholders for twenty-five years and the

other one has lost money for its stockholders for twenty-five
2016 years, but the plants were practically the same, about the
same number of subscribers, and so forth, would you pay just
as much for the one that had lost money as you would for the one
that had made money?

A. The subscribers would probably pay a higher rate for that

poor one than they would for the good one.

I would not necessarily pay just as much for the one that had lost money as I would for the one that had made money, but after the readjustment, I probably would, because the rates would be higher, and the returns would be a little higher. I would not pay either one of them, I don't think that is a fair question. I would not pay either one of them.

Q. Suppose you represented an inventor that wanted to buy prop-

erty?

A. You mean, in this sense, to sell his stock?

Q. No, I mean an investor that wanted to buy a telephone plant.

A. Well, there's lots of them, buying lots of them and selling lots of them. You try to buy a telephone property and you pay a magnificent price for it, Mr. Frank.

Q. Well, I am assuming that you represent a man that is able to buy one of these two plants, now, would you buy if you could

get them at the same price, would you buy the one that had been making money, or the one that had been losing money?

A. Under the law, I would buy either one of them, be-

cause you would be entitled to a return on your investment in either case.

Q. You wouldn't make any difference?

A No, if the thing was administered and adjusted according to the public utility law, they would both be just the same.

Q. Under your theory of early deficit, the one that lost the money

would be worth more, would it?

A. Why, pretty near it, that is the way it worked out.

Q. Does that appeal to your mind as reasonable?

A. Absolutely reasonable. I am not saying it is right, but I tell you the company in this country today that has lagged and lost money, stands a better chance before the Court and the Commissions to get a higher rate than the company that has always maintained its property well.

Q. But I am trying to find out the company that stands before you, as an engineer, in fixing valuation, which one would get the

highest price?

A. They would both come out just about the same. Q. What is the use of your deficit theory, then?

A. Well, your deficit theory through the years is the the 2018 only way of getting at this proposition.

Q. What is there in the deficit theory—

A. The stockholders have put the same amount of money in each plant, haven't they?

Q. But we are trying to find the value of the plant.

A. You are trying to find the value of the plant and by and by

when we get this new rate adjustment in force and the return is the same and the stock probably would be worth just the same.

Q. Although one had lost money for twenty-five years and the

other had made money for twenty-five years?

A. Yes, after it is once correctdd.

Q. And it is the same property and the same size?

A. The stock would be worth the same in each case.

Q. So there would be no advantage in finding the early deficit in

one plant as compared with the other, would there?

A. I am merely saying that it is one of the peculiarities in this telephone business. You have never had this graft and bonus stock, your Bell properties have always been well run. In the other cases, however, they have, they have got the same investment in the same plant, but one has been rifled and robbed and the other has not. You are trying to get protection, but it don't need protection because it had a little better luck, probably had better management.

Q. So as a valuation expert you would put the same value

on both of them?

A. Yes, for rate making purposes

Q. We are not talking about rate making purposes.

A. That is the only way you can consider it. There's only two ways in which to consider it, for taxes and for rate making purposes.

Q. Yesterday I understood you to say that we make a few P. B. X switchboards?

A. You bet.

2019

I mean my little company. We probably made fifteen or twenty switchboards last year. We don't want to make them, we only make them for accommodation. As to how big they are on the average, oh, about two hundred, three hundred, four hundred; we only do that when people can't get them from the old companies, and it is an accommodation. We have been making switchboards seven years. This little company and I have been making switchboards and working on them ever since 1898. Our switchboard manu-

facturing is growing wonderfully.

2020 It has been since 1914 since I sold switchboards for the Kellog Switchboard Company. I did not begin making them myself about the time I quit the Kellog Switchboard Company; I retired a while. I had made a little money, I had quite a little bit of money, I had quite a little,—quite a little bit of money and I thought I would rest, but I couldn't stand it any longer.

As to how long it has been since I sold a switchboard with ten thousand lines on it, well, let's see,—along about twelve, I think we put two, five thousand lines in Philadelphia, but we figured on them right along, you know. I think my last sale was San Parlow.

Q. You said yesterday that in order to sell a switchboard of that kind, you would not need any overhead expense, you would not need any engineering, no specifications, all you would have to do would be to find out the number of lines and multiply it by forty?

A. That is all; I don't know anybody around here that had anything to do with a switchboard.

Q. Would it make any difference whether a switchboard was going to serve a town where the calling rate was five or ten—

A. (Interrupting.) You have a cross connected frame 021 to take care of that. You specify all that.

Q. You would want some specifications would you?

Ves 1

Q. Would it make any difference whether your switchboard was located, part of it, on one floor and part of it on another floor?

A. It wouldn't make any difference, we would get a floor plan in

each case.

Q. Would it cost any more?

A. Why no, you have one board on one floor and another on another there is nothing mysterious about this switchboard business; it is almost as simple as buying and selling eggs and meat.

Q. I believe you stated that if a man started to build a building

he would not have to get any plans?

A. A building that would come under architects' plans; that is something done locally.

These switchboards aren't very special things,—standardized; been standardized for twenty years; the construction of the switchboard is very much simpler as compared with the construction of a building. Why I would a good deal rather undertake to

building. Why, I would a good deal rather undertake to 2022 build a switchboard these days than I would a building, when you consider the labor union and fight on the jurisdictional scrap between the paper hangers and the brick layers and

dictional scrap between the paper hangers and the brick layers and door hangers, your switchboard would be free from all that. You would not have to have specifications to build it; you give an order to the manufacturer and he makes them all.

Q. You would have to have specifications to build it?

A. No, you give an order to the manufacturer and he makes them all.

Q. Don't you furnish him with any plans at all?

A. He merely looks them over; his action in buying a switchboard

is almost infinitesimal.

Q. When you let the contract for the ten thousand line switchboard, that you referred to just now, do you just agree to a certain price on it, without looking at it?

A. Why, yes. This Keystone, this proposition they sent us there what they wanted was for it to be built and put in and give us the

money for it.

Q. Referring just a minute to this reproduction theory, did I understand you to say that you would not consider that in finding the value of a piece of property?

A. I said that's one of the considerations. Q. That is one of the considerations?

A. In view of the early history of the property. can't make any one rule infallible in this case; in the case 2023 of the Bell Telephone Company reproduction new is a fine

thing.

Q. Tell me whether or not you agreed with this statement; "The first method of valuation, namely, actual cost, less depreciation, is favored by engineers and public service commissioners. method, however, has not the sa-ction of the Court. The decision of the United States Supreme Court, which is the final tribunal in America is that the value of a public utility for rate making purposes is the reproduction cost less accrued depreciation." Do you agree with that statement?

A. Well, I suppose that is a statement made-

Q. (Interrupting.) This is a statement made by Mr. Lyndon, in his 1914 report on page 56.

A. I don't think any Court would dare even to fix such an un-

stable rule as that.

Q. You don't think any court would?

A. I don't think they would after mature deliberation, ever fix any one factor in this valuation theory. Now, I tell you at this particular time, reproduction new is a fine thing for the company. Ten years ago it was not, because, you see, the prices have gotten higher.

Q. Is Mr. Lyndon right or wrong in the statement?

A. I never saw Mr. Lyndon until he came down here.

Q. Ever see him here?

A. Oh, yes.

2024 Q. Is Mr. Lyndon well known in the telephone world as a telephone expert?

A. I never heard of him in the telephone business as an engineer? Q. Did you ever have-in all of your experience as an editor and telephone engineer, did you ever know of his doing anything in the telephone world?

A. Yes, his contribution to the storage battery is a very important

part.

Q. As a telephone expert, Mr. Lyndon is a good battery man?

A. I think he is an excellent gentleman and an authority in these matters. He is an authority in electrical matters. He was in Mr. Edison's labratory, working as a consulting engineer. I know Mr. Thomas Edison wouldn't have a dummy in there, assisting him in all his different problems. I think Mr. Lyndon is a very remarkable young man.

Q. But he isn't remarkable as a telephone expert?

A. Oh, he didn't have time. You were accusing me of being a banker and everything else. I don't know why you did that.

know I worked,—I was afraid of poverty.

Q. Mr. Kelsey, what was it I understood you to say about the conduits and duct foot? What was the price you said you ought to pay?

2025 A. Oh, I said that just along in 1900 the entire duct system frequently was built for eighteen or nineteen cents a foot, duct foot, including man holes, too, Mr. Frank.

Q. Was that for a single duct foot?

A. No, no, that was all, they had as high as thirty-six ducts I think in some places they had seventy-two ducts in one trench. You know these people build with some sense, too.

Q. Now, Mr. Kelsey, you picked out the best item?

A. I just took the top item there.

Q. On Page 51, of Mr. Hoag's appraisal?

A. Yes.

Q. Exhibit No. 18, where it said two ducts-

A. Trench with two ducts in it.

Q. Trench,-two ducts, trench feet 1,254, 1.42 cost in place?

A. Yes, that average would be 71 cents, wouldn't it?

Q. Yes.

A. Well, add them all up-

Q. (Interrupting.) Look at the six duct and you will find there 2.28, that would be about forty cents?

A. Be about forty cents,-well add them all up.

Q. Now take 10 duct, it would be 3.21, or thirty two cents a foot?

A. You are getting down to reason, yes.

Q. And if you had twenty ducts, it would be 4.75, or twenty-three cents a foot?

A. You are getting down to pretty good figures.

Q. And if it was forty-two ducts, it would be \$7.80, or about nineteen cents a foot?

A. You are getting down to some sense there, Mr. Frank, but the thing to do is to add them all up and to divide them and get the total average. You start awful high.

Q. Let's see if we do, the two duct, we have only 1,254 trench

feet in the entire system.

A. That is about all you would have.
Q. Of six duct, we have 25,482 feet?
A. Yes, considerably more than that.

Q. So that your criticism, it sounded like our prices were too high when you analyze it it shows that the prices are not too high?

high, when you analyze it, it shows that the prices are not too high?

A. I haven't had any time in this case to take into consideration all of your prices. Your prices are always high in Central Office equipment, when it comes to duct and cable, you always are fairly reasonable.

Q. Yesterday you said you thought it was too high?

A. We were only talking about the top line. I said that I found it \$1.42 cents, and I said it looked like 72 cents. It was your business to come and show the facts.

Q. Well, we have shown you, haven't we?

A. I don't want to sit here with the idea of even deceiving you.

2027 Mr. D. A. Frank: You are not deceiving me; I am not easily deceived.

When we start to build an eight thousand line switch board, in order to determine how long it should be we have got so many

lines per cabinet, so many cabinets; it is specified, all cabinets have a standard measurement, six feet long, I have forgotten now, but I could get you that very quickly. The number of lines and positions and the number of positions per section determines how many different panels you have; that would be true in all different panels. Some boards you have fewer lines to the positions; the fewer calls you have, the fewer lines you have to the positions you have; we have some boards we fill six lines to the position. You would practically have to know what the calling rate is before you could determine what the switch board should be, but we would not know exactly. Not all positions have the same number of lines, you know. There is nothing mysterious whatever about the number of lines in cabinets. We have cabinets made of oak and mahogany. That old Waco cabinet of yours fitted into C'eburne without anybody being able to find it.

"Q. Now, you said yesterday that the Preston Exchange switch board would cost \$450,000.00, and that the Capitol would cost \$150,000.00; now, Capitol has 4,500 stations."

"A. I took the number of lines and multiplied it by dif-

2028 ferent figures.'

"Q. Now, how did you get \$150,000.00 for Capitol?"

"A. How many lines is that?"
"Q. Forty-five hundred."

"A. I think I put that down at about thirty thousand lines."

"Q. Do you happen to know that while there are forty-five hundred lines at that switch board, it is merely a division of the Preston switch board?"

"A. Well, it has so many feet of cable, so many cabinets."
"Q. But it is just the same as having nine thousand on Preston

and forty-five hundred on Capitol?"

"A. All right; add the multiple jacks additional in there, twentyfive cents per jack, and you have got it."

"Q. But it is really a thirteen thousand five hundred switch

board?"

"A. Oh, no, sir; it is a forty-five hundred line board with a multiple distribution coming from another board, making it a ten thousand multiple. You couldn't make more than ten thousand in your board, because you would have to get a girl on a step-ladder to get any higher. We build eighteen thousand boards."

"Q. You have not seen the switch board, have you?"

"A. Oh, no; I have seen switch boards?"

"Q. Do you know what they cost?"

"A. You mean Western Electric cost, or what I would pay

2029 on such a job?"

"Q. I mean if one was exactly as expensive a panel as the other, would you change your mind on it?"

"A. It could not be."

"Q. But if it actually is?"

"A. No, I don't know as I would."

"Q. You wouldn't change, even though it actually cost more?"
"A. It wouldn't make much difference in the proposition, even

at the maximum; no, it wouldn't, I wouldn't change that at all." "Q. Now, there is some other equipment there amounting to \$23,000 that you did not consider."

"A. Oh, ves; oh, sure. To keep operators' desks and information

desks and trouble desks and all the other desks.'

"Q. Then, there was some construction in progress, amounting to \$45,000.00?"

"A. That is probably in there; that is in another item, you know," "Q. Another thing that you did not consider was the "B" board?"

"A. Oh, yes, there is a "B" board in there. It is always "B" boards when you have more than one office."

"Q. But you did not count the "B" boards?"

You know the "B" board has "A. Oh, yes, I put them in there. a certain relation to the "A" board."

"Q. The prices that you are giving here -\$30.00 and \$40.00 a

line; how do you arrive at those prices?"

"A. Why, from our present standpoint of value."

"Q. That was really the figure you used seven years ago, 2030 wasn't it?"

"A. No; Kellogg is still building mannikin switch boards; they built a switch board for you at Tulsa."

"Q. You have not sold a ten thousand switch board since 1912,

have you?"

"A. Yes, but we bid on them; the company does, -my old associates."

"Q. Who bids on them?"
"A. The Kellogg."

"Q. But you haven't been with them-

"A. (Interrupting.) I know, but I am still in there in a consulting capacity."

"Q. Do they have to come around to consult you as to how much

they will charge for a switch board?"

"A. Oh, no; but the President and I discuss all of these problems."

"Q. The figures you read yesterday for Preston, \$400,000.00; Capitol, \$150,000.00; Taylor, \$87,500.00; Hadley, \$200,000.00, making a total of \$887,500.00; then other equipment would be \$23. 000.00; construction work in progress, \$49,400.00, and if we think that our "B" board at Hadley and Taylor would be worth \$50,000.00 and at Capitol \$30,000.00, that ought to be added, because it is \$40.00 a line instead of \$30.00 a line; that would make your figures run up about \$1,039,000.00 without any overhead?"

"A. I am telling you, in hot competition that the Western 2031 Electric would have built that board at that figure, or less."

"Q. Well, for the purpose of the record, and in order to let you see what has been done in this, I want to read just a little excerpt from Mr. Lyndon's report of 1914, beginning on page 146 at the bottom, and see if you agree with what he says: "In valuing the Central office and sub-station equipment, we have taken the figure submitted by the Southwestern Telegraph and Telephone Company as the proper value of the equipment, including all overhead charges. We feel sure that the figures are too high, but there are only two companies in America prepared to furnish Central office apparatus of the character and magnitude in use by the Southwestern Company, namely, The Western Electric Company and the Kellogg Switch Board and Supply Company, both of Chicago. The Western Electric Company is practically owned by the American Telephone and Telegraph Company, and therefore we did not apply to this Company for quotations on similar equipment, feeling in advance that we could not obtain figures for our purpose that would show any material reduction below the cost submitted by the Southwestern Company. Quotations were obtain- from the Kellogg Switch Board and Supply Company, and this Company accorded us every courtesy in making up quotations for us. To make an estimate of this character of equipment delivered and installed, together

with all the cable, wire and accessories, is a long and tedious process, and we could not expect any manufacturer to make

such a close estimate for general estimate purposes as it would if there were a prospect of a contract for the material. The Kellogg Company's quotations, when loaded with overhead charges, came so near to the figures given by the Southwestern Telegraph and Telephone Company, that we have considered it better to accept the Southwestern Company's costs. We have obtained considerable information about the cost of other exchanges of approximately the same size and character, and from these we believe that the actual reproduction cost of the Central office and subscribers' equipment would be from \$65,000.00 to \$75,000.00 less than the figures which we had adopted. In the absence, however, of proofs based on definite quotations, we have no option but to accept the figures of the Southwestern Company, which we have accordingly done." Now, there is where—"

"A. (Interrupting.) Mr. Lyndon got the engineer's estimates,

you know."

"Q. There's where Mr. Lyndon made an investigation and decided that our figures were lower than the Kellogg Company's."

"A. Oh, yes, he went to the Kellogg and asked them to do a lot of work on something; they turned them over to the engineers and they gave them what they call the list price. The list price and the selling price have no relation whatever."

"Q. So you think the Kellogg Company put one over on Mr.

Lyndon?"

2033 "A. They didn't put one over him; they didn't pay any attention to him, because he was no possible customer."

"Q. Why didn't they inquire the number of jacks?"

"A. Absolutely a hopeless proposition. Why, why should they waste their time answering a question about Houston for? They are sensible and they have to work for a living. They wouldn't waste thirty minutes. They turned it over to some engineers who loved to keep themselves busy,—to keep their jobs going."

"Q. Why didn't they turn it over to the Sales Department?"

"A. The Sales Department might have answered it that way, but it got into the engineers' hands. The engineers never know what

the Sales Department sells at; they would not waste a minute on this thing."

Mr. Howard: You are talking about manufacturing; you manufacture this stuff?

Mr. D. A. Frank: We are interested in knowing the manufac-

turer's cost, not the sale cost. The Witness: You can't find a buyer who is going to waste any time on it.

"Q. When you said yesterday that a telephone instrument could be made for fifty cents, what did you mean by that?"

"A. A telephone instrument?"

"Q. Yes,—you said a transmitter could be made for fifty cents."

"A. It can be."

"Q. Is that the shop cost?" 2034 "A. Manufacturer's cost."

"Q. Then you said immediately afterwards that in order to find the selling price of any manufactured article you multiplied the shop cost by five?"

"A. Yes, that would give you shop cost about twenty cents if you

are selling it for a dollar, you know."

"Q. Did you ever know of a new transmitter being sold for fifty cents?"

"A. No, but they sell them for a dollar."

"Q. Did you say that the testimony in the Cleveland case was that they were selling them for \$5.50?"

"A. That is Mr. Wilson's testimony; they are selling them in the

open market."

"Q. But that was before the dollar went up?"

"A. No, no; they are still selling them; anybody would be a fool for selling a transmitter for a dollar when you could get \$1.65 and \$2.00 for them."

"Q. You are selling them yourself?"
"A. Yes, sir."

"Q. Selling them by the hundreds of thousands?"

"A. No, no; I said that I had sold them. I sold something like one hundred and twenty-five thousand a year in my late Kellogg days."

2035 'Q. How long ago was that?"

"A. Up to 1914. No man keeps on as Sales Manager forever."

"Q. You are selling telephone instruments now?"

"A. Oh, yes, but we have got a small shop; we sell about five thousand telephones a year."

"Q. Are you making any of them new?"

"A. Some parts."

"Q. But the entire instrument?"

"A. Oh, no; we find that we can make more money by buying telephones that you folks throw away."

"Q. What do you pay for them?"

"A. Fifty cents."

"Q. Fifty cents for instruments?"

"A. Yes, sir."

"Q. And what do you sell them for?"

"A. A dollar."

"Q. Those are second hand, aren't they?" "A. No, they are not second hand."

"Q. You said the ones that are thrown away." "A. Not thrown away,-not needed any more."

"Q. The ones that are not needed by us and antiquated, you take and sell them for a dollar?"

"A. Nothing antiquated about a receiver and transmitter."

"Q. What would a receiver and induction coil that has been worked over by you sell for?"

"A. Two dollars and fifty cents."

2036"Q. That is just the induction coil, transmitter and receiver?"

"A. The rebuilt cost,—yes: the sale cost of 1914."

"Q. That is for all three of them?"

"A. Yes, sir."

"Q. Now, the new price, according to Mr. Wilson's statement, was, on the market, \$5.50?"

"A. The theory of a rebuilt pricing is usually seventy per cent

of the new."

"Q. How much?"

"A. Seventy per cent of the new, possibly." "Q. Seventy per cent of the new?"
"A. Yes, sir."

"Q. Do you sell any new instruments at all?" "A. Oh, yes, we have lots of new instruments." "Q. What do you get for your new instruments?"

"A. You can't tell a new instrument from a rebuilt instrument."

"Q. What do you get for your rebuilt instruments?"
"A. We get them in lots from the Western Electric Company."

"Q. You buy them new?"

"A. Yes, sir.'

"Q. And then sell them at seventy per cent of what the Western Electric Company sells them for?"

"A. That is about what our price is."

"Q. What do you get for a set new?"

"A. We get \$10.00, flat."

2037

"Q. Well, let's eliminate the part that we are not talking about; let's take the transmitter, receiver and induction coils; what do you get for that brand new?"

"A. We don't sell them brand new. We sell all transmitters for a

dollar, all receivers for one dollar, all coils for sixty cents."

"Q. But do you actually buy new receivers, transmitters and induction coils, like you have them here in Houston?"

"A. Oh, yes."

"Q. From whom do you buy them?"
"A. Oh, we repair——"

"Q. (Interrupting.) I am asking you about brand new ones."

"A. They are practically brand new ones."

"Q. I am asking you whether or not you buy brand new ones."

"A. No. What do we want to buy brand new ones for?"

I think Kellegg got their price up to \$1.95 for transmitters, \$1.95 for the receiver and sixty cents for the induction coils, which would be \$4.60 per set.

"Q. Would it be interesting to know that that is the exact figure

that Mr. Rhodes used in this case?"

"A. Why, Mr. Rhodes uses a great many figures since 1914."

"Q. Four fifty is just exactly the figures that he used; that would not be sensible?"

2038 "A. No, that would be a very sensible figure for the present

price."

"Q. Have you figured what the carrying charge on that instru-

ment that costs \$4.50 is?"

"A. You haven't two instruments in this house that cost \$4.50. Twenty thousand of these instruments in this town were put here under that dear old price, you know."

"Q. Mr. Kelsey, I am not going to argue with you about that, but

the facts are quite different from that.'

"A. They are not."

"Q. But let's assume that you start with \$4.50 as a figure; now, as an engineer, tell me what the carrying charge would be on that instrument."

"A. I am not caring a rap about a carrying charge. I made this statement, that I put in fifty cents, because you were tickled to death to lease these instruments to anybody for fifty cents a year."

"Q. Does your mind work enough to---'

"A. (Interrupting.) My mind can't work in comparison with yours, I am sure."

"Q. Can't you believe a \$4.50 charge on an instrument and tell me what the carrying charge would be?"

"A. Yes, but you didn't pay that for it."

"Q. Regardless of whether we paid that for it or not?"

"A. Here's your cost of the instrument; the Bell Tele
2039 phone Company has its own report, you know. They carry
all their instruments on their books at about \$2.42; that is
about what they cost."

"Q. As an engineer, you can certainly calculate what the carrying

charge would be on \$4.50."

"A. Well, I could if I would."

"Q. If you can, let's see if you will or not? What amount would you charge for maintenance of one of those instruments—"

"A. (Interrupting.) That maintenance is all taken care of down

in New York by the Western Electric Company."

"Q. But we are assuming that New York has nothing to do with this. This is an independent company, now. This is a fellow that bought one of these instruments; he is down here at Port Arthur, now, and he has taken a notion that he can buy his own instruments, and he has bought them and at the present time he has paid \$4.50 for them, and—now, tell me what the carrying charge on it would be?"

"A. Well, did this fellow down in this place pay \$4.50?"
"Q. Yes, sir."
"A. But he did not."

"Q. But I assume that he did,—you start from that point."
"A. Well, what do you want?"

- "Q. Well, I want to know what the carrying charge would be on that instrument."
- "A. Carrying charge? Do you mean how much main-2040 tenance?"

"Q. Yes, how much maintenance?"

"A. On the transmitter, receiver and coil?"

"Q. Yes, sir.

"A. He wouldn't have any, unless he was struck by lightning and had his coil damaged; probably five cents a year would be absolutely the maximum for the maintenance of the transmitter."

"Q. Five cents a year?"

"A. Yes, sir."
"Q. What would five cents cover?"

"A. Everything."

- "Q. Cover everything for how long?" "A. Five cents a year indefinitely.
- "Q. Five cents a year indefinitely would cover all maintenance?"

"A. Yes, sir."

"Q. How much would you have for depreciation?"

"A. Oh, you probably would have—it ought to run forty years, those instruments, with a little readjustment, they do,-I can show you instruments in perfect health that have been running since 1898; just as good,—no reason why they shouldn't be just as good."

"Q. Just fix your own price on it."

"A. On the basis of \$4.50, I give him ten cents for depreciation." "Q. You would make that in two and a half per cent, would you? You would have 11/2% for maintenance and 2041 21/2 % for depreciation?"

"A. Oh, no; we are talking about what it actually costs."

"Q. (Interrupting.) Would you have any administration?"

"A. Oh, no; we would probably have one cent." "Q. Well, that would be about one-fourth of 1%?"

"A. Your administration of the independent plant never runs over \$2.50 per station, complete."

"Q. What would you count for return on investment?"

"A. Well, most of these fellows never get any return on their investment until the Bell buys them out."

"Q. What would you count for return on the investment?"
"A. They ought to have something."

"Q. What would you count?"

"A. Anything,-six, if you want to; they would be tickled to death with it."

"Q. The evidence in this case would be around ten per cent."
"A. Who said that?"

"Q. That is what the bankers say."
"A. Do the National bankers get ten per cent on their loans? They better report to the Secretary-Treasurer in Washington. they are getting ten per cent, they had better make an explanation to the Secretary of the Treasury.

"Q. But they claim in the National banks, they get security and they get only 7%. Is that a fair rate of return in the telephone business?" 2042

"A. You have a wonderful security; you have the guarantee of the Constitution."

"Q. Well, would you take the returns yourself?"

"A. Well, six per cent; they would be awful glad to get six."

"Q. You say six per cent would be fair?"
"A. Yes, sir."

"Q. Although the men who know claim ten?"

"A. Who?"

"Q. Houston bankers."

"A. Are bankers business men? All the banker does is take your money and loan it out to somebody else with a little security on it. It is the most cowardly business in the world."

"Q. He knows a little bit about what money is worth, don't he?"

"A. A banker knows less about business than anybody else; there is no réason why he should know anything about it; he grew up in a cage and he thinks every man is a liar and every man is a crook from the time he is an office boy."

"Q. Is that the way you think about it?"

"A. No, I grew up from an office boy; I am a borrower, you know.

"Q. Wouldn't you concede 8%?"
"A. He would love to get 8%."

"Q. It wouldn't be unusual; these banks here in Houston average about 121/2 % a year."

2043 "A. Our banks in Chicago earn about 5%."

"Q. Here they earn about 12%."

"A. I don't know how they get it."

"Q. You would have to pay something for taxes, wouldn't you?" "A. Oh, the taxes run annually about \$2.00 per station for everything."

"Q. I am taking this instrument, now."

"A. About two cents on the dollar. The taxes would run one and one-fourth per cent, about."

"Q. How about omissions and contingencies?"

"A. Oh, that's a joke. What would you miss in talking about a transmitter?—a receiver and induction coil?"

"Q. If you were valuing an entire plant, would you count anything for omissions and contingencies?"

"A. Why, I think it is the silliest confession that an engineer ever made to charge somebody \$100.00 or \$150.00 a day, and then say, but we have made a lot of mistakes, so we will have to put in a percentage to cover that. It is rotten confession. I am ashamed of it."

"Q. On this basis you have here, Mr. Lyndon used-

"A. Say, you told me Mr. Lyndon was a storage battery man; I don't vouch for his findings in the telephone business at all."

"Q. He made a report in 1914 and another report in 1918, and in one of them he had 28% and the other one 21%. Now .-

2044 "A. (Interrupting.) I don't believe in percentages in the first place. I am telling you as a man that handles and rebuilds these things what it costs in actual money to handle them."

"Q. How many telephone receivers have been in Houston more than three years?"

"A. Oh, there ought to be practically all of them here; and what in the world is the reason that a transmitter, receiver and coil should be changed in Houston. If there wasn't something radically wrong with it, it ought to stay in Houston fifteen years."

"Q. Would it be interesting to know that the turnover in

instruments-

"A. (Interrupting.) Yes, when you change and move, you go and take out an old one and put in a new one. It is still just as good; it has the nickleing off of the front, which you could have done for three cents."

"Q. But those instruments are turned in to the American Tele-

phone Company-"

"A. (Interrupting.) That is where your extravagance comes in; right here in Houston are plenty of shops that could renickle your transmitters at three cents a piece."

"Q. Well, don't they ever get out of adjustment?"

"A. Why would they get out of adjustment? You take a screw driver and repair anything about it."

"Q. These instruments are turned in to the American-

2045 Telephone Company every four years."

"A. If you turn them in every four years, you have got a mighty rotten instrument; I will tell you that.'

"Q Do you know how many different types of receivers are used?"

"A. Oh, yes, you finally had to come to our —; you bet, that is an improvement. You borrowed that from the Independent. using those receivers yet, you know."

"Q. In one breath you tell us to use them for forty years, and then-

"A. (Interrupting.) The Bell Company is using them; you are using them in the country, but magneto telephones don't need the protection that common battery telephones do. You can use them forty years, and then when the Western Electric Company gets them, then all they do is to nickle the front and put in a screw and it is just as good as new."

"Q. Did you know we had forty-eight different types of receivers

and sixty-eight different types of transmitters?"

"A. You don't; you've only had three different types in the last

twenty years."

"Well, the sworn testimony in this case is that there is forty-eight different types of receivers and sixty-eight different types of transmitters.

"A. Not in the public hands. I have been using telephones for

twenty years---'

"Q. (Interrupting.) Probably you didn't notice the difference."

2046 "A. Oh, yes; that is one thing I always do, -look at the inside of them. I venture to say that I know as much about a

transmitter as any other man in America."

"Q. Out of the forty-eight different types of receivers and sixtyeight different types of transmitters that have been used, you have recognized only three?"

"A. Oh, no; they have been used and, of course, you have made them; you have them in wireless; you have them in other things; we

make that many types ourselves."

"Q. Now, Mr. Kelsey, an instrument that could be made, which could be bought now for \$5.50, or taking Mr. Rhodes' figure of \$4.50, in order to be conservative, you think that that instrument, if a man could afford to rent that instrument out at fifty cents a year-"

"A. (Interrupting.) They tried to do it awful hard, Mr. Frank."

"Q. When?"

"A. Oh, for years and years. It was the most pitiless industrial warfare for years. When the Western Electric Company come into the field the Bell Company tried to jam this Bell receiver down the independents' throats and it would not go. Then, when they could not sell them they began to lease them.

"Q. How many years has that been?"

"A. Up to 1914. We were still fighting a little bit; then I retired, but the battle is still on."

"Q. Has any instrument been rented in the last few years

2047 for fifty cents?"

"A. I do not know that those contracts are still in force." "Q. You know of your own personal knowledge that anybody is

getting fifty cents?"

"A. Yes, sir; right in Chicago today. The City of Chicago is getting it. They leased all of their instruments at fifty cents; cheated us out of a good sale."

"Q. From whom?"
"A. The Western Electric Company." "Q. Who maintains their instruments?"
"A. They do."
"Q. Who maintains them?"

"A. Oh, I think the Bell Company likely maintains what is to be maintained about them. They are all there yet."

"Q. How are these instruments used?"

"A. Why, on the P. B. X service, policemen, firemen and alder-

"Q. Is there a service charged them besides that?"

"A. Oh, yes; they have that old measured service in Chicago; whenever they hit a line it is charged up."

"Q. They put the instruments in there at fifty cents a year, then

charge extra for the use of them?"

"A. Oh, yes, sure."

"Q. That would be really an extra charge?"

"A. What has that got to do with it? They do ninety per cent of the talking among themselves." 2048

"Q. When was the last time you saw the contract?" "A. About '17 or '18; I was over there at the City Hall."

"Q. You looked at the contract?"

"A. Yes, sir.'

"Q. Who signed the contract?"

"A. I think Mr. Sonney."

"Q. Mr. Sonney, on behalf of whom?"

"A. The Chicago people had to do that; the Company had to make the deal, if I remember right; you can get that, you can show that.'

"Q. Fifty cents per year or fifty cents per month?"

"A. Fifty cents per year for the instruments, on the basis I mentioned."

"Q. What else was in the contract?"

"A. That was all."

"Q. Just the instruments,—and that was a special contract entered into when?"

"A. About 1912. I lost the sale somewhere along in there."

"Q. For how long a term is that contract to run?

"A. I don't know."

"Q. Could a contract like that be modified now?"

"A. I don't know."

"Q. What would the Kellogg Switchboard Company make a contract like that now?"

2049 "A. A lease at fifty cents? I don't know. They would have at that time."

"Q. Would you make a contract like that at that time?"

"A. We always believed that people ought to own their own tele-

phones; it is cheaper."

"Q. Would you make a contract as a manufacturer to furnish the Southwestern Company the transmitters, receivers and induction coils, to keep them in good condition, at fifty cents a year?"

"A. Is that all they charge you?"
"Q. I am asking you would you do it?"

"A. I can't conceive of such a foolish question as that."

"Q. Isn't that the amount that you alleged in this case, -for fifty cents a year?"

"A. After you pay for broken shells, you pay for broken parts twice,—you pay the freight and you pay the express both ways."

"Q. As a manufacturer, would you undertake to furnish even your second-hand instruments at fifty cents per station?"

"A. Yes, sir."

"Q. Have you ever done it?"

"A. No, nobody is that foolish, besides yourself, to undertake to do business on that basis. It is a foolish condition, a subterfuge condition; every company ought to own their own instruments."

"Q. If they owned them they would have to have them 2050 maintained and repaired, and have to have replacements?"

"A. Yes, that would show in your sheets every day. think that is something you ought to do yourself. I think it is absolute folly for you to ship them. I think you ought to do it yourself."

"Q. Do you know whether the Western Electric Company have a

repair shop here?"

'A. They should have one. They ship much of that stuff right straight back from the main office.'

"Q. Have you examined here to see whether they do it?"

"A. Not here, but I have visited a great many Western Electric Company offices, Mr. Frank."

"Q. I believe you stated that you told Mr. Howard, with respect

to this division plant, the toll plant-

"A. (Interrupting.) Yes."

"Q. (Continuing:) That you would have to stand or fall on the twenty per cent?"
"A. Yes, that is the only way to arrive at that."

"Q. In other words, that is the only hope of his making any showing in this case at all?"

'A. Why, that is ridiculous; I did not make any such assertion

at all."

"Q. You put in just as little as possible in the plant?"

"A. A man pays twenty-five cents to go out here on the railroad, and I said the only basis of charging these tolls would be to 2051 charge for the use of them by the respective subscribers, but we couldn't find out-

"Q. (Interrupting.) What was it you said when I asked you. with respect to the percentage you used, and you said you didn't

know whether it would be ten per cent or twenty per cent?"

"A. At that time I did not know. At that time, really, I thought it was none of your business, anyway,—what I was going to do with this proposition anyway, in the first place."

"Q. But you stated that you told Judge Howard that you would have to stand or fall on whether or not it was twenty per cent?"

"A. I said that is the only basis,—is the use of the line."

"Q. What did you mean by saying that you would have to stand

or fall on whether or not it was twenty per cent?"

"A. Well, I say if people in Houston use these toll lines in proportion, the City would have to stand it,—that all. That is perfectly obvious. If it was twenty, then they could charge you with twenty per cent of the total of the toll investment."

"Q. But when you were on Cross Examination before, on Page 2078, you testified,—I asked you the question: "How would you proportion the toll property in the States?"-and you testified as

follows: "Well, I am going to have composits-I have got to 2052 study your pro rata of the expense you have got loaded in

Houston. You have got Houston loaded with practically \$120,000,00 of expenses here that I don't know what it is. Q. Are you going to divide it on the basis of expense? A. Not yet. going to wait and see. Not until I see the books. Q. Are you going to wait and see what result you are going to get before you decide? A. No, I haven't yet. I never fool myself that way. Q. Name some of the ways in which you might divide the toll property of the State? A. You show me the books. You don't know how, I don't know how I am going to take care of the proportion until I make a study of the situation. Q. Now, let's see, Mr. Kelsey, you could divide the toll property of the State on the basis of the proportionate part of the entire property as found by loading the Houston exchange property with all the property in the State, couldn't you? A. Oh, I presume so. Q. Now, you could divide it on the basis of the proportion of the entire expenses in the State as compared with the entire expenses in the City of Houston, couldn't you? it could be, I suppose. Q. Now there are four different ways of dividing and allocating the toll property in this State to the City of Houston. Which one of those do you intend to follow? A. I don't know."

Then, after a colloquy between the attorneys, you say: "Show me the books. Q. Does your answer depend-does your system depend upon what the answer would be? A. I want to know 2053 on what basis you do all your allocating. Then I am going to-I don't propose at this time to say what I am going to do about that allocation. Q. Can you tell the Court at this time what would be a fair way of——. A. (Interrupting.) No. Q. Now, Mr. Kelsey, have you ever done this anywhere else? A. I presume so,-

I don't remember."

So that, Mr. Kelsey, it was just an accident, wasn't it, that you stumbled on the lowest percentage that it was possible to use for the allocation of the toll properties to the local exchange?"

"A. Did you ever make a speech and think of the many things

you might have said, after you sat down?"
"Q. I am not testifying."

"A. You know, I thought of a lot of things after I got away, out of Houston, that I might have added to this case, but we were going at high speed and I told you that I would come to a final logical reason, and I finally did. If a man buys service from the railroad, he can use it so far, and no further."

"Q. Answer my question, whether it was an accident that you

stumbled on the lowest percentage?"

"A. No, sir."

"Q. It wasn't an accident? I didn't think it would be."

"A. Well, I don't believe in accidents in this business my-2054 I don't take anything for granted, Mr. Frank."

"Q. Did you figure out the percentage any other way?" "A. No, that's the only way. I never even made another calcu-On the train, I said to Charlie Gates, or the man with him, I said: "I want to know what your toll business is"-and then I wasn't surprised to find that Houston wasn't getting its full share; and I told Judge Howard at the time that the large city doesn't seem to originate the tolls,-that the small cities do. I found that out in Montreal,—that the small cities were originating all of the toll business, and I said when I got here: "I am very much surprised if Houston isn't doing what the other large cities do." Now Birmingham had a small amount compared with the rest of the community.'

"Q. You say you didn't figure out the rest of the percentages,-

the other percentages?"

"A. I don't think I did."

"Q. What is the meaning of the "deadly parallel" on the third page?

A. That is to show that the charge here is just in proportion to the portion-

"Q. (Interrupting.) You stated that you didn't figure the other percentages."

"A. Well, not in this relation."

"Q. And on the third page of your exhibit you show that 2055 16½% of the company's telephones are operating here in Houston.'

That is for the information of the Court, and by a strange

coincidence, 161/2% of the traffic is here."

"Q. You found out that 161/2% of the traffic is here in Houston?"

"A. Charged right here to the dollar."

"Q. And that 161/2% of the telephones are in Houston?"

"A. Yes, sir."

"Q. Then you found out 19 per cent-"

"A. (Interrupting.) You have got this town loaded with maintenance and depreciation a little bit more than there ought to be."

"Q. Then you found out 23% of something; what is that, of the investment; the company's engineers have almost unanimously agreed you say that the Houston property shows an investment of practically \$8,000,000.00?"

"A. I saw one item here that come pretty close to eight million. That was my impression until I saw your figures yesterday,-six

and a half million."

"Q. Then you say: "Surely a calculation which reveals 23% of the property of this Company in Houston proves its own absurdity, when it is noticed that but 161/2% of its subscribers are in the City.

"A. Well, you consider that Dallas is a big property, and Fort Worth and San Antonio; you couldn't conceive of any proposition

whereby Houston would have 23%." "Q. So that was figured out?" 2056

"A. It has no relation whatever with the special condition. I was trying to solve that toll proposition, which was bothering me a great deal, and I found it quite logical and practical, too."

"Q. Now, the total plant in the City of Houston is about 20% of the total exchange plants of the Southwestern Company in Texas. Why wouldn't that be a fair basis of dividing the toll properties?"

"A. It is not, at all. It is impossible to conceive of conditions like that, when you consider Fort Worth, Dallas, San Antonio, Galveston,

Cleburne, and you can't, by any imagination, conceive of 20%. If you have, there's something rotten again,—something wrong. You couldn't have 20% of your investment in this town, unless you have got an old farm plant in Dallas and an old farm plant in Fort Worth. Why, it's ridiculous. There's other parts of this country."

"Q. How many stations are there besides the Southwestern?"

"A. One hundred and fifty-one thousand, I think."

"Q. One hundred and fifty-one thousand?"

"A. Yes, sir.'

"Q. And how many stations in Houston?"

"A. Twenty-six thousand and five hundred. That is 161/2%, I believe."

"Q. Now, about 161/2% of the property, you are going to 2057 allocate 10% of the toll property, are you, or 9.4%?

"A. Yes, because they only use that much."

"Q. Now, do all of those \$4,667,000.00 of toll receipts originate at the one hundred and fifty-thousand stations?"

"A. Yes, that belongs to the Company; that is the money that is left."

"Q. Do you say that it does originate at those stations?"

"A. That is the money that is left; that is the toll business that belongs to them."

"Q. Now, there happens to be on the very report that you got that figure of the number of stations from, that happens to show, if you

had just looked at it, their connecting stations in Texas-"A. (Interrupting.) That has nothing to do with that; that is the money that the Southwestern earned and turned in,-their own financial statement."

"Q. That is the money that they earned and turned in, their own

financial statement."

"A. It has nothing to do with it." "Q. Those are connecting stations?"

"A. Yes, sir; that has nothing whatever to do with this case." "Q. So that the \$4.667,000.00 originated at one hundred and

fifty thousand stations?"
"A. Not necessarily. The net result of your toll business in one year in this wonderful company resulted in \$440,000.00, last

year in this town."

"Q. Do you happen to know that in the City of Dallas there are thirty-seven thousand stations?"

"A. That has nothing to do with this case at all."

"Q. And they are not counted in this one hundred and fifty thousand?"

"A. That has nothing to do with it. Who owns Dallas?"

"Q. Let's see where we are going to get on our allocation. are going to allocate ten per cent of the total toll property in Texas to Houston. Where are you going to allocate the other ninety per cent?"

"A. To the other various towns that originated it. That has nothing to do with the State of Texas, Dallas or Fort Worth; it has

nothing to do with anything."

"Q. Then a little town like Bryan might have an allocation of

25%,—mightn't it?"
"A. It might have; that is a wonderful earning, too. You are proud to have that little station down in there. That is where your money comes from, Mr. Frank."

"Q. Did you know that the total figure that you used contained over \$100,000.00 that wasn't telephone rentals at all, but was for

leased wires for telegraph service to the Associated Press?"

"A. That won't make much difference. It is very small. dealt with those telegraph tolls and all of that is in there. You know that is a part of this system. You know that is in there. You know Houston has a leased telephone business

and they have these wires in here."

"Q. Suppose you were told that in the one hundred and fifty-one thousand stations in Texas, that only about two-thirds of the \$4,667,000.00 of toll business was originated?"

"A. I don't care whether it is originated or not. You collected

that much money. What has that got to do with it?"
"Q. All right. Now, that is two-thirds of it. Now, in allocating

"A. (Interrupting.) Allocating nothing. I am talking about all

the tolls that you earn."

"Q. In allocating your long distance lines to the various local exchanges, if you would allocate it on the basis of use, as you have done, you would leave about 33 1/3% of your plant up in the air; where would it be allocated?"

"A. What 33 1/3%?"

"Q. There is only about two-thirds of this amount of the total revenues from toll business that is originated at the one hundred and fifty-one thousand stations."

"A. And paid for." "Q. And paid for."

"A. How do you know that?"

"Q. Because we have the figures."

"A. Your balance sheet shows so much earning for the year." 2060

"Q. Our balance sheet shows a little over two-thirds of the

tolls originating-"

"A. (Interrupting.) Originating? What are you talking about? What has that got to do with it? You might originate any amount and send it to New York. The money you have kept out of your toll business amounts to \$4,667,000.00."

"Q. Let's assume-

"A. (Interrupting.) Don't assume anything. Your toll earnings are just-don't matter whether you originate it or terminate it,—you have collected the money and kept it, and you have paid all commissions, too."

"Q. Now, these \$441,000.00 worth of tolls originating in the City of Houston is the thing; that is the percentage on which you

have allocated the toll property?"

"A. (Interrupting.) That is the information I had. Do you

come into this town and admit that you had \$441,000.00, but that you were trying to gum-shoe them out of three-fourths of it? folks always keep the books and hide them out and never will let anybody see them, and then you come in here with some of your wheres and wherefores. You earned \$441,000.00 on toll business in Houston, and that is the basis you are going to settle on,-the money you earned on your long distance business."

"Q. Oh, I am just trying to find out why you left out the rest of it. Suppose there was one hundred and fifty-one thousand

stations-2061

"A. (Interrupting.) Nothing to do with stations."

"Q. Well, I notice you abandon stations?"

"A. Well, you abandoned it too. Never was considered in this I had those conditions in Dallas in mind,-all those proposition.

conditions."

"Q. Mr. Kelsey, if there were five other towns in the State of Texas and only five other towns where we were doing business, and each one of them had a plant the same size of Houston, or approximately 26,666 stations, that would total one hundred and sixty thousand stations. Now, I want to show you the fallacy of your reasoning, by showing you-"

"A. (Interrupting.) I am not talking about stations, Mr. Frank."

Mr. Howard: You might demonstrate the foolishness of your own, Mr. Frank.

Mr. D. A. Frank: I will come back to that in a minute.

"Q. Out of the total earnings of \$4,667,523.00 for tolls, the total originating tolls on stations belonging to The Southwestern Telegraph and Telephone Company was \$3,277,969.00, these figures being given to me by Mr. Scott, leaving \$1,389,554.00 of these tolls that were originated on connecting line companies."

"A. (Interrupting.) And on which you earned mileage and terminal fees, and everything else; you earned so much during the

2062 year."

"Q. Now, you have compared the \$441,000.00 originat-

ing in Houston-

'A. (Interrupting.) Not necessarily originating in Houston; the amount that Houston is alleged to have earned during the year."

"Q. It isn't alleged to have earned that."

"A. Yes, sir, it is. It is the amount of toll business in the City of Houston."

"Q. It is the amount of toll business collected for in Houston." "A. Well, it doesn't matter. We are talking about the toll business that you do in your territory. You did it, or 9.4% of it here."

"Q. Let's put it on the per station basis."

"A. It has nothing to do with the per station basis. Toll business has nothing to do with the stations. Toll business is toll business; lines running around this town——"

"Q. (Interrupting.) \$3,277,000.00 of tolls originating at one

hundred and fifty thousand stations."

"A. That has got nothing to do with the case. Originating—what has that got to do with the case?"

"Q. That would be about \$2,000.00 a station, wouldn't it?"

"A. You claim to be a good mathmatician,—you use your pencil."

"Q. That would be about \$20.00 a station, wouldn't it?"

"A. Presumably, if you say so."

2063 "Q. So that the amount which Houston ought to originate, according to that basis, ought to be something like \$520,000.00?"

"A. Yes, sir."

"Q. Now, if you allocated your total plant-"

"A. (Interrupting.) What has the total plant got to do with toll business?"

"Q. Now, if you allocate to each town upon the basis that origi-

nates at that town——"

"A. Oh, no, this is the money that you alleged that Houston earned in tolls, and you gave them a fourth of it."

"Q. Now, if you do the same thing with every town in the

State-"

"A. (Interrupting.) It is a pity that you haven't a statewide case; we would have them all here simultaneously."

"Q. Now, answer the question,—where would you be if you did

allocate them to each town?"

"A. I haven't allocated them and don't intend to. We allocate the earnings of Houston as paid to the company as a whole; that is 9.4%. I am putting these figures in here,—they are not yours."

"Q. Mr. Kelsey, if you allocate to every town in the State just like you have in Houston, the result would be that you would have 32/46ths of your plant allocated and you would have 4/46ths of your plant unallocated, wouldn't you?"

"A. Because you did so much of the toll business in the

2064 rest of the country and so much here."

"Q. Well, how have you allocated it to the rest of the towns?"

"A. Each town in proportion to its toll earnings."

"Q. Would that make 100% of the toll earnings?"

"A. Absolutely,—100%."

"Q. How would it?"

"A. Because that is all you take in. That is all that Houston is credited with,—that \$441,000.00."

"Q. But there was \$1,389,554.00 derived from the other stations."

"A. I know, but that was earned by the toll lines and valid receipts, and that has got nothing to do with this case; that is a part of the earnings, legitimate earnings of the toll lines."

"Q. Don't you see that on the basis of your allocation you would

never give 100% to the plant?"

"A. Why, absolutely not. Here's all the money that you earned, \$4,667,000.00; that's your earnings for the year, a wonderful earning. Houston was only given, according to your statement, \$441,

000.00. I think that is low and I have agreed to it because most of

the large towns added a small percentage."

"Q. But on the same basis of \$441,000.00, you have been told several times that the originating toll revenue for the State at the Southwestern stations amounts to \$3,377,969.00."

"A. I don't care anything about that. Don't you handle anything that comes in? Don't you terminate any business

on your toll lines?"

"Q. Just tell me how you get 100%."

"A. Absolutely because your 100% represents your toll earnings,—\$4,667,523.00. That is the report that you made, that your toll lines received a certain amount. Then you used your toll lines for — and everything else."

"Q. Will you take a piece of paper, please, sir?"

"A. I am too tired to do your figuring."

Mr. Howard: You can make the computations if you want them. He is not a clerk.

"Q. Take a piece of paper and show me how you get 100%."
"A. Well, name the towns, all the names of the towns."

"Q. Instead of giving all the names—"

"A. (Interrupting.) No, no, the thing for you to do in this case you've made a lot of bluffs to me in this case. I am going to call some of those. We'll show you all about that 100%. That is what you are dodging. We will make you eat that quick. That is just the point I am insisting on,—100%, and you are trying to cut this down 20%."

"Q. You just take the figures-"

"A. I won't take the figures until you give me a list of all the towns."

"Q. Well, it would be a map of the State of Texas."

"A. Well, bring it in, bring in all the towns."
"Q. But you are under cross examination."

"A. I know it. How can I create 100% if Houston-"

"Q. (Interrupting.) Now, \$3,277,969.00 originated at one hundred and fifty-one thousand stations?"

"A. Yes, but how much is terminated?"
"Q. Didn't you say that it was 43%?"

"A. No, no, sir."

2066

"Q. If there is six or eight towns, or twenty towns, or any other number of towns in the State—"

"A. There's more than that."

"Q. In the State?"
"A. Fifty towns."

"Q. And all of them were in here at one time."

"A. Yes, sir."

- "Q. And the total amount that was originated in all these towns-"
 - "A. (Interrupting.) But why that—why allocate the other?"
 "Q. \$4.667,969.00——"
 - "A. (Interrupting.) But other companies have local earnings."

"Q. Let me finish my question. Now, if all of the other tolls just like they are in Houston, amount to \$3,277,969.00, and you attempted to divide the plant into proportions as between the \$3,277,-969.00 as compared with the total toll earnings for the State, part of which was taken in at these other two hundred and

twenty-five thousand stations in the total amount of \$4,667,-2067523.00, can you see that you would have about 331% of

your toll plant allocated?'

"A. Yes, and I can see that you are cheating Houston out of about \$277,000.00. You put into this town what belongs to it by the way of terminating-you are cheating Houston; you are assuming that Houston gets nothing for terminating a call."

'Q. Your idea is that they ought to put in more than actually

received?'

"A. Yes; you state in this case and come in here and find that the City of Houston is very nearly ruined with but \$441,000.00 a year. I go on up to the General Office and find that the Company, as a whole, earns \$4,600,000.00; I find if Houston has got its full credit for everything it is entitled to, it originates about 9.4% of the toll business; but if it comes out and is true that the City of Houston is being denied its share of this million and a half of terminal earnings and other things, which belongs somwehere, belongs to the Company, why, then I am perfectly willing to rest on Why not?" my theory.

"Q. All right, Mr. Kelsey."
"A. That would give \$600,000.00 to this town, and we would be

perfectly willing to take our increase through investment."

"Q. All, right; let's go a step further. Suppose that the Southwestern Telephone Company should sell every local exchange in every town in Texas except the City of Houston, it would 2068 still have the same toll line property, amounting to \$8,602,-359.00, it would still have the toll earnings of \$4,667,000.00. I ask you to state to the Court whether you would allocate them the entire \$4,667,523.00 to the City of Houston?"

"A. It is an absurd condition that is not practical."

"Q. Well, it is possible, isn't it?"

"A. No, in that condition, then Houston would be loaded up with all these General Office charges,—these operators over here, these operating expenses."

"Q. Your theory of putting a part of the toll plant into the local

exchange-

"A. (Interrupting.) I don't know what you are talking about.

You don't know either."

"Q. Well, I don't know whether you do or not. I know what you are talking about. I just asked you to answer that question,whether you would favor putting the entire toll plant in the City of Houston—the entire toll earnings in the City of Houston?"

"A. It is an absurd situation, without parallel and without hope of parallel. It is a condition that is not possible. As long as we have this present condition existing in this town whereby Houston

is loaded up with all the charges that could possibly be put on it, and it originates and handles and only receives a credit 2069 for-I can't see a reason now, while Houston is held to its proportion. It is being cheated out of what is going out."

"Q. If that was the condition, if the-

Mr. Howard: He didn't state that.

"A. If you put a proposition up to me, that you segregate absolutely the toll lines of the company and build little switchboards outside of the community and connect with the trunks, then you have got a sensible condition; but you can't come in here and take the biggest part of your traffic expense, toll operators in the City of Houston, and load them in here on the City of Houston and try to erect any edifice as you did awhile ago."

"Q. (Interrupting.) Will you stick to my question, Mr. Kelsey?

If I understand you, then if this company was-

"A. (Interrupting.) If it was all a long distance company?"

"Q. Except the City of Houston."

"A. No, that would be absolutely absurd. Take your A. T. & T., which has no terminals, then you have got a fair condition, but here you camo-flouge all the expense of running the long distance in on the Houston people."

"Q. Take the A. T. & T.?"

"A. That is a separate concern. You never would have had all this argument in Court if you had had a separate toll 2070 company."

"Q. About eight years ago the A. T. & T. had one local exchange." "A. Down in North Carolina? Yes, they tried to get rid of it quick."

"Q. I don't think it was in North Carolina, but it was in Ala-

bama."

"A. Yes, sir."

"Q. Now, they had one exchange; you wouldn't undertake to load the whole long distance plant of the A. T. & T. Company on that one little plant down in Alabama, would you?"

"A. Oh, that is a perfectly absurd question. It has nothing to

do with this case whatever."

"Q. Just where would it cease to be absurd?"

"A. We are talking about this condition that exists here."

"Q. Where would it cease to be absurd?"

"A. We are talking about a State telephone system here, of which we are all a part."

"Q. There's two hundred and sixty-two telephone companies in

the State of Texas?"

"A. Yes, I imagine that there's more than that."
"Q. That's doing business with the Southwestern Telegraph and Telephone Company."

"A. Yes, sir.

"Q. Now, there are some of them that are purely local exchanges"A. (Interrupting.) That has nothing whatever to do with it.

"Q. Let me finish my question. Now, there's some of 2071 them that are purely local exchanges, some are purely long distance, and some of them are both long distance and local exchanges. Now, there are some of those lines that you might be called on as as expert to value."

"A. Not me."

"Q. (Continuing:) And I want to know if you went to value the local exchange or one of these long distance systems in this State that happen to own only one local exchange telephone plant——
"A. (Interrupting.) What is the name of the company?

"Q. (Continuing:) I want to know whether or not you would allocate-

"A. (Interrupting.) Name the company."

"Q. (Continuing:) I want to know whether or not you would allocate the entire plant of a long distance company to the local exchange?"

"A. You name that condition, and after I look it over I will tell

you exactly what I will do.'

"Q. You don't have to have the name of the local company, do

"A. Oh, yes; there's a thousand local conditions in this country. You can't erect any of this hypothetical bunk that you are erecting here and get away with it. We are talking about an actual physical

condition. You show me a physical condition such as you 2072 suggest and I will go over there and look at it and look it over, and I will come back and tell this Court."

"Q. Can't you answer the question?"

"A. What is the question?"

"Q. I say, you don't have to have the name of the local company. I want to know if you went to value the local exchange of one of these long distance systems in this State that happen to own only one local exchange of the plant, whether or not you would allocate the entire plant of the long distance part of it to the local exchange?

"A. That is an absurdity."

"Q. It is not; in fact, there's quite a number of them in Texas."

"A. Name them."

"Q. It is not necessary to do that."

"A. Yes it is, because I have got to see it before I can answer it." "Q. Can't you conceive of such a case as that?"

"A. No, sir."

"Q. Did you ever know of a concern that operated only in a city?"

"A. Yes, sir."

"Q. Does the Chicago Telephone Company operate only in a

"A. No, not in Chicago; you know, it reaches down to Joliet and

'Q. Does the Cleveland Telephone Company operate in Cleveland only?"

"A. That operates all along."

"Q. Did the Commission allocate all of the long distance 2073 lines to Cleveland?"

"A. They have a contract."

"Q. Most of them have a contract?"

"A. Where you have a separate contract and a separate long distance company, that is different. You have here an intermediate

concern: you have to use a separator, you know."

"Q. The City of Dallas telephone plant is owned by the Dallas Telephone Company, a merger of the Bell telephone plant and the local telephone plant; a large part of the stock is owned by the Bell people, but still there is something like twenty or thirty or forty per cent of it that is owned by the local people and they have no long distance lines at all. In valuing the City of Dallas would you add a part of the long distance earnings to the local exchange?"

"A. If it is a separate concern, you have an entirely different con-Here is a condition in this town that is so intermingled that you can't allocate it. There's more toll operators than there are

local operators."

"Q. Do you swear that?"

"A. Yes, sir."

"Q. That there's more toll operators than there's local operators?"
"A. That can be proved."
"Q. But you are swearing now. You testify under oath?"

"A. Yes; I am glad you mentioned that, because I overlooked it." "Q. You are testifying under oath that there are more toll 2074

operators and more expense than local?"

"A. You have got a tremendous traffic load in this town."
"Q. What difference does that make with reference to this theory of yours?"

"A. Not a bit."

"Q. In the City of Dallas you wouldn't undertake to do that?"
"A. That is a different condition entirely. Here is a condition right here that is so plain,—it is as plain as your hand."

"Q. The City of Dallas, as I understand it, is connected with four

or five long distance lines going in there."

"A. I imagine that they have got the old Texas long distance tele-

phone lines.'

"Q. Well, they have got several going into the exchange there. Now, if you were valuing the City of Dallas telephone plant you would not undertake to allocate a part of the toll-

"A. (Interrupting.) After I looked over it——"
"Q. (Interrupting.) But you wouldn't undertake to allocate any of the long distance lines, or any of those four or five companies that operate in there, would you?"

"A. Yes, and I am going to see that the local community gets its

share. That has been the great game, -hiding these things."

"Q. Have you a conception of what we are trying to arrive at in this case, Mr. Kelsey?"

"A. I am trying to arrive at what the City of Houston 2075 ought to pay you for those services."

"Q. Do you know that what His Honor is trying to arrive at is

the value of this property in the City of Houston?"

"A. Yes, and I have given you that in my opinion." "Q. Why do you go out of Houston and drag in-

"A. (Interrupting.) Because the confiscation depends on your

earnings."

"Q. In other words, your idea is that if the long distance lines were losing money on the outside, but the City of Houston would have to raise its rate in order to carry the long distance lines?"

"A. Just about the size of it."

"Q. On the other hand, your idea is that if the long distance lines were making money, that the rates in the City of Houston

ought to be cut down?"

A. Why, the City of Houston is paying for all the toll girls and everything else. The thing for you to do is to separate the long distance from the local; build your switchboard full outside of town and you won't have this argument and confusion; but you are getting away with something."

"Q. Mr. Kelsey, do you remember what per cent you claimed was used for overhead expenses on central office equipment by Mr. Hoag?"

"A. What do you mean by that, Mr. Frank?"

"Q. When Mr. Howard was questioning you he asked you 2076 to state how much, in your opinion, it would take to install the switchboards at Preston and Hadley and Taylor, and you made certain figures for him; and then he asked you how much overhead there was on there. You remember what per cent you used?"

"A. No, I don't but I can tell you in a minute; about 50% I

think it was, Mr. Frank."

"Q. Just tell us how you arrive at the 50%?"
"A. Well, add land, buildings, distributing system, central office equipment and station equipment-

"Q. (Interrupting.) Well, he was merely talking about central

office equipment."

"A. Yes, I will tell you. By adding these items it amounts to \$4,655,000.00, and by taking the loadings the total amounts to something like \$6,915,000.00; in other words, the loadings are 50%, the indirects."

"Q. Just tell us what loadings."

"A. Contingencies and omissions-"Q. (Interrupting.) How much contingencies and omissions?"

"A. Three per cent; engineering, 4%; general expenses, 2%; taxes during construction, interest during construction,-

"Q. (Interrupting.) How much?" "A. Why, that runs \$550,000.00."

"Q. Interest during construction?"

"A. Yes, sir.

"Q. That would be about 9%?" 2077

- "A. Yes, and the cost of establishing business,-practically a million dollars.'
 - 'Q. Is cost of establishing business an overhead?"

"A. You have got it in as an overhead."

"Q. Do you call that an overhead?"

"A. Yes, sir."
"Q. That's the way you arrive at 50%—by putting in the cost of establishing business?"

"A. Yes, by adding 50% to the direct charges."

"Q. So when you said the central office equipment was loaded up with 50% overheads, you meant by putting on there what we call overheads, and in addition to that putting on something for the cost of establishing business?"

"A. Yes, your switchboard in question amounted to \$750,000.00, and I said in your loading scheme you had made it about \$1,100,-

000.00 for the switchboard."

"Q. Now, as a matter of fact, the cost of establishing business is not a part of the physical plant at all?"

"A. It isn't a part of the plant at all in this case."

"Q. Well, in any case?"
"A. Where you have that expense in starting a business, it is a direct intangible, of course,—that is, the cost of establishing business—putting on the business, running the business, but there is no

reason for it in this case, as there is no reason to ever expect that there will ever be any period in your life where you will lose money in that way." 2078

"Q. Do you understand, Mr. Kelsey, that these entire figures are reproduction figures?"

'A. Yes, sir.

"Q. And you understand that the figures used for the cost of establishing business were not actually lost to the Company?"

"A. No, based on all these reproduction figures."

"Q. Do you understand how they were arrived at?"
"A. We used to arrive at it by adding 15%. Over in Houston, over in Montreal-

"Q. (Interrupting.) And some of them add 25%?"
"A. Yes, sir, and I wonder why you didn't add more."
"Q. Twenty per cent is rather the average?"

"A. Oh, all percentages used in any basis of analysis-

"Q. (Interrupting.) Twenty per cent for cost of establishing business?"

"A. In 1912 they thought that 15% was all right. Since that time some of them have claimed 20%; some of them have claimed 35%; there is no limit to their claim.

"Q. The cost of establishing business was not put on there before

depreciation, or subtracted, was it?"

"A. You have two values. What do you mean?"

"Q. What are the two values?"

"A. You have one without depreciation,—\$6,915,309.00."
"Q. Now, tell us what that is called in Mr. Hoag's ap-2079 praisal."
"A. This is reproduction cost new."

"Q. And how much did he take off for depreciation?"
"A. Well, apparently he takes off—he calls this plant 92.91 good; in other words, he removes 7.9%."

"Q. And what does that amount to in dollars and cents?" "A. It isn't figured that way; he has two sets of figures here." "Q. Well, what do the figures show the depreciated condition of

the property to be?"
"A. Well, let's see,—the depreciation is \$402,968.00."

"Q. Well, now, what is that figure,-read it over again."

"A. According to my calculation, 7.9% of your total reproduction cost of physical property, \$5,683,610.00 is \$402,968.00.

"Q. And what does that leave for the present condition of the

property?"

A. \$5,280,642.00."

"Q. Now, down to that point there hasn't been anything said

about the cost of establishing business, has there?"

"A. Oh, yes, you have two costs of establishing business and this applies to both of them. Two applications of it,-the same figure in each case."

"Q. But is 92 and some per cent applied to the cost of establishing

business?"

"A. No, no, it is not."

"Q. As a matter of fact, engineers don't generally think 2080 of the cost of establishing business as an overhead expense, do they?"

"A. Oh, if he doesn't he will get left and ruin himself."

"Q. Well, did you ever know of any engineer that claimed that as

an overhead expense?"

"A. I know, too, that every banker, or every large business man will start in and create a surplus to overcome that very thing,losses during the early period.'

"Q. We are not talking about the same thing."
"A. Oh, yes we are; it is an indirect expense that disappears; it's losses."

"Q. Well, does going value ever disappear?"

"A. It never appears. I can imagine indirect losses, such as lost tools, broken tools during construction, missing parts-

"Q. (Interrupting.) Does interest during construction disappear?"

"A. It's in there."

"Q. Does that disappear?"

"A. No, that's part of the investment that a stockholder buying a share pays for that."

"Q. What did you mean when you said that that is an expense that disappears?"

"A. What expense disappears?"

"Q. Overhead expenses."

"A. It can't disappear, because it doesn't appear. You have no cost of establishing business in Houston."

"Q. I am asking you about overhead expenses in general. 2081 Is overhead expense a legitimate expense to charge up in-

"A. (Interrupting.) Certainly, there is no protest on that.

"Q. Is the cost of establishing business usually called an overhead expense?"

"A. Why, it is nothing but overhead in those cases where you have

the cost of establishing business; it is a loss.'

"Q. Tell us what overhead expenses are." "A. Losses that you can't account for. It's waste, tool makers, for instance, in a factory, the men you have to rebuild tools, broken tools, waste of gas, waste of fuel, and all other little items that go in

and disappear. "Q. Anything that you lose and that disappears is overhead ex-

pense?"

"A. Yes, you take the unproductive load in a factory, and when

an unproductive factory goes out of business-

"Q. (Interrupting.) Could a person go into your factory, for instance, and take an inventory of the factory and arrive at the true value of the factory?"

"A. I can't conceive of such a case. We are not selling our property."

"Q. The Supreme Court of the United States in the Loncoln gas case said that the complainant had not such a monopoly, nor were its profits virtually guaranteed in such a sense to restrict it to a return of 6% upon invested capital. Now, the Supreme Court thinks that we haven't got a guarantee. You think we have?"

"A. I think you have."

"Q. Well, is there any guarantee here?"

"A. Well, you are asking for something, and at least have got a recourse that I couldn't get in behalf of my business,-you have got a privilege that I haven't got.'

"Q. What privilege have we got?"

"A. You are coming in here and claiming a higher rate,—you are

claiming confiscation.

"Q. Don't you see that what you can do in your business is to raise your rate immediately, and you don't have to go into court, and instead of this being a privilege, it is a burden on us to go to court."

"A. There is no relation there at all,—you have a cinch. mire your courage, whether you come in and ask for rates or not."

"Q. Well, what do we get after we get our rates?"

"A. Get a return on your money." "Q. Somebody will pay the return?" "A. The public generally does."

"Q. We have the privilege of charging them so much?"

"A. Yes, sir."

"Q. Now, the Supreme Court also thinks that we have the right to have going value considered, but you think we haven't?"

"A. You certainly have got a right to it if they cost you money,

but you never lose through that reason."

"Q. How do you know we haven't?"

"A. Oh; the Southwestern has been successful from the start, and the Houston plant has been a success. You may have lost a little money during early life——"

"Q. Interrupting.) Do you know what the history of the South-

western Company is?"

"A. I know the history of a great many of the principal Bell telephone companies."

"Q. Do you know what the financial history of this Company has

been?"

"A. It has been a very wonderful success."

"Q. Do you know what per cent it has made during the entire history of the plant?"

"A. According to your figures, you have probably lost money."
"Q. Do you know that the dividends paid for the entire history of

the plant averages 5.36%?"

"A. Well, that may be true. How much real money have you put into the Southwestern plant? That ought to be in that case"

"Q. Is that a wonderful investment?"

"A. I think, considering the indirect charges that have been made,

that the plant has always made money."

"Q. Well, the sworn testimony in the case is that there has been about \$37,016,863.91 in real money put into the Company, and the sworn testimony is that on the stock outstanding there has been 5.36% paid over a period beginning in 1883 and ending in 1919, which is 36 years. Now, do you consider that a wonderful investment?"

"A. To the owners it has been a very wonderful property. Mr. Glidden, and every owner that ever had it, made money on it. I

don't care what your dividends were."

"Q. 5% is wonderful?"

"A. That isn't all the earnings you had in this property. You have drawn money out of this property, other charges and fees and contracts."

"Q. All right, tell us what money we have drawn out?"

"A. I don't know; you could show that."

"Q. Well, when and how much?"

"A. I don't know."

"Q. You don't know? Why was it?"

"A. Because I know it?"

"Q. You realize that you are under oath, don't you, Mr. Kelsey?"
"A. You bet; I have realized that from the time I hit this town."

"Q. You swore this morning positively that we had more tool operators than exchange operators?"

"A. No, I gave it as my opinion that it cost you more to operate

your toll lines than your local exchange."

"Q. But you stated positively this morning that we 2085 had more toll operators than we had exchange oper-

ators."

"A. I know that when people get to speeding up they sometimes do say something that they have to back-pedal on, and we were going at a very furious pace this morning; but I am still satisfied that the toll expense in this town is almost as high as the other, and I would like to know what they are; I haven't seen them subdivided.'

"Q. Mr. Kelsey, the total number of toll operators in the City of Houston is 92 and the exchange operators number 415, making a

total of 507."

"A. What is your pay roll for each one? I am talking about

all costs, direct and indirect."

"Q. Can you conceive of 92 getting more money than 415?" "A. No, but I am talking about switching operators. The whole foundation is laid for your long distance business; the whole theory of your organization,—they all start messages out of this town."

"Q. Are you ready to take back what you said this morning about our paying more toll——"

"A. (Interrupting.) If you prove to me that I was wrong, I would, yes, sir.

"Q. Anything I can prove is wrong, you will take back?"

"A. Yes; you pulled the Birmingham record and took it back, and

I want the same privilege."

"Q. Mr. Kelsey, what are some of the things that enter 2086 into the makeup of a switchboard? Do switchboard jacks enter into it?"

"A. Yes, sir."

"Q. What are 92 switch board jacks worth now?"
"A. Twenty-five cents; they used to be fifteen."

"Q. Where they come 20 per strip?"

"A. Yes, or ten per strip. The largest one used to be 35."

"Q. And No. 12 jacks-twenty per strip-what are those worth?" "A. I don't know, but they-I don't know what they charge for them now. We used to get thirty cents for them."

"Q. And No. 12 lamp jacks, ten per strip?"

"A. If you will let me get my price book I will price everything you have got in your shanty. One thing that a Sales Manager has to learn is not to try to carry any prices in his head."

"Q: You won't undertake to tell me what a No. 12 length lamp

jack, ten per strip, costs?"

"A. Oh, yes."

"Q. How much?"

"A. I can look at the book and tell you. No. 92 jacks, twenty years old now, are good for thirty years more service. I think I read from that yesterday,-No. 92 jacks-here is 92 jacks, 25 jacks,—a jack has been a quarter ever since the world began."

"Q. Did you know that the Western Electric Company was charg-

ing about 27 or 28 cents?"

"A. What's to stop them from charging fifty cents?" 2087 "Q. Did you know that the Kellogg Switchboard Company was today selling them for twenty-eight cents?"

"A. They ought to, if they are not."

"Q. And the No. 12 lamp jack which you say is 30 cents, did you know that the Kellogg Switchboard Company was today selling it at 45 cents?'

"A. No. I think you are wrong there. I can find out and bring

my price book down and keep you busy."

"Q. What's a No. 110 'A' key, Kellogg, worth?"

"A. I don't know. We have about 700 different keys, different springs on each one, ringing and listening keys; I will get my price book and tell you exactly."

"Q. Well, you were undertaking yesterday to criticise the prices." "A. Yes, but with all this multitudinous detail of engineering

details-how many lines have you got? Five thousand. I will tell you in a minute how much you pay for it."

"Q. You don't happen to recall what a No. 110 'A' key costs?"

"A. I don't remember. I had to ask you what it was."

"Q. What is a No. 109 plug worth?"

"A. About sixty cents."

"Q. Would you be surprised to know that the Kellogg Company

has quoted us a price of a dollar today on those?"

"A. How did you get that quotation? I wouldn't be surprised at anything in the telephone business. Are you trying to get others too?

"Q. What is a No. 447 six point cord worth?"

"A. About five hundred seven—I will furnish you all the cords you want for forty-five cents."

"Q. Will you furnish the same kind as the No. 447?"

"A. Yes, ten thousand; I will furnish you one hundred thousand cords, and I will furnish them at that price. I just had a quotation from Belden on those cords,—just bought ten thousand receiver cords last week. Ask me about that price."

"Q. What is No. 163-'E' relay line of cut off worth?"

"A. They have changed those, as well as anything else. I think it was \$2.25."

"Q. Would you be surprised to know that the Kellogg Company quotes us a price of \$5.45 on those today?"

"A. They might quote that to you."

"Q. And the Western Electric Company charges us \$2.35?"

"A. Well, under what circumstances did you get the quotation?" You know I have been in that game many, many years, and it is according to who is ordering the stuff. What's the last time that they sold you anything?"

"Q. Do you know how much No. 84 cable, 63 wire, is worth per

foot ?" "A. It used to be about seventeen cents."

"Q. Would you be surprised to know that the Kellogg Switchboard & Supply Company quotes that now at 41 cents?"

2089 "A. That's good, because we have got about 100,000 feet of the stuff and we will raise our price on it.

"Q. So you gave a figure of seventeen cents?"

"A. That's what we have been selling it at right along. You see we got all of the old cable out of Buffalo."

"Q. Do you know what No. 70 switch board cable, 41 pair, is worth?"

"A. No, I don't."

"Q. You don't happen to know what it is worth?"
"A. I don't know."

"Q. Do you remember what it used to be worth?"

"A. What?"

"Q. No. 70 switch board cable."

"A. About 21 cents."

"Q. Would you be surprised to know that the Kellogg Switch Board Manufacturing Company has quoted us 53 cents per foot?"

"A. It wouldn't surprise me any. Let's see those Kellogg quotations."

"Q. No. 24 switch board cable, 21 pair?"

"A. That used to be 11 cents.

"Q. Would you be surprised to know that the Kellogg Switch Board Company quotes this today at 29 cents a foot?"

"A. Well, you know that most of these companies are shipping to Europe; you know the average American can't buy any metal now."

"Q. So your estimates on these things have no comparison at all, and appear to be from one-third to one-half of the quoted prices today :

"A. From 1914 on. Are you talking 1920 prices, or the average

prices of the last five years?"

2090 "Q. I am talking about prices right now."

"A. I don't care anything about the prices right now; they don't concern this case at all. If you want to talk the prices for the last five years, bring me your 1915 price books, your 1914 price books, your 1915 and 1916 prices, and 1920 price books and put them in the Court here if you want them."

"Q. Now, all of the materials that I have just called off to you

are used in switch boards, aren't they?"

"A. Yes."

"Q. And make up—these ten different kinds of material quoted to you practically make up the switch board, except the frame?"

"A. Yes, some of them."

"Q. Cables and jacks and plugs and keys and relays?"

"A. Yes."

"Q. And cords?"

"A. Yes, sir, very simple devices."
"Q. Those are things that make up cable?"

"A. Cables?"

"Q. Make up a switch board?"

"A. Yes, sir."

"Q. That's true?"

"A. Some of it."

"Q. Now, you have guessed from 331% to 50%-

"A. (Interrupting.) I haven't guessed at all. I have told you what the prices used to be and what I sold them at. I told you I din't have my price book along, and nobody ever remembered 2091 in detail those prices where they have got ten thousand to

remember."

"Q. The prices given us were the prices seven years ago?"

"A. Yes, and from the Western Electric at 45 cents-what about

receiver cords,-give me a quotation on receiver cords."

"Q. Do you know, Mr. Kelsey, that all of these prices that I quoted you here from Kellogg are considerably higher than the prices used by Mr. Hoag?"

"A. Well, I think Hoag was fair enough to go back and get the

average of five years."

"Q. Mr. Hoag's average covered 1918 and 1919.

"A. Well, he ought to have taken the five year average."

"Q. Well, would the five years' average give you a true picture of what it would cost to reproduce the plant,—of what it would cost to reproduce the property?"

"A. It would give us one of the figures,-only one of the ways."

"Q. Mr. Kelsey, if you were called upon to find the value of a piece of machinery out here, would you have to know what money was put into it in order to determine the value of it?"

"A. What is it, public utility machinery?"

"Q. Well, any kind of machinery,—take a street car company."
"A. Yes, you always want to know what a fellow paid for some-

thing."

"Q. Would it be possible for an engineer to value a piece of street railway company property if the books were burned up and he had no records at all?"

"A. Why, yes, then you have no records at all and it is uncertain and we have to resort to that in that case, and it would be

2092 the best possible way we have to get that value."

"Q. Your idea is that you would only take an inventory in a reproduction cost of the property whenever there were no books?"

"A. As one of the ways, yes. I told you this morning when we were dealing with some inventories that the Company resorted to the historical method."

"Q. Take the new telephone building, and it is a pretty good

building-

"A. (Interrupting.) A very beautiful building."

"Q. That building cost about \$200,000.00, and the present reproduction cost of the building would be about \$425,000.00 on the basis of the evidence in this case, and now you say its value would be what it cost?"

"A. Well, what we were after in this case is protecting the investors. It don't make any difference and doesn't matter what the

property is worth.

"Q. But can you put yourself in the attitude of being an engineer

who is going out to find the value of property, irrespective of whether a man lost money or made money?"

"A. According to what? Rate making purposes?"

"Q. Can you conceive value without rate making purposes?"
"A. No, sir."

"Q. You put a handle on it?"

"A. You ought to have the facts, but I do not mean to say that

because a reproduction value, Mr. Frank-

"Q. (Interrupting.) Well, you could speak of the value 2093 of a horse, or the value of an automobile, without knowing what they were used for?"

"A. Why, sure; I would want to know whether it was a trotting horse or a dray horse, and with a good record it would, of course,

bring a higher price."

"Q. Can't your mind work as fast on a telephone company?" "A. No, sir; there is no horse racing in the telephone business. I would want to know whether it was for rate making purposes, taxes, or sale."

"Q. Suppose the property cost \$5,000,000.00, but, as you have assumed, it has been badly managed and the present reproduction cost of it was only \$4,000,000.00 but it actually cost the new stockholders \$2,000,000.00,—what would you say is the value of the plant now?"

"A. For income purposes it is the value of the money they put

"Q. Five or two million dollars?"

"A. What it cost."

"Q. Suppose you had another company that wanted to buy it,you didn't have any matter of rates,-but had a purchasing company that wanted to buy the company now, and it originally cost \$5,000,000.00, the bond holders or the new stockholders have paid \$2,000,000.00 for it and a careful inventory and appraisal, taking into consideration everything they had, going concern value,

working capital, and organization, and everything, was \$4,000,00.00, and you were selected as the Engineer by the purchasing company to go and value the property,-what would

you tell the purchasing company to pay for it?" "A. If they purchased the proposition,-not for rate making?"

"Q. Yes, not rate making."
"A. The least they could get it for." "Q. The very least they could get it for?" "A. Yes, sir, all the traffic would bear."

"Q. Suppose the man that owned it said it cost \$5,000,000.00 and he wanted \$5,000,000,00?"

"A. And him losing money all the time? I would tell them not

to buy it."

"Q. Suppose he would think a little while and say he would take

\$4,500,000.00?"

"A. If I could make money on the \$5,000,000.00 basis and the purchaser wanted it real bad, I might advise him to take it: but if one man failed on the \$5,000,000.00 basis, it is also reasonable that the new owner would have an awfully hard job to make good on the same basis."

"Q. In that case you might recommend to your client to pay

\$500,000.00 more than the reproduction figure showed?'

"A. If these people put in that much money,-in funds-the cost of establishing business again, -in that case the company lost money during the period, so they only had \$4,000,000.00 in

real money and lost money in the meantime trying to engage 2095 in the business. There you have the cost of establishing business again."

"Q. Would you pay more on that account than if the property had always made money?"

Have you a specific case in mind?" "A. Not necessarily.

"Q. As a purchase proposition?"

"A. As a purchase proposition, I wouldn't recommend to anybody to buy any badly mixed up concern."

"Q. Turning to the last page of your report, where you say the earning percentage is 8.6% for the entire Company. You also have on the second page the rate of earning for 1919 as 8.6%. That is your own conclusion?"

"A. What?"

"Q. That is your own conclusion?"

"A. No, sir, it is a mathematical deduction." "Q. Did you get that from the books?"

"A. It is a mathematical deduction."

"Q. Eliminating the 4½%?"

- "A. I am talking about what the owner makes. The owner talks about confiscation and we show what he makes out of the business here.
- "Q. Let's get back to your report. You have here as exchange rental-\$880,439.28, and that, on the basis that you have used, with all the additions you have made and subtractions you have made, makes, according to your figures, an earning for 1919 of 7.7%?"

"A. Yes, sir.

"Q. Now, you were told when on the stand before that that figure of \$880,439.28 was \$134,000.00 too large, because it had the advance rate under Government operation."

"A. We discussed that quite thoroughly."

- "Q. Why didn't you take it out of these figures?"
 "A. You collected that much money during the You collected that much money during the year." "Q. The present rates in effect are \$5.00 and \$2.00?"
- "A. That makes no difference. You collected so much money in 1919 and you made so much money on your investment. Later on, you can come in and show what you did in 1920, but you have got lots of nerve to come here and anticipate this proposition."

"Q. You have made this report, trying to help the Court?"

"A. Yes, sir, showing what you earned. I have said nothing what-

ever about rates, but you made money last year. You may not make any this year.'

"Q. How much light does this give the Court on what the present

rates will produce?"

"A. It gives the Court the light that you earned this much money

last year.

- "Q. If the rates last year produced \$130,000.00 more than the rates in effect now, in all fairness to the Court, ought you to subtract that?"
- "A. No, sir, we will subtract that this coming year when you have it happen. You earned this much money and collected it last year. We have nothing to do with the 2097 rates-

"Q. (Interrupting.) Do you know what the Court is trying to

"A. Yes, sir, I am thoroughly familiar with it."

"Q. What is the Court trying to determine?"
"A. Whether or not you are losing money."
"Q. If we are charging the rates now under the City ordinance, they will produce \$130,000.00 less money?"
"A. This year?"

"Q. Yes, than the figure you use."

"A. That will appear in the statement this year."

"Q. It ought not to be taken out?"

- "A. No, sir, there will not be anything to take out. You will have a less figure this year. What will you take out?"
- "Q. If it produces \$130,000.00 less this year at the present rates?" "A. It has no bearing on the case at all. You earned so much money last year. We are not getting all the tolls that are coming to us.

"Q. If the present rates had been in effect last year, how much money would we have taken in for exchange rental?"

"A. But they were not."

"Q. Answer my question." "A. I took a condition,-not a theory. I found you earned that much during the year on an investment of so much money. I had nothing to do with how you earned it."

2098 "Q. The rates last year were \$3.00 for residences and \$7.50 for business telephones, with some measured rates, six or seven months of the year under Government operation-

Mr. Howard (interrupting): You have that too large, Mr. Frank,-only May, June and July.

(By Mr. Frank:)

"Q. From February 1st,-six months."

"A. It wouldn't have made any difference if you had a ten dollar a month rate. Whatever price you charge on, the fact remains that you collected the rental, \$883,439.00, and if I should take an alleged computation based on some condition or theory-what I may here is telling what this Company earned last year. The first of July, after you had six months experience of this, I looked at your report and I noticed that you were earning less."

Mr. Howard: You are mistaken about that, Mr. Frank. We are not contending that these abnormal revenues should be carried into the returns, but it is a fact that these rates were put in under the injunction only about three months and you had them about three months and the people were not paying their telephone bills.

Mr. D. A. Frank: They paid every bill, or we would have cut them off. Didn't you pay the rate for six months? If you hadn't,

you would have been cut off.

Mr. Howard: I didn't pay any at all for a long time, pending the injunction. I paid it all later. I may have 2099 paid it for the six months. We are not contending this abnormal rate should be carried into this return, if that is the point you make.

"Q. The City ought to have about 100% of the tolls, plus about \$200,000.00? Why are you so modest,—why don't you take it all?"

"A. I thought you told the truth and had it all in."

"Q. Why don't you take the income of the whole Company?"

"A. Only the income that Houston earns."

"Q. If the Court asked the question, to tell him whether or not these rates were too high or too low, all you would care to tell the Court would be last year-

"A. (Interrupting.) There is no question about that so far. They had a pretty good year last year."

"Q. A good year last year with \$130,000.00 increased exchange rental from the Government rate?"

"A. Yes, sir, and I imagine by the first of July you are going to have a pretty good idea of what you are doing this year. You are You can't anticipate about things of this kind."

"Q. Did you know that the \$5.00 and \$2.00 rates have been in

effect for several years?"

"A. Yes, sir, I think so. After a year of that you can find out how much you earn in that one year by those rates,-it 2100 don't matter whether two, five, eight, ten or twelve dollars."

"Q. You think-you wouldn't undertake to tell the Court what

the present rates are producing?"

A. About the first of July, after I see the quarterly statements, I can tell, and then you can recover on the deficit theory. You have still got a chance to recover."

"Q. Your advice to us, as a telephone expert, is to rest easy and it makes no difference how low the rates are .- in some sweet by

and by we will get our money back?"

"A. Be diligent. That is your business. You are not hurt, you will not be hurt by waiting until the first of July. If you have a deficit, you will be entitled to capitalize it."

"Q. The best way to do would be to set down and wait and keep

losing money?"

"A. You are holloing before you are whipped."

"Q. Keep losing money, and when you lose it capitalize it?" "A. Your losses during this next six months wouldn't hurt you."

"Q. Our income last year was \$130,000.00 more on the rates then in effect than they can possibly be this year, with the present rates in effect?" .

"A. You have a very fair assumption that you are going to have a little shortage, but wait until you get it and can see it reason-

ably."

2101 'Q. Speaking about the local exchange losing,-that is true, isn't it?"

"A. It stands to reason, there is \$130,000.00 difference."

"Q. You have \$4,855,392.00 as the total investment,—then \$130,-000.00 would be about 3% of that?"

"A. Yes, sir, but you haven't lost it yet. Wait until you lose it. You have got it here, you earned it this year."

"Q. If we had the present rates last year we would have earned \$130,000,00 less?"

"A. Yes, sir, and it will show in the first six months this year." "Q. That would be a 3% loss on your own valuation?"

"A. You haven't lost that. You earned \$885,000.00 last year."

"Q. Don't you know that it is very easy to prove,-very easy to prove the fact that the Government rate last year did produce \$130,-000.00 more than it would have produced with the new rates?"

"A. The rates you had last year produced \$880,439.00. That is all I know and all I am interested in, and all anybody ought to be interested in."

"Q. According to your own figures, when you have eliminated quite a good deal-when you start with figures you call Company figures, over \$3,000,000.00, and cut them down to \$2,672,-

2102 000.00, you start with a figure that is not accurate and you have taken the very smallest percentage you possibly could of the toll, and even on that-

"A. (Interrupting.) I deny that, absolutely."

"Q. And even on that basis for last year the earning was 7.7%?" "A. Yes, sir, and I find from your questionings this morning that

there is about \$200,000.00 of tolls that belong to this town that they have not gotten."

"Q. Tell us how they could be allocated to Houston?"
"A. They could be."
"Q. In what way?"

"A. Plenty of ways."

"Q. Tell us how, so we can get your story with all of its details."

"A. I will keep that. When you come into court and tell us that of that \$4,600,000.00 toll earnings that \$3,000,000.00 originated here, you let the cat out of the bag.

"Q. How would you divide it?"

"A. I don't know. I want to find out what it is." "Q. You want to go off and make some other figures?"

"A. No, sir, I am satisfied to rest on this record without any further figures. This morning you unhitched a horse in your own

pasture, old man."

"Q. We have a statement here, Scott's Exhibit No. 42, showing that the last four months of last year the Southwestern Telegraph & Telephone Company lost \$49,804.00 before deducting depreciation."

"A. You folks are the best losers on paper I ever knew."

"Q. That was in the City of Houston?"
"A. Yes, sir."

2103

"Q. Would you think, then, you would have to go further than that in order to come into court and ask the Court to give us

relief?"

"A. I don't know what Scott did here,-I am not interested in what Scott did. I found in 1919 that you had a very comfortable year, and we ought to, right now at this particular time, January, February and March, be able to show about what you earned during that period. You come in here and say if you had done so and so. You actually collected and kept in your treasury this much money. It is absolutely absurd, because you made so much last year and have got it in your pockets."

"Q. Have we got it in our pockets for this year?"

"A. I don't believe you are broke."

"Q. If our rates will produce \$130,000.00 less this year than last year, you still think that we ought to wait?"

"A. We don't know until we get all these tolls in here."

"Q. You know the same rates are in effect now that were in effect

two years ago?"

"A. You would not be in Court if they were not, but you are crying before you are hurt on this proposition right now. You have all the protection in the world. When you can tell the Court you are losing money-but you can't today."

"Q. Look at your report. When you got down to the total Houston receipts, \$1,342,535,46, including this \$130,000.00 made from the Government rates, you have "Less Instrument Rentals, \$13,250.00." Your original report put in the 4½% payment. When did you change your mind about the 4½% pay-

ment."

"A. I didn't change it."

"Q. Why did you leave it in your first report and cut it out of the

"A. That was what I found. This is a statement of what the owner of this property is making in Houston."

"Q. And in your Exhibit No. 1 you have "Less 41/2%, \$43,-528.06." Why did you put in the 4½% there?"

"A. I found those figures at the time."

"Q. You found them?"
"A. Yes, sir, and I said at that time: "At this time I don't care to dispute these figures. I expect to, if I am ever called back again."

"Q. You put in 41/2% in your first statement and cut it out of the

second?"

"A. Yes, sir."
"Q. Did you experiment, to see whether or not you could do it and

still get 7% or 8%?"

"A. The owner of this property is making this complaint and is charging himself with a lot of alleged services, just like a farmer owning his own business charging himself with his own work."

"Q. I ask you, on your oath, on this stand, whether you would have cut out this 41/2% if you could have arrived at 2105

your 7.7% any other way?"

"A. I didn't have anything to do with it. I never figured ahead in my life, and never will."

"Q. You have total receipts of \$1,329,285.46 by eliminating the

"A. Not all of it. Part of it is there."

"Q. You have maintenance—\$110,675.96?"

"A. Your own figures."

"Q. Is that all the maintenance?"

"A. No, sir, you have some reconstruction during the year."
"Q. Is that all the maintenance?"

"A. As far as I know; that is the record."

"Q. That is the maintenance in the City of Houston?"
"A. Yes, sir."
"Q. Now, you have eliminated 10% of the long distance—

"A. (Interrupting.) Your maintenance men run out of here and repair these lines. It is absolutely logical; they are here and the repairing is done from here."

"Q. On page two of your report you have maintenance, \$112,-441.00. You didn't inquire how much was toll maintenance?"

"A. That is all maintenance. I didn't care about that, because all I wanted to know was all the maintenance, because-

"Q. (Interrupting.) This report here, Mr. Kelsey, was 2106 the report put in for the City of Houston,-just the local maintenance--

2107 "A. (Interrupting.) You have got this town charged with a great deal more than its share."

"Q. You didn't even try to find out how much toll maintenance there was in the State of Texas?"

"A. No, sir, I didn't. I am not interested in that. from here and every point around here. It is in there." "Q. You didn't inquire what the toll maintenance was?"

"A. Maintenance in the Houston District, and there it is, and a pretty liberal maintenance, too, when you subject it to the test. It must be pretty good, because your plant is 93% good."

"Q. Our toll property is in pretty good condition?"

"A. It has got to be."

"Q. And has to be maintained?"
"A. Yes, sir."

"Q. Do you know what amount of toll maintenance there was in the State?"

"A. I didn't care about that."

"Q. If the figures are for company toll maintenance, \$211,-109.00-

Mr. Howard (interrupting): I would rather you would ask questions, and not testify.

"Q. Is that the figure?"

"A. These men are on your pay roll, and you know it is

common practice."

"Q. You are not taking the position, are you, that there was no toll maintenance?"

"A. It is in there."

"Q. The figures you have got here are the figures we use here for the local maintenance of \$110,675.00."

"A. That is the total maintenance. It is proved out when you go to compare them."

"Q. Where did you get that figure, \$110,675.00?"
"A. That is your figure."

"Q. For local maintenance?" "A. You always put in your best figure when you get into a rate I have never known you to be backward and bashful."

"Q. Did you ask anybody about what the toll maintenance was?" "A. No, sir; I knew you run your maintenance men out of here; they got their supplies from this office and gasoline from this office."

"Q. The testimony in this case-"

"A. (Interrupting.) You can get any testimony in this case that vou want."

"Q. Sworn to by reputable men, is that this \$110,675.96 is for local maintenance. "A.

"Q. May have been him, but that is the testimony."

2109

"A. Your toll maintenance is in there."
"Q. If there is an additional amount of \$211,109.00 for toll maintenance-

"A. (Interrupting.) Then that would be \$20,000.00."

"Q. That would be \$20,000.00 for expense in excess of what you have counted?"

"A. No, sir. You can't show, to save your life, a toll maintenance charge in this district of \$20,000.00, in Houston and what goes out of Houston,-Houston city."

"Q. You are taking a certain percentage of the entire State,

aren't you?"

"A. No, sir."
"Q. Didn't you take a certain percentage, 9.4% of the entire toll lines?"

"A. Yes, sir."
"Q. Wouldn't it be fairer, even on your theory, to take the same percentage of the company's toll maintenance?"

"A. No, sir, because no maintenance—you can't show any maintenance around here of even \$3,000.00."

"Q. Why around here?"

"A. That is all we are interested in-right around Houston."

"Q. But you are interested in taking part of-

"A. (Interrupting.) Repairs by Houston." "Q. Taking part of the plant all over the State-"

"A. (Interrupting.) No, sir."
"Q. You didn't take just 9.4%?" 2110

"A. I have-

"Q. (Interrupting.) You took 9.4% of the entire State. Why shouldn't you take 9.4% of the entire maintenance?"
"A. It is in there already. Your pay roll shows your toll line

reserve."

"Q. But your testimony is that there is no toll maintenance; is there?"

"A. I know it; but I saw it in this report that Mr. Lyndon has. Prove it by Lyndon."

"Q. Show what it is."

"A. Prove it by Lyndon. He will show you."

"Q. You are content to rest on that proposition?"

"A. I will take my professional oath that \$110,000.00 covers all the maintenance you have around this territory."

"Q. But you haven't just taken the property around this terri-

tory; you have taken a percentage of the entire State."

"A. I am talking about the Houston toll line the people pay for." "Q. You took a percentage of property for the entire State, did you not?"

"A. No, sir, I haven't touched on that at all."

"Q. Didn't you take 9.4% of the property for the entire State?"

"A. For toll purposes."

"Q. Why didn't you take an equal per cent of the maintenance?" 2111

"A. It is already in there."
"Q. How much does this \$110,000.00 amount to per month per station?"

"A. My daughter could probably figure that out."

"Q. On the basis of 27,000 stations, it would be about thirty-three cents per month?"

"A. What are you talking about? Your maintenance ought not to run over \$5.00 per station. You can't spend the money."

"Q. \$110,000.00—\$5.00 a station." "A. It would run \$3.50 per station."

"Q. Take \$5.00 a station and 27,000 stations."

"A. Around \$110,000.00. I am talking about four and a half, four dollars and four and a half."

"Q. You said this is high, and that is one of the items we are

proud of."

"A. You are an underground plant."

"Q. That is one item we think is a bif attainment of the telephone company.

"A. That maintenance?"

"Q. Yes, sir."
"A. You have got to attain some more."

"Q. You said \$5.00 a station?"

"A. I am talking about the average plant. My goodness alive! the maintenance of the North Dakota property, scattered over a cold-ridden country, never run over \$4.00."

"Q. Why did you mention \$5.00?"

2112 "A. I know of companies that run to \$5.50. They didn't have this underground plant."

"Q. Five dellars wouldn't be an unusual amount?"

"A. Yes, sir, with an underground plant,—it would be absolutely absurd."

"Q. With twenty-seven thousand stations?"
"A. Yes, sir."
"Q. \$135,000.00 a year at \$5.00 a station?" "A. Yes, sir, would be an overhead plant." "Q. We have charged up only \$110,000.00."

"A. I thought that was what you actually paid for maintenance."

"Q. We charged it up because we actually paid it."

"A. I mean-

"Q. (Interrupting.) You are naturally suspicious?"
"A. I am getting to be."
"Q. You were born that way?"

"A. No, sir."

"Q. Your second item is reconstruction; you know what that is?"
"A. Your books show that that is reconstruction."

"Q. \$9,635.04?" "A. Yes, sir."

"Q. When on the stand before I told you that was wrong. Did you make any effort to find out and get the right figures?"

"A. If that is wrong, you gave us the wrong report. You are in the habit of that. I doubt it very much. You have a lot to say about reconstruction. You have one year \$149,000.00 and \$125,000.00, but at no time did you need a figure higher than the reserve I gave you for that."

"Q. If you want me to, I can give you the figures to work with,—

the realized depreciation by years."

"A. You should have given me those figures-

"Q. (Interrupting:) They were given you when on the stand before."

"A. No, sir; when did you give them to me?"

"Q. When on the stand before."

"A. For what years?"

"Q. Beginning back as far as 1909."

"A. Beginning back further than that. You know you can't go back any further than that. You can't say this whole thing has got to be done in three years. I want your twenty year record, since 1898, and I will tell you what the record from now on will be."

"Q. You charge up for reconstruction \$9,635.04. That figure

was an extraordinarily, -an extraordinary item?"

"A. All of those items are extraordinary. Reconstruction is extraordinary and couldn't be charged in maintenance."

"Q. There was no reconstruction figure, and I told you."
"A. No, sir; you said that year was unusually good, but the year before you did quite a lot more. If you will show this Court, if you are fair enough and frank enough to show your absolute record of reconstruction since 1898, I will abide by anything 2114 you find."

"Q. Why 1898?"

"A. Because you start in with the common battery system and commence to put on the airs you have today."

"Q. Can't you be honest enough-"

"A. I want you to be honest enough to give this Court the record since 1898."

"Q. We are working on 1919."
"A. I am working on the basis of 1898 up to now."
"Q. You have used a figure that I told you was wrong."

"A. I asked you for all the figures and you seem to be afraid to show what happened during the last twenty years,—your experience here."

"Q. Mr. Kelsey, what difference does it make what we spent

twenty years ago?"
"A. I want to know what your maintenance was, how big you were, and then you have something to tell the Court. You can't tell the Court you spent all of your reconstruction in three years. That has to be amortized and covered over a period of years."

"Q. In the year 1912 we spent \$183,903.00."

"A. I wouldn't be surprised; you might have spent more than that."

"Q. In 1913 we spent \$121,396.00."

"A. That sounds like it. Your record is almost typical." "Q. In 1914 we spent \$67,916.00."

2115 "A. I would not be surprised."

"Q. In 1915 we spent \$112,846.00."

"A. That is all right."

"Q. And in 1916 we spent \$121,681.00."

"A. Yes, sir."

- "Q. And in 1917 we spent \$85,720.00." "A. Yes, sir; getting down a little."
- "Q. During the war, wasn't it?" "A. Yes, sir; what was it in 1910?"

"Q. In 1919 we spent \$69,075.00." "A. What was it in 1910?"

"Q. Let's finish this. In 1919, \$32,178.00. On account of the

Government having control of the operation of telephone lines during that time, do you know that the Postmaster General didn't allow

any reconstruction?"

"A. No, sir; he had to allow a lot of things. He did in Cleveland,—\$365,000.00, which they tried to make the Government pay, and the people paid it."

2116 Cross-examination.

Questions by Mr. D. A. Frank:

I understand that the valuation that I have used on the first page of my last exhibit does include something for the intangible assets item of \$700,000.00, or the difference between what was actually paid for the property of the Houston Home Telephone Company and the structural plant that went on to your books; that has been my impression. I understand that it does, and then in that Million, Three Hundred and Seventy-four Thousand, Five Hundred and Sixty Dollars you have accounted for a great deal of it. That figure is the amount of money put into this plant since 1914 furnished me by Mr. Lyndon and his book accountant. If there is \$700,000.00 of that that is intangible property, it is not necessarily entirely all right to have it in; according to the conditions, I think it is in there, because, otherwise, \$1,374,000.00 has resulted in only Forty-five Hundred telephones, there is something radically wrong. I get the idea that there was Four Thousand Five Hundred telephones, because in 1914 you had Twenty Thousand and some telephones, and later on you had Twenty-six. According to that, there are Five Thousand additions, and that is very ridiculously high.

"Q. At the beginning of 1914 we had Twenty Thousand 2117 and Sixty-six stations, and in 1919 we had Twenty Thousand,

Seven Hundred and Seventy-five stations?

A No

"Q. That makes a difference of Seven Thousand, Seven Hundred tations.

"A. No. Twenty-six Thousand, Five Hundred is the figure that I have used, and that was given to me as your average number of tele-

phones in 1919."

If you have got Seven Thousand stations at that expense, that is absurdly high for stations, even at this time. That is pretty near \$200.00 per station. I am inclined to believe that the Twenty-seven Thousand is included in that. You can find that out and show the Court clearly by Mr. Lyndon and his accountants about that.

If you paid \$1,300,000.00 for the Houston Home Telephone

Company's property, you were very foolish.

"Q. If it is admitted that we were very foolish, if we did, and we had the actual value of the plant of the Houston Home Telephone Company, that we put on our books as something over \$600,000.00, leaving \$700,000.00, what would you say ought to be done about the \$700,000.00?"

"A. Well, there is no question but what the letting in of the sec-

ond telephone company in Houston was an economical error 2118 on the part of the public, and that amount should be charged to the people in some form or other, but it should be amor-

tized over a period of years, and carried as a permanent account." "Q. That is right. Now, the \$700,000.00 for the present, though, under the Interstate Commerce ruling, would have to be carried in your plant account or in your capital account."

"A. (Interrupting.) You mean indefinitely?"
"Q. Not indefinitely, but would be carried as an intangible and

amortized,-that is correct?"

"A. No, you can't charge that entire amount up to one year—it's 1919,—it should have been reduced by this time considerably, very materially."

"Q. It has been reduced."

"A. How much reduced? Before we get into this discussion, how much has it been reduced?"

"Q. I am not on the stand; but the \$700,000.00 ought to be car-

ried into that plant account until it is amortized?"

"A. We ought to know that before we go into this. How much is it? I have found it awful hard to get information from you and I think you ought to enlighten the Court as to what that has been."

But the \$700,000.00 ought to be carried into that plant account until it is amortized. I always insisted that the admission of the second plant was an economical error, and the public

is responsible for it, although the public is not always wise in their selections; so that, if the balance of the intangible that has not been wiped out has not been amortized yet, if that balance has not been included in the Thirteen Hundred and Seventy-four Thousand Dollars, it ought to be included, but in addition to that we ought to have a most thorough investigation of what that Thirteen Hundred and Seventy-four Thousand Dollars is for. normally high. I have not seen the evidence, but I can not see how any evidence can justify a figure of almost \$200.00 per station.

I admit that what I tried to get to start with in 1914 was the valuation of the Company's property for rate making purposes at that

time.

"Q. Well, for rate making purposes. Now, if there is about \$700. 000.00 left out of that, that would make an additional \$700,000.00 that ought to be added on, wouldn't it?"

"A. Why, I think fundamentally that would be true, if it were

the fact.'

"Q. Now, coming to your exchange rental. If the Master desires to know what the income would be for the first year, you would have to calculate on the basis of what the Company was spending now, wouldn't you?

"A. I would suggest that he wait and get the quarterly

2120 statement and see what it is."

"Q. But the Court can't wait, of course, for time to go by on a thing of that kind."

"A. Yes, and I said yesterday, you had rushed in here before you were hurt.

"Q. Do you still stick to your statement that we ought not to sub-

tract the \$130,000.00 from the \$180,000.00?"

"A. Certainly not, because you were dealing in 1919. The question of what you earned in 1920 is an entirely different matter. In that case you may show a loss; I have no way of knowing yet, but you have so many factors entering in here in the way of tolls, miscellaneous sales and rentals—"

"Q. In 1919, if the exchange rentals were \$180,000.00, and included in that was \$130,000.00, due to the accrued increase rates under Government control, then if the rate would produce the same in 1920, merely for exchange rentals, it ought to be reduced by

\$130,000.00, oughtn't it?"

"A. No, no; you can't tamper with your 1919 business. You have a certain earning for that year and I don't see how you can

go in and juggle and manipulate."

"Q. Mr. Kelsey, does it take any juggling to determine that a certain number of telephones at \$2.00 per station and a certain number of telephones at \$5.00 per station will produce \$130,000.00, or more, if you make the rate \$7.50 and \$3.00?

"A. It would be very rank juggling in this case. You 2121 know the present part of this year ought to tell the story.

"Q. You mean to say, then, that for 1920 an estimate for the exchange rentals would be \$130,000.00 less than the figure you have used?"

"A. It might not be."

"Q. You can't say that. Will you explain to us how it would be possible for the same number of stations to produce just as much money at the \$2.00 and \$5.00 rate during 1920 as was produced in 1919, with the \$3.00 rate and \$7.50 rate in force for six or seven months of the year?"

"A. But so far as your rental is concerned, that is very obvious; but you know your company is a financial company as well as a long distance company; you have many ways of earning money; you can apply that to your rental and it would undoubtedly be

\$130,000.00 lower.'

"Q. We are talking about the Houston exchange."

"A. So am I, and as the Houston exchange we share in all the

successes and failures of the home company."

"Q. No, Mr. Kelsey, Scott's Exhibit No. 42 shows exactly what the four months ending December 31st, 1919, produced under the present rate. Would that convince you in any way?"

"A. It doesn't interest me whatever; we are dealing in the 1919

report; that is your fiscal year, you know."

"Q. You would not be interested in knowing what these rates produced during the four months they were in effect?"

2122 "A. No; I would like to begin at the first of the year, under all conditions. A very proper test would be the first six months of this year, to give this Court an accurate idea. Conditions change; conditions in 1919 have nothing to do with 1920.

Your toll earnings are different, your rental earnings are different; they all ought to be in here. The more I get into this case, the

more I think we ought to have some information-some more information than we have had. I took your word for a lot of these figures, but I begin to suspect some of them."

"Q. What is the basis of your suspicion?"

"A. You gave one figure of Nine Thousand yesterday, and now you say Thirty Thousand."

"Q. You say that the Nine Thousand was extraordinary re-

pairs?"

"A. That is what I call it."

"Q. And the \$32,000.00 was replacements?" "A. But it was in your maintenance account."

"Q. It is very proper to be in our maintenance account."

"A. We credited you with it; you spoke of a mysterious toll yesterday-

"Q. (Interrupting.) Isn't there something further back of your suspicion, Mr. Kelsey?"

"A. No, the greatest suspicion I have is that I haven't all of the figures."

"Q. Isn't your suspicion due to the animus you have towards the Western Electric?" 2123

"A. No."

"Q. The American Telephone Company?"

"A. Not the least bit of suspicion towards any of them." "Q. Towards the Bell Company and its employees?"

"A. We have stock in the Bell Company. I have known those gentlemen for years. In fact, the Bell Telephone Company is my meal ticket-my extra money. I would hate to have them-

"Q. (Interrupting.) What do you mean by your "extra money?" "A. This work that I do around here in Houston, Cleveland and Minneapolis. The A. T. & T. has been one of my best little spending monies that I have."

"Q. You make your spending money off the A. T. & T.?"
"A. Yes, sir; I simply am forced on the pay roll against the A. T. & T. all the time."

"Q. You make your extra money that way?"
"A. Yes; the City of Houston asked me to come down here and make a study of this case. If you did, I would do it for you."

"Q. Would your testimony be different?"

"A. It might be, but you know my ancestors never had that little boat called the Mayflower."

"Q. Would your testimony in this case be the same if you had been representing us?"

"A. Well, I should say it might not be. A man has to admit that he has to serve his clients, necessarily, and get

the best points out of each case. Attorneys have to defend criminals when they know they are guilty sometimes."

"Q. Where a man swears,-you know, an attorney does not

"A. It is a good thing they don't; they would all be in the penitentiary; that is the advantage you have over a civilian."

"Q. Now, one of the reasons you have got it in for the Western

Electric-

'A. No, I haven't. I have the greatest admiration for the Western Electric Company. I go around there a great deal and visit the boys and go over their plant. They are glad to see me out there. I buy their goods."

"Q. You stated yesterday that they ruined you by flooding the country with telephones at fifty cents?"

"A. They didn't ruin me. They tried to, but they couldn't do You see, there is that lawyer part. I said that they tried to sell them, but after they found out they could not sell them, then they tried to rent them and they didn't succeed very well."

"Q. Did you rent any at fifty cents?"

"A. No, I sold them outright. They stand in line wanting our stuff.

"Q. The Western Electric couldn't rent them at fifty cents?"

"A. The Bell Company rent them; you see, for years the Bell Company and the Western Electric Company tried to run a little missionary department and tried to rent,-get them to use your apparatus, but somehow or another, after they try it for a while, they didn't see the virtue in it that you folks do.

"Q. Do you know what the regular rental of these instruments

are?

"A. Yes, fifty cents a year."

"Q. Where?"

"A. Everywhere. I never heard of any independent company ever having its instruments left on them."

"Q. Of course, you have kept up with the rental of telephone in-

struments, haven't you?"

"A. Well, yes, you know, almost every telephone man in the United States has come to me with his troubles and told me his problems. In fact, we have a free consulting bureau there."

"Q. But while you were a professor-

"A. (Interrupting.) A professional baseball player,—don't leave that out; I am proud of it. I am more proud of that than anything. Don't leave that out of the record."

"Q. You didn't have time to keep up with the prices on telephone

instruments?"

"A. I had to keep up with it, because they were coming to me with

"Q. Did you know that in the City of Dallas, right there, there is the Dallas Telephone Company that has a great many telephonee, and that we pay them a dollar a year for the rental of their instruments?" 2126

"A. Oh, you can do anything between yourselves.

have a very great faculty for making wonderful contracts."

"Q. Did you know that there were one hundred telephone companies in the United States today that were paying a dollar a year for the rental of the instruments?"

"A. Do you own them? That is the thing that interests this

Court,—is what that investment of \$13,000,000.00 is. Then we might believe some of that stuff."

"Q. The testimony in this case shows that the rental — worth

\$1.10 per instrument per year."

"A. Whenever you can get control, you can make it worth \$2.00; but I am talking about free and uninterrupted; a man who has his own judgment in this matter never would pay more than fifty cents;

you can never get him to pay it."

All the independent companies that are not connected with your company are not all paying a dollar a year; they buy their own telephones. I sold more Kellogg telephones in Texas than in any other State in the Union; it is one of our best States. They always did get fifty cents. I am talking about independent companies; none of those fellows you make a gentlemen's agreement with. I do not now know of one company in Texas that is getting their rental at fifty cents; out of two hundred and sixty-two companies, I do

not know of any now; I do not think that they would pay

fifty cents for your telephones. I don't think any of them wanted such an agreement. If they were left to their own volition, they would not pay forty cents; they would buy them in preference; they can buy a better telephone than they can rent from you.

"Q. Mr. Kelsey, your division of the long distance line leaves out, of course, the Two Hundred and Forty-five Thousand, Nine Hundred and Thirty-nine connecting line stations in Texas?"

"A. Oh, I don't know anything about that; you know that has nothing to do with what your company earns."

"Q. It leaves out of consideration the toll property in about fortyseven other States of the Union, that occasionally are used?"

"A. Your company had left for the year \$4,600,000.00 from its

toll activities."

"Q. Now, during the year, or the last two years, the City of Dallas with thirty-seven thousand stations, or thirty-three thousand stations, has been sold by the Southwestern Company.'

"A. (Interrupting.) To themselves?"

"Q. (Continuing.) To the Dallas Telephone Company."

"A. To themselves."

"Q. There are something over thirty thousand stations, Mr. Kel-

sey, that you did not include."

"A. Oh, yes, the earnings that your company got from 2128 those stations appears in your annual report, and you netted \$4,600,000.00. It don't matter whether you stole it or how you got it,-you have got it.

"Q. Suppose we are paying the telephone company in the City of Dallas a certain percentage of the originating tolls for handling the

toll business there?"

"A. You are paying them that twenty-five per cent, unloading

with all the expense."

"Q. The balance of it, seventy-five or more per cent of the tolls, originating in Dallas, is included in this four million dollars, isn't

"A. Not necessarily, oh, no. The net income that your company

gets out of all transactions amounts to \$4,600,000.00. You can't escape that. Now, you may have an agreement with your combined company, but the net results appear in your accounts. You are not reporting to anybody else that you are not earning this \$4,600,-That isn't a gross toll earnings; that is the net toll earnings 000.00.belonging to your company."

"Q. What has been taken out?"

"A. Your own expense. That is the net proceeds.

"Q. The expenses have been taken out?"

"A. All of your expenses down below,-maintenance, depreciation, traffic, commercial, general, taxes and all."

"Q. Did you ask anybody that question?"

2129 "A. I know that this is all the money that you expended in your business during the year,—running your entire business

for the entire company. Do you have a secret fund?"

I know that the maintenance expense of \$1,112,441.00 had a maintenance charge in it of over \$200,000.00 to the tolls, and what is your supervision of maintenance in Houston but your general loading of the whole company? Oh, yes, that has something to do with it. It is the maintenance of the whole company loaded, that you could not apply to Houston locally; you turn around and apply it generally. It is absolutely unthinkable that this town would spend \$18,000.00 for maintenance in supervising a little plant of That is the kind of maintenance that you can't localize in this town, and you turn around and generalize it. After I left last night, I got to thinking, and I said, this toll maintenance is there, of course, but it is camouflaged beautifully in what they call supervision. I think you have said a great many times that the books are kept in accordance with the Interstate Commerce Commission's rules. I do not know that to do what I have just said that would cause them to penalize you; you have got a perfect right to localize all of your earnings.

"Q. Do you know that some of the calls for which this \$4,767, 000.00, included in this, originated in Dallas, Waco, Marlir, Temple,

2130 "A. (Interrupting.) Of course it did, but that was the

net result of your transactions."

"Q. (Continuing:) Sherman, Denison, Denton, McKinney, Texarkana, Greenville, Brownwood and San Angelo, and that under your system these towns would not get any allocation at all of the

toll plant."

"A. Why, they have all had their allocation. Why didn't you put Halifax in, and Nova Scotia? That don't make any difference. In your expenses, where is your deduction for expenses and commissions paid? This is your net tolls. What are you talking about? All mileage charges have been settled with McKinney, Sherman----"

"Q. (Interrupting.) Mr. Kelsey-"

"A. (Interrupting.) Let me name them all. With Dallas and all those other points, that has all been settled and this is what is left. That is the pride and glory of the Southwestern Company,—

that they are earning almost as much tolls as they do in rentals. You keep all of your rentals and this much is what you keep of the tolls. It is a wonderful concern."

"Q. Let me ask you if one hundred per cent is paid to the City of Houston, if we are not putting something over on the connecting companies?"

"A. One hundred per cent of all the tolls that are left belong to

the company.

2131 "Q. Just take any particular call now,-a call that goes from Houston to Dallas?"

"A. Yes."

"Q And is paid for in Houston."

"A. Yes, sir.

"Q. And costs \$2.50."

"A. Yes, sir."

"Q. Now, your idea is that that whole \$2.50 ought to be paid to Houston?"

"A. Yes; supposing Dallas calls Houston and they pay \$2.50 out of that net,-who keeps that in that case?"

"Q. All right; let's suppose that a call starts at Waco and comes

to Houston over the Texas long distance lines?"

"A. According to your figures, you don't get any credit for that at all. That is why I say that I am getting suspicious of your accounting, because you showed yesterday a million dollars that you have not got credited."

"Q. The entire company would get twenty-five per cent of the call. Oughtn't we to get the additional seventy-five per cent, or the whole one hundred per cent of it?"

"A. No, no; you have what is left. You pay them an originating commission, and then you have your mileage settlement. You get the mileage; I don't know what that is."

"Q. There is no mileage settlement." 2132

"A. That is, over your lines."

"Q. No, the Texas company,—not our own lines."

"A. That makes no difference,—what you get; it is apparently credited up in Dallas instead of here, in a call of that

"Q. I am asking you if it wouldn't be fair if the telephone company gets one hundred per cent of this commission?"

"A. No, not at all; that has nothing to do with this case. don't seem to understand it, and I don't think you want to."

"Q. Do you understand it?"

"A. Absolutely. I have been off this since 1904."

"Q. Does anybody in the world believe in this theory but you?"

Mr. J. D. Frank: Any Court ever follow it?

"A. Well, the Dominion Railway Board accepted our views of one hundred per cent. Mr. Bloom went up there and tried to put over seventy-five per cent. Mr. Bloom said: "I am going to be liberal and allow seventy-Sve per cent." I said: "Mr. Bloom, you are going to be liberal and allow one hundred per cent"—and the Commission allowed it."

"Q. You testified in the Birmingham case, didn't you?"
"A. Yes, you bet I did. And tried it well. That is the That is the first time you folks ever loosened up and allowed it."

"Q. Did the Commission allow it there,—did they allow it there?"

"A. Why, certainly they did; it was not protested."
"Q. We have the opinion here; I want you to take the 2133 opinion and find it."

"A. You find it. You have been talking about that Birmingham case and four-flushing about it; now come clean on it. The first crack out of the box you sprang Birmingham on me, and then you retreated."

"Q. Then you went to Cleveland and you tried the same thing up there. Did they pay any attention to you at all there?"

"A. You bet they did."

"Q. Did they?" "A. Yes, sir."

The Chairman of the Commission did not say that there wasn't any use of cross examining me. You are the first Bell attorney to cross examine me for quite a while, and I am greatly obliged to you They did not cross examine me up there at Cleveland; I wish they had: I would have filled that record with something the Commission wanted to know. The City of Cleveland,—the conditions there are entirely different; Cleveland is an isolated concern and connected with no outside concern.

I did not say I had testified in three hundred cases; I have ap-

peared for probably a thousand times.

"Q. Did you ever ask for one hundred per cent of the tolls

in any other case besides these cases?" 2134

"A. In Kansas City and Montreal; we have always asked for what we took in. We tried our best to analyze this situation. You all never come clean on this. If you didn't have all the expense of your tolls loaded in here, it wouldn't look so bad, but you have got everything in here loaded with as much as you can get."

"Q. Well, we will clear that up before we get through, to your

satisfaction.

"A. I hope you do."

"Q. What per cent, ordinarily, of the subscribers in a town like Houston use the long distance service?"

"A. Well, not a very large per cent. I don't think in Cleveland

over thirty per cent of the subscribers used long distance."

"Q. Then there is seventy per cent of the local subscribers who don't use the long distance to amount to anything?"

"A. Oh, yes; your telephone business—ninety-seven per cent of

your calls are local."

"Q. Then, if your system of allocating the long distance tolls to the local exchange is sound, Mr. Kelsey,—and I am asking you now as a telephone expert,-if that is sound, then if you had a toll linehad toll lines that were not making any money,-say that they were losing money,—you ought to raise the rate in the local exchange in order to take care of it?"

"A. Why, that is done. We always, in a rate case, show that a company is losing money. You folks for years said that you never could separate your local and long distance, and if you were losing money in your long distance business, why, naturally, you have got to get an income from somebody, and you reach out for the nearest relief, which is through getting your local rate raised."

"Q. So your idea is, if we would lose money in the long distance

business, we ought to penalize the local people for it?"

"A. No, you have revenues of all sorts which you are charging them for.'

"Q. Then, your idea-

"A. (Interrupting.) To get right back, it is just as expensive to have these long distance people ready for you as it is to use it."

"Q. Let's assume the case, now, of where the toll lines were not making very much money?"

"A. I know, but you can't assume that condition in Texas, because you are making money."

"Q. Can't you think of that, Mr. Kelsey?"

"A. Yes, I know of lots of long distance companies that are not making money."

"Q. Name one that isn't."

"A. The long distance business-I don't think the Ohio 2136 State ever made any money on the long distance business."

"Q. Well, name some town in Ohio that would be connected with the Ohio State Company."

"A. Why, Cleveland, Columbus, Dayton."

"Q. All right, take Columbus, for instance; if you were testifying in a case at Columbus and the long distance lines were not making any money-

"A. (Interrupting.) Yes."
"Q. (Continuing.) Would you allocate a part of the long dis-

tance line to Columbus?"

"A. If they were locally owned by the same concern, but they were separate companies. You wouldn't have any trouble in this case if you had a separate long distance company."

"Q. Do you know of any case where they are not separate?" "A. Yes, in the North Dakota Independent,—we had one pot for the whole thing.

"Q. In the North Dakota case, did you allocate a part of the long distance lines to the local exchange?"

"A. We always did,—every dollar they took in."

"Q. So that if you were making twelve per cent in the local exchange alone and allocating a part of your long distance lines, you could cut your percentage down to six per cent, you would do that?"

"A. Oh, we did, whether we lost money or made money on our tolls, lost or made money on the rentals. We always had a 2137 composite rate case. You claim ever since the world began that you couldn't separate these accounts."

"Q. You would try to put in a part of the tolls into an exchange

where the exchange rates were very high, would you?"

"A. If they were owned by the same company, we always put them in."

"Q. Supposing that you were earning practically nothing on the long distance lines and earning eight or ten per cent on the local exchange?"

"A. Well, your company is still in business, and that is one of

their ways of earning."

"Q. You would then allocate a part of the long distance lines to

the local exchange?" "A. Why, yes; you ought to allocate to Houston even a part of

your earnings on your investment."

"Q. You think that would be considered by a Court or Commission?"

"A. Why, certainly; it is considered."

"Q. Can't you fix your local rate so that you would earn money

on your long distance lines?"

"A. No, that has nothing to do with the case. You have plead, and always have pleaded, as your justification for charging that it was because you lost money in the smaller communities. That has been your strong claim all these years."

"Q. How long have you been advocating putting in all of the tolls

to local exchange account?"

2138 "A. When it is one company, I have always."

"Q. I didn't ask you that question."

"A. Always; in Kansas City, in the old Kansas City rate case." "Q. Name one decision by a Court or Commission that followed you."

"A. Well, that is something for the attorneys to find out. I am

not interested in that."

"Q. You have testified in three hundred cases?"

"A. Even after I leave the case, I never take the pains to read the case."

"Q. How many times did you advocate that in the three hundred cases?"

- "A. Always. You know, if I had not been consistent, you would have had me pinned to the cross the first hour in this case. I have had a consistent program for sixteen years and I have never swerved an inch."

"Q. And nobody has followed you an inch?"
"A. I hope not. I don't care."
"Q. Is your name even mentioned by a single Court or decision, in a single decision?"

"A. All I am after is this coin.

"Q. Have you, Mr. Kelsey, counted an thing in your figures, in your set-up here, for taxes on the long distance lines?"

"A. Oh, yes, they are in there"

Q. Just show me where your proposition is."

"A. All right. Now, your outside taxes are \$693,685.00." 2139 "Q. \$693,685.00?"

"A. That includes your income taxes, and all."

"Q. All right; show me where you proportion any of them in this set-up."

"A. I have not proportioned anything, because your taxes of

\$99,000.00 are very unusually high."

"Q. Well, the taxes in Houston are unusually high, aren't they?" "A. Because the taxes for telephone stations run about \$2.00, and here you have got almost \$3.00, or more."

"Q. You think that is pretty high for them?"
"A. You are paying pretty high taxes; I know you are not responsible."

"Q. Who made these high taxes?"
"A. The community in which you live, which have to pay all their expenses, meets all of these higher costs."

"Q. The taxes that you have here-\$99,965.00,—what is that?" "A. Well, that wasn't what is left out of your income taxes, but I think that is your full proportion of normal taxes."

"Q. It is nothing on earth except the taxes that are actually paid

in the City of Houston."

"A. The physical taxes—I think you can find out more in detail from Mr. Lyndon, why we deducted that."

"Q. Well, you did not allow anything for the income taxes paid,

did you?"

"A. No, because you know that the stockholder himself has got to pay that; he ought to, at least, but, of course, in private business they don't; we pass it on. But you folks are caught in this proposition."

"Q. Now, Mr. Kelsey, you had the figures \$123,461.49——"
"A. Yes."

- "Q. (Continuing:) All of taxes actually paid for the City of Houston?"
 - "A. Yes."
 "Q. And you had that before you made any allocation whatever?" "A. No, I did not make any allocation."

"Q. Of the toll lines?"

"A. No."

"Q. You had that when you were on the stand before?"

"A. What was it?-\$123,000.00?" "Q. \$123,000.00,"

"A. All right, one-sixth of your property is in this town. total taxes are only \$130,000.00. Now, by this deadly parallel again, Houston is paying more taxes than it should on this basis. You said the maintenance was charged to Houston. I said "charged," or do they actually spend it? Now, you have charged these taxes to Houston, which is about twenty per cent."

I know that the tax rate out in the country is not as large as it is here in Houston. You see, you do not like to go into the . things as a whole. Here's all of your taxes, your total taxes

your company paid during the year was \$693,000.00. one-sixth of your property is supposed to be here. Your taxes would show that you are carrying your proper burden."

"Q. Suppose the City of Houston didn't think it was, and stuck \$123,000.00 on us?"

"A. But part of that is income; I didn't stick that on you." "Q. All right, take \$99,965.00 that was paid to the City of Hous-

"A. They did in other places."
"Q. We paid that in Houston."

"A. County too, didn't you, and State?"

"Q. In the City of Houston,-for County, State and City."

"A. Yes."
"Q. Now, you went out and got all of our long distance property and allocated it to Houston, didn't you?"

"A. Yes, because we had always paid our share of the total tax on it."

"Q. You did not bring in Texas with it, when you did it?"
"A. Yes, it all is; it is more than here, Mr. Frank. You have

got 161/2% of your property in this community, but you have got it loaded with practically 20% of your taxes."

"Q. Is there any tax at all in the City of Houston on the \$808,-

000.00 of long distance property?"

"A. There is in the State."
2142 "Q. Why didn't you bring it into your statement?"
"A. We are paying our share. You have allocated and loaded everything on Houston that you could possibly get, because it is human nature; if you ever missed putting a dollar in it, I am surprised."

"Q. Wasn't \$99,000.00 the actual figure, Mr. Kelsey?"

"A. I don't know. Mr. Lyndon furnished these figures, and when that gentleman comes I want you to solve that with him."

"Q. And you didn't figure anything at all on this \$808,000.00?"

"A. Yes, I did."
"Q. It is in there?"

"A. Why, certainly it is. That is why I went to Dallas and got your General Office expense."

"Q. Now, if we paid it to the City of Houston, then we paid to the

City of Houston-

(Interrupting.) Altogether, your company paid every-Houston, Dallas, Fort Worth, the United States Govern-"A. (Interrupting.) ment, the State of Texas, and all the Counties in them, \$693,685."

"Q. How much city taxes did we pay the City of Houston on the

toll investment of \$808,000.00?"

"A. I don't suppose you paid any."

"Q. You say it is in there. I wanted to know how much is in there."

"A. Because it is bound to be in there. You have got one-sixth of your property. I am talking about the load that your company carried in this town. This maintenance load is something that you charged here-"

"Q. (Interrupting.) Do you realize that you are under oath and that you are swearing?"

"A. Yes, you bet. You have never let me forget that for a minute. You have kept me out of trouble all during this case."

"Q. And still you say that no taxes ought to be allowed on the

\$808,000.00?"

"A. It is allowed and it is in here, Mr. Frank."

It is in there, because I have said repeatedly that during the year the total taxes paid, every community, every hamlet, every township, every county, every part of the State, the United States Government, and all, was \$693,685.00. They have charged this community down here an amount which, instead of being about one-sixth, as it right to be, is about one-fifth. I don't care about the fact that the taxes in Houston are about double what they are around the rest of the State; the figures are here.

"Q. But the City of Houston collected from us \$99,965.00." "A. That is all right; the City of Houston is diligent."

"Q. Now, if you are going to allocate \$800,000.00 worth of long distance property, can you conceive of it being fair to allocate some of that \$808,000.00-

"A. (Interrupting.) No, you have already got it in there, because the taxes that you paid to the City of Houston is in this \$693,000.00, and by a strange coincidence one-sixth of your property is located here, but you have got one-fifth of your taxes

loaded here. Now, it is very curious; now, you know that you have got Houston loaded with everything the old camel will bear, and it would be natural for you to do it in a rate case, -to put all of your expenses in, and you never missed an opportunity to leave out a

"Q. If the Court should tell you,—if you knew that the Court was going to-that the \$808,000.00 was not going to be allowed as an item, then would the \$99,000.00 tax have to be cut any?"

"A. I am not interested in that."

"Q. Ought it to be cut? Suppose you were instructed by the Court to confine your property to the property within the City limits, would the \$99,000.00 be cut in any way?"

"A. No."

"Q. It wouldn't be cut, would it?"

"A. I can't see how it would. You would have to pay it. can't conceive of the Court refusing to consider this \$99,000.00."

It seemed reasonable to me to throw out the income tax. You claimed that you are losing money, so I can't imagine how you could be charged with that when you are losing money. Mr. Lyndon had that view point, and that is for you and him to fight out. When I went to Dallas and found out your total

taxes of \$693,000.00 for the entire company, I felt that we were not

It is a fact that taxes in Houston are higher than in any other City in Texas.

"Q. On that account, because of the fact the City of Houston is higher than any other City in Texas, you would not allocate any taxes to the long distance property?"

"A. You have got it allocated; you must have, because your total tax is \$693,000.00, and when you compare it, -one-sixth of the prop-

erty is here and you have got about one-fifth of it."

"Q. Why didn't you investigate it?"

"A. I wasn't interested in that particularly. I think you and Mr. Lyndon can fight that out."

"Q. Who is going to pay the taxes that you have thrown out?"
"A. You have already paid it—\$693,000.00."

"Q. What community is going to pay that?"

"A. All of them, -everyone in the telephone business."

"Q. What about general expenses?"

"A. You have it in here."

"Q. \$377,384.00, general expense for the entire company."

"A. Yes, sir."
"Q. Did you put any of that general expense into your 2146 set-up,-in your new set-up?"

"A. It is all in there. You have a general expense of \$377,-

000.00."

"Q. How much did you put it?"

"A. I accepted your figure for it. I compared it and found out that Houston was bearing a share."

"Q. Our figures were set up for local exchange?"
"A. No, sir. You have no general office expense here of \$48,-640.00; it would be absurd."

"Q. Why would it be?"

"A. It is ridiculously high. That is your general office loading. You know that very well. It is carried out through the community."

"Q. Do the toll properties bear any of the general office expense?"

"A. Sure, you are all doing it."
"Q. Why didn't you allocate—

"A. (Interrupting.) It is all here." "Q. Did we make up this set-up?"

"A. Yes, sir, you did."
"Q. We made the set-up for the local exchange?"
"A. Yes, sir; you have everything in here possible to get. "Q. And you got ten per cent, or nine and four-tenths per cent of the property and brought it in here and took the whole one hundred per cent of the tolls?"

2147 "A. I thought the Houston subscribers ought to bear their

share."

I did not bring in my nine and four-tenths per cent of the general expense; that is already in here, allocated in here. I brought in nine

and four-tenths per cent of the taxes.

I did bring in nine and four-tenths per cent of the maintenance; it is all in here. All you have got to do is to compare your total with your Houston figures. It is a remarkable coincidence if Houston escapes her share.

"Q. Did you find out there is some operating expense for the toll plant around over the State that was not allocated?

"A. Yes, sir; it is allocated in here."
"Q. Where?"

"A. In your supervision."

You have maintenance supervision and traffic supervision. don't suppose it costs \$26,000.00 to supervise traffic in this town. You have got a commercial expense in this town of \$74,000.00, and then I find that you have \$10,657.00 of general commercial expense left. That is not on the local exchange; Houston district. You run out of here and repair your toll lines, and your boys take out the wire and cross arms, and all those things, and they go half way to Galveston and Galveston comes half way here. You know very well that you have no separate long distance operation at all.

Your toll line repairs are paid out of the Houston exchange. The toll expenses are charged right in here. I did not allocate any to the City of Houston,-you are very peculiar.

The biggest item of your expense is in the operators and you have them all here, and then you go and quarrel with little petty maintenance or little petty general expense.

"Q. If you are going to divide all the expense of the toll of the

"A. (Interrupting.) Does the local manager watch the toll lines

out of here?"

"Q. I asked you this question. If you are going to divide the toll expense of the State, oughtn't you to find out what the total

expenses are?"

"A. I don't know what they are. Ever since 1904 until I struck your remarkable personality in this case, you always insisted you could not separate them. Now I find a separation suddenly evolved

"A. You just now said you did. You came in vesterday showing that you had \$40,000.00 maintenance on toll lines."

"Q. Didn't you know there was any on a toll line."

"A. Yes, sir; there is maintenance even on a brick house."

"Q. What you did was to take the line and take all of the reveunes and ignore the expenses?"

"A. No, sir; the expenses are all here. These expenses of 2149 the running of the Southwestern Company have been all paid and loaded on to the place they belong. There never was a company in the world that didn't allocate its expenses to where they belonged, and that is what you done, and you do it beautifuly, too.

"Q. The revenue you have got in here is the revenue for last

year, and not prepared for this year at all?"

"A. No necessity for it."

"Q. Let me detail just a few of the things that you have in here, about which, at least, there is some question.

"A. I don't think there is a question about the figures."

"Q. Under receipt, exchange rentals, \$880,439.28, of which \$130,-000.00 is due directly to the increased rates which were charged during Government control,-that is item number one. Item No. 2—the tolls,—you have allocated a full 100%.——'

"A. (Interrupting.) I haven't allocated at all. That is what

you done."

"Q. Which means \$441,029.80——"
"A. (Interrupting.) There is no allocation there."

"Q. So, whereas, if this was an independent plant and the toll lines belonged to a separate company, 75% of that would have to be thrown out and only 25% retained."

"A. This is not an independent company."
"Q. That is item No. 2. Item No. 3 is that there should 2150 be $4\frac{1}{2}\%$ of the total gross receipts, amounting to about \$58,000.00, for the $4\frac{1}{2}\%$ payment, and you have thrown that all

"A. No, sir. The owner gets that anyway. That is all in there.

When you count that money up it is all there.

"Q. You have thrown that away."

"A. No, sir; I haven't taken that away from anybody. It is all there."

"Q. And instead of that you put: "Less Instrument Rental, \$13,250.00."

"A. Yes, sir; fifty cents per station."
"Q. You have taken the maintenance \$110,675.00 in the City of Houston."

"A. That is local maintenance."

"Q. Reconstruction \$9,000.00, when the Local Reconstruction was \$32,000.00. That makes \$23,000.00 more."

"A. No, sir; it is in the maintenance. That is part of your

\$110,000.00 maintenance."

"Q. You have been told we would be subject to a \$5,000.00 fine if we did that."

"A. No, sir; that reconstruction is in your maintenance account,

and you know it is."

"Q. The testimony in this case, Mr. Kelsey, shows there is \$32,-000.00 in addition to the \$110,000.00.'

"A. Why wasn't it in there?"

2151 "Q. Because it is not properly chargeable as maintenance.'

"A. Why wouldn't all the maintenance chargeable to Houston be

in here?"

"Q. The other items you have in here are for the local exchange down to total disbursement. If, however, the Court should conclude a part of the tolls should be counted in the City of Houston, you would have to add a certain amount for toll maintenance and a certain amount for toll reconstruction."

"A. It is that.

"Q. And for supervision, and a certain amount for traffic operators, and a certain amount for incidentals miscellaneous, and a certain amount for supervision, and in addition to that an additional amount would have to be added for general commercial expense in addition to the items we already have."

"A. Do you want Houston to carry the entire load of the Company? You pretty near suggest it, if you carry out your plan."
"Q. In addition to that, Mr. Kelsey, you have taken our figures for the uncollectibles."

"A. That is \$15,084.1"

"Q. And you have taken into account—and have not taken into account \$70,000.00 of uncollectibles. You have eliminated entirely the income tax of twenty-five or thirty-five thousand dollars, and have taken only the taxes paid in the City of Houston,

amounting to \$99,965.00. If you want to allocate any portion of the toll lines to the City of Houston, the taxes on that property ought to be added on your figures that you have. Is that

true?"

"A. No, sir; if that was true you would find that Houston was carrying about one-half of the Southwestern total in the State."

"Q. Then, you have reserved for depreciation \$146,120.00, which is set up in your original report as being proper for the local exchange in the City of Houston, and you have not added anything on account of the fact that you allocate 9% of the long distance lines-

"A. (Interrupting.) It is all in there. It is quite a coincidence that you have 19% of the depreciable charge to Houston when you are only one-sixth of the total company. It is a curious proposition that Houston gets it every time."

Mr. Howard: What percentage of the maintenance is allocated

to Houston?

"A. About 19%."

Mr. Howard: What part of the property is located here?

"A. 161/2%.

"Q. In addition to that, Mr. Kelsey, your reproduction value, 1914, company figures, you use \$2,672,211.00, as compared with the Company figures of \$3,372,667.00. That is true?" 2153 "A. No, sir.

"Q. It is also true that you left out the \$700,000.00 intangibles? "A. No, sir."

"Q. Which ought to be added in?"
"A. That has not been demonstrated."

"Q. If it has been left out, it ought to be added in?"

"A. No, sir; the Court ought to investigate very closely that expense since 1914."

"Q. In addition to that, Mr. Kelsey, assuming the very lowest percentage of the toll plan, even on your own theory-

"A. (Interrupting.) I did not. I followed the one and only way of measuring that. When you deal in corn, you deal with bushels, and when you deal in cotton, you deal with bales."
"Q. I told you before you got off the stand the other time, that

is what you would do?"

"A. I would take the word of any opposing lawyer in a law suit." "Q. I predicted that you would use the lowest percentage."

"A. You are a good prophet."
"Q. You just answered Mr. Howard that what per cent of the maintenance was charged to Houston."

"A. Maintenance and depreciation,-you can't separate them;

19%."

"Q. The total company maintenance, according to your 2154 own figures, is \$1,112,441.00?"

"A. And the depreciation is \$1,446,406.00."

"Q. We are talking about maintenance."
"A. They are brothers and sisters,—you can't separate them." "Q. If you had a big storm one year, your maintenance would be

greater?

"A. Yes, sir, certainly it would."
"Q. What would happen to your percentage down here of seven and seven-tenths per cent, if the \$130,000.00 be taken out of the \$880,000.00?"

"A. What?"

"Q. If the \$130,000.00-

"A. What right have you got to take it out?"
"Q. What would happen to it,—increase or decrease?" "A. Probably decrease, but you got that money."

"Q. What would happen if the whole 100% of the tolls was not allocated to the City of Houston, would your total percentage be increased or decreased?"

"A. I can't change the law of mathematics, Mr. Frank."

"Q. Answer my question."

"A. That is certainly answering the question."
"Q. Would it increase or decrease?"
"A. That is a self-answering question."

"Q. Answer the question."

"A. I said I couldn't change the law of mathematics." 2155 "Q. Do you mean that would decrease it?"

"A. No, sir; I leave that to your own clever interpretation."

"Q. Answer the question.

"A. I answered the question by saying that I couldn't change the w of mathematics. Three and two is always five, and two from law of mathematics. five is always three."

"Q. To allow the 41/2% would also decrease it?"

"A. Not in this case, because I am dealing with the owners' profit. The owner in this case claims confiscation. The owner put this in his pocket."

"Q. To add anything to maintenance would increase it?"

"A. It would."

"Q. To add for taxes?"
"A. That is mathematically sound."

"Q. And to add anything for uncollectibles would decrease it?" "A. But still you would come in here claiming confiscation-

"Q. (Interrupting:) To add anything here to the company's figure for reproduction value in 1914 would decrease it?"

"A. If you keep on you will have the entire load on Houston's shoulders."

"Q. That would decrease it?"
"A. I can't change the law of mathematics."

"Q. If the \$700,000.00 on account of intangibles,-if that was added in, that would decrease it?" 2156

"A. Yes, sir."
"Q. If you allocate the toll investment in the State of Texas on any other basis than on the one you used-

"A. There would not be any logical way of allocating that."

Redirect examination.

Questions by Mr. W. J. Howard:

If they did not earn any money at all, that apparently would decrease their returns. I repeat, I can not change any law of

"Q. All these statements that Mr. Frank,—the testimony which Mr. Frank has just given, you don't concur in them?
"A. Certainly I do not."

"Q. And the questions he asked were merely Mr. Frank's construction of these figures, and you don't concur in his statement?" "A. Further, he is treading on dangerous ground if he carries it

to a conclusion."

"Q. You don't concur in his testimony?"

"A. I certainly do not."

"Q. Mr. Kelsey, just one other thing I am concerned with here,— a thing that Mr. Frank has overlooked. He has overlooked developing the manufacturing cost of the telephone manufacturing

companies, such as Kellogg and the Western Electric Company, and the others. I wish you would state, Mr. Kelsey, if you know from actual experience whether the profit upon those manufactured articles by all of these companies is small or

"A. Large, enormous, and always have been. There is no more profitable business on earth than the telephone manufacturing."

"Q. The Western Electric Company is furnishing this equipment to this local exchange, as I understand you; is furnishing them at

"A. Yes, sir."

Taking the manufactured cost of this telephone equipment they have here and adding to it a legitimate profit of ten or fifteen or twenty per cent, taking the manufacturing cost as a basis, it would approximate fifty per cent of the amount that is charged to this local company, because you have eliminated all expenses of sale. is no sale expense. The sale expense is usually 100% alone, and that is entirely missing in this transaction. These companies order this apparatus a year in advance and there are no salesmen on the pay roll. That is an expense that all independent companies have, a tremendously expensive sales department. It would approximate

fifty per cent, including the salesmen's cost, but eliminating that, it would not, and there is no salesman's cost.

Recross-examination.

Questions by Mr. D. A. Frank:

I have not examined a single book of the telephone company to see what prices are being paid. I have not examined a single work order in the City of Houston to see what has been paid; I am not interested in that at all.

I do not know that the Southwestern and all the associated companies buy their equipment from the Western Electric Company at a very much lower price than the independent companies have been able to buy them; it does not appear in any transaction I have ever seen.

"Q. The testimony in this case shows that one engineer who was entirely independent of the Bell Company-"

"A. (Interrupting.) Who in the world is that?"

"Q. Mr. Topping.

"A. Yes, sir, entirely independent,-brought up by hand by your people. That is a good example. Poor Topping was raised by you fellows all through the age of impression."

"Q. Is it a crime to have worked for the Bell Company?"

"A. You never can change a man's view point after you get him." "Q. Have you changed many of your view points?"

"A. I left them when I was still young." "Q. Take Mr. Hoag's appraisal and show us how much could be saved on the various items.

"A. The thing to do is to put that up into honest, competitive conditions."

"Q. Show us how much can be saved."

"A. I will not attempt to do that." "Q. You will not attempt it?"

"A. It is according to how anxious the Kellogg and other com-"Q. You will not undertake to show us what money could be saved?" panies would be for the business."

"A. Not at this time, but if you will give me a bona fide order, I would fix it for you.

No. 108. Equity.

SOUTHWESTERN BELL TELEPHONE COMPANY

versus

THE CITY OF HOUSTON et al.

TRANSCRIPT OF RECORD ON APPEAL FROM UNITED STATES DISTRICT COURT, SOUTHERN DISTRICT OF TEXAS HOUSTON DIVISION.

VOLUME III.

2160 Mr. Lamar Lyndon, a witness for the defendants, was sworn, and testified as follows:

Direct examination.

Questions by Mr. Howard:

The valuations that I have made for the City prior to the one that I made for the Telephone Company in 1918, were made prior to what is known as the World War. There have been radical 2161 changes in the commercial world brought about by that war, of course, everybody knows that. Labor prices and material prices and all those things have undergone great changes, perhaps now even undergoing changes. Prior to that time there has been by the Commissions and among engineers two theories suggested, one known largely as the historical or original cost less depreciation, and the other known as the reproduction cost new less the cost of depreciation, that is building up at that time a theory a plant to take the place of the one in existence. Prior to the war there was no marked difference between these two methods. The fact that that is borne out by the value which I made here in Houston of the Electric and Power Company property. I made a valuation based on the original cost less depreciation and the company was dissatisfied with the findings, it not being enough, and it was the standard Public Utility objection to an engineer's finding, and they demanded a valuation based on reproduction and the municipality decided that in order to preserve peace and harmony that they would have a second report made on that basis, and it was made on that basis and most of the company's own figures of the then new costs were ac-

cepted and my present memory is that the variation was less than one hundred thousand dollars on a property valuation of two million dollars, that is, we were so near together that there was no question involved as to which was the better way, which was the fairer. In the valuation which I have made of this property and concerning which I propose testifying I have not given any serious consideration to the cost of reproducing this plant that was constructed, perhaps, at least 90 per cent of which was constructed prior to the abnormal changes in price level. I have not given any consideration to reproducing the property based upon these abrupt changes in prices, because a reproduction valuation is a basis that is inherently unstable,—the reproduction cost, and there is no opportunity to check the values against the value of the property; they fluctuate from month to month, or year to year. It means a specific condition for a public utility, while the conditions for certain public utilities, to my mind, and in my judgment should be stable ones. Furthermore the amount of money that is invested as I see it, is the amount to which the company is entitled to receive a return on.

The fact that the material copper and poles and wire and switchboards, and central office equipment and the buildings and the land upon which the buildings stand may have enhanced for a while, or even permanently, does not render the service any better, it does not make it any better, so far as the service being rendered, that is there is no additional advantage to the public being furnished by the utility. Therefore, the values that they get, is just on the 2163 enhancement of the quoted prices of the materials that are already in the building, or in the utility. Supposed it was conceded that they are entitled to the enhancement of these materials that is no way that I know of in which the utility could realize at this time on the enhancement. You see the property as an operating property has a value, which value is commensurate with its cost. If the property, if there is any attempt made to sell the property except as a whole operating property it, of course, becomes junk; the sale as a whole operating property, of course, is another matter, assuming there is a willing buyer, and it is then sold on the

"Q. Now, Mr. Lyndon, you have before you there the Hoag inventory. Suppose the city could have conceived the idea of getting up an inventory and applying these scaring prices, wild and erratic prices, to an inventory in trying to get at the question before the court here, and you were furnished the inventory, what would you do with it if we had called upon you with a view of getting a list of this property and apply these abnormal prices, would that inventory have satisfied you,—Would you assume practically that it was a correct inventory?"

basis of what it might be able to produce from the public.

2164 "A. Yes, I have been over many inventories of many public utilities, and I have yet to see one that is radically wrong; they are practically all reasonably correct."

"Q. So for the purpose of furnishing any such report here to the

court if it was thought at all helpful, would you consider that part of the work done, that is the inventory here?"

"A. I would be willing to accept it."

I have a summary on the top of the first page of my Exhibit No. 1.

Mr. D. A. Frank: If Your Honor please, before we go further I desire to object to Mr. Lyndon's further testifying in this case as a valuation expert as he has not been properly qualified; he has not shown by his testimony that he knows anything about telephone properties. His testimony shows positively that he has never managed a telephone property. Never operated a telephone property; and never bought or sold a telephone property, and in fact, does not know anything about telephone property, and has stated that it is only necessary for a man to have a little mathamatical knowledge

and to be able to count to make an inventory, a valuation, and for that reason we object to his testimony, testifying at 2165

all unless he is first shown to be qualified. The Master: The objection will be overruled.

Mr. D. A. Frank: Note our exception.

I have several telephone exchanges. I conducted, for the purchaser of a telephone exchange the valuation, being one of the firm of consulting engineers that have a staff of men doing the actual And when the papers came into the office, and it was deemed necessary to give them consideration it was done, and the money for the purchase was furnished by other people. All we got out of it was a very small fee. Mr. Frank is aware about of what sort of fees telephone service pays, and that's all we got out of it. Those properties were some properties in Pennsylvania and West Virginia. I think the largest property was a Pittsburgh property, Pittsburgh and Allegheny; and then one in Wheeling and one in Harrisburg. Let me see, this was in 1907, it is thirteen years ago, and the details and the names of the properties have escaped me, but in spite of Mr. Frank's view of the subject, I can only reiterate that the valuation of a public utility is not a high order of technical skill. I have had experience in valuing street railways and telephone. I have valuated isolated electric plants; I have valuated street railways; I have valuated interurban railway properties; I have valuated water pow-

ers; I have valuated city lighting plants; and valuated one 2166 bro-ze powder works once, which was 50 per cent of all bronze powder works in the United States, there being only two. There is not a bit of difference between the cement that goes into a traction company, and the cement that goes into a telephone com-The character of the installation of the wire, of course, differs in a telephone company from that of any other character of electrical distribution, but any competent electrical engineer understands these matters.

Mr. D. A. Frank: There is nothing mysterious about it?

Mr. Lyndon: Not a bit. To a scientific man it is rather an open

book. I understand that from the beginning of this hearing the gentlemen have come in here with the idea that they are teaching a kindergarden, for instance, in a wire is strung on poles, they tell you that is a wire strung from one pole to another, and that it is fastened in a certain way, that if you dig a trench, you dig it with spades. I know all of those things, but I might find out something else; I hope to always.

I have been actually engaged in some very considerable construction work, and in many parts of the world. I am not limited in my experience to the United States at all. The nearest work to you is the dam which I built across the Colorado River, here at Austin Texas. The dam never did break. The dam is there yet,

2167 and it will be there four thousand years from now, longer, if the world lasts. What did break was the company, and that caused a great deal of tribulation, but no dam has ever broken, it is there yet. I was the consulting engineer on the whole works. The transmission lines, the whole generating equipment and that I may mention is the broadest form of engineering because it comprises masonry work, hydraulic control, pipe lines, water wheels, water wheel governors and speed control, dynamos, switch-boards. transformers, transmission lines and power station design, and includes the largest number of different branches of engineering application of any other type of construction. There is no connection between the breaking of the company and my engineering work on the dam, except that certain policies were pursued which were contrary to engineering advice repeated often, and backed by the prediction that disaster must follow if these policies were pursued. It was the fact that the contractors had no foresight and made no preparation for the work; they made contracts that did not mean anything with the people who afterwards didn't fulfill the obligations and then the contractors had to start new. That delayed con-struction until they got into the flood period of the river, and when they got into that period, why, the end was practically in sight. first helf of that dam was built in a single coffer dam, which never

2168 as long to build and fourteen coffer dams washed out on them in that period. That was the cause of it. I was not the business manager for the construction company in any way. They did not meet our requirements and our requests and our protests.

washed out; the last half of that dam took around five times

"Q. But, now, taking the item of interest during construction there, that'- got to be accounted for some way, hasn't it?"

"A. It is very definite; it is as definite as the cost of the apparatus or the construction, which must be accounted for."

I did not allow anything for taxes during construction, where a plant is built "piece meal" that way, especially under the laws of Texas, where property not on hand on the first of January is not

taxed, I would hardly look to find any costs of taxes during construction. If I were operating a public utility I would not expect to pay any. I have not prepared a separate exhibit upon omissions and contingencies because there isn't any such thing.

I valuated this property by another method than the reproduction of 1914 plus the additions from 1914 to 1920. I took the 2169 actual book cost of the property showing what it cost the company to purchase this plant here. The books being accepted throughout and in every detail except two instances which have been mentioned, one being the aerial wire figures and the other the Houston Home Telephone Company property.

Adopting that method of handling the revenues and expenditures incurred here in order to finally arrive at a conclusion of the ultimate return on the property, unquestionably it will be necessary to allocate to the Houston Exchange a certain part of the long distance investment. I have not done that because it would be impossible to even approximate it. It would require a complete survey or a complete statement from the company. At any rate when I made this set-up the information was not available. In the choatic condition of the records in trying to make an apportionment in handling these revenues and expenses I would have to look over the situation and from the percentage that the property here bore to the entire property, or from the returns out of the property here in the toll service, I had to make some allocations based on the capital account and allow interest on it. Now, let's take this next statement here. Statement of Revenues,—toll revenue. I mean by this, "other expenses, general" and "other expenses not incurred

in Houston," I mean by that allocated charges based on the 2170 general officers, or incurred by the general officers and then divided into some arbitrary proportion among the various officers of the Southwestern Company. The operating expenses here in the city and the maintenance expenses and all the other local expenses, including both the cost and maintenance and operating these local and these toll systems, are included in the company's annual statement of costs for Houston. This 25 per cent is simply an experimental figure to show what the result would be if 25 per cent were It is the per cent that the company used, but I have taken other per cents to show what the condition would be. I do not know whether or not that 25 per cent would pay for the expense incurred in handling the long distance tolls by the local exchange. A series of approximations based on probable rational assumption could be made and a general idea obtained, which would simply be a general idea; it would not be an accurate statement of the costs incurred here because of the toll business, that is, we would know whether it was around 30 per cent, or around 50 per cent, but we wouldn't know whether it was 29½ or 32½ or 47½ per cent. We would determine in a general way approximately what it might be. On the basis of 25 per cent, I am assured by the few computations that I have made, based on certain assumptions that the local company would be bet-

ter off without any 25 per cent of the toll receipts if it could 2171 divorce itself absolutely from every cost and charge incurred because of the existence of the toll line. That is to say, interest maintenance, depreciation value and allocated charges and all the rest of them at 35 per cent, I am not sure. I think 35 per cent of the total toll receipts of this local exchange, I believe, would make a little profit, but at 25 per cent, there is no doubt in my mind, but what some loss is incurred by assuming all the cost and burden of the tolls with only a 25 per cent return.

The Master: If this was an independent company operating this local exchange here in the city of Houston, would it be to their

advantage not to connect with the toll lines on that basis.

Mr. Lyndon: On that basis if they had to put an investment into toll apparatus, provide a building, and add the depreciation charges and operation that is true. I mean that on the basis of net returns, the long distance convenience to the public, I think the local exchange would far better financially if — was conducted as a separate enterprise,—on the basis of 25 per cent only. If that percentage is carried to 30 per cent, I believe, that it would be about even; If carried to 35 per cent I believe it would show a profit for the local exchange.

It has been brought out here that I have never operated a telephone company. Mr. Frank has referred to it at least once.

"Q. Mr. Lyndon, that being the case, could you from your knowledge and experience and familiarity with telephone companies and their operation come to any conclusion as to whether or not that was a high or low charge per station for the traffic expense incurred in operating a telephone company?"

Mr. D. A. Frank: I object to that because it shows the witness is not competent.

"A. I cannot make any statement of my own knowledge from the operation of a telephone system, and even if I had operated a telephone exchange system and ceased to operate it two years ago it would not be indicative now of what you would naturally expect in the case of traffic charges."

"Q. In other words, do I understand you to say, that the fact that the manager that is operating this plant here would come in and say it was most reasonable and the lowest charge that could possibly be brought about, you might think they were very much in error in

their judgment and might be mistaken and that it would not necessarily be an established fact and to know, and my only basis for the statement which I now make is that—that is

that the charges appear excessive is a definite knowledge of the costs which one or two other companies

Mr. D. A. Frank (interrupting): I object to any statement about what any other companies do and don't think this is relevant for two reasons. In the first place the witness shows he isn't competent to pass on traffic expenses,-doesn't know anything about it, and anything that he says about it would be purely hearsay. People who know anything about the telephone business would not get on the stand and criticize expenses in one exchange on the basis of the expenses in another exchange as so many things enter into the necessary cost of handling traffic that it is impossible for any man to get on the stand, even when he knows what has been done in another place and tell us what ought to be done. For instance, take the question of operator's salaries; suppose a man had operated an exchange the size of the plant in Houston, or in Dallas, or in St. Louis, or in Kansas City,-now, it may be that the cost of operators per day, or per week, or per month would be greater in Houston than the other place; it may be that the operators in Houston are less efficient than the operators in Dallas, or in Kansas City, or St. Louis, and it might be that the calling rate in the city of Houston, would be greater than the calling rate in any other town, and so the

witness ought not to be permitted, in all candor, to sit here 2174

and tell us what has been done in some other place, and it seems to me to be clearly prejudicial.

The Master: The objection is overruled. Mr. D. A. Frank: Note the exception.

(By Mr. Howard:)

"Q. Mr. Lyndon, first, what goes to make up the traffic expenses, I assume you know?"

The Master: You needn't further qualify him I have overruled the objection.

(By Mr. Howard:)

"Q. Do you know anything about the elements that enter into

traffic expenses?"

"A. Yes, of course, the principal,-the main, and, in fact, the governing elements are the wages paid the operators; that is so much the largest item that it almost fixes the cost of traffic. The wages paid operators of course, depend,-I mean the total sums of money paid operators depend on two things. The first is the wages paid and the next is the number of operators. Now, as to the wages paid, it is assumed that can not be escaped. We do not assume that the company is paving more for operators' wages than it is compelled to, but as to the efficiency of operation and the number of operators which may perform the service, that is a matter of

2175 managerment, and possibly a matter of exchange management.-I mean arrangement in a small degree, and be that as it may, we find by an investigation of the costs of other companies of various kinds located in various places that the traffic charges are not anything like as high as they are in Houston. Now, Mr. Frank states, and properly states, that traffic charges are, in a measure, a function of local conditions; you cannot reason that, because one company can operate on \$7.50 that another company in the same size town can also operate on \$7.50, but you can reason that if one company is operating on \$7.50 that another company of similar size that requires above \$14.00, that it is getting out of the bounds of relationship and it is only—

"Q. (Interrupting.) Now, in speaking of \$7.50, you are not assuming that as an arbitrary figure, but you know of companies in operation that their traffic expenses run around \$7.00 a station?"

"A. I know of a larger company where the cost of labor as I understood it to be in Houston—

Mr. D. A. Frank: What company is that?

"A. The Keystone."

Mr. D. A. Frank: Your Honor can you see the justness of our objection to detailing something about the Keystone when
2176 interrogations, direct and cross, have been filed in this case to the Keystone Telephone Company, and their witness has refused to answer the questions; they could have proceeded to take them, but for some reason have failed to take them, giving us the reason that Mr. Stockwell refused to answer the questions. They

reason that Mr. Stockwell refused to answer the questions. They did not proceed to make Mr. Stockwell answer the questions as they could have done, and now a man gets on the stand to tell us second-handed the one thing, that the traffic expense is lower there than here. I merely throw that out to Your Honor for your consideration.

I have never built a telephone plant at any time since I graduated from the University of Georgia up to the present time. The nearest I have come to it is placing telephone equipment on long distance transmission lines, or patrolling the line. That was not lab-ratory work. You see I rehabilitated the Junita Water Power Company in Pennsylvania. If you have been from Pittsburgh to New York in the day time you have seen the the transmission line. I designed this and we had to have a telephone system to take care of the patrolling of the lines, and I worked out an arrangement at that time. We have one line of 40 miles to Altoona; the plant is at Warrior's Ridge, and the question at that time came up as to how the patrol should cut in at nearly any point,—at points not widely separated and notify either end of the line as to what has 2177 necessary in case of failure of the transmission line. We

only had one telephone circuit, just two wires, a metallic substance, No. 12 copper, and I worked on a scheme for contact. Placed on stubbs removed from the main poles and let the patrolman carry his telephone sack with him and plug in on the stubs. All we had to do was to run a wire from each circuit down to each stub and

fix a place to plug in, and have the proper instruments at the two ends. That is the only telephone construction that I recall just now. I never built a local exchange. Forty miles of circuit would not be a very big plant, I just put the circuit up on the frame poles with the transmission conductors. Practically all there was that was a few telephones and eighty miles of wire.

As I said on direct examination it does not take an engineer to value property. I do not say that anybody that could use a pencil and count and multiply and add and divide and subtract would make an engineer, but I do say that he would be perfectly competent to make a valuation. I want to make clear this: that when I say that anyone can make a valuation, and an engineer is not required, I mean on a plant that has been built. Nobody but an engineer can make and lay out a plant and determine what it is going to cost to build it. But after it is already built anybody that can look over books and tell what brokerage costs, or anything else of that kind,

can tell what the plant has cost. In case the book happens to be destroyed, then, in that case, an inventory would be 2178 If there was an error in the books, why the error would show itself in the final conclusion, if the books were adhered to, but I would rather think there was an error in the inventory than an error in the books. I do not believe that I ever inspected the books of the light company, the gas company, the street railway company, or the telephone company, or the books of any company, personally. I have always had an accountant to do that. not do accounting work. Neither am I a lawyer, but I am an engineer. It appears to be incontroverted that the valuation work could be done by any person who has the qualifications I have detailed. If any business man had to be an expert in whatever he handled and get values on, he would never get anywhere. manager of a department store would be practically unable to get anywhere if he had to be an expert in everything he handled. have no means of knowing how many people there are in a town the size of Houston which probably has from one hundred and fifty to one hundred and sixty-five thousand people, that would meet the qualifications I have outlined for a valuation expert. How could I I don't know whether any school teacher could do it .- I don't know the qualifications of a school teacher. I will say this, Mr. Frank, that you could do it. Yes, most any school teacher can add and subtract and multiply and divide, and if the valuation of the telephone company's property is made strictly on

tion of the telephone company's property is made strictly on the books, I see no reason why he could not do it. Bank clerks and bookkeepers would be competent unquestionably, and even some lawyers would be competent. I should say that practically every engineer would be. There might be a few people in the city of Houston who would be competent to make this valuation, but I have no means of knowing. It would be logical to suppose that there are a thousand school teachers and bank clerks and lawyers in the City of Houston out of a population of one hundred and fifty

thousand, it would be logical to suppose that, yet I don't know that to be a fact. I cannot say when the City of Houston hired me and paid me \$100 a day and expenses to make a valuation here, that they were doing a very expensive job that might have been done very much cheaper. Your assumption of having been paid I think you had better omit. They paid me some that they owed me several years ago though. There is this: Engineers as I have explained before, were originall- in this field of valuation, and they have acquired a facility in making them that comes from having gone through it before, and that as far as I see is the only advantage, except that in case of disagreement between the engineer making the valuation, and the company, the engineer has sufficient reason that he can bring forward in an argument that the other man might not have, but as far as taking the books of the company and determining the value of the property, provided the ages of the

apparatus and the rate of depreciation are known, which are obtainable from records and documents by anybody. I don't see that an engineer is an absolute necessity. The same thing would apply to taking a force of men and boys and going around and getting a physical inventory of the property and familiarizing themselves with catalogs, and getting prices and applying them, that is a thing of obvious simplicity, it is just as simple as running a department store and checking such goods and getting the prices. I don't know how simple running a department store is. What I am bringing out is it may require a great deal of tedious work, it may require a great deal of effort, and it is not any high intellectual obtainment. Certainly I would feel competent to take charge of any department store and run it, and also the Rice Hotel. Any engineer ought to be able to do those things. Also if you have trained men all around you to do the work, and they stay there and they keep doing the work, probably anybody could run a railroad. I think running a street car system is a very tedious and confining job, but there is nothing mysterious about it. Running a bank has always been a mysterious thing to me, I don't know how it has been done. let out money on loans that don't seem to have any basis, and they decline loans that appear to be good. I would not say that running a bank requires a higher class of intelligence. Of course,

as far as I have been able to see, bankers work on what is known in the street as "hunchy superstitution." They are not scientific, not logical in any manner that I have been able to discover. I don't know much about running a college, but I think it would be a good easy job to run a college. As to running a plantation, that depends, if you have people to do the work, it is no trouble, but to work yoursef, that is hard luck. A big plantation down on the Mississippi River, or down on the Brazos River in Texas, say five or ten thousand acres of good rich land, or any of the things you have mentioned would require attention and supervision on the part of the owner, or whoever was in charge of it. I think it would require some experience to run it, although you will find out that a number of people have the wrong idea and their experience merely fixes their

errors. We have seen that in a number of cases. I do not see that there is anything mysterious in running a telephone plant. Anybody could take charge of a telephone plant and in one month could run it if they had all the staff and people to do the necessary things, and the work to maintain it and keep it going. Certainly I feel competent to run a telephone plant. Any engineer could run a telephone plant if he had the staff already gathered about him and he could find in a very few days what he would have to do. Now, the staff that would actually do the work must have some ex-

2182 perience. The man that directs the staff, has to have a little experience, of course, it would be helpful to him, but it is We find that men who have gone in absolutely not necessarily so. new on work have sometimes surpassed those who have been in it for years, and gotten into some definite rut. Most of the businesses or professions that I have mentioned are truly simple. I don't think that I quite make myself clear there, Mr. Frank. The idea is that a born numb-skull, who could not work, could not do any of those things. It takes some intelligence. It takes some intelligence and some higher education in fundamentals and a general character and a willingness to work continuously. With that, there is not one of the things that you have mentioned that a man could not make a success of and I am simply differentiating all that from really different intellectual processes of the originator of new things, and the changing of existing arts, not the maintenance of the art as it stands, but the moving of the art forward. It takes a little judgment in order to value a piece of property, it takes a little judgment to do anything. In order to determine what a piece of property is worth, on some basis of reproduction, he would have to use possibly a little judgment. If you take the book cost of the plant, which I, of course, regard as the value of it, I can't see where the exercise of judgment would be required. It may be, but I don't see it now.

My understanding of the meaning of the word "Value" 2183 is as far as I can see it,—the word value is incapable of any one definite experience. For instance, the value of a piece of real estate, or the value of a suit of clothes would be fixed on two entirely different bases. If I was talking to a child six years old and trying to tell him what value is I would say it is the thing you have to pay for it, the amount you pay for it. I think I can clarify that. If you tell a child six years - what the value is, you would say the value of this is a dollar, because I had to pay a dollar for it, and that was the best price I could get for it. But if it was bought a year ago, say, "the value of this was about, but now it is not so valuable because it is practically worn out." If you would tell a child that the value is what it is worth, then where would the child be? The child would be just where it started, I don't know whether a child learns worth b-fore it learns value, I am hardly an expert, but I do not believe so.

"Q. Doesn't the boys say this ball is worth a nickel and this marble is worth a nickel, doesn't he learn that early in his life, hear his father say that cotton is worth 40 cents a pound and chickens

are worth fifty cents a piece?"

Mr. Howard: Is that among your employments in any of these years, kindergarden work?

2184 Mr. Lyndon: Not professionally.

Mr. D. A. Frank: Don't think that would be a simple way

of telling the child?

Mr. Lyndon: I don't know. Even then it would be a matter of my own personal knowledge. It is quite possible that the child learns the word "worth" before it learns the word "value." It seems logical as to what you have said there that that would be the case.

That is the way most of men's minds determine the word "value." When you speak about "value" ordinarily, you think of what anything is worth. That seems logical and it sounds true. With reference to whether a man would be able to tell unless he had some judgment, what a thing is worth, even when he knew what the book said, well, he would naturally assume that what the books said were true and that is what it was worth, less, of course, whatever period of use it has passed through.

Suppose a man has a building here and he has some books that showed the building was worth one hundred thousand dollars, that is, showed that the building cost one hundred thousand dollars, and built on a lot worth \$25,000.00 and I looked at his books and from the books I would think that the building and lot was worth \$125,000.00, and say it was constructed a very short while ago, but last

night there has been a fire which burned this building down,
I would say that the worth of the building was its original
cost, less its reduction in value, which it had sustained. If

the reduction in value was 100 per cent, then the building would be zero. I should say that the books would tell exactly what its worthwould be, with whatever reduction in value it has sustained.

To take the cost of telephone company equipment as shown by the company's books, requires no telephone experience whatever to make a valuation; even a reproduction valuation after the work has been constructed, requires only a small amount of knowledge in order to cover the construction costs. They would have to be really assumed and the construction costs are usually known from the books previously kept and by the application of a percentage showing the rise in price of labor from the date that the labor was actually done to the date the reproduction value was made; it can be very closely approximated, and on the production value it is nothing but an approximation after all, it is not difficult. Whether you would have to know something about it in order to pass judgment on a piece of telephone property depends upon what factor the judgment is to be exercised concerning. To exercise judgment as to the character of the work, or the degree of the excellence with which it is done, naturally requires some knowledge of the business, but we are going

on the assumption that the money was honestly spent and 2186 the company is entitled to a return on it regardless of the character of the equipment within reasonable limitations, but as long as it is an operating telephone company, and as long as we assume that the money is honestly and reasonably spent there is no place where I can see that the exercise of experience and knowledge in the telephone business would make a difference in the valuation

which might be reached.

This thing that you hand me looks like an induction coil, and these other two look like transmitter and receiver. Now, I will take off all parts that I understand the American Company does not furnish. We ought to have a mechanic on this job. To save time I will tell you what parts I am going to take off, I am going to take off the front and shell and take out simply the transmitter itself containing the diaphragm and carbon chamber, and the carbon electrodes, and I believe the back bridge is a part of the—

Mr. J. D. Frank (interrupting): Mr. Hoag will do that and save you the time. While Mr. Hoag is working on that for you, take the other. You can take that apart by hand.

This has external screws. This that I have in my hand is the magnet portion of the receiver. I understand that this portion that I hold in my hand is furnished by the American Telephone

Company. I am not sure about the end piece that the dia-2187 phragm rests on, but my impression is that this whole piece is furnished by the American Telephone & Telegraph Company. I do not know how many different pieces there are in the parts that I hold in my hand. I don't know how many different pieces there are but just to humor you let's tabulate them. There is some where between twenty and thirty parts, that is the receiver. Now, taking the transmitter, it is my understanding that the American Telephone & Telegraph Company furnishes all of that except this front plate, that is, exclusive of the shell. I take off the shell and front plate, that is my understanding. This inner piece I regard as a portion of the shell, in other words the entire electrical apparatus and the back bridge is the apparatus that I understand that the American Telephone & Telegraph Company furnishes. In order to tell how many of the different parts of that that the American Company furnishes, they would have to be counted, but there is a considerable number of parts in the carbon chamber. Counting the carbon chamber as one part I should approximate it at somewhere between 20 and 30 parts that are furnished by the American Telephone & Telegraph Company. There are more parts to that than the other, possibly. The two parts together are not supposed to have somewhere between 75 and 100 parts unless you consider each screw,-you often get 100 screws in a little box, and in that manner there may be many parts.

I did not mean to testify yesterday that these transmitters 2188 and receivers are turned out for ten cents a piece, and turned out like a box of tacks. I said that the parts were turned out rapidly, automatically, and classified under what is known in mechanical art as duplicating work. They are turned out automatically. They have to be assembled. In my set-up I have gone on the assumption that all that is furnished is the parts that I have indicated there, the transmitter, the receiver and induction coil. If I was informed that I had not pointed out all that is furnished by

the American Telephone & Telegraph Company I would not revise my figures, because my figures are based on the statement of costs by the American Telephone & Telegraph Company in its annual report. I would, as I have stated before, I have never made an estimate of the cost of manufacturing these articles; it has been my understanding that these portion- that I have indicated are furnished, and if more are furnished it simply means that I have been mistaken in my assumption as to the parts that were furnished, but not as to their cost. I mean as to the book set-up of the American Telephone & Telegraph Company as to that cost to them.

I don't know that that was a rather indefinite way to arrive at it. It is apparently borne out by the fact that we get the same prices from other manufacturers and got the costs of one telephone company for the same character of apparatus as was furnished by the American Telephone & Telegraph Company in 1918.

think at the time this 1918 report was made all these prices 2189 about checked with the 270 which I have made and is the I had not gotten any prices since. basis of computation. definite prices recently. Now, Mr. Kelsey informed - that these parts were worth about -hree dollars and a quarter now. I am just telling you where the information came from. I have no means of knowing what the induction coil is worth, and do not know what I could buy that for from the Kellogg people, I have no idea. If I had one dis-assembled and could measure the quantities of material and see exactly the total of material I could tell you about what it could be made for in the factory, for labor and material, but not what it sold for. A local telephone company is not a manufacturer, and if it were a separate company it would have to buy them in the open market. If the market today is one dollar for the induction coil, the Southwestern Telephone Company would have to pay a dollar for it,—it would if that was the least market price obtainable. And if the subscriber's set transmitter was priced by the Kellogg people at \$2.00, the Southwestern people would have to pay \$2.00 if they wanted to buy it if that was the best place for the purchase, and the lowest price which would be obtained, they would be compelled to pay that regardless of the cost, If \$2.00 was the best market price, and if it was the only source of supply, that is the Kellogg Company, the Southwestern Company would 2190

have to pay \$2.00 for it if they wanted to buy it. That is true. So that, the three of them would come to \$5.00 from the Kellogg people, if those are the Kellogg quotations.

"Q. Your idea is that in making an inventory and appraisal all that a man would need to know would be the ability to count, and then the ability of multiplying?"

"A. And the ability to obtain the proper prices from the manu-

facturer."

(By Mr. D. A. Frank:)

"Q. Now, any telephone engineer would have an idea as soon as he saw any of this as to what it is?"

"A. If he had been in construction work."

"Q. Just like you would about matters of batteries and matters of power and generators and things of that kind, you would have an idea at once as to what the market value of such instruments would be, wouldn't you?"

"A. I would have an idea of what they were at that one time, but with the changes that are going on, I would be at a loss on probably

anything now. You can't tell."

As I have stated I have never operated a telephone plant at all. In some of my reports I have criticized your traffic expense, and advised you how you could cut down your traffic expense. I said that your traffic expenses are too high, true, they are. If I could tell you what is the matter with your traffic expenses, and what I would do if I were operating the Southwestern Telegraph & Telephone Company, that would call for consulting engineering advice without a fee, Mr. Frank.

"Q. Now, you say Mr. Lyndon, that calls for consulting engineering advice without a fee. Now, you are on the stand and you set yourself up here as a critic of our traffic. Now, I would like for you

to tell us how to cut down the cost?"

"A. I would have made the suggestion at the time. I felt that the people who were best able to modify traffic costs were people that were immediately concerned. However, the fact that they do know their business, and were in charge of the company did not necessarily carry with it the assumption that they were operating at the least possible cost, and the reason why I criticized the traffic cost was due to the fact, as I stated before, that I found the traffic cost on larger systems where wages were equally as high, very much less, not 5 per cent less or 10 per cent less, but 40 per cent less. I am now talking about the Keystone Telephone Company in Philadelphia. The Keystone Telephone Company has 40,000 lines,

2192 and I understand it as against Houston's twenty-six or twenty-seven thousand. It is not a fact that the Keystone Telephone Company operates in the down-town section mainly,—it supplies Germantown. I do not know how many stations there are in Germantown. I know Germantown itself is around three hundred thousand people, it is a suburban district. It is quite possible that there are over two hundred thousand Bell telephones that supply the same territory that less than forty thousand telephones supply. In order for me to answer if it is a well known fact that whenever there is one telephone plant five times as big as the other that it always carries the load of the town and that the one with the small plant has a very small load, you would have to define "load." There are three or four understandings of the word "load." If you

mean the traffic load, it is a very logical assumption, but the small company carries a small load and the large company carries a large load. I do not know that the traffic of the Keystone Telephone Company is less than one-third of what it is in the Houston Telephone plant. I think I have some data on that that I would rather refer to before I make any definite statement, but I feel perfectly sure that that is in error, that they have three times the traffic load in Houston that they have over the Keystone lines, I think is in error.

2193 I have the record here of the book account showing what the traffic load is in Houston, the number of calls, and the total, we also have, I think the maximum traffic of the maximum hour in any one day. I cannot guess at it because I am a poor guesser. I know that it is over five and under fifty. I do not remember what the traffic is in Houston. Any telephone man would know if he looked it up and then he might forget it. The data is on record, there isn't any question about that. The number of calls per station run from 8.2 to 9.2, varying with different seasons of the year. This is the number of calls per station. It was 9 in January, it was 8.9 in February, 8.7 in March, 8.2 in April, which was the lowest period, and went along to 9.2 in November, this is 1919. I understand that load to be above the average load. It is really a very high load so far as I know, not having had experience in traffic and strictly dependent on statements in standard works on the subject. When I say standard works, I am thinking principally of Miller, McMean & Miller's book on Telephony, which is one very well written work and there are some books that are put out by the Scranton Schools. I could not say how much traffic there is there in that first book that I mentioned. I would not say that there is no traffic in there at all, but might introduce the work and discover. It is a very large book, I should judge it weighs five pounds. If there is any traffic in that I will tell you the next time I am on the stand. I have obtained some information con-

2194 cerning the telephone business from various sources, just as we obtained knowledge of the mechanical arts. There is also a section on Telephony in Perder's Hand Book that I have read; there is a section on Telephony in Foster's Hand Book. I think it is thirty or forty pages, I do not remember. Then there is a small hand book,—I can't remember the name of the man but it is a fairly good work, but it has got occasional data in that. I do not know that anybody has ever written a book on telephone service.

I think it would be a simple matter of dinision to calculate how many calls are being handled by the Houston operators per day, but I have never done it. It may be that the calculation is already made. We will have to make an assumption which seems logical that the greatest number of operators are in service at the busy hours; that seems a logical assumption. I have no hourly report here showing exactly how many are on for each hour, it is at intervals, from two to three hours. We have a number of operators

on at that hour, but does not state what the busy hour is. I think it is a fair assumption that the greatest number of operators are giving service at the period of the busy hour. It is rational.

2195 It certainly ought to be done. You don't have to have any experience in telephone traffic to reach that conclusion any way.

The proper way to get it for any period of time would be to take the calls in their period of time and the number of operators that made the calls in that period of time and divide the one by the other. It's the only logical and mathematical way to ascertain it. The call is the unit of service as I understand it.

In order to be perfectly fair to the telephone girls the way to do is to take the number of trunk calls and add them, and add them to the flat calls and divide the total by the number of operators. The process I was engaged on here was to take the number of untrunked, double the number of trunk calls, and add that double number to the untrunked calls and then the total number of operations as indicative of the number of connections. Of course, the trunking of a call does not call for twice as much labor as the straight call on the one multiple.

I understand that two hundred calls per hour is near the top limit for the girl to handle in one hour, an extra good operator. I did not know that the girls in Houston, many of them handle 250 calls per hour. I didn't know that and I don't think that that is borne out. If it is it has been a certain spurt, it is not a usual thing, because it is not borne out by the traffic data that you have. When a girl is handling 200 calls an hour during the busy hour, it is necessary that she is occupying one position,— I judge so, and if the number comes to the position that is further away she has got to pass the cord or get up and let the other take it. Now, if the other two girls, one on each side is on duty she has got to reach very much further, and she cannot possibly handle as many calls when she reaches further than she does when the cords are right before her. If the limit of her capacity is reached during the busy hour, she cannot surpass that at any other hour and any other condition, that is obvious. You know when the maximum capability of anything is reached, you cannot go beyond that, I do not know what the average number of calls are that are handled by the operators in the city of Houston, nor do I remember what Mr. Kelsey testified as to that. I do not remember what he testified the calling rate was in Cleveland, I do not remember what those figures were at all. Even if I heard them I don't remember now.

Possibly he did testify that the calling rate, not the calling 2197 rate, but the number of calls handled by the operators at Cleveland ranged from 300 to 475 and that on the basis he calculated the girls in Houston were handling about 600 calls per day. I remember that he said that the rate of calling at Cleveland was extremely low, and that it was something that should be changed or revised, and that they were doing better in Houston, but still, I do remember this figure he said a girl should manage to handle around 900 to 1,000 calls per day. It would surprise me to know that the girls in Houston on an average are handling more than 1,000 calls a day, and it would indicate a recent and extraordinary improve ment. If the figures that I have got in my hand will show that ther are handling over a thousand calls per day it would surprise me. ! have not taken any pains to try to find out from your traffic people just what the girls are handling.

There are other factors of course outside of your station that enter into whether your traffic expenses are high or low. The wages would be another factor, the pay and the number of calls that are sent in would be the predominating factor. It should come down to cost per call, not cost per station. It is true that telephone traffic is the telephone calls.

a telephone call; the average time is now of answering a telephone call; the average time was taken here in Houston at the time that report was written and given to me from data; I don't know that it was given to me personally; it was given to either Johnson or Ebersole, or someone of the men that were on the job

I was building a dam at Austin at the time, and it was necessary to have some assistance on the work and it was desirable from the point of financial savings. The matter of how long it ought to take to answer a call depends upon the operatives entirely that you have. But I see no reason if they are experienced operatives and willing to work, I see no reason why it should exceed somewhere between four and two sixths seconds. I determine that by statements that I have obtained from various sources. I don't know whether I read it in an encyclopedia, or whether some experienced traffic man informed me, or whether I was told by several traffic men what their experience has been. It was just some engineering knowledge that I had acquired in the usual fashion of getting other men's experience. I have no knowledge of what the average time of answering a call was when telephones first started, I have no idea.

"Q. The evidence in this case shows it was fifteen minutes. The evidence in the case shows that the instructions, written in 2199 structions to the user of the telephone was "if you don't get an answer in fifteen minutes, not to be impatient, we are doing the best we can". Now, we have got it down to between four and six seconds?"

"A. As to what good practice should be, not as actual results that we have experienced."

I have never heard of a plug count. I only know of a peg count. I don't know that I have ever heard of a plug count. I don't know specifically; I can grasp what it probably is, but I don't know specifically what it is, and how you employ it. Certainly a telephone expert would know what a plug count is. He would know what these little fuses are.

In 1914 in my report I adopted the reproduction theory, but in this case I abandoned the reproduction theory, and I abandon it,—I think the statement is made in the report and I will be glad to quote from it. On page 51 of the 1918 report, we are discussing under the theory of cost reproduction: "Having shown the fallacy of this theory, the question arises why did Lyndon & Elrod apparently use the cost of reproduction theory to determine the value of

the Telephone Company's property in 1914, if they now consider it an improper method." There are several reasons for

2200 this seeming change in opinion. In the first place we never did believe in any other theory than that of actual cost and so stated plainly in our report of 1914, see page 56. Prior to making a report of the telephone company's property, we had made a report on the Houston Lighting & Power Company, and in this later report adopted the actual cost method of valuation. The Light & Power Company officials made the usual and customary objections to the valuation of their equipment and requested a new valuation based on reproduction cost be made. The City of Houston, engaged us to re-appraise the plant on this basis and this we did. Our own views did not enter into this second appraisal of the the Lighting & Power Company's property. We merely performed the duty for which we were specifically engaged. When the second appraisal was complete, we found that it varied so little from the actual cost value that there was nothing to be gained by either side, adhering to either theory as cost had remained substantially constant.

It was the view of the city authorities, and their legal advisors that the Court at that time favored the reproduction value theory, and, in order to be on the safe side, they preferred valuations made and rates fixed, on the cost of reproduction basis, especially as the results were the same, no matter which method might be adopted.

Acting under these instructions and conditions, we made subsequent reports on the two telephone companies, and the

Houston Gas Company.

2201

While we apparently based the valuation of the properties on cost of reproduction, we found, in actually making the appraisal, that the installation costs were the more accurate in nearly every instance. Furthermore, it was fully understood between ourselves and the officials of the telephone company that the more satisfactory figures, both for the company and for the city, were the actual cost prices,

which we used for nearly all the items. Statements to this effect will be noted in various places in our report of 1914." (Which pur-

ports to be a reproduction cost report.)

"We started with the intention of basing the plant value on the cost of reproduction theory, because we were asked to do so by our client, the City of Houston. We did this as far as we were able to with any degree of accuracy, but, as stated, we were obliged to rely on actual cost figures for the greater part of the plant. By attempting to follow out the cost of reproduction theory, however, we did not accept this method as fundamentally correct. We know that it gave the same results as the other rational method, and thereby forms a satisfactory basis for the establishment of just and proper rates for service, which was the whole object to be achieved."

2202 "Q. Now, just now you read from page 51 of your report, this language, "In the first place, we never did believe in any other theory than that of actual cost and so stated plainly in our report of 1914 (see page 56)." Now, turning to page 56, of your 1914 report and reading that language, read what the language

savs.

"A. The first method of valuation, namely, actual cost less depreciation, is favored by engineers and public service commissions. This method, however, has not the sanction of the Courts. The decisions of the United — Supreme Court, which is the final tribunal in America, are that the value of the public utility for rate making purposes, is the reproduction cost, less accrued depreciation."

"Q. It doesn't sound exactly like the quotation?"

"A. It is a question of what I stated myself. I said the first method of valuation, namely, actual cost less depreciation, is favored by engineers and public service commissions, and we say that the Supreme Court has made decisions based on the reproduction theory."

Mr. Howard: You are in error in that.

Well, I was in error at the time, but the error came in this way. When the first report was made on the actual cost basis, it was then that Mayor Campbell and I think Mr. Hutcheson said that

2203 we would have to have a report made on the cost of reproduction basis, because the Supreme Court favored that method. I went no further. I was simply instructed to do a certain thing, and I did it. Judge Hutcheson told me that. That was when he was city attorney, and I regard him as a good lawyer. He unquestionably stands high as a lawyer in this community. As I understand, his views at the time he himself thought that actual cost was the appropriate thing, but there was no use in attempting to enforce something that would be more troublesome to enforce when the same result was achieved by an easier method. I know nothing about whether the Supreme Court has changed since 1914. I have been told by competent lawyers that the Supreme Court never did adopt a reproduction theory as a final and only factor.

In my judgment the way to arrive at the valuation is the book costs, the actual costs incurred for the property then in service of the public with such reductions that had accrued from increasing age, use and wear of the plant. I think there are a thousand different people in the city of Houston who, if they took the same view as I take, and could make the same computation and had the same data they would reach the same answer. I do not think there

2004 would be room for the exercise of an independent and intelligent judgment. If there should be it would not be in any vital matter. I don't recognize the necessity of any judgment further than to take care of such matters as I have pointed out, where I made departures from the book in the valuations that I made. That is to say, if the books show a million four hundred thousand dollars paid for a property that cost six hundred and sixty thousand, or several hundred thousand say, then the operation of judgment as to whether the seven hundred and twenty three thousand dollars was a fair addition to capital account might arrive, but it seems to me it would take a very trivial amount of judgment to settle that question.

I have made no attempt to find the reproduction cost of this property, and the figures that I have outlined have been merely the figures as I have adjusted them to show what I call the cost value,—one set of figures comes in that classification; there is another set which you might call a mixed valuation; that is the one in which the company's reproduction figures for 1914 were taken and the book costs adjusted from that date to now,—added to them. If I were to take the property now and attempt to apply unit costs as of present

2205 day prices, to the property, I understand it would be considerably more than the figures I have given. I have not attempted to do that, but feel perfectly assured that it would be con-

siderably more.

Now, if I were to make an appraisal today on the physical property based on the average of 1918-1919 prices and apply them to the same inventory that Mr. Hoag used, possibly I would come out at the same place that Mr. Hoag came out. It would be a mathematical computation if the same unit prices were used, I would have to come out at exactly the same thing. I would get the same figure Mr. Topping got if I used the unit costs that he used. I would necessarily come out at the same place.

I have Exhibit No. 1 before me. I have taken the reproduction value in 1914 of two million eighty thousand nine hundred and thirty-five dollars, and to that I have added the additions from 1914 to 1920 with such corrections as I have pointed out, other than the exact book figures. If I were to undertake to find the reproduction cost of the property today, of the physical property, I would expect the two million dollars to be raised considerably. I would not expect any great increase in the one million four hundred twenty-seven

thousand dollar item. The cost is made up of two items; one is the property in place in 1914 and the reproduction value at that time, and if those items were reproduced today they unquestionably would cost a good deal more than two million dollars. I should say conservatively that it would be not less than three million, how much more I am not sure without a computation. The other item is \$1.227,000.00 which arises from the additions made from 1914 to the present time, or to 1920. Now, if those items were reproduced, the price would be increased some, but not anything like the same proposition, because a great deal of that expense was experienced during the period of high prices. The period of high prices began about 1915, if I remember correctly. Of course a large part of this million and four hundred and twenty-seven thousand dollars is the purchase of the Houston Home Telephone property, not new additions. I covered the data as to exactly how much separately. It has been included. You will find it in a number of the tables and exhibits too. Two values for 1915, and one of those values is for the addition made by the telephone company as new, and the other value is for the property taken over by the Houston Home Telephone Company, so I have not got those separated, but I should say around five hundred thousand dollars, between five and six hundred thousand dollars, would be the amount which would leave about eight hundred twenty-seven thousand dollars, or around that roughly as the additions made, exclusive of the Houston Home Telephone Company from 1914 to 1920.

Page 2 of Exhibit No. 2 shows what life I assume the various pieces of property. That is in percentage. The reciprocal of that, of course, is the life tables, 21/2% means forty years. The Central office assume that the buildings will last forty years. equipment 121/2 years and the sub-stations the same. Toll lines the Aerial cables 33 years. The aerial terminals and miscel--aneous.-I understand that the exchange apparatus in all public utilities while theoretically should go into depreciation, is carried in the maintenance account. That is not an assumption, but the I. C. C. rules allow it. If everything that you change is chargeable to the depreciation, I am unable to understand how the high maintenance report arrives. Page 56, paragraph 21, "Repairs Defined" reads "Repairs as used in the text of the various operating expense accounts, includes ordinary and extraordinary repairs. Ordinary repairs include:

(a) Testing for, locating, and clearing crosses, breaks, grounds, and other line troubles, including routine work, intended to prevent such troubles, as for example, pulling up slack, tightening guys and reseting guy stubs, trimming trees, straightening poles and cross arms, and cleaning and adjusting apparatus;

2208 (b) Replacements of minor or short-lived parts of structure, equipment or facilities:

(c) Replacements of minor parts of wire plant or equipment-

I should define a minor part as one that failed to be a major part, by reason of its size or its value. As to drawing a line between the minor and the major I judge that would have to be a matter of figures for the particular accountants. Suppose a thing cost \$10 off-hand, I would call it a minor part.

Mr. D. A. Frank: Well, the Interstate Commerce Commission calls it major.

There is then, a statement to that effect in here too, which I can insert. "Made necessary by reason of faulty judgments, excessive strains, mechanical injuries, or other minor casualties, not provided against in the charge for depreciation of plant and equipment;

(d) Rearrangements and changes in location of plant, except subscribers' station equipment (for which a special account is pro-This includes rearrangements of circuits, reassociation of party lines, rearranging grouping of trunks and calling circuits, recross connection on distributing frames, rerunning jumper wires, underlining switch-board jacks, etc., together with materials used

for such purposes which do not add to the tangible value of

2209 such plant;

Extraordinary repairs include:

(a) Restoring to an efficient or proper condition buildings, structures, or other units of property which have deteriorated;

(b) Substituting in order to maintain normal efficiency, new parts for old parts of continuous structure, such as pole lines, cables, wires, conduits, etc., where such substitutions do not amount to a practical replacement of any considerable length of such continuous structures.

I don't know to what account you charge extraordinary repairs, I was just reading what the Interstate Commerce Commission says.

I did not take any percentage on any life table for aerial terminals because it is charged up to maintenance. To substantiate that I will just start and say on page 66 there is a broad heading which says "Instructions Pertaining to Operating Expense Accounts." Then page 21 is "Repairs defined," which I have already pointed out, and it says that this includes ordinary and extraordinary expenses.

"Q. Well, depreciation is an expense isn't it?"
"A. And the pole lines, cable wires, conduits, etc."

"Q. You think it is included in "and so forth"?"

"A. That is specifically mentioned, small parts of cable terminals or any other small parts, it simply says minor parts, any minor parts. 2210

"Q. Is an aerial terminal a minor part?"

"A. An aerial terminal all by itself may not be a minor part but some of its parts are minor parts."

"Q. But the aerial terminal is what we are talking about."

"A. The whole thing."

"Q. Yes, now where have you found in there, that it is charged to

maintenance?"

"A. Well, there is no specific mention of that nor anything except a few general statements. I simply wanted to point out that minor repairs—"

"Q. Now, get down and tell us what a minor part is?"

"A. A minor part is a part which related to the whole represents a very small investment, is what I would say as an immediate definition."

"Q. Where would the line be drawn."

"A. I doubt if it is drawn at the same point in different companies, it may be drawn at totally different points. There may be some lee-way of judgment allowed in there."

"Q. Is a \$2.50 shovel a minor part?"

"A. I should say that a \$2.50 shovel is a part of tools. If you lost one, it would be a minor part, it would come under the head of majors."

"Q. You think and believe anything in here that you say would cost \$2.50, in your 1914 report, is that a minor part or a major part?"

"A. That is a part that comes under the head of maintenance. If you repair two, three or four of them, if you repair one hundred of them, it would come under depreciation."

"Q. How many poles would you have to put in to be a minor

part?"

"A. I don't know."

"Q. Would four poles be a minor part?"

"A. Four poles would come in at once as a repair, it would probably be, and written in the maintenance account. It depends on the accountant, the way his principle felt about it. I have not defined it to you and you have not given me a basis to reach a definition."

"Q. Well, how long? You are on the stand, I am not, I am a lawyer. You are on the stand, you are an engineer and you ought to be able to tell us what a minor part is and what a major part is?"

Mr. Howard: It is not a matter of valuation; it is a matter of segregating and classifying accounts.

"A. I have stated and state again that it is not definitely fixed. There is an element of allowance for the possible specific conditions under which any utility may operate and for the exercise for some latitude and judgment by the accountant."

2212 "Q. But, Mr. Lyndon, if we have the charging to our reserve for replacement every time we send out and put in one pole, you think we have been sleeping on our rights then, we could charge that to maintenance."

"A. I not only think you slept, but I am certainly under the impression that you have been doing it."

"Q. Well, we have not."

Mr. Howard: If Your Honor please, Mr. Frank, made a statement a while ago that the \$10.00 is not a minor part. I don't accept Mr. Frank's statement and I ask that that be stricken from the record.

"Q. Would you be surprised Mr. Lyndon, to know that the Interstate Commerce Commission has distinctly ruled that one telephone pole would have to be charged to depreciation and not to maintenance."

"A. I would be surprised to know that and I would furthermore wonder why it had made such a ruling in regard to telephone companies and apparently had not with regard to traction companies.

"Q. So that you put down nothing for an annual rate for reserve for replacements of terminals in miscel-aneous on the theory that that goes into maintenance expense, is that true?"

"A. That a portion of it would and other portion would be 2213

comfortably covered by the three per cent.

"Q. Pure iron wire, what is the life of pure iron wire?"

"A. The life of pure iron wire is very short. I think possiblywell, you are now speaking of aerial wire?"

"Q. Yes, aerial wire?"

"A. Now I ought to have that report here to show you."

"Q. What report is that Mr. Lyndon?"

"A. That 1918 report, that six per cent was reached, we recognize that aerial wires have a short life.'

"Q. Here it is?"

"A. About 30 per cent of this wire is drop wire, of which the cost of replacement or changes is divided into approximately 80 per cent labor and 20 per cent material. The 80 per cent labor is charged to maintenance, and the 20 per cent material cost is charged to depreciation, which latter charge is therefore 20 per cent and 121/2 per cent which is 21/2 per cent of the cost of new drop wires. However we are allowing depreciation of three per cent on the cost of new value, we are taking a depreciation of 50 per cent per annum other than drop wires. This just doubled the value used in 1914. net life of the wire, is, therefore, taken as 16.06 years, that is to say, we have separated the drop wires, the short lived but frequently re-

moved and changed drop wires from the actual pole con-

2214 ductor."

"Q. So that if you did take the pure iron wire by itself, you would assume a very much longer life for it, than you do when you include the drop wires?"

"A. The pure iron wire used as conductors and put in with the rest of the aerial wires was given a sixteen and two-thirds year life."

"Q. But the other is-

"A. (Interrupting.) The drop wires are given practically 20 per cent depreciation or a five year life, but the depreciation on the total cost of the drop wires includes depreciation on the material plus the depreciation on the labor, and therefore, if the figure is to be applied to both of those things it must be less than the actual depreciation on the material taken alone. That is clear, is it not?"

"Q. Yes, that is clear."

"A. Now, we have been informed that 80 per cent of the cost of the drop wires in place is labor, 20 per cent material, and in that—we have taken three per cent on one hundred per cent, which is fifteen per cent on twenty per cent—no, I was wrong about a five year life. It is a six and two thirds year life that we allow for drop wires."

"Q. If you leave that out of your wire calculation, you would have to raise the life of the pure iron wire, wouldn't you? After you make a calculation of pure iron wire, say at twenty years and the drop wire at six and two thirds years, you get

something around fifteen or sixteen years, wouldn't you?"

"A. No, the drop wires are taken specifically at six and two thirds years. All the rest of the wire is taken specifically at sixteen and two thirds years. Now, some of that wire is copper and a little of it is iron. That is by, "little" I mean the money value."

"Q. Yes, pure iron wire then, lasts sixteen years?"

"A. I doubt it. I have seriously doubted it. I think it makes no difference whether it lasts sixteen years or not. I think it would be replaced before sixteen years was passed"

"Q. Well, if you are going to fix a reserve for replacements you would have to have a percentage big enough to make a replacement,

wouldn't you?"

"A. You certainly would. You see we are dealing with two and a half or three million dollars' worth of property, exclusive of all overheads and all worth of materials and labor—

"Q. (Interrupting.) We are dealing right now, with just one

part of it, that is iron wire."

"A. Yes, and to seg-grate out everything, every \$100.00 worth would be to make a volume bigger than Webster's dictionary.

"Q. Well, we haven't any such volume here and we have segre-

gated every item?"

"A. Well, we have had to take some combinations and approximations. Now, if the value of the iron wire is as much as \$15,000.00 or \$16,000.00 and we have given it a sixteen and two-third-year life instead of say, an eight or six per cent, it ought to have been twelve, why you are out \$7.20 a year?"

"Q. Well, we are not counting what we are out. We are trying

to get your life tables' life?"

"A. The life tables taken on an average, we simply take the aerial wires as a bare example. We admit the short life of drop wires and have taken care of this in this method pointed out."

"Q. Well, you must have assumed that pure iron wire, if you combine it with drop wire, you must have assumed that the pure

iron wire will live longer than sixteen years; otherwise, you would not have made a combination of six and two-thirds per cent?"

"A. It has been combined with drop wire. If you will look over

it you will see."

"Q. Will you give them to me separately and-

2217

"A. Yes."
"Q. What is the life of pure iron wire?"
"A. I haven't given any life of pure iron wire. We have not assumed that your aerials are all pure iron wire. I assumed that some of them are copper."

"Q. Did you find a single mile of aerial copper wire in this

plant?"

"A. I have not made any inspection. In 1914 we took your inventory. In 1918 we made an inventory too and checked with yours. If you have your inventory there, I can tell you in a minute whether it shows any copper wire or not. I have certainly been under the impression to this very minute that there was copper wire in those aerials."

"Q. Mr. Hoag tells me, if Mr. Howard does not object that there might be a mile or two miles of copper wire in the entire plant, that the rest of it is all iron wire or copper wire, which is a twisted pair.'

"A. Copper clad?"

"Q. Yes."
"A. And did he tell you what proportion was copper clad?"

Mr. D. A. Frank: How much of it was copper clad? Mr. Hoag: 80 per cent of the total.

"Q. 80 per cent of the total was copper clad."

Mr. Howard: What do you mean by copper clad? 2218

Mr. Hoag. A copper clad wire is a wire having a steel core enclosed with copper. The steel core is to get the tensile strength, the copper is to get the conductivity. The copper wire, while of a small guage would not have the tensile strength. You have to use a fairly large copper, then it is twisted in pairs.

"Q. Now, Mr. Lyndon, you heard Mr. Hoag's statement there that eighty per cent of the aerial wire is insulated wire, copper clad, what life do you assign to that?"

"A. I see no reason to change the life, sixteen and two thirds."

"Q. Sixteen and two thirds years?"

"A. Yes."
"Q. Would you be surprised to know that in this climate it wears out practically on the average of every five years and has to be replaced?"

"A. What wears out, the wire doesn't I know."
"Q. The insulation of these wires wears out?"
"A. The insulation might."

"Q. How long can you talk over a copper clad wire that the insulation is off, and twisted together?"

"A. Twisted pair, there the insulation begins to go at all, it ends the usefulness of the wire until reinsulated."

"Q. We haven't any way of insulating wire around Houston, have we?"

2219 "A. Not that I know of."

"Q. The only way we could do, is to pull it down and junk it and put some more up there?"

"A. That would be the proper method of course."

"Q. You recognize that the rainfall in Houston is heavy and that has some effect on insulation?"

"A. Yes; there are climatic conditions here that might affect it."
"Q. If the experience of the company is that these wires have to be

changed on an average of every five years-

"A. (Interrupting.) If the experience of the company is and uniformly has been, that an average of every five years these wires have to be changed, then that would change the depreciation rate unquestionably."

I assume an indefinite life for underground conduits. I have gone on record about that underground conduit matter. I assume that it is indefinite, but in deference to the suggestion of the I. C. C. I take one per cent. The I. C. C. says that you should take an amount which would approximately take care of the repair for which outsiders could not be called on. I don't know that it states it in those words, but that is the understanding that I have from the statement of depreciation I set up by the I. C. C. But I

think, myself that there is no depreciation in it at all. I do not accept changes that are caused by external conditions

not accept changes that are caused by external conditions such as the change you had on the Magnolia Avenue grade, and on the Main Street bridge here where you had to tear out large quantities of it, for which the Telephone Company would be reimbursed. I do not know who would reimburse the Telephone Company when the City requires it to move its underground conduits. If the Telephone Company had underground conduits down Main Street and the city should grow to be the size of Chicago and wanted to put in a sub-way, and required the telephone company to move, I don't know what the law is, as to whether the city would be compelled to pay the telephone company for tearing out that, but in all equity it should. I have not assumed one per cent on an assumed life of one hundred years. It is no assumption of a life of one hundred years. It is no assumption of a life of one hundred years. It is no such thing as life itself of the conduit.

With reference to subsidiary conduits, there is some of that that should be changed occasionally, but I should regard it as very small and covered by the one per cent. In fact, the records that I have from the company, indicated that all the changes that you had had and the costs you had undergone at the time of this 1918 report was made, would be covered by one per cent on the cost of the

conduit. The figure of four per cent that I had used
2221 has no relation to subsidiary conduit, not kin to it. The
two per cent that Mr. Hoag has used on underground con-

duit mains is too high,—far removed from any conditions that are conceivable, or any that I have been able to obtain data on, that have ever been experienced. If public requirement here should cause you to have to change the underground conduit that you have, you would certainly be entitled to charge that to capital account. If the Inter-State Commerce Commission will not allow you to do it on one hand, and the city of Houston won't let you abstract it from the other, I don't know exactly where you would be, kind of between the devil and the deep blue sea.

"Q. You think we ought to take a chance on that and not try to

have reserves to cover it?"

"A. I think it sort of ought to be a mutual thing. I think you ought to cover some proportions of reasonable expectation and take a chance on the rest, and not make the public absolutely cover it."

"Q. Well, did you know that we have already spent \$40,000 on

this very item in Houston?"

"A. Then it has been recent."

Mr. Howard: Now, here I object to the testimony of Mr. Frank.

2222 Mr. D. A. Frank: I am asking the question, if he knows it. Mr. Hoag testified to it already.

"A. (Continuing:) It has been recent. The Maximum at the time the 1914 report was made was \$8,000.00 and some odd dollars."

"Q. Well, the figures must have been corrected since?"

"A. Now, it is possible that that \$40,000 arose from changes in bridges or the viaduct that you have just mentioned.

"Q. Now, Mr. Lyndon, on underground cables, what life do you assume for underground cables?"

"A. Before we leave underground conduits Mr. Frank, I would

like to add a word or two about that."

"Q. All right, sir."

"A. The record which we had showns the losses due to various causes, principally repairs of the underground conduits, were around \$1,000.00. I understand that since that time another \$40,000 has been required owing to extraordinary changes that were wholly unexpected."

"Q. I don't know whether it is another \$40,000; I think it was

\$40,000 altogether."

"A. Well, 40,000 total. These conduits have a value now. That is, they cost something over \$400,000.00. That is to say, not—in the entire time the conduit system has been here, there has been a ten per cent—

"Q. (Interrupting.) The entire time since 1910?"

"A. 1910, the entire time in ten years, there has been ten per cent expended and that thirty-two thousand dollars has come from an extrordinary cause, such as it is scarcely possible could ever be repeated, the changes in this viaduct."

"Q. Couldn't you build some more viaducts around Houston, in the future?"

"A. Yes, they might. In that case, they would simply be additional, you wouldn't tear out the ones you already have."

"Q. Couldn't they change the grades in streets here, wouldn't that have some effect on underground conduits?"

"A. It is possible."

"Q. Couldn't the city make some-lay some large water mains and require us to get out of their way?"

"A. I never heard of that being done."

"Q. Couldn't they lay a large storm sewer in some place and tell us to get out of their way?"

"A. It might be a remote possibility."

"Q. Don't you know it does happen to us all of the time, it is not an unusual occur-ence for the City to put in a sewer and require us to get out of the way?"

A. And yet, in these ten years, it has amounted to \$40,000.00?" Q. Well, that takes up the entire amount for reserve for

replacement doesn't it, on that basis?" 2224

"A. Yes, there's thirty two thousand that apparently is extraordinary and is highly concentrated."

"Q. But the extraordinary part, that's one of the things that we set aside reserve replacements for, which you do not anticipate will ever happen in anything, your life tables are all formed on the theory that nothing will ever happen, isn't that true?"
"A. No."

"Q. Do you take into consideration anything in the way of changes or things that are likely to happen for extraordinary re-

"A. If, they don't happen, what becomes of the money that has been set aside for the purpose. It goes into a fund does it not?"

"Q. Well, if you were trying to set aside a reserve for replacements, why the question with you would be-what is your idea of a reserve for replacements?"

"A. Well, I haven't an idea of reserves for replacements."

"Q. You have no idea at all for reserve for replacements?"

"A. I have an idea of replacements."

"Q. You have no idea at all of reserves for replacements?"

"A. Oh yes, I think I know all it is and what it is used for and all that, but I am speaking about this specific thing. certain sum of money that should go to the company as a net amount, part of that is a return, part of that is to do this 2225

thing, to amortize the company's property within a reasonable time because whenever you install any piece of apparatus, from that day it starts in its inevitable march to the junk heap, and as it proceeds on its way, its value continually diminishes and as its value diminishes in order that the investment may maintain its initial value, there must be some money handed back to the owner."

"Q. But, in 1914, you said that the underground conduits did not depreciate at all and you would not allow any amount for that?"

A. It does not depreciate, the only thing that can happen is

extraordinary repairs and that is the basis on which the Interstate Commerce Commission, apparently suggests that a fund-not a fund, but a depreciation rate be set up against it. It is obvious that unless a conduit is abandoned or removed that it is as everlasting as the ground that it is put in."

"Q. Do you know that fifty years from now they are going to be

using conduits at all?"

"A. No, I made the statement that in seventy five or one hundred years there might not be any occasion for conduits, but by that time all present financial schemes would probably have dis-

appeared too. It has proven futile-it is perfectly futile to mark out and outline any scheme of action to take care of

one hundred years from now."

"Q. So you don't recognize the advisability or the practi-bility of setting up a reserve for replacement to take care of this property

when it is finally taken out?"

"A. It is highly desirable for the company for the setting up of a reserve for replacements. It is the duty of the public to supply the company a net amount of money, which will every year compensate the company for its change in value, for the diminished value of the plant and that they have every right to collect and that should be awarded them and that the city never has contended against."

"Q. Is it your idea that the reserve for replacement should be

just exactly proportionate to the diminishing in value?"

"A. Not necessarily. That is a matter for the company to decide what it shall do with its money, but if the public should pay any

greater amount, I don't regard it as just."

"Q. Do you recognize Mr. Lyndon, however, that we will maintain utilities, try to set aside a reserve for replacements on the theory that the public can never be harmed by setting aside this reserve, because once set aside, it can be used for no other purpose, except to rebuild the plant, but the public may be harmed by not setting it aside on

the theory that the time may come when the company is 2227 called upon to give service and the company not be able to give any service, do you recognize that principle in public

utilities?"

"A. Perfectly understandable."

"Q. Is there anything to criticize in that theory of public utilities?

"A. Not if the amount contributed by the public to the reserve fund does not exceed the amount owed by the public to it, which is the reduction in value each year."

"Q. Mr. Lyndon, how does the public owe anything?"

"A. It gets service and for that service it incurs a definite debt and

obligation.

"Q. Do you realize however, that the members of the public who get service, pay only for what they get and that they will not pay for something that they do not go?"

"A. Well, they get two things; they get service and they get the use-you may say the consumption of machinery. An electric light

plant burns up coal and it burns up machinery just as surely as it burns up fuel. The only thing is that the fuel goes faster and must be replaced frequently; the machinery goes slowly and must be replaced at long intervals?"

"Q. So that it is necessary to have reserves for replacements?"

"A. It is necessary to have, it is desirable to have reserves for replacements and it is necessary that you collect from the public an amount which reduces the change in value of the plant 2228 from year to year. Now, if the change in value each year, the amount which you collect, does not pay for your replacements-

"Q. (Interrupting.) What are you going to do Mr. Lyndon?"

"A. The difference must go into capital account."
"Q. Now, Mr. Lyndon, you are assuming that it goes into capital What is your authority for saying that anything like that goes into capital account?"

"A. Stick to the fundamentals, and I don't think we will diverge

much. Mr. Frank."

"Q. All right, I am ready to hear."

"A. A man buys a \$1000 bond and he gets five per cent interest on it for 20 years. At the end of 20 years he gets his money back, because the bond is redeemed. A man who puts a thousand dollars into a public utility has a right to expect the same identical treatment he gets his six or seven per cent, or whatever it may be, on his investment and that as the thing which he has put his money in loses its value, it is returned to him. Now, with that situation it depreciates. You see, the amount the public owes is the amount that the man invested in this machinery. Now, if he invested a thousand dollars in it, it finally passes out, he has collected a thousand dollars, but he is going to replace it and a new one costs \$2500, then he has only got all his money back, the other \$1500 must be capital account."

"Q. That isn't the same proposition Mr. Lyndon."

2229 "A. Now, the suggestion that you have a thousand dollar investment and you are going to be confronted with a \$2500.00 investment and that within the course of a certain number of years you shall set up an amount to collect from the people to take care of that \$2500 investment does not appeal to me.'

"Q. That has not even been remotely suggested by me; but what I did suggest to you, taking your own illustration, is that if you had one thousand dollars invested and say a fair return would be 8 per cent, and you did not make the fair return, for, say five years, during that 20 years, and that would be \$400.00, your proposition is that \$400 ought to be added to the \$1000 and your investment then is \$1400.00?

"A. Yes."

"Q. Now, I am asking you to do that; now I am asking you how we can do that under what law we would be permitted to add \$400 to our capital account?"

"A. It is my impression that before all cases—in all cases before Public Service Commissions, that that is done. It was originally

suggested, or originally was brought to me attention away back in the early days by the Wisconsin Commission and they had a very definite scheme of working that out and setting it up."

"Q. Don't you know that the Wisconsin Commission itself has

abandoned that scheme?"

2230 "A. I do not."

"Q. Can you name one single case in the last five years

that is set up on that scheme, one single case?"

"A. No, I cannot name a case at any time that was set up on that I have read a number of cases, but I don't remember whether it did or did not."

Mr. Howard: The Massachusetts Commission recognizes it yet.

Mr. D. A. Frank: No, the Massachusetts Commission does not; I beg your pardon, the Massachusetts Commission does not go on that theory. The Massachusetts Commission goes on the investment theory pure and simple.

"A. I certainly regard it as fair. The Wisconsin Commission may have abandoned it, but the logical thought they gave for adopt-

ing it is unescapable to my mind."

Q. The trouble is if we are under the Interstate Commerce Commission and have to obey their rules in making out our accounts and can't even set up accounts different from what their rules require, we would be in very poor position to take advantage of that, if it were approved by the Commission here or by the Court, wouldn't we ?"

"A. If that is true, you would. But I didn't know that the Interstate Commerce Commission did anything more than require a system of accounting. I didn't know they actually controlled your investment." 2231

"Q. They don't control our investment, but they do control the kind of accounts we have. Now, how would we take advantage of our books of adding your capital-adding to our capital, as you say we would, something that the Interstate Commerce Commission would not allow us."

Mr. D. A. Frank: Let me read the rule to you and you can see. Page 33, rule 10: "Costs to be actual money costs.—All charges made to fixed capital or other property accounts with respect to any property acquired on or after January 1, 1913, should be the actual money costs of the property. When the consideration actually given for anything with respect to which a charge is made to any fixed capital or other property account is anything other than money, the actual consideration should be described in the entry with sufficient fullness and particularity to identify it, and the amount charged should be the actual money value of such consideration at the time of the transaction."

"Q. Now, you recognize the fact, do you Mr. Lyndon from that

rule that we could not set up on the books any theoretical value on

account of a loss, do you?"

"A. I would not attempt to at this time construe it, but it mentions there "consideration." I would not attempt in the presence of lawyers to construe a statement of that kind, but it does not seem

to me that failure to collect a sum of money from the public which it owed you for services and for which you were insufficiently paid would be a sufficient consideration for your

receiving it at a later time under another guise and setting it up."

"Q. Mr. Lyndon, let's go on to this annual rate of reserve for replacements. You assume for underground cable, what life, main underground cable, you have it set up on page No. 2, of your Exhibit No. 2."

"A. Two per cent."

"Q. What is the life then?"

"A. That would make the life, if it were applied only to depreciables which it is, that would make the life of underground cable, lead cables, fifty years."

"Q. Well, do you suppose there are any lead cables anywhere fifty

years old?"

"Q. No, the telephone art is not fifty years old."

"Q. Well, is it likely there is any that will last fifty years?"

"A. I see no reason for its depreciation. You might get electrolysis in lead occasionally, but you see the entire thing is sealed up in a lead, just like canned vegetables. There is no way in which deterioration can take place except through injury to lead sheath. A pin hole in a lead will let the water travel a quarter of a mile in a cable but assuming that the cables are all good and that you are

not afflicted with electrolysis, I see no reason for the cable

2233 giving out on you at all, the lead sheath."

"Q. Now, suppose that we had assumed a fifty year life for a cable twenty years ago and had set our reserve aside on that basis, the fact is, that we have very little cable anywhere in our territory that is twenty years old and if we had a great deal of cable twenty years ago?"

"A. Lead sheath, underground cable, insulated cable?"

"Q. Yes."
"A. Twenty years ago?"
"Q. Yes."

"A. And it has all disappeared?"

"Q. Practically."

"A. And none in use."

"Q. Very little. Twenty years ago we had cables that had about two hundred pairs of wires in lead sheath cable, and now we have nine hundred pairs and when the plant grows to such an extent that we require the additional number of wires there, the time necessarily comes, doesn't it, that we have to take out the old cable and put in the new cable?"

A. It does; sometimes sooner than you expect."

"Q. And as we take out the old cables, they are all in short lengths aren't they?"

"A. Well, the standard man-hole length." 2234

"Q. Well, something like 250 feet?"

"A. Somewhere from 260 to 300 feet long."

"Q. As they come out, you know how they are usually treated, when they come out?"

"A. I understand that they are pulled out but used in other

conduits."

"Q. Well, do you know that, as a matter of fact, as they are pulled out they are usually chopped into two feet lengths and melted into

"A. No, I understood that they were pulled out and used other

places.'

"Q. What determined whether they were used in another place?" "A. Whether or not they are large enough or too small for the service."

"Q. Could you take out an underground conduit and use it for an aerial cable?"

"A. Of course, you could as a matter of fact."

"Q. Would it be economical to do it?"

"A. I doubt it. It would be too heavy to suspend and you would

have to make a splice at each intersection."

"Q. So that you would have to take into consideration the then certain condition of the cable as to whether or not, there were any defects in it on account of electroylsis, and also the question of cost of making the splices and the question of whether

or not it was suited for the purposes for which it was going to be "A. It would seem to be logical to pull it into other places where

the 200 pair cable is what you want and what you need."

"Q. Well, are these conduits?" "A. (Interrupting.) Well, you try and make man-hole lengths around three hundred feet apart."

"Q. As a matter of fact, no two of them are just exactly the same

length apart are they?"

A. No, I doubt it."

"Q. It would be like a woman tearing up a dress to try and make another dress with it, it would be hard to make it?"

"A. I don't understand it is impracticable, I understand that it is done, and done by the Bell Company."

"Q. Where is it done by the Bell Company?"

"A. I don't know. I told you this information is what has been given to me and that is what is done with the cable, and that is the reason for the low depreciation. If you have to pull out cable, this cable will not be worn out or obsolete, but it will become antiquated and its life may not be over ten or twelve years; it might in some instances not be over twenty years."

"Q. Would you be surprised to know that the experience of the Bell Company through the entire system is that the life of it

on the average is not over twenty years?"

"A. That is the average life of all the cable?"

"Q. Of all the cable?"

"A. It would surprise me. That is computing it from the day it is bought to the day it is sold as junk?"

"Q. That is the idea exactly."
"A. Yes, it would surprise me considerably."

"Q. Mr. Lyndon, right there, I don't know whether you realized it or not, but the probability is that you have made an error in the assumptions of your life tables and the use of life tables, the life tables that you have used here are the old Bell life tables, aren't they?"

"A. I think so."

"Q. Now, do you know how they were arrived at?"

"A. No, I don't know. As I told you, these tables have proceeded from practical telephone men and operatives and maintenance men.

I would not have attempted to fix those myself."

"Q. Now, that was exactly what I thought from your report, that had happened—that you had taken the old Bell life tables and had misunderstood the use of them, at least our ide-s, you might have had your own ide-s, but you had misunderstood our idea of the use of those tables. The manner of arriving at our depreciation rate on the underground cable, for instance, would be to subtract fir-t the

junk value, which is 40 per cent from the one hundred per cent of the entire value, leaving sixty and then that is divided

by the average number of years, which is twenty, so that we arrive at three per cent that you arrived at. Now, what you have done is to take your three per cent and assume that percentage should be applied for the depreciable property only and that, therefore, dividing one hundred by three would give you the life of the cable, or two as you use in the other tables. Now, that has resulted through your entire set-up, I am stating it to you, very frankly and sincerely as I know how. That has resulted in all of your set ups being off to the extent that you think that we have not taken into consideration the fact that the property depreciates—leaving junk and that is the main difference between your figures and the figures of our engineers in this set-up, do you see what I am talking about?"

"A. I understand perfectly, yes, and-

"Q. (Interrupting.) We have no criticism however, of your doing it because it is a misunderstanding on your part, of how they are used."

"A. That may be, and it may be perfectly applicable to strictly telephone property, such as, for instance, paper insulated cables, but in matters of such as pole lines and insulators and cross arms and

hardware and all that, they are common not only to telephone 2238 systems and—but in every other character of systems. Now,

on this, I have used the knowledge that I have. Now, on this underground cable I questioned that low depreciation rate. It looked low to me and I was informed that the reason it was low was the one that I have given you, that when inadequacy overtook a cable, as it nearly always does, until you get up to the limit of cable sizes, the cable was simply transferred to other conduits."

"Q. Well, of course, you could realize that unless you found another conduit that was just exactly the same length that if you pulled out three hundred feet in one place and wanted to use it in a two hundred feet one, you would have to cut off a hundred feet which would then have to be junked."

"A. Yes."

"Q. Or if you had a 260 foot piece which you wanted to use in a 300 foot run, you would have to make a 40 foot splice?"

"A. Yes."

"Q. And either one of them would be uneconomical?"

"A. Well, cutting it off might not be, but splicing it costs a lot of money.

"Q. Now, you have used two prices in the report which you have just read for your underground cable, whereas in your present set-up, I think in order to be fair to you, you used three 2239 per cent in your Exhibit No. 2, on page 2?"

"A. Oh, the present Exhibit?"

"Q. Yes."

"A. Yes, as I told you that two per cent always looked a little bit low and I had to have it confirmed before I would use it and in making these exhibits, I thought it looked too low any way and arbitrarily lifted it fifty per cent and made it three per cent."

"Q. You can easily see that if what I have stated to you frankly, is correct, that some of the calculations you have made on the value of this property would make some difference in the final outcome?"

"A. If the life is twenty years, and that has been your experience, shown inescapably and the indications are that both cables arealthough cables now made up as large as you can pull them into the conduit that that would be the case in the future, then five per cent is the amount to apply to the depreciable portion of property?"

"Q. And if you put it as we do on the entire amount why the three per cent should be applied to the one hundred per cent in-

stead of to the sixty per cent?"

"A. But my present view of the matter is that most of the 2240 fundamental work was begun with small sized cables because

they were big enough for the then needs and even immediate prospective needs and that cables that have been recently installed, say within the past four or five or six years have been about as large as the conduits would permit and therefore, the question of inadequacy can never arise with those cables. The inadequacy of your conduit system may and you may have to add to it at a capital account cost, but you can't pull any bigger cable in than those that you already have in, in a number of places."

"Q. You realize that instead of tearing up our conduits the General Staff of the American Company has been working for years on

the proposition of-

"A. Smaller cables having given number of pairs."

"Q. That is smaller cables having a given number of pairs or a greater number of pairs for the same size cable?"

"A. Yes."

"Q. So that, whereas a two hundred pair cable used to fill up a cable run, we lay out a four hundred and six hundred and are now using a nine hundred pair and they are even manufacturing a twelve hundred pair cable that will be used eventually; you know of that development?"

2241 "A. I know of that. I think that was brought out in the testimony."

Mr. Howard: How do you claim credit for the General Staff, in the idea or in the construction of the cable?

Mr. D. A. Frank: That has been fully covered Mr. Howard, and I don't care to go into it right no, unless you are very anxious to.

"A. In that case, if you have cables that are from, say, six hundred pair up, the prospect of inadequacy is very much less than the prospect of inadequacy was fifteen years ago on the then existing cables."

"Q. Well, suppose Houston continues to grow as rapidly as it has in the last twenty years, we would probably have to use twelve hundred pair, where we have got now four hundred pair and six hundred

pair wouldn't we?"

"A. It might be so, but it would only be very short runs from the station out. It would mean that streets that are not now covered, you will have to cover. For instance down Main Street, there are about all the telephones per unit length of street that — may reasonably expect. You can't expect them to be doubled, no matter if the city grows enormously to five times its size. It means that other territories will be covered.

2242 "Q. But down here, but between here and the Rice Hotel they have torn down an old building and are going to put up a large office building?"

"A. I understand so."

"Q. Don't that mean we will have to run more wires to take care of that?"

"A. Unquestionably."

"Q. And then, the oil company is putting up some sky scraper, that is intending to, don't we have to take out the small cables and

put in some large ones?"

"A. True, but the percentage increases will be nothing like has occur-ed. That is, the prospects of inadequacy within the space of time you mention is nothing like as great. I know, although you didn't say, that this twenty year life that you mention is not due to the cable wearing out, it is inadequacy."

"Q. It is inadequacy and in some respects obsolescence. Well, I

don't know wh-ther you would call it obsolescence or not?"

"A. It don't have enough pairs in it, that covers the whole thing. Now then if they lasted twenty years from the beginning, with the rapid growth the high percentage growth per annum, they will last much longer than that, beginning from now on, and as the city grows each year the percentage increased in any given run of underground conduits should be naturally less."

2243 "Q. But you should have additional developments for the city, where you will have virtually the same situation that has obtained heretofore, in the business part of town, isn't that true?"

"A. No, I think that you will find that there are certain streets

that you are covering with aerial in which you will put down underground cable and when you do you will put down sufficient number of ducts and draw in cables with a sufficient number of pairs to cover whatever prospects you will receive for a number of years.'

"Q. But we don't put cable in big enough in the cable duct, for instance down Louisiana Street, we would not put in cable longer than to last for about five years?"

"A. That I don't know."

"Q. Would it be economical? Suppose we knew positively that within the next ten years that Houston was going to be as big as St. Louis, and that it was going to extend South and east, that is sometime within ten years, that we are going to require as heavy cables out certain streets here as we have in the downtown section. Now, would it be economical to go and build the construction for that period, ten years in advance?"

"A. Not at this time."

"Q. The only thing you could do would be to put your permanent

construction in at this time, wouldn't it?

"A. Yes, and I don't know how much of that, this time is a period of certain high prices."

"Q. That you might better afford to wait?"

"A. Much better afford to wait, yes."

"Q. So that there is, this thing of inadequacy is something that

we are likely to have at any time in any part of our plant?"
"A. Unquestionably. I admit that, but the only question is, is the prospect of inadequacy as great as the prospect for inadequacy was fifteen years ago, when you first laid cables? I don't think so, If twenty years was the life of the cables, beginning from twenty years ago, then I should say they ought to at least last twenty-five or twenty-six years before inadequacy overtakes them as an average. Of course, there's cables you will cut down and in thirty years you will have to pull them out, as an average.

"Q. Mr. Lyndon, when we adjourned yesterday we were talking about underground cable, and as I understand from your testimony, the percentage that you used there was used,-that is, all the percentages have been applied by you under a misapprehension of the

use that is ordinarily made of these percentages?"

"A. No, I understand that these percentages are the percentages used at one time by the Bell Company, and if applied to the total cost and not to the depreciable value, but-

"Q. And you take the very same percentages that the Bell Com-

pany had used?"

"A. I did in the case of the underground cables. For other percentages, which as I explained at the time, refer to general character of electrical equipment, with which we are all familiar and on those I took percentages which I know to be correct."

Specifically, the first I call to mind is pole lines. I used 8 per cent on that. I gave the pole plant a life of twelve and one-half That average is fairly standard among engineers, and while it is too short a life as the average life, I feel it is a safe figure. I have used variously twelve and one-half years and ten years all my life. I have never had a shorter period of time than ten years, and I think I never used a longer period than twelve and a half years. Telephone companies use ten years constantly, but that does not mean that they wear out in that length of time. Figures for depreciation should be based on mere wear. I changed over from ten years to twelve and a half years because of poles that are newer that have been planted and are still in use on transmission lines that I knew of more than twelve years old still continued, and that

as far as I could find out in Houston from going over the leading properties here, that it was probable that twelve and one-half years was a fairer life than ten and other data in various The gross additions to the plant in Houston of pole lines might amount to more than what it is shown to be on the books as the cost of the poles in Houston or might not. The total amount of the gross additions would show the total amount of what was in the plant at present, if the gross additions were made within a comparatively short space of time. If the life of the poles is ten years, or longer, the gross additions should show the actual poles in place. If the gross additions do actually show for the last ten years a larger amount than the company's book account of poles, it would tend to verify the company's figures of ten years,—it might even do more than that, it might show higher assets in place than the books account for. I do not understand that you claim more property than the books account for, but a higher value on the property than it had at the time it was purchased. I have never understood that you made the claim that the books will show less than the actual cost of the property, I never understood that you made any such claims as I did not know that prior to 1912 there was several items of cost that did not go on the books. Your books which purport

2247 to give the expenditures the company incurred for plants do not actually do it. I did not hear Mr. Kelsey say that no books prior to 1912 were accurate, and I have not read his testimony on that.

I do not know that such expenses as general expenses, engineering expense, taxes, and interest during construction were left out of the books prior to 1908. Of course, that would not apply to anything that had a twelve year life, because, prior to 1908,—anything put in prior to 1908 that a twelve year life would have to be replaced now, and would be about new now.

I did not allow any junk value for poles; I do not regard them as having a junk value. I am assuming and applying my per cent to the depreciated value instead of the actual value, and that would get the same results either way from poles for the reason that there is

no junk value.

On an aerial cable I used three per cent, and also used three per cent for underground cable. The aerial cable should have somewhat more rapid obsolescence than underground cable. I do not see that it would have any deterioration other than possibly it might be torn up some by storms but in that case, it is simply replaced. If it is simply replaced, you do not have to have something to replace it

with; if the cable is blown down it is tied back up as soon as the storm is over,-lead sheath cable isn't ruined by being blown down. It might and might not be damaged by being blown down, the probabilities are it would not. The copper wires are covered with a lead sheath and is a right substantial structure. Cables up in the air are subject to accidents. It is true that a larger amount should be allowed for an aerial cable than on underground cable, and in all the reports, except this one it has been one. But in this case instead of increasing the aerial cable, I simply increased the underground; that is what makes them equal.

"Q. Mr. Gates, in testifying allowed a percentage of six per cent, and Mr. Player, who had a great deal of experience, fifteen or twenty years, with Commissions, allowed six and two-thirds per cent, and Mr. Hoag allowed five and four tenths per cent for an aerial cable?"

Mr. Howard: What did you say Mr. Player allowed?

Mr. D. A. Frank: Six and two-thirds per cent.

Mr. Howard: If you will go over that you will find you are wrong about that.

(By Mr. D. A. Frank:)

"Q. And Mr. Hoag used 5.4 per cent. Mr. Topping had eight per cent, and you used 3 per cent. Now, there are five engineers who average something like six per cent, and you have used practically half, so it would seem reasonable that you might be wrong on that, wouldn't it?"

"A. It would be possible, but the true test would be the actual experience of all telephone companies over a long period of years and that's what these figures are, -- that's what they amount to and

If the American Telephone & Telegraph Company's figures based on forty years experience are 5.4% the same as used by Mr. Hoag, it might be and might not be pretty good evidence of what would be right; it depends entirely on the basis. If the evidence shows that the average of cables as found in the whole experience of the American Telephone & Telegraph Company that 5.4% applied to the depreciable value is the true amount, why, it would be difficult to contradict it, but if the experience of the American Telephone & Telegraph Company indicates not that the life of a cable is the criterion that fixes that five and three quarters per cent, but that it is desirable to set aside that amount of money, it would be quite another thing.

"Q. But these are the figures that are entirely divorced from the figures desirable to set aside based on engineering study of the actual life and experience, that is, the actual life of the cable as shown by the experience of the American Telephone A Telegraph Company in-" "A. (Interrupting.) That is about 17 years."

It has been true up to the present time that just a small per cent of the telephone plant wears out. There is nothing that occurs to me that would actually wear out except poles and cross-arms, and you have mentioned that the insulation or twisted pair cable, that is exposed; Iron wire wears out, but I should judge that would be removed before it has a chance to simply corrode away. I did not use six per cent on iron wire; I haven't considered iron wire. I regarded the cost of iron wire as forming such a small proportion of the aerial wires that a special separation of this part of the equipment and a special rate of depreciation did not seem to me to be worth while. I did apply six per cent to an aerial wire which includes a little bare wire. On an aerial wire I took the junk value that was suggested by the Telephone Company which was 30 per cent of the original cost. There is no junk value to iron wire, but let me say again the value of the iron wire I regarded as,-first I admit that these are improper values to apply to iron wire specifically per se as including nothing else; iron wire itself is not considered with anything else, iron wire has a negative value as junk; the labor cost

more to take it down than it is worth. The figure is not 2251 minus 16 per cent; you could put up wire for less than that. On familiar ground I have strung a great many miles of wire. and it is wrong in the amount that you have specified as the negative

Anybody can take that wire down for very little money, so little that it would be practically negative. After you get it down it is worth substantially nothing; it is hardly worth hauling away. I do not know what it cost you to take down a mile of it, but I do know that if it would cost more than six or seven dollars a mile to take it down, then somebody is spending money that ought to be

I do not know what a mile of ordinary 12 guage iron wire is now worth, F. O. B. Houston. I do not know whether six dollars a mile on 14 guage sounds right; it might be around six dollars.

I do not think that two dollars is excessive to pay for taking down a mile of wire; that would be 33 and one-third per cent of the wire Taking it down might cost thirty-three and one third per cent of the cost of it and after having it down it would not be worth anything, but you are taking the wire just F. O. B., and the real value of the wire as shown on your books, and as we estimated it, is the wire strung in place.

I think that Mr. Hoag is wrong in assuming that the iron 2252 wire depreciates to minus 16 per cent. I might I might ac-

cept that if I had a rational basis for it, but it, the wire costs a certain amount of money, you say now about six dollars. I do not know what amount it is. It has got to be strung, tied in place; I do not know what it cost you, but assuming that you do that you do that for \$13.00 would be a total cost of \$18.00, and if you took it down for \$2.00, it would be one-ninth of the cost or something like 11 per cent, and if you took down a large quantity of it, there is some slight junk value, but of course, if you take small lots it has no junk value because you haven't got enough to sell and could hardly afford to bundle it up and carry it to the railway sta-

tion, but, if you have a large quantity there would be some junk. Now, let's admit that it sinks to 15 per cent, just to carry out the answer I started to make to the question; the proportion of the value of iron wire in the total, I have regarded as too small to either segregate or to let influence the figures which are used for copper wire.

The figures are wrong, every one of them, as set down by either There is nothing definite about depreciation; it is an approximation and when I used them, it is an approximation and now, to try to get exact results out of an approximately fixed basis has no logic to it. The only difference is that your figures are not based on 40 years' experience, and that mine are taken

out of thin air. Your figures are based on different experiences that cover various parts of the country and you should have a reasonable and fair average basis for the total, but your own experience has shown you that the rapid changes in the past has caused obsolescence with a rapidity, which you probably do not expect in the future, and the present figures are not totally based upon experience, but are partially predictions.

"Q. Now, the figures I have read you are the figures of the American Telephone & Telegraph Company for bare wire, and for insulated wire of 12.9 per cent as comparable with your 6 per cent, whereas, Mr. Hoag taking the experience in Houston, used 16.5 per cent for bare iron wire and 15 per cent for insulated wire."

"A. Six years' life only?"

As to whether or not I can conceive of any reason why bare iron wire and insulated wire would wear out faster in the City of Houston than it would on an average throughout the United States, as I stated before, I do not believe that iron wire gets a chance to wear out. It comes down though. In a damp climate insulation will deteriorate more rapidly than in a dry one, but that still does not point to any five or six year figure to me.

If the gross additions in the sub-station equipment account for the last five years more than equals the entire total carried on the company's books for sub-station equipment that would convince me that the books were wrong, and we wanted another basis. I do not know why the books would be wrong. If the property now in use, not only for sub-stations, but any additions that you may choose to name, exceeds the books I would conclude

that the books are in error.

"Q. Well, that's exactly what we tried to impress upon you from the start, that the books do not contain all the property, and that's necessarily true because no entries will be made except for property actually constructed-

Mr. Howard: We would rather that you prove these things, than to testify to them yourself.

I have used thirty-three and one-third years as the life of underground cable, underground cable subsidiary and blocks, and underground cable house, and underground terminals, and miscel-aneous, and I have bunched all of these and used 3 per cent for them. I judge underground terminals do not last as long as underground cable. I do not know what the life would be of underground terminals. That would be subject to change with the change 2255 in conditions. The ratio of the cost of underground terminals to the cables is so small—I think I could best

terminals to the cables is so small—I think I could best illustrate it, if a man had a thousand head of cattle and one horse, that he would take, and say the value of my life stock is \$80 a piece,—is \$80,000. Now, you have got a horse in there that is worth \$100. Now, to attempt to separate the whole thing out into individual items, each of which is somewhat different in its rate of depreciation would make a long and cumbersome document, and we would not be any closer to the fact finally than by approximating. In the matter that we are discussing, I took the ordinary Bell 2 per cent, raised it one per cent, and called it 3 per cent.

As to where I got the Bell figure of 2 per cent for underground cable, I understood that was what you said yourself yesterday.

"Q. No, you said it, I asked you if you adopted the old Bell figures on some items of the plant, but not underground cable. The figure of the Bell Company for years has been 3 per cent. Underground cable, main and underground cable subsidiary has been 4.6 per cent. Mr. Hoag's figures were underground cable main, 3 per cent; underground cable and subsidiary and block, 7 per cent; underground cable house, 6 per cent; underground terminals and

miscel-aneous 10 per cent. Of these about three fourths would 2256 carry the 3 per cent and one fourth would carry the higher per cent, which would be rather a substantial item, wouldn't

it ?"

"A. Yes, it might be. That means that there is a little more than four hundred thousand of that property and that would mean that according to the books three hundred thousand would carry 3 per cent and one hundred thousand would carry some other percentage, which would then depend on the various percentages into that one hundred thousand, which we adopt for terminals and subsidiary laterals and for the rest of it."

It would make some addition if those figures are correct, I mean,

actually based on the life which has been found to exist.

I did not use any right of way, and of course if I did not use any right of way, I could not use any rate for it. The investigation that we made showed that in right of way forty six or forty eight hundred dollars have been incurred in Houston; I mean has not been incurred in Houston, but was an allocated charge, that is, the right of way of the whole company had cost so much money. As to whether or not I know that you are paying for right of way to the city of Houston, and cannot even set a pole without paying a 50 cent charge, that refers to a new pole; you can't replace a pole without paying a charge. If you have 17,000 poles in the city of

Houston, that would mean something over \$8,000 for right of 2257 way, even for the city, that is if they were placed subsequent

to the time that they passed the ordinance. If they had that ordinance twenty years, then you had to pay it, but I understand it was put in your construction cost. With reference to people who have property where you want to set a pole on the back end of a lot, and they charge you for that, as to whether or not that is right of way depends on whether you pay that money and charge it to construction cost or not. As to whether or not all of that has to go into right of way if you make such payments I am not sure of. I thought — was all part of your construction. The Interstate Commerce Commission has not been working but a comparatively short time, and I judge there has been but few new poles planted in that time, in fact, in the past eight years the tendency has been to take out poles, rather than to put up any new ones. The town has been continuously growing but the tendency has been more to extend the underground system. I do not know that you have got more poles today than you had ten years ago, but that can easily be determined by reference to the book of statements which we have here and we can look at that and see.

I understand that the city of Houston has grown in ten years from 90,000 from what has been variously estimated from 2258 one hundred forty to one hundred seventy thousand people, and that the suburbs have grown very largely themselves, that is, people have moved further and further out, and ordinarily suburban construction is an aerial construction, so that, of course it would not be unnatural if you have more aerial construction than you had ten years ago, but that would depend on the rate at which

you had removed poles in the more congested sections.

If your gross additions the last ten years amounts to more than the entire book cost of poles as carried on your books, it would seem to indicate that you had been putting up a good many poles in the last tens years. If that is a fact when you include the Houston Home purchase. I do not know how many poles were in the Houston Home purchase, but the poles had an initial value of bout \$66,000.00. I do not know how much of that was put on the company's books. I think they put that down on the company's books at \$59,000. They were put on the company's books in accordance with the Interstate Commerce Commission's ruling, which required that they be put there at the then depreciated value of poles. The relevancy of taking out the poles of the Houston Home Telephone Company would be only this. That ordinary judgment would show that there must be duplications, but how much I cannot say without making a survey, but it is impossible for the mind of an engineer, or an ordinary business man to conceive of two companies,

one of which was a competitor of the other, that did not parallel and overlap at some points. I do not know that any of the poles have been removed at all. Taking out the automatic which was \$59,119.00 if the gross additions by this company for the last ten years, exclusive of that has amounted to more than two hundred thousand dollars out of a total of two hundred eighty eight thousand dollars, it would mean that we would have to revise the entire subject as far as I am concerned, because it would show that the

basis of which it was founded was wholly wrong,—the basis on which these reports exhibits and conclusions are founded are wholly wrong. We have taken the net additions and have gone further than that; we have changed the ages to accord with the theory that the life covered only a certain portion of the time. We have never had either the gross additions, nor the actual amounts spent for replacements. I do not know that the city had those figures from 1910 up to the present time. I have never asked the City Secretary for the reports made by the telephone company year by year, and do not know that I could have gotten them by asking for them; I thought it was best to ask the telephone company.

I did not personally ask the telephone company for gross additions. We had some accountants to attend to this work and I wrote them two or three letters. One after the other asking for

2260 this information and they replied they were not able to obtain. Now, I cannot say why, not having personally done that, why they were unable to obtain it, but one reason I wanted to obtain this information was that the actual realized depreciation through the past ten years would be an excellent criterion of the best rates of depreciation to apply.

"Q. Did you look at the files of the letters written by the General Auditor to Mesers. Ernst & Ernst with reference to this matter?"

"A. They sent me one or two letters about it, but at the time our communications was by long distance telephone or direct here in Houston."

"Q. Did you see a copy of a letter writtem February 14th 1920, to Ernst & Ernst, and signed by the General Auditor, the last paragraph of which I will read to you "Regarding the charges to depreciation reserve since 1901, we do not think it is possible to get accurate information back to 1901, however, information is on file at Houston in the reports submitted by this company to the city of Houston showing such charges back to about 1910, and Mr. Lyndon can obtain the information he desires from these reports." Did Ernst & Ernst show you a copy of that letter?"

Did Ernst & Ernst show you a copy of that letter?"

"A. What is the date of that letter?"

2261 "Q. February 14th, 1920."

"A. No, and the reason is that the information was asked for, I believe, fully a month before that, and on February the 12th, I had completed all the work here I had to do and went to New Orleans, and was not there from the 13th, and that letter evidently was not in Houston until the 15th. On the 15th I was in New

Orleans,-on the 19th I sailed for Havana."

Of course, it was not the fault of the telephone company that I was in Havana, but you see I asked for these details a month prior to that date. I asked Ernst & Ernst for it and they telephoned or telegraphed the request to Dallas. I do not know on what date they telephoned it. I can look up the Ernst & Ernst correspondence and you can take the bills from the Southwestern Company showing the date of the call and get that, but it was fully a month prior to that time as I remember it that we requested that as rapidly as it could be obtained, or as quickly as it could be obtained, I do not remember

the date we requested the information, but it was about a month prior to the time that I requested this information in a memorandum handed to the general auditor in the court room on January 12th

of this year,-just about a month prior to that letter.

2262 "Q. But, on February 5th, Ernst & Ernst notified the office here of Ernst & Ernst, that is, Ernst & Ernst from Dallas or St. Louis, to the office of Ernst & Ernst at Houston that they got this by years from 1901, and following that came the letter from the General Auditor, on February 14, giving a mass of detailed information in response to other questions asked by you, but stating that the information could not be given back to 1901, but stating that you could get it from the city of Houston. Now, did Ernst & Ernst furnish you a copy of that letter?"

"A. Not a copy of your letter of the 14th, because I had concluded the work of the preparation of these exhibits, which is really bringing the valuation of the company up to January 1, 1920, at that time or prior to February 14th. What date I asked Ernst & Ernst for the date on realized depreciation I don't now know. I have a copy of my letter to them; they put it up I know by telegraph or telephone and my request was not limited to the time from 1901 to the present day. I asked for the data as far back as it was possible to go; for one year, two years, ten years or twenty years,-the date as far back as possible to go and to get the information immediately."

"Q. So at any rate the combination of the misapplication of your depreciation rates and the theory that you set it up on, of net additions instead of gross additions would virtually make your

2263 entire Exhibit No. 2 wrong?"

"A. No, if the books of the company are wrong, then my Exhibit No. 2 is wrong. That is to say this, the figures, the accountants have given me have come from the company's books. Now, if the books are wrong, why the accountant's transcriptions are wrong, and the resulting document is consequently wrong.

"Q. Now, just to apply a test to that, Mr. Lyndon, let's turn to

page 15 of your report now of your Exhibit No. 2."

"A. Yes."

"Q. On underground cable, now you have up to 1901, \$34,273.00 worth of cable."

"A. Yes."

"Q. Which you say is twenty-five years old, and the total depreciation on it is \$15,423.00, making the present value \$18,850.00."

"A. Yes."

"Q. Now, if you had obtained these figures from the city and found that your totals of cost new, \$563,000.00 worth of underground cable, had more than been put in the gross additions since 1909, why necessarily, these figures are all wrong, aren't they?"
"A. It would indicate that these figures are wrong, yes if that is

true."

"Q. You have estimated that in 1910 the removals exceeded the additions by \$10,000, and they ought to be subtracted from 2264 the \$34,000?"

"A. That ought to be subtracted from the amount in 1901, which would leave \$34,000, and that is, the \$34,000 is not the sum for the value of the cables there in 1901."

"Q. How do you apply that in 1916 where the removals exceeded

the additions by \$1,286,00?"

"A. It is assumed that the removals applied to the oldest cable, and certainly not to cable put in — 1910, for cable put in in 1910 was not removed in 1910, and the removals applied to the oldest cables. The actual amount the books showed on hand in 1901 was \$45,716. Now, that being the oldest cable we deducted the removal of \$10,157.00 in 1910 and \$1,286.00 in 1916, which instead of giving the negative quantities, or quantities in the red in 1910 and 1916, they were applied to the 1901 value, bringing the \$45,000 value down to \$34,000; the sum total being identical with what it would have been if we had left the \$45,000 in 1910 and put in red the amounts in 1910 and 1916."

"Q. But what you deducted was the excess of removals and not

the removals?"

"A. The excess of removals?"

"Q. Yes."
"A. Yes."

"Q. So that if—let's just assume, for instance, that in 1910 there was \$50,000 worth of cable taken out and \$40,000.00 of underground cable put in."

"A. Yes."

"Q. Now you would assume that only \$10,000.00 of old cable was

taken out?"

"A. That is the only thing we could do without a knowledge of the true figures, which you now give. If that were true, the \$50,000.00 should have been deducted from the 1901 value and \$40,000.00 credit in — 1910,—that is in the 1910 value, but of course, the sum total would be the same in any case."

"Q. Would the sum total of the present value be the same?"

"A. Would the sum total of the present value be the same?" No, it would not be the same because the age,—the average age of the cable would be somewhat reduced under these conditions, if these are the conditions."

"Q. So that-

"A. (Interrupting.) By the amount of change in depreciation."
In a measure I could have gotten the gross additions for 1915,
1916 and 1917. These gross additions from the company's books.
In the gross additions are included the purchase of the Houston

Home Telephone Company a certain arbitrary valuation and they would have to be separated out, and the result might not be a definite thing that showed the expenditures. It is true that the additions would only be for one year of the Home Company; it would cover only one year. If I knew the figures the Home Company was paid there would not be any trouble to figure that out.

Referring to my exhibit No. 2, page 15, in order to get what I call the per cent value I take \$34,000 of the underground cables and

I have that as though it still were in the plant today with the present value of \$18,850. Then in 1902 I had \$8,000 of underground cable that I gave the age of seventeen and one-haif years, and have that depreciated down to \$5,670, and so on down the line, I have assumed that various items of underground cables are the years set out in my exhibit on page 15; that much expired life. I do not know that if I had taken into account the gross additions, that all of this column would be wrong. If the gross additions for the past nine years exceed \$563,000, then, you have more than \$563,000 original cost of cable there, and you have a greater value at present than \$475,000. If the gross additions in the period of nine years, exceeds the cost total shown in any one of these setups, then the value of the property actually in use exceeds the amount of the sum. That is a very obvious thing and in that case

your books are wholly wrong. That doesn't illustrate to my mind that my theory is wholly wrong; the theory is sound;

it is as sound as the multiplication tables.

With reference as to whether or not I think I could take the net additions, and the present life of a piece of property, without ever seeing the property, or knowing anything about the gross additions; the net additions have no relation whatever with the life of the property. The net additions show the growth of the property and that is all. The removals would show the life of the property.

"Q. But in all these reports you have here-in Exhibit No. 2, you show no removals at all except in the case where the removals ex-

ceed the additions, do you?"

"A. Oh, yes, we have-

"Q. (Interrupting.) Wherever it exceeds, your estimated life, then you have another cycle?"

"A. Yes, we assume that the replacements were made."

We assumed that regardless of the facts because, we hadn't the facts, and the only fair thing for the company was to assume that they were actually replaced at the end of the theoretical life.

"Q. Now, suppose, Mr. Lyndon, that in 1901 we had put in \$563,-810 worth of underground cable, and year by year we had taken out as much as we put in so that the net additions-

so that there would be no net additions but from time to time the cable would be replaced, but there would be no gross,-according to your theory in 1919 you would assume that all this was brand new cable, one-half year old, wouldn't you?"

"A. As I understand it you each year would remove the entire lot

of cables?"

"Q. Oh, no, each year we would just remove whatever was necessary.

"A. And replace it?"

"Q. And replace it immediately, but not have any additions."
"A. The age of the cable would be the average age of all those portions then in place. It would not necessarily follow that the age would just be half a year for the entire lot."

"Q. But on your theory the part that was put in in 1901 was re-

2269

placed in 1918, wasn't it, and at the time of making this report, would be one half year old, or in 1919 whichever you assumed."

"A. No, the additions there put in for each year are given for the

actual age in 1919."

"Q. I say you are assuming,---

"A. (Interrupting.) The reason being that the life as assumed is longer than any period back to which we go."

"Q. I see. The life is longer than 25 years. Well, let's take poles,

what page?"

"A. You will find that on page 17."

"Q. On page 17. That's probably a more accurate way of putting it,—a better illustration. Now, when do you have the cycle of poles, 1907?"

"A. 1907, yes".

"Q. Now, if you had been making this set-up in 1907, if all the poles, from 1901 up to 1907 had been placed in 1901, then in 1908, you would have assumed that all of them had a 11½ year life, wouldn't you?"

"A. I didn't get that."

"Q. Well, what do you do when the cycle comes around?"

"A. We assume that they were replaced. We haven't the data to show, but then it is due to the company to assume that they did replace them."

"Q. And you assume it regardless of the facts?"

"A. No, we assume that if the company did replace them it spends just that much in replacements."

Mr. Howard: In other words it is more favorable to the company

to assume that than not to do that.

"A. Certainly."

As to whether or not the whole thing is pure theory without any application to the facts at all, I will say it is based on the theoretical life of each portion of the plant, the equipment, and as we did

not know when the portions were replaced, we took the date of replacements as of the theoretical life. Now, if they went

a longer period of time than that, why, of course, the company is better off than our computations would show. It would have to be mathematical, without reference to the facts at all; we hadn't the facts.

"Q. And it would have to be corrected even on your own theory to be consistent, you would have to correct it, in the first place, to

get the correct life of these items of plant, wouldn't it?"

"A. It would have to be corrected, but to what degree I don't know,—but it would have to be corrected if we had the actual facts

with reference to all of these items."

"Q. Well, if you had looked in the City records and got the gross additions from 1910 to 1920, that is, if you were to start to do that now you would have to correct those figures in accordance with the facts?"

"A. Yes, but it is quite possible that when the corrections are

finally made,-

Mr. Howard (interrupting): We would be put under obligations to correct this report for what would have been obvious if the information had been furnished prior to the time the estimates were made.

Mr. D. A. Frank: You are assuming that we are under the duty of furnishing you the information to make your 2271 case; another thing you assume is that because the city happens to be the defendant in this case that some duty rests on the

plaintiff in the case to make out the defense for it.

Mr. Howard: We are assuming that the accountants employed by Mr. Lyndon asked the company for the replacements, the time made, and the amount of them and all information referring to that subject. It appears that Mr. Lyndon did not get the information and that he set up the estimates on the assumed life of the property.

Mr. Duls: Mr. Frank read in the record all of this information

on the 11th of February, and it is all in the record.

"A. It took us a month to get that information."

Mr. D. A. Frank: It hasn't been held back; It has been furnished year by year and is in your files.

"A. Why take a month to tell me that the data were on file here?"

Mr. D. A. Frank: I can't answer the question. You talked to them about the question of finding a great deal of information and that information was partly in Houston, partly in Dallas, and 2272 partly in St. Louis. It It takes some time to get the informa-

tion out, but I do know that our people worked in good faith to give you all the information you ever asked for, and finally when it came to the last question your accountants were informed that you already had that information.

Mr. Lyndon (resuming): We have the very intelligent paragraph at the end of that letter saying that the data are all in file in Houston, in the City Clerk's office. If they had only given us the information obtained in that paragraph at the time it was requested, we would have had the exact data. I did not know it was there.

I have not been working on this case for eight years.

I prepared Exhibit No. 2, the first part of February, and did not know the city had any data on this case. Mr. Howard did not say anything to me about these reports that you made to the city; I never knew it until you told me, or brought it up here since I have been giving testimony. I was here in February and left on the 12th. I do not remember that I heard you read into the record the gross additions; I did not testify here in February at all. I was here a part of the time that Mr. Kelsey was testifying, but wasn't here all

the time, and it might be that you read this when I was out. I have not read Kelsey's testimony; I read a few pages, spotted here and there, but I haven't had any time to read Kelsey's testimony. It is a fact that if the facts are as stated the set-up is wrong. How much wrong I do not know, it might be ten dollars, a million or it may - two or three hundred thousand dollars.

With reference to the rate of annual reserve for replacements on central office equipments the rate I used was 8 per cent; I used 8 per cent in comparison with Mr. Hoag's 10.5 per cent. I used a 12½ year life and apply my rate to the depreciable property. It cannot be that Mr. Hoag figures a 10½ year life and applies it to the whole property, that cannot be, because the only reduction in value is on the depreciable part of the property. I have not found any junk value for central office equipment. I took the telephone company's values, which I have set up here and that is 17 per cent.

Station apparatus, station installation, interior block wire, private branch exchanges and booths and special fittings, all those things

I have bunched and used 8 per cent for them.

"Q. Whereas Mr. Hoag used 11 per cent for station apparatus, three for station installation, and three for interior block wire and eleven for private branch exchanges and 11 per cent for

2274 booths, and special fittings."

"A. You see how timely the item is split up. We have a total cost of \$341,000 about, for that equipment; there is less than \$5,000 of that for booths. Now, to take off \$5,000 out of \$341,000 for a separate set-up where we must use approximations, is getting down to a degree of accuracy-

"Q. (Interrupting.) Mr. Hoag has brought to us actual figures and actual experience rather than theoretical, hasn't he? You say

you just tried to get an approximation?"

"A. It is a well recognized factor in mathematics even in infinite forces that an approximation is all that we ever get. Now, it is utterly impossible where we have a factor like depreciation, that probably no group of engineers agree on exactly, one may say 8 per cent and another 81/2 per cent-

"Q. (Interrupting.) And for that reason you bunched the whole

business?"

"A. Bunched the whole business where one of the items is practically negligible. We have \$341,000, and we have an item in that \$341,000 of \$5,000, and as part of the item composing it, one of 5,000,"

"Q. (Interrupting.) So you think that Mr. Hoag is hypocritical in having an exact figure on as small an item as \$5,000."

2275 "A. I think when you separate \$5,000 out of \$341,000 that it reaches a degree of absurdity."

"Q. Now, just exactly which one was absurd,-which is \$5,000?"

"A. The booths."

"Q. Well, he has applied the figure of 11 per cent to that, the larger percentage."

"A. Yes."
"Q. Which is the largest one of the items, station apparatus, station installation, interior block wire, private branch exchanges or booths and special fittings?"

"A. The private branch exchange."

"Q. Now, how much is it?"

"A. I do not know how much that is. The statement is made up of a number of the items and I happen to remember how small the booths and special fittings were, and gave you that figure from

memory."

"Q. Now, in making up an inventory and appraisal, a man who was doing that sort of work would bunch the whole thing together and say we have got about \$300,000.00 worth of this property."

"A. Oh, no, his inventory would show, but he would not carry the

calculation across on each one of them."

"Q. Now, when he got the totals, Mr. Lyndon, why, it would certainly be accurate for him to apply the proper percentages?"

"A. It certainly would, but he knows the proper percent-

"Q. Of course, you say it is approximation, but it is not taken out of thin air. Approximation is taken from the experience of

engineers for the last forty years."

"A. If the only test of the approximation you have to use is something that will happen in the future, not what happens in the past. Now, of course, the best guide you have is what happens in the past. Now, this is not a complete guide."

"Q. What is depreciation?"

"A. Reduction of value due to the passage of time and use."

"Q. Now, your idea is, that in forty years of experience with millions of details where accurate records have been kept by engineers of the performance that it is only an approximation as to what would happen with reference to any one piece of plant?"

"A. As to what vall happen."

"Q. And the same thing is true of life insurance with reference to one particular man."

"A. True."

"Q. But on the average the life insurance companies come pretty near telling what the average life of a thousand will be, that's true, isn't it?"

"A. Within some percentage. But there is always an error in life insurance computation,—a plague of influenza or anything where they based their calculation totally—

"Q. (Interrupting.) But, so that over a period of fifty years their experience would come pretty near being accurate?"

"A. It comes more near being accurate than ordinary guess."

"Q. By the way, let's examine the matter of depreciation a little with reference to your theory,—under your theory you subtract a certain amount from the value each year?"

"A. Yes, which amount must be paid to the company."

"Q. If it had not been paid to the company, you still subtract it just the same, but then the amount will have to be carried over to the cost of establishing business as a loss. But we have your testimony yesterday, or you at least thought that the Supreme Court of the United States thought we couldn't carry our losses forward into capital account."

"A. In that case, Mr. Frank, you see this whole matter is merely an establishment of a capital account on which the company should have a fair return. Now, it makes no difference whether you have a half million dollars depreciation on your plant, and you never

collected but \$200,000 depreciation, and therefore suffered a loss of \$300,000 which is set up in another account, to your credit,

or whether,-we will say having collected \$200,000 for the depreciation account, you can only put \$200,000 depreciation It makes no difference where the accounts are carried, the final thing is merely to establish a fair value and a reasonable rate

of return. "Q. But the value is the same, regardless of whether you collect

the income or not?" "A. It should be."

"Q. The value is just the same."

"A. No, if you have collected a sufficient sum of money to have paid the proper depreciation each year then that amount of money should be written off the value of the plant."

"Q. Do you know of any utility in the world that does it?"

"A. I don't know what utilities do?"

"Q. Do you know of any Commissions in the world that requires

it to be done?"

"A. I don't know of any Commission that does not require it. That is, whether the Commission requires or assumes that the value of the plant reduces annually?"

"Q. Yes. That is, reduces by the amount of the reserve for de-

preciation, is that your idea?"
"A. It reduces by the amount of the depreciation that is not set up, whatever that may be."

"Q. Name one decision by any Commission in the United

2279States that holds you?"

"A. I can't name you a decision. I think I could show you one this afternoon. I will attempt to at any rate."

"Q. You say you read the Knoxville case, does the Knoxville Water case hold that?"

"A. As I recall, I believe, that the Knoxville Water case rejected the allowance of a depreciation fund, if I recall it now."

"Q. You testified in the street care dase, and I thought-"A. I did in 1906 or 1907, but that's been some years ago and other things have intervened and I regret that I haven't a memory like a-I just simply have to refresh my memory from time to time. I don't remember anything about the Knoxville case except they fixed a lower rate than anybody who knows anything about a public utility would regard as a confiscatory rate. I think the net rate of the company was 4 per cent."

"Q. Don't you remember, Mr. Lyndon, that by the Knoxville Water case it was decided with respect to the depreciation that had to be subtracted that you couldn't use the 100 per cent new theory, but had to take into account depreciation in fixing the value?"

"A. As I remember it they allowed an insignificant sum for that."

2280

"Q. And that was physical depreciation referred to, also, wasn't it?"

"A. Well, it is quite probable it was a physical depreciation;

although on that I believe it was substantially the first case of its kind that we had in America.'

"Q. On what question?"

"A. On the question of confiscatory rates with reference to public utilities."

"Q. Wasn't the case of Smyth vs. Ames, wasn't that in 1897?" "A. (Interrupting.) I thought the Knoxville Water case older

than the Smyth vs. Ames?"

"Q. Smyth vs. Ames is in the 169th U. S. Reports, and the Knoxville Water case is in the 212 U.S. Reports. Would that indicate to your mind which is the older case?"

"A. It would, but that was not my memory."

Mr. Howard: What is the sense of putting that kind of a question,-they are all matters of memory.

(By Mr. D. A. Frank:)

"Q. Now, as a matter of fact, just using common sense and regardless of what your impression is as to what some Commission or Court has found, wouldn't you say that a piece of property you started to value would have to be examined, and your opinion formed on the present condition of the property rather than by taking some theoretical figure from a book?"

"A. You mean a determination of its condition by inspec-

tion?"

2281

"Q. I mean look at it, inspect it if you want to, but wouldn't the

best way to find out what it is worth be to look at it?

"A. It would be indicative of how the plant is kept up. It would be an indication. You could see that everything looked good and the plant was in fairly good condition, or you could see the apparent condition,-you could get a general feeling of the condition of the plant, but as for determination of its condition, why, of course, that 18 utterly impossible."

"Q. For instance just take the amount of depreciation that you claim in this plant, of \$918,000 on the book figures as used by you of less than \$4,000,000 and you get a percentage of 74 or 75 per cent

condition of the plant."

"A. No, not condition."

"Q. Well, what is it you do get?"

"A. Seventy to seventy-four per cent unexpired life." "Q. Well, you called it value, you call it per cent value?"

"A. Yes sir."

"Q. You say the per cent value is 74 or 75 per cent of the cost?"

"A. Yes."

"Q. Now every other engineer that has testified in the case including your associate Mr. Kelsey, has testified that the plant is in 92 per cent or 93 per cent condition. Now, are those engineers all wrong?"

"A. No, they could be right if their definition of condition was proper. If by conditions they mean unexpired life they are all wrong, but if by condition they mean the ability to operate. I should think they are too low."

"Q. You think it ought to be 100 per cent?"

"A. Yes, 99 to 100 per cent."
"Q. Well, that would be one thing that you and Mr. Allison

agree on."

"A. Well, probably now you distinguish between ability to operate and unexpired life, for instance, you may have a pole that is carrying wires, and as long as that pole stands up and carries wire it is a 100 per cent pole, but the day after it has been a 100 per cent operating pole it may break off at the ground and then the life, expired, may be 99.9 per cent gone, leaving .1 per cent unexpired life and yet it may have 100 per cent ability to do the work until the period of time of life has expired."

"Q. All right, let's look at page 1 of your Exhibit No. 2, where

you have buildings. You have buildings, \$280,496?

"A. Yes."

"Q. Now, you have the junk value of \$106,560?"

"A. Yes."

"Q. You have the depreciable value of \$173,936 and you have the accrued depreciation of \$30,295, and you have the 2283present value of these buildings \$250,201?"

"Q. Now, theoretically the buildings are worth \$250,201.00?"

"A. Yes."
"Q. Practically the buildings are worth more than double that, aren't they?"

"A. No."

Well, what are they worth practically, -actually?"

"A. They are worth actually \$250,201.00."

"Q. Notwithstanding the fact that it would cost nearly \$600,-

000.00 to build them today?"

"A. Regardless of that. It, to my mind, is not related to the sub-It did not cost that, and what might have been if something else happens is not, as I can see it, one of the points. These buildings cost a certain amount of money and it is quite probable that in common with every utility, that money was raised on bonds, and therefore-

"Q. (Interrupting.) But they were not, Mr. Lyndon, because

this company has no bonds."

"A. Well, as a general thing the money is raised on bonds and the investor who paid for that building, if that had been the case,and this is a case where you radically differ from other utilities, if

that had been the case, all the investor could ever get or hope 2284 to acquire is his bond, his face value, that's the man who furnishes the money to put up the building."

"Q. Well, what about the man who takes the risk and puts up the

building?"

"A. It is customarily assumed that the man that puts up the money is the man that takes the risk."

"Q. Well, if a man owns a lot by the Rice Hotel, his lot is worth

\$400,000.00, and he has \$200,000.00 in cash and borrowed \$400,000.00 from a trust company, making a total investment of a million dollars, is it your idea that the man who loans the \$400,000.00 is the only man taking a risk?"

"A. No."

"Q. As a matter of fact he is the one taking the least risk?"

"A. Whoever puts up the money, if a risk exists, is the one who takes the risk."

"Q. But the man who advances money on bonds is the one who takes the risk?"

"A. Not necessarily."

"Q. Doesn't he take less risk than the man who puts money in stock?"

"A. Yes, usually I should say that a man who puts money in a bond takes less risk than a man who puts his money in stock, but as a general thing most of the money that has ever been put in any

utility has come, in the past, almost entirely from the sale of bonds. Now, then it happens that this isn't necessary in

the case of the American Telephone & Telegraph Company, but no matter how you shift values on paper, the actual investor never gets any change in his investment, simply because on that bond he gets a return that is stipulated, and if values go down, why, it means, that somebody else has to suffer while he gets that return and if values go up he doesn't get any profit from it, and the real investor the man who furnished the money is always therefore tied to the original return regardless of theories or what happens."

"Q. Suppose the court was so beknighted that it couldn't follow

your theories and wanted to find the value-

"A. (Interrupting.) Yes, sir."

"Q. Then he would have to go through some sort of mental process to find out what was the actual cost of the building, what it is worth now?"

"A. If he determined that he wanted to know."

"Q. And if, instead of finding the cost, he wanted to know the value?"

"A. And if he wanted to know what it would cost to erect such a building, now, why, he would have to go through the tribulation of detailed estimates, not too detailed, not too completely detailed,

he could drop out several small items of a hundred dollars a piece and aggregate them under a general estimate, but it would be necessary to get an estimate on the cost of such a building at the present time, if such information were wanted, and if it were assumed that it would in any wise bear on this case."

"Q. Now, suppose he thought he had to find the value of the property, why, according to your idea, the figure that you have to put in is merely the cost figure and does not pretend to be a reproduction figure, then he would have to go to the reproduction method?"

"A. If he wanted the reproduction value, he would."

"Q. Now, if the Supreme Court of the United States holds the reproduction method is to be employed then this court would be

bound by the Supreme Court's rulings and necessarily would have to go through that process?"

'A. I don't accept their statement."

"Q. Mr. Lyndon, when we adjourned you were about to tell us why it was, or had been trying to tell us why it was that you took a very much lower figure for buildings although the actual cost had gone up very materially in the last few years, since the buildings have gone up here?"

A. I did take the actual cost."

2287 I did take the actual cost but not the present value. I took the value of each object at its original value with the accrued Due to depreciation on everything except the land which had a negative depreciation, that is, instead of having suffered a reduction in value, from the time it was purchased, it had an increase in value, which is just as logical to apply, as to apply a reduction in value due to depreciation, which continues with the prospects of obsolescence or inadequacy or final wearing out. Of course, we all know that the buildings constructed here by the Telephone Company are never going to wear out, within a period of time that would be covered by any financial methods or assumption that now obtain, that is to say, if that building is maintained, I see no reason why it shouldn't be a good structure in fifty years, and so the question of its wearing out, as I view it, is wholly removed from this discussion. It will either become obsolete or inadequate, or the value of the property may under some conditions rise so high that it will actually pay to remove that building and carry your exchange somewhere else. It is the prospect that the usefulness of that building, so far as the telephone uses are concerned will pass within forty years, but certainly not that the building will wear out or rot out, or become useless as a building. Now, assuming that 40 years will be its useful life to the Telephone Company as a telephone exchange, its value each year diminishes each year by 2½ per cent.

2288 "Q. If we had two buildings just exactly alike, one of them was built seven years ago and cost \$200,000.00 and the other one was built this year and cost \$400,000.00 your idea is one is worth just double what the other is and they are exactly alike, and that both of them will live one hundred and fifty years?"

"A. Oh, usually they do that. In one case you double the investment, in the other,-in one case you have double- the investment

in it and are entitled to double the return on it."

"Q. I am not talking about what we are entitled to, but am talking about—well, the facts are that we have two buildings just alike and on lots equally as valuable and you were valuing them at the present time, and one of them was built seven years ago, and the one was just completed; the fact that one cost \$400,000.00 wouldn't make it any better than the other one, which cost \$200,000.00."

"A. It wouldn't make it any better."

I do not see that it would make it worth any more. From one point of view it would, and from another, it would not; that is it would not be worth any more as a telephone exchange as affecting as it were, its usefulness to the company. That could not be helped

though if you had invested the money the public would-if it were built at that time of high prices to fulfill a public need and public demand, it would be the duty of the public to pay a return on it.

Q. I am not talking about duty, but am trying to get away from your theory and get you back to a common sense theory-

Mr. Howard (interrupting): What he wants to know is if the two buildings are both worth \$400,000.00, whether they are both worth the same.

(By Mr. D. A. Frank:)

"Q. Mr. Lyndon, let me re-state it to you: That is we have two buildings precisely alike on lots equally as valuable, but one was built seven years ago, but kept up in 100 per cent condition to the present time, and the other one just completed, but the later one cost \$400,000.00. Now, the question I am asking you is this; would the building built seven years ago be less valuable to the Telephone Company than the building just completed?"

"A. It would not be less useful to the Telephone Company and would not be less valuable to the Telephone company for telephone

purposes."

It would have less worth as a portion of the assets of the company; it would have less worth by whatever small depreciation had taken place, but including that, it would have less as a

portion of the assets of the company. The cost would control as fixing the assets of any company, and furthermore, if it were not so, and there would come later a time when both might be reproduced for less than either of them cost, you would have to begin changing the worth of the buildings and everything else with every change in the market. At the present time I think one building would be worth as much as the other as an asset of the company, and another thing about getting to it, the idea as I understand it the value upon which rates can be predicated not for a few months, but for some years probably.

I understand what the court was trying to do at the present time is to try to determine the present value of the property on which rates should be based and rates which undoubtedly for the purpose of stability, would be made for some considerable period of time, I was being asked merely about the value of the property, and the question of what is going to happen in the future is not before me, and I am trying to assist the court in arriving at the fair present value of the property. The present value of the property wouldn't have any value except as junk if there was no future possibilities of the company.

The future of a paving stone would probably be very brief. I am unable to separate in my mind the immediate existing value of this company from its future operations. I do not take into consideration something else besides cost. I consider that

the book cost is really the value, because in that case the company is protected, because no matter where values go in the future you are not having to make additions at the top of the market, at the highest prices, and I do not regard it as fair to the company to place the possibility of that high cost to be eliminated, because at some future time when things return to their normal state again, they cannot then demand a reproduction value, and I would not regard it as fair. My view of the present value of the property is whatever the books show has been actually expended for it. Land is the only part of the plant that has gone up in value, and even though it would cost twice as much to reproduce one of these buildings I say it has not gone up in value. If we have a certain number of thousand feet of underground conduit, and that has gone up in price so it would cost more to reproduce it in my opinion that isn't worth any more money, and for this reason: you cannot dis-associate this element,-if you attempted to sell the building today and should be able to do so at something like the present cost of reproduction, and then attempt to sell some other part or draw out cables and sell them at the present cost of reproduction the balance of the plant would be junk. You cannot separate the units and the only

criterion of that kind that you can possibly offer is the plant as a complete unit. Now, if there is a purchaser for the plant as a complete unit at a considerable higher price than it actually cost the company, the purchaser taking depreciation as well, it might be one element which would determine the value.—determine the value that would lie beyond the book cost, but to segregate each separate portion, to sell this for so much money, and that for so much money, leaving the rest as junk doesn't appear to my mind as being logical. You could not pull the land out from under the building and sell it, but, as I pointed out, it may be that the value of this land might appreciate to such an amount at some time that it would pay you to move the building somewhere else, and the increase in the value of the land would be such that you could not only pay for that, but take a profit besides. If that never hap-The cost of the pened, you would be just where you are today. land plus its appreciation in value. The change in value and taking the equipment first, the change in value comes from the fact that you know that within some period of time, and what period of time is a thing which nobody actually knows, but within some period of time, the different elements of this equipment will have to be replaced: it matters not for what cause, at some time it will have to be replaced, and if you assume some time based on fairly

2293 good judgment judgment and previous history, then you will see how rapidly this change from its original cost to its junk value takes place, and if it takes place in a given number of years, it undoubtedly diminishes in value eachy year. That's so much for the equipment. That's assuming the life and assuming that the property will last just exactly that number of years and will be replaced in that number of years. Now, in the case of land, the land does not diminish in value, it doesn't wear out. That is practically true of all land in any American City; there are exceptions, of course that there have been drifts and movement of population away from a certain district and some land will diminish,

and if it does it suffers a depreciation, but as a general thing in any American City land appreciates in value. It is certainly so with the property that you have in use now. Now, there is nothing that can happen to that land that will require its replacements; that land will be there forever as far as we can see, and there will never be any occasion for its replacement. There will come a time when its appreciation in value will be such that you can sell it to some individual and move the building somewhere without interrupting the telephone service, and make a profit out of the transaction. Until that time comes you would count the appreciation because there is some character of increase in the land that is decreased in the value

of the equipment. I do not merely take into account the 2294 appreciation of the land in order to cut down my depreciation reserve: it makes scarcely any difference in your depreciation

reserve, but considerably reduces your accrued depreciation.
"Q. You look at page 146 of your 1918 report where you set up a detail of something you mention on page 8 of your Exhibit No. 2 with reference to the San Antonio Board?"

"A. Yes."

"Q. Now, you criticized what was done there and drew certain conclusions from it. Now, tell me what your idea is as to what these figures mean with reference to the Board taken from San Antonio,"

"A. Into the Houston Exchange. Just a minute, I don't know where I offered a criticism. I think I made just a simple statement.

I do not recall that I ever criticised.'

"Q. If you object to the word criticism, I will say said at least that the Board was worn out."

"A. No. on the contrary-

"Q. (Interrupting.) What did you say."
"A. I said that the Board had in all probability reached a con-

dition where it was inadequate."

"Q. You say on the theory that the life of a switchboard is twelve and a half years it would have been replaced over five years ago, however, I understand it is still in good operating condition, and may give service for some years to come. With a de-2295

preciation allowance of 8 per cent the entire depreciable value of the board was amortized some year- ago so that the depreciable value has been zero for around five years, and its remaining value is simply that of junk, and while that is not physically a fact it is financially true. Now, look at what you call the work sheet, which is set out on page 146 and just tell me how you arrive at the conclusion that I have just read in your exhibit?"

"A. Well, the conclusion is drawn from my understanding of the

age of the board wholly."

Q. Well, what happened there,—what does this work sheet or

estimate amount to?"

"A. Well, the estimate first shows that authority is requested for doing certain work, which work is this: This estimate covers cost and installation of one relay central office equipment for 2,250 subscribers' lines and the necessary inter-office trunking facilities this equipment is that taken from the old San Antonio Exchange. The

estimate is necessary in order to care for additional growth, present board being equipped to its ultimate capacity." That is to say-"

"Q. (Interrupting.) We understand that, but explain the figures

is what I am after."

"A. The estimate,-gross expenditures is \$39,800.00, that is new plant, plus cost of removal old chargeable to construction of new plant is \$39,150.00."

"Q. What is the \$11,000.00?"

"A. That \$11,000.00 less salvage,-that's the salvage that I assume was allowed to the San Antonio Exchange or the credit and that leaves \$28,800.00 as the amount chargeable to the Taylor Exchange."

"Q. And what does that \$28,800.00 mean there?"

"A. That \$28,800.00 is the amount of money which you have charged the Taylor Exchange after deducting the salvage and crediting the San Antonio Exchange."

'Q. It is, or that \$28,800.00 of the Old San Antonio Board is

carried or is charged now to the Houston plant."

"A. Yes."

"Q. You would be surprised to find that it is not true, wouldn't you?"

"A. I would. That is, as I understand these figures, that the gross is a certain amount, and the salvage is a certain amount. Less salvage of a certain amount indicates that the amount is credited into a place from which it is taken. That is the engineering understanding of salvage."

'Q. But it is due to your engineering inexperience in telephone engineering that you don't catch what you will see if you look at the

figure, that the \$11,000.00 is the salvage from the Taylor 2297 Exchange and not from San Antonio at all, the old Taylor Exchange, do you see that?"

"A. It is not indicated on this work sheet. The statement is made here very clearly on this estimate that it is to cover the cost of establishing additional facilities in the Taylor Exchange and that the

equipment is taken from San Antonio."

"Q. But these figure are only treating of the actual cost charged on the books and the salvage credited to it in the Houston Exchange, and that alone there shows that the expenditures,—the gross expenditure in Houston,—in the Houston Exchange will be \$39,800 less the salvage that will be taken out of the Taylor Exchange of \$11,000 which will mean that the net expenditure will be \$28,800?"

"A. Well, the net expenditure is the figure we will be concerned with, and that is just exactly what I have stated that the net expenditure was, \$28,800, and the fact that I credited the salvage to San Antonio instead of the Taylor Exchange has absolutely no bearing on it. I assumed it was to the point where the switchboard was taken out which regardless of specific telephone experience is the customary assumption, that is, the place from which equipment is removed is the place to which it is customary to credit salvage."

"Q. Mr. Lyndon, don't you know that the account in Houston

would not contain the salvage to the San Antonio Exchange, but that the books would be kept there in accordance with the facts and the time the salvage was taken out?"

"A. No, the account in Houston is the account, of the Southwestern Telegraph & Telephone Company involved two cities and

while what you say was probably true-

"Q. (Interrupting.) Because of the fact that you didn't understand it, why, you jumped at conclusions and made assumptions there and that were not warranted by the facts?"

"A. No."

(By Mr. D. A. Frank:)

"A. Look at that Mr. Lyndon, can you recognize that the—in the first place, do you recognize that this is only an authority sheet, you called it a work order. You see the words 'Authority Sheet' at the top of the page?"

"A. Yes, this particular sheet is an authority sheet and the

amounts in there are the estimates."

"Q. You recognize the fact, do you, that from the first line that we have just been considering the net cost of the switchboard as installed would be \$28,800.00 charged to the Houston Exchange. Do you recognize that? That is, if there was salvage from the Taylor of \$11,000?"

"A. If the total was \$39,800 and the salvage there was \$11,000,

the balance would be \$28,800."

2299 "Q. Not salvage from any point, because Salvage from San Antonio would not be subtracted from the \$39,800. You would add the salvage if it were taken from San Antonio, don't you see that?"

Mr. Howard: Mr. Frank that doesn't follow.

(By Mr. D. A. Frank:)

"Q. Mr. Lyndon, if you can't see that-

"A. (Interrupting.) If you consider the property as a whole it doesn't follow, but if you consider the two exchanges absolutely separate then it would, that is, salvage credited to a part of the property, it diminishes the succeeding value of the board. That's a very obvious thing."

"Q. Will you take a pencil and a piece of paper and let me give you the items for the San Antonio Board so you can under-

stand it?"

"A. Aren't they given on the following sheet?"

"Q. Not as far as I know."

"A. The details of material—
"Q. If you had known anything about economy or telephony
you wouldn't have jumped at the conclusion that \$28,000 was the
junk value of the central board?"

"A. I never have so stated."
"Q. Well, what have you stated?"

"A. I took the \$28,000 as the amount chargeable against the Taylor Exchange as a portion of the cost."

"Q. Well, you wouldn't have taken the \$11,000.00?"
"A. If I had known the specific methods of the Bell Com-2300 pany. I wouldn't have done that."

Mr. Howard: That is the idea.

"A. (Continuing:) And I think the principal thing that I wanted to show there was the life of the switchboards is sometimes much longer than that which we assume. I understand, of course, the evidence has been adduced here to show that all of the switchboards removed, the average life is less than seven years, but did not include the switchboards all through Southwestern territory, which have not yet been removed."

"Q. That is the trouble with your whole theory, Mr. Lyndon."

Mr. Howard: Now, if the Court please, I object to Mr. Frank setting himself up as the Master in this case, because he is not. If he has those opinions about Mr. Lyndon, what he knows and he don't know, he should reserve those and argue them to your Honor, when we come to argue them, if you will hear the argument, but it is not a part of his duty now, because he is-

Mr. D. A. Frank (interrupting): I will put that in the form of

a question.

Mr. Howard: Every time I ask about three words, you interrupt

"Q. Mr. Lyndon, the assumptions that you indulged in are 2301 assumptions that grow out of the fact that you are not familiar with the telephone business, is true, isn't it?"

Mr. Howard: Now, Mr. Frank-

"A. (Interrupting.) I don't know-

Mr. Howard: Mr. Frank, that is a statement that should not go into this record because it is an unqualified statement of Counsel, who is not under oath, and besides it is a statement and one that ought not to be made.

The Master: Objection overruled.

Mr. Frank, and without any qualification, there are many things in the Bell System of Accounting and running its offices and a good many things about records of traffic and standards of operations which the Bell Company have adopted that I do not know, and that I would not have means of knowing without making an investigation of such an extended character that this city could not afford it. Either from the standpoint of the time consumed or the money required. There are many approximations I have been obliged to make, and which I believe to be in the main, correct, due to the fact, that I had only a comparatively limited time and a very limited fund to draw on. We have not been able, of course to take

up the matter in the detail that you have been able to, naturally there are many approximations, but I believe that every approximation that I have made has been in favor of the company. If it has not been, it has been an error of judgment be-

cause I have tried to make it so.

"Q. Mr. Lyndon, if the switchboard, if the parts of a switchboard that can be moved from one town to another are parts that don't wear out as Mr. Kelsey said here, they last forever, as he put it, whether they last forever they last quite a long while, for instance, frames don't wear out do they?

"A. No, there is no reason why a frame should wear out."

"Q. And take the cables, a lot of those things about a switchboard ?"

"A. For instance, I don't believe your jacks wear out. springs may require replacing occasionally, but I see no reason why

a jack should wear out; I mean in a reasonable time."

Q. If we take a switchboard that costs \$26,000.00 at San Antonio and costs \$6,000.00 to install there, making \$22,000.00, we spend tearing it out \$1,100.00, making \$33,100.00, and we charged up \$15,100,000 for reserve for replacement over at San Antonio and took that just as its junk value of \$15,000.00 and take that and go and spend \$5,000.00 on it, so that we make it practically the same as brand new-a brand new switchboard and install it down here, carrying that part of the material at practically \$20,000.00,

which it had cost-which had cost \$32,000.00 in San Antonio, would it be perfectly fair to do as you have done and assume that that switchboard has the added life at San Antonio and at Houston, shouldn't you compare it with a new switchboard?"

"A. A comparison with a new switch-board would hardly be a suitable thing for this reason; that regardless of how well you can rehabilitate that part, the only thing you can provide against is wear. You cannot provide against inadequacy nor obsolescence. That part has been induced a certain length of time and is started towards obsolescence even if not inadequacy. It reached inadequacy at one point, it is brought to a pint n point now, where it is wholly siequate. It may become inadequate, but it is more likely to become obsolescent. What I am trying to point out is that inadequacy and obsolescence are real factors that cause removal of equipment. There is not much of actual wearing out and getting down to the point of where you can't proceed any longer to operate."

"Q. Well, but that is not the point we are discussing."

"A. It is in this way; that from the date that board is constructed until the time it will be removed permanently for some reason, there is a certain span of years, let's say twenty-five, fifty 2304 years, anything that is some time-

"Q. But that is purely an assumption, isn't it?"

"A. No; it is a known thing that everything in this world perishes, and that is a matter of organic life or construction by mankind, fortunately. That isn't an assumption and I don't believe your engineers would say that is an assumption. I think they will

agree that a time will come when that board will be absolutely removed from service at all."

"Q. Well, that is stating a fact, of course, that is bound to be

recognized."

"A. Yes, now, then, we must assume, we can't classify one specific board, we have no data on specific boards—one specific board, naturally its time of life is ultimately ended. We have to use the average of what happens to switchboards in general. Now, if we apply it to this board, we will say it has long outlived its theoretical life, which is my statement there, that theoretically this board perished six years ago; practically it is still working."

"Q. Doesn't that mean theoretically though that the entire plant put on the same basis perished on your theory and practically we

could be operating a telephone plant here?"

"A. Unquestionably, which shows and would show that 2305 the rates of depreciation have been taken too high, but we always take them a little too high. We are afraid something might happen for which we would not be prepared."

"Q. That would cause your values that you have assumed though,

to be entirely too low, wouldn't it?"

"A. In this way, it might — that if the rates of depreciation were diminished, the accrued depreciation would be diminished and, therefore, the subtractive factor would be less, making the per cent

value of the property higher."

"Q. Where would be the difference, Mr. Lyndon, in one section of the switchboard here in Houston, I don't say section technically, but one portion of the board which was practically the same as the rebuilt portion of the San Antonio switchboard, where would be the difference between the two, if the portion that was rebuilt was practically the same as a brand new switchboard and they were put together so that you couldn't tell, would there be any more obsolescence in the old section than there would be in the new section?"

"A. If they were put up at the same time, if one board is completely habilitated so that all the wear is eliminated and then it is identical with a brand new board that is put along side of it and the

two operate together under the same conditions, the date of obsolescence or inadequacy should be simultaneous."

"Q. There was an advantage wasn't there to the company and in a measure to the public in putting in that section of the switchboard, the net cost of which was \$28,800.00, over using the same kind of a switchboard brand new and paying, say, forty or forty-five thousand dollars for it, wasn't there?"

"A. It was the only rational thing to do."

"Q. So that you have no criticism to offer of the act of the com-

pany in putting it in?"

"A. On the contrary, if they did have a board that they could rehabilitate and put in, there would be a criticism if they failed to do it and bought a brand new board for the purpose."

"Q. Let's examine your exhibit a little bit on your License Contract or License Revenue, I believe it is your Lyndon No. 13. Now,

here you have considered nothing except the instrument services, have you?"

"A. That's all."
"Q. What do you know about the work of the General Staff for

the licensee or for the Associated Company?"

"A. I understand that there is some considerable experimental work being carried on. Just how much of this work is done by the Western Electrical Company and how much is done at the cost of the A. T. & T. Company, as a separate organization, I don't know.

Nor, do I know the value that the efforts of the "General 2307 Staff may be to the many thousands of local companies scattered about the country. I regard it as a Consulting Engi-

neering arrangement."

"Q. Do you regard the financial arrangement by which this company has obtained practically all of the money that has gone into the plant, do you regard that as consulting Engineering?"

"A. No."

"Q. In the street car case, you allowed the Street Car Company \$252,900.00, for stock and bonds discount, didn't you?"

"A. Yes, because they have experienced it."

"Q. Now, if it had not been for the relation between the Southwestern Company and the American Telephone and Telegraph Company, there would have likely been some such experience as that on behalf of the telephone company, wouldn't there?"

"A. I should say so. You see the Street Railway Company is

not kin or related to anybody."

"Q. Well, suppose the Southwestern had not been kin or related

to anybody?"

"A. The Southwestern Telegraph & Telephone Company is an inseparable portion of another organization. The fact, that a man goes to the banker to borrow money and the banker—I mean some—

I think are comparatively different; that is to say, you would probably have suffered the same sort of loss that the Street Railway Company did if you had a strictly independent local company, but to say that there is a credit to attach because you

lend money yourself is a thing I can't quite gather."

"Q. Well, do we lend money to ourselves?"

"A. Well, if the American Telegraph & Telephone Company own the Southwestern Telegraph & Telephone Company, and one furnishes money to the other, it has that aspect."

"Q. Is the American Telephone & Telegraph Company a banking

corporation?"

A. I don't know whether it is a banking corporation, but I understand it is highly prosperous."

"Q. Well, how does it get money?"

"A. It has out securities which I understand, a large portion of which, I understand, was sold and that money came from that

"Q. Well, for the last several years it has been paying more than eight per cent on its money and we have been getting money from them, the evidence in the case shows, that 5.88 per cent.

Would you consider that of some value to us?"

"A. I don't believe that 5.88 per cent is any less than the companies,—up to the past two years, I don't know about before the past two years,—that highly solvent, permanent, prosperous 2309 companies have been able to borrow by paying that, without having any relation other than that of banker and customer."

"Q. The American Telephone Company, though has loaned this money to us from time to time, and they have taken stock for the

notes. Will any banker do that?"

"A. I don't know that. I suppose that a banker will make a purchase of notes if he regards them as good and won't if he doesn't."

"Q. That practically amounts to taking stock for all of it. We have no bonds outstanding. The American Company has taken stock for it, but such money as they have loaned us, they have loaned on the basis of 5.88 per cent. You think that is not an advantage to us?"

"A. I think it would be an advantage that you don't have to go through the negotiations necessary to get money at 5½ and 6 per cent. But what I do know, and I know very definitely, that up to a year and a half ago on well secured loans that some money was being loaned on four and three quarters per cent."

"Q. But that was a loan. This is a stock proposition. How much stock could you sell on the basis of four and three fourths per cent?"

"A. To the public? Very little."

"Q. Well, where are we going to get money unless we get it from the public, unless we get it through that relationship?"

2310 "Â. As the relationship is that of an owner, I can't understand just why the public should pay to the owner any amount of money, because the owner furnishes the money to his own property."

"Q. But that is actually costing him on your theory of ownership, it is actually costing him more than eight per cent and into the account has been charged only 5.88 per cent do you think that

should be taken into consideration?"

"A. Unquestionably, but I never—this is the first time I ever heard or had the slightest suspicion that the American Telephone & Telegraph Company had to pay above 5 per cent for money."

"Q. You think that they can get money for 5 per cent, do you?"

"A. I did think they could get it around 41/2 per cent.

"Q. Have you looked into today's paper or have you looked in a paper for a week to see the quotations on the American Company's

six per cent convertible?"

"A. No, I have not, but we are speaking about the immediate present. We are speaking about the period of a number of years. Most of the money that has been put in this property was put in it about two years ago."

"Q. But we are talking about the value of this relation to The

Southwestern Telegraph & Telephone Company."

"A. Yes."

"Q. And do you recognize the fact that this relation was entered into at the time when The American Telephone & Telegraph Company was not the controlling factor in the Southwestern Company?"

"A. I did not know that there ever had been a time when it was

not the controlling factor."

"Q. Well, the evidence in this case shows that the time the contract was entered into The American Company owned only thirty five per cent of the stock?'

"A. Well, if that isn't a controlling factor with the rest of the

stock scattered, I would not know what one is.'

"Q. It so happened though that one witness testified here with reference to about 35 per cent which he said that his company at the present time has the relation and the American Telephone Company has never exercised any control or attempted to exercise any control over his company?"

"A. I would regard an obligation-I regard a block of one third of the total stock in the hands of one control as the dominant and controlling element if the rest were scattered. Now, if as a mat-

"Q. (Interrupting.) You assume though that some is scattered?"

"A. Well, let me qualify that and finish. If the rest is in the hands of one party, then it would not be, but if that holding is the sole block of any magnitude, it seems to my mind unquestionable but that it would control?"

"Q. Well, if it were in fact, in the hands of local subscribers-it might be quite the reverse, mightn't it?"

"A. It might."

"Q. Now, you have valuated this 41/2 per cent on the instrument service in the 1918 report, haven't you?'

"A. Yes, I valued that in the 1918 report."

"Q. Do you remember what per cent you took there for the instrument service?"

"A. No, I don't remember."

"Q. Now, your Exhibit No. 13 you have taken 18 per cent have you not?"

"A. Yes."

"Q. What did you take in 1918?"

"A. I don't know. We have a copy here."

"Q. Now, Mr. Lyndon, compare page 136 of your 1914 report and page 100 of your 1918 report and page 1 of your Exhibit No. 13 on Instrument Service. Now, in 1914, you assumed a cost of these instruments of \$2.50, 1914, \$2.50."

"A. Yes."

"Q. And in 1918 you assumed a cost of \$2.75, that is correct, isn't

"A. Yes."

"Q. And in this report you assumed a cost of \$2.70?"

"A. Yes."

"Q. Just how would you assume a price of only 20 cents more for instruments now, than you did in 1914?"

2313 "A. The fact that 20 cents applies to all the intruments and that is for twenty-six or twenty-seven thousand instruments of which twenty-one or twenty-two thousand were in use in 1914?"

"Q. Well, do you think the same instruments are in use now?"

"A. I don't know whether the same ones are, but I believe those instruments, like a brook, go on practically forever. They are taken back to the factory at times repolished, renickeled and a screw put in here and there and sent out again."

"Q. Now, in your report for 1914, you had an annual charge for

interest of eight per cent?"

"A. Yes."

"Q. But this year you used only seven per cent?"

"A. Yes."

"Q. Interest charges have gone down?"

"A. Not that; I am quite clear I think in my report why I had allowed seven per cent as the net return during the present time, instead of the usual eight per cent which is usually customarily allowed public utilities and that was that the war had put a brake on everybody and it was the duty of utilities to bear some of the burden."

"Q. Notwithstanding there was no Court ever held that, you are

going to reduce the interest rate for public utilities?"

I gave that as a reason for the recommendation to the City Council to limit the present returns at the present time, and

until things got better.

The rate of return I assumed when I was talking about the street car case, I discussed seriously, six, seven and eight per cent. My recollection is that I testified that seven per cent was an ample return at the present time. My testimony does not show that I adopted eight per cent. The Court adopted eight per cent in his findings. I testified that eight per cent was a fair normal return for all utilities at the present time. It is not my recollection that I ever testified that eight per cent was the proper rate of return at the present extraor-

dinary financial period.

In 1914, I adopted seven per cent for maintenance. And in this report adopted three per cent, that was used, that was due to additional data, which I got. You see in the 1914 report I took a great many things from the suggestions of the Bell engineers. Later when I made the 1918 report I got other and additional advices that indicated to me that the amounts used in the 1914 report was too high. I do not know as a matter of fact that the Bell engineers have used only one and a half and one per cent for maintenance. I got from some source that three per cent was sufficiently reliable to my mind to use, and seven per cent in 1914. For depreciation,

2315 but I felt at the time that it was too high still.
In 1914 I used eight per cent for depreciation.

"Q. And at the present time you use five per cent, whereas Mr. Rhodes testified to eight per cent, and Mr. Pennell to eleven per cent for depreciation?"

"A. Yes, it is my opinion that depreciation except for possible ob-

solescence, is almost negligible. They are so easily maintained and there is ample maintenance expense, but obsolescence overtakes them always, there is no question."

For general miscel-aneous in 1914 I used one per cent, and in the

present exhibit I use three per cent.

In 1914 I used for taxes three and a half per cent, and for insurance one half per cent, and those items were left out of my present exhibit, the idea is that taxes are not based on full values at any time, and the amount that is necessary to take care of the taxes is included in that three per cent general and miscel-aneous item.

In 1914 I used twenty-seven per cent for an instrument charge, and in 1918 I used twenty one per cent without giving any details; that is on page 100 of my report, but I was under the impression that the details were given in there. I know that the items were

- detailed. It is evident that they were detailed only on the working papers, and not detailed in the report, but I know that 21 per cent was the correct figure used by me with the details used. The percentage used by me now is eighteen per cent. Now, that eighteen per cent varies from twenty-one per cent, by three per cent. One of those per cents come from the change from eight to seven as the net returns. You have got the details of it. The actual cents that I allowed for instrument service in 1914 was 67½ cent-for instruments, and in 1918 it was 58 cents, while in my present exhibit it is 48.6 cents to eighteen per cent or 48.6 cents for instrument service. I believe that the former percentages were too high, considerably too high, and in the case of the 1914 report, obviously too high.
- "Q. Now, Mr. Rhodes, who testified on this, used the basis of twenty per cent and a valuation of the instruments at \$4.50, and Mr. Pennell who testified on it used a basis of twenty-three and a half per cent, and a valuation of \$4.45, so that Mr. Rhodes found the instrument service to be 98 cents and Mr. Pennell found \$1.10 as compared with your 48.6 cents."

"A. Yes, but their percentage was not far from mine, it was within two per cent. It was the charges for instruments that made the dif-

ference."

I did not adopt a price of \$2.70 in 1920, for instruments which sell on the market according to my testimony as you people understand it for merely five dollars. I understand that they sell those parts furnished by the American Telephone & Telegraph Company, now sell from \$3.20 to \$3.30 is my understanding. Mr. Kelsey told me that. I don't know that Mr. Kelsey testified to that on the stand. I have not read his testimony, but I went over that with him and then I put that on the basis of the total number of instruments in use owned by the American Telephone & Telegraph Company and the set-up on their books for the total number of instruments is figured \$2.57 each on that basis.

"Q. So the only basis you have is what you remember that Mr. Kelsey told you about what the instruments sold for without knowing whether they were the same instruments or not?"

"A. No, the real basis is the seven million telephone sets owned by the American Telephone & Telegraph Company, with a book cost

of \$18,000,000.00."

That is \$2.57 each, and supposing that were true I should think that necessarily would assume that the instruments in Houston were worth just on an average of what they would be worth; I would assume that, and I would think it was very logical, and a well based assumption.

As to whether or not I got any quotations at any time on these instruments from the Kellogg Switchboard Company, or the Western Electric Company, I haven't had any quotations since 1918, and the quotations then I do not recall having gotten direct. I got them through a telegraph Company,—rather a telephone company.

Mr. Howard: Just a moment, Mr. Frank, you spoke about the open market for these instruments. What open market is there in this country for these parts?

Mr. D. A. Frank: Oh, there's a big open market, millions of them

sold every year.

Mr. Howard: Sold by whom?

Mr. D. A. Frank: By the Kellogg Company, Stromberg-Carlson Electric Company, and the Western Electric Company, and there is some of them in St. Louis.

I do not know a specific instance, but I understand that the Western Electric Company is, say around \$160,000,000.00; the Kellogg is about \$6,800,000.00, and the Stromberg-Carlson is probably doing \$3,000,000.00. That is enough to make enough instruments for Houston. I used twenty-six thousand three hundred and eighty instruments in my set-up, and I think I took your January 1st, 1919 number; I am under that impression now. The number on Decem-

ber 31st would be twenty-seven thousand seven hundred and 2319 twenty-five,—about twenty-seven thousand eight hundred.

"Q. Now, do you know in addition to that, that there were 674 instruments at the switchboard that you didn't use, at the Central office?"

"A. I understand that that was a part of the C. O. equipemnt."

"Q. Well, it is a part of the C. O. equipment."

"A. Oh, it is a part of the apparatus furnished by the—
"Q. (Interrupting.) American Telephone Company?"

"A. Yes."

"Q. And that there were seventy-three used for testing?"
"A. I didn't know you had that many for testing."

"Q. And for advertising there were five."

"A. Seventy-three and five."

"Q. And on a private line twenty-seven."

"A. I they-I thought they were included in the total number

of instruments."

"Q. No, the total number of instruments were those that were being rented and that there were left on subscribers' premises twenty-six. I will give you the total, Mr. Lyndon, without your having to—

"A. I want to see just how far the data here of property and equip-

ment show these instruments."

"Q. And the reserve in stock was 842, making a total of 1,647 instruments furnished by the American Telephone & Telegraph Company that has not been included by you in this set-up?"

"A. How many?"

"Q. 1,647?"
"A. Correct."

"Q. If that figure is correct, that would mean an addition, wouldn't it?

"A. It would unquestionably. If there is anything that has been

left out, why-"

"Q. Now, pardon me, Mr. Lyndon."

"A. (Continuing:) If there is anything that has been left out why it should go in. There is no intent at all to omit any computation that you ought to have and then a little."

"Q. Now, Mr. Lyndon, you have great respect for the Wisconsin

Commission, haven't you?"

"A. I have."

"Q. Did you know that they allowed the full 41/2 per cent?"

"A. When?"
"Q. In 1916?"

"A. I did not know that. Before coming to a conclusion about it, I would like to read the case and see what mental operation cause I that allowance by the Wisconsin Commission. I have always had considerable respect for it. I hope not to have occasion to lose at of it."

2321 Mr. D. A. Frank: Would you object to my reading just a little? The Commission says this:

In some investigations which have been conducted, investigators seem to have lost sight of the fact that the furnishing of the instrument parts is not only valuable services supplied to the associated company. In other words, there seems to have been an assumption that the agreement would necessarily be unreasonable because of the control of the associated companies by the American Company. In cases where investigators have failed to consider services other than the furnishing of instrument parts, we think that it is clear that they may not have made sufficient allowance for reasonable payment for services rendered. In other cases where reduction has been recommended, the facts submitted as a basis for such reduction are

rather meager. The assumption not only of the complainant in this case, but of some of those who have investigated the four and a half agreement seems to have been that any agreement of

this kind must be unreasonable because of the relation existing between the American Telephone & Telegraph Company and its associated companies. Now, notice this, Mr. Lyndon, it is our opinion that the ownership of the companies comprising the Bell System does not in itself prove the unreasonableness of any inter-corporate agreement which they have. However, any excessive charge which may be made to the Wisconsin Company by the American Company leaves their effect upon the rates of the Wisconsin Company and it becomes necessary not to prejudge the case, but to investigate the agreement in the light of all of the available facts to determine first whether or not it is unreasonable and second, the extent of any unreasonableness that may be found." Then they go on and approve the payment.

"Q. Now, did you know the Maryland Commission, the Colorado Commission, the Washington Commission, the Pennsylvania Commission, the New Jersey Commission, Louisiana Commission, and the Kansas Commission, the Alabama Commission and the Michigan Commission have and all of them with the exception of the Louisiana Commission, within the last seven years approved this relation?"

2323 Mr. Lyndon:

"A. I did not know that, Mr. Frank. I would be equally interested to know where it had not been sustained. If we had the ability to go into this with the same thoroughness, we might be able to cite a series of places where it has not been allowed. I judge that it has not been uniformly allowed every where; there has been some people, some Commissions and Courts that have not.

"Q. Well, what Commission has not allowed it?"

"A. I say if we had the ability to prepare this case, with the same thoroughness, we would probably be able to—

"Q. I think it is as reasonable as some of the other assumptions

that you have made?"

"A. I think it is as reasonable as some of the propositions. Isn't it reasonable to think you will find reasonable people somewhere."

Let me say, Mr. Frank, that is my belief that whatever is furnished to the Southwestern Company, or to the Houston Company by the American Telephone & Telegraph Company should be paid

2324 for in some reasonable rate, or on some reasonable basis, and it does not strike me that the services such as are rendered are properly fixed by a percentage on gross returns. I recognize that that was probably a mere convenience, but there should be a very definite showing of the money value that is received and that amount of money should be paid.

Supposing the Southwestern instead of getting \$42,000.00 services here was getting \$300,000.00 services here the arrangement would be an advantage and manifestly unfair. No company has the right to take \$300,000.00 worth of services and pay \$200,000.00 for it.

But, if the American Company is willing to take that from the Southwestern Company as to whether or not there is any reason why the Southwestern Company should not avail itself of the opportunity, I would say as a corporation, it possibly would, but my view is, whatever services rendered should be paid for on a just and adequate basis. Now, I have been unable to find anything that this four and a half per cent covers, outside, of the very tangible apparatus which it furnishes, and which we try and make a conservative allowance for, except the engineering. I do not know that any services are performed in an accounting way that would be required if this were

an independent plant and not associated with all the other 2325 plants and not associated with all the other long distance plants and toll services, and it is further my view that accounting is necessary to properly distribute the profits, it is a system of necessity and convenience for that purpose and not prop-

erly applicable to the Houston local public.

"Q. How could that be possible that they would have to have a form of bookkeeping to properly distribute the profits, and all they would have to do would be to pay a dividend and cash the check to

get the profits properly distributed, wouldn't they?'

"A. Well, that might be in a measure true, but there is a great deal of accounting which must be done by reason of a number of companies associated together, which is not done by an individual company. I understand, that the accounting force is sufficient to take care of the local business, if this were a strictly local company."

I do not believe that they need any assistance at all from the Gen-

eral Staff in accounting due to local traffic here.

As to whether or not they need any assistance in engineering, I think that every corporation needs certain engineering advice occasionally. The frequency and its amount depending upon largely

the character of the plant, and on the character of the local engineer in charge, or rather the ability of the local

engineer.

"Q. You see we are considering say, \$14,000.00 for the rental and maintenance of these parts, furnished by the American Telephone and Telegraph Company. There remains about twenty-eight or thirty thousand dollars for some sort of service, around \$2,500.00 a month. That is, take it on your basis or take it on our basis and what you do allow, take it on the basis of the instrument value put on there by Mr. Pennell who is Chief Engineer of this Company and he valuated it at \$1.10 per station as compared with your 48 cents."

"A. Well, in that case we would have twenty-seven or twenty-

eight dollars a year, as the rentals.

"Q. Twenty-eight. Wouldn't you have sixteen hundred and something added to twenty-seven thousand, would be twenty-nine thousand and something."

"A. Well, say \$12,000.00 would be—\$43,528.00 and from that \$12,000.00 will leave \$31,000.00 for these intangible services."

I don't know how tangible they are. Take patents alone, if some patents that should be made this coming year would not be used by

the local concern, why, they might tax us \$1,000.00 a month on these patents.

If it is worth \$1,000 a month for the prospective possibility of a patent in a well developed art, which patent would be absolutely essential to the welfare of the company. That is the only thing to consider. But the possibility of any such patents and limited to the production of the general staff, to my mind. is extremely remote. The Independent telephone interests fellows tell me that the real progress has been made by the telephone people. in the independent telephone manufacture. They say all the progress has been made by them. I did not investigate and find out exactly whether or not that is true. It would require possibly a year's study of all the details of telephone operations, who the patentees were, how fundamental they were, and all the rest of it to come to any conclusion about that. I did not make it as a statement of my own. I made it as a statement I have heard reiterated at different points from different independent telephone men. I do not know whether that is true or not, I have a belief that it is partly true and that the competition which they developed was instrumental in enlivening the general staff to produce whatever it might I do know this, that at the present time the independent companies are able to obtain apparatus which enables them to operate at as low cost as the Bell Company, and in the most cases, lower cost and give equally good service; I know that to be true.

There is no independent telephnoe company that gives service from New York to San Francisco, but we are dealing with a

2328 local situation here.

I feel that at the present time in a telephone case that seven per cent is a fair rate of return. My report in the Street Railway case shows that seven per cent was my recommendation to the Council for the present time.

"Q. On page 580 of your testimony in the street car case this question and the following answer were given by you: "Q. You say you have figured in there a return of eight per cent? Why did you "A. It has been a customary allowance by Commissions, and it is also my own view that that is a reasonable rate of earning for a public utility. "Q. How did that compare with the interest rate in the community during the period?" "A. I understand that the interest rate in this section, is approximately eight per cent." That is it has been?" "A. Yes."

'A. I think there is some more testimony."

"Q. Is that correct, Mr. Lyndon?"

"A. I think there is some more testimony there."

"Q. Well, is that much of it correct?"
"A. That much of it is correct, a reasonable—it is unreasonable to continue this return over normal periods."

Mr. J. D. Frank: From 1896 to 1919.

"Q. Where—when did you testify to that?"

"A. That was in December or January. I don't know which."

2329 "Q. December or January, 1920?"

"A. But there is on record somewhere in the testimony, that I regard seven per cent as sufficient for the present conditions.

"Q. Well, why did you say eight per cent?"

"A. Well, the context and what precedes that may explain it." "Q. What did the Master find in that case, Mr. Lyndon?"
"A. He found eight per cent."

"Q. And you still want to say that seven per cent is fair for a finding in accordance with your testimony that eight per cent was fair."

"A. It was not in accordance with my testimony at all."

"Q. The Master says this, on page 11, of his printed report: "All of the witnesses in the case use eight per cent as a fair rate of return. They all agree that the operation of a Street Railway property is attended with risks that do not attach to the ordinary security and that the greater the risk the greater the return rules should apply." Now, is that correct? Look at it and see if that is correct. On page 11 down at the bottom there on the page?"

"A. Yes."

"Q. That is the Master's report in the Street Railway, is it?"

"A. Yes, testimony stands here plainly that I have always considered eight per cent as a proper return, but you will find somewhere that I stated that seven per cent was a sufficient return, but you will find somewhere that I stated that seven per cent was a sufficient return under the present abnormal conditions.

As to whether or not the Master did me an injustice in saying that all the witnesses found eight per cent, I agree that the eight per cent was a standard and usual thing so that it was not totally an injustice, but it was not indicative of all that I had said.

As to whether or not eight per cent is a fair return or not I will give you the same answer here, under ordinary conditions. It is my idea and always has been that a part of the burden should be

carried by the utilities.

As to whether or not in an abnormal period like this it is very difficult for a corporation to get money, that is, more than it is in normal times and that they have to pay more for it, I have been recently informed that utilities have to pay more for money now than they used to have to pay for it. The decisions of all the Commissions that I know of, are that the rate must be sufficient to attract the capital. It does not take a commission to determine that. If you don't attract capital, you don't get the utility, that is all. I do not know, but I doubt if you could sell any public utility stock in the city of Houston at six per cent; I do not know if you

2331 could sell it at eight per cent, and have no idea if you could sell it at ten per cent. I judge that you could. It would be my judgment that any public utility that was well founded and making a profit, that you could sell the stock at ten per cent, provided, of course that the limitations of earning was not such that the stock could never pay ten per cent.

Supposing that I was just like the street car company here or any other public utility, I could not do anything but hazard a guess as to how much stock I could sell at ten per cent. It would not be anything that would mean anything at all, and I might guess definitely now, and two days after discussing it with people around town, I might make another guess.

"Q. Three of the leading bankers of the city of Houston got on the stand and swore that you couldn't sell over a million dollars stock of the Telephone Company in this town, even if you were offering as much as ten per cent. Does that sound reasonable?"

"A. I don't know, I don't know whether they know anything

about it either."

They are in the business of selling certain kinds of paper, and it may be that that very business blinds them to the fact that the public is ready to buy something else, I don't know. When they tried to sell stock and met with a rebuff of the public that would be a pretty good indication of what the public would do, and that would be an education, if they ever made any such attempt. Very few banks are constantly floating securities and trying to sell them. For instance, the Texas Company, if the Texas Company should want to sell \$50,000,000.00 worth of stock or bonds I doubt that some of them would be floated in the home town of the Texas Company here in Houston; it would be my opinion without knowledge, of course, that they would have that entire issue underwritten by some New York or Chicago house. would not necessarily in get local banks to underwrite it. might trade it around among a few of the banks in New York, and market the securities. For instance if it was an issue of \$5,000,000.00, that would be larger than any one bank would handle. It would be an underwriting syndicate, I should judge, for an amount of that magnitude.

The final figures that I give as the value of the telephone property in the city of Houston is the net value of the depreciable property, \$2,745,248.00; supplies and working capital, \$100,000.00.

I think the supplies and working capital that I allowed in the street car case was \$100,000.00 working capital and forty or fifty thousand dollars' worth of supplies. I don't recall that it was something over two hundred thousand dollars. I remember the

working capital was \$100,000.00. I think the \$200,000.00 the Master allowed was working capital and stores and supplies. We have the record here I don't know, but we can look and see. On page 7 of his printed report where he gives working capital \$200,000.00, it is my belief that that includes stores and supplies. It is frequently put together, for instance, the telephone company groups them, I think \$165,000.00 is the telephone company's own estimate of its working capital, stores and supplies, as I remember it.

"Q. Now, the telephone company is a little bit larger corporation here than the Street Railway Company?"

"A. You see I have made estimates on both of these properties and we—

"Q. (Interrupting.) Well, haven't we got more working capital than the Street Railway Company has? Didn't you testify in that case that the Street car Company got their money in advance every day and had their money in the bank every night for the day's operations.

"A. Yes."

"Q. And the telephone company gets its money-

"A. (Interrupting.) In advance."

"Q. (Continuing:) From twenty to forty days after the service

is performed?"

A. No, the telephone company sends out its bills on the first of the month. There is undoubtedly a number of the subscribers that pay by the fifth; of course, a larger number that pay by the tenth; and there are some that defer it until the last minute, of course."

"Q. But, will the time ever come, Mr. Lyndon, when somebody doesn't owe us for services rendered?"

"A. I think not."

"Q. And how does that compare with the Street Railway? Does anybody ever owe them for services performed?"

"A. None of the public that patronizes the lines"

"Q. And the Street Railway Company, then with their money collected in advance all the time and having nobody owing them and having no outstanding accounts, were allowed by you \$100,000.00 working capital and that is what you think we ought to be allowed?"

"A. Yes, you see the Street Railway Company have much heavier expenditures than the telephone company. Their expenses in 1919

as I recall were \$1,400,000.00."

"Q. Well, they don't have to wait to make any collections at all, they get their collections every night don't they?"
"A. Yes." 2335

"Q. And they even get some of this money in advance, by selling of tickets don't they?"

"A. I don't think so.'

"Q. Well, on page 489, of the record in the Street Railway case, I find this question asked you: Mr. Tucker says that Mr. Howard asked you, I guess it is direct: "Well, does that rule obtain in relation to the traffic company? A. No, it is the only utility I know of in which it does not obtain. The street Railway obtains its money in part each day. Q. Doesn't have to wait for any collections to pay off and even gets its money in advance? A. Yes, for tickets, where they sell tickets. A. And, at any rate gets actual cash at the time they perform the services? A. Yes. That is your testimony?"

"A. Exactly for tickets, where they sell tickets. They don't

sell tickets here."

"Q. Oh, they don't sell tickets here, so that was just thrown in

to amuse the Street Railway Company?"

"A. No, I had made a suggestion that the fare be raised and that one changed in which a proper income could be received without too greatly augmenting the fare, was by making the cash fare high and the ticket fare low, and selling tickets in advance. It was on the assumption that that general scheme might be used and, 2336 therefore, it was pertinent in that reply."

(By Mr. Howard:)

"Q. They contemplate some such plan now, don't they?"

"A. They do, and I feel very sure it will be inaugurated before long, but not now, it is not done."

"Q. Go ahead with your final figures on cost value. I want to

see where it comes out?"

"A. \$100,000.00 for working capital and stores and supplies and \$75,000.00 as the cost of establishing business, making \$2,920. 200.00 practically \$3,000,000.00."

"Q. You put in about \$800,000.00 in the Street Railway Company

property for "going value," didn't you?"

"A. Oh, more than that. It was nearer a million dollars, if I remember correctly."

"Q. Nearly a million dollars, you think they had a million dollars

of "going value" and that we have got \$75,000.00?"

"A. On my definition of "going value" that is true. This is fair that they have about a million dollars, while I can only set up about thirty-four or thirty-five thousand dollars for the telephone company."

"Q. How did you check that? Where did you find that?"

"A. I went back at the beginning of the statistics that I had in

the 1918 report."

"Q. Just tell us what page it is on, or just tell us what it was, Mr. Lyndon, you needn't get the exact details of it?" 2337 "A. The records of the company shows a period of years

in which there were no developments-

"Q. (Interrupting.) Well, this is not "going value" in the sense that we understand it, but it is under your theory that deficits-

"A. Yes."

"Q. And the million dollars that you allowed the Street Railway Company were a million dollars off deficits?"

"A. Actual deficits."

"Q. That is the company—you fund out by examining the records back to 1898, that the company had lost a million dollars and you

just added it to the valuation of the plant?"

"A. Yes, and in it—not a dollar of "going value" other than that, was added by me or by any other person, either for the company or by the city. Nor was any value other than that considered by the Master, as I remember the Master's decision, which I read a few days ago."

"Q. Will you tell us what the total of your cost value is, that you

are standing on in this case?"

"A. Well, this is the total of the depreciable values."

"Q. Well, that is all right."
"A. That is \$2,920,000.00, \$2,920,248.00. Now, the cost value is \$918,000 more than that, because that is the amount that has been deducted for depreciation."

2338 "Q. But you are going to add that \$918,000.00?"

"A. No, there was an amount of money which after \$918,-000.00 had been subtracted from it, left the \$2,745,000.00 that is the original cost value of the property, of the depreciable property alone, was \$3,663,432.00."

(By the Master:)

"Q. What exhibit are you reading from?"

"A. This is Exhibit No. 2 Page 1. And adding to that \$100,-000.00 the working capital and \$75,000.00 the cost of establishing business, the total cost value is \$3,838,432.00, that is new undepreciated property. Deducting the accrued depreciation of \$918,000.00 from that—it is \$913,100.00, but we will simply call it \$913,000.00 is about \$2,920,248,00?"

(By Mr. D. A. Frank:)

"Q. Now, what do you call the \$2,920,048?"

"A. That is the present value of the property?"

"Q. So you don't agree with any engineer that has testified in the case as to what the fair present value of the property is?"

"A. If they differ from that figure, I don't. Of course, you understand that it is the book cost adjusted less depreciation, no reproduction value has been considered."

"Q. You have not considered the reproduction value?"

"A. No."

"Q. But just figured \$2,920,048.00?"

"A. Right from the books, from the company's books."

2339 (By Mr. Howard:)

"Q. Mr. Lyndon, by taking the reproduction value of the company, even accepting that, you get, of course, another figure?"

"A. Oh, that would be another amount, and a considerably higher amount unquestionably."

(By Mr. D. A. Frank:)

"Q. This makes no pretense of being the present dat- reproduction cost?

"A. No."

"Q. And this does not even pretend to be what the books show the cost of the property is?"

"A. It does not, in so far, as the seven or eight hundred thousand dollars intangible amount."

"Q. Well, how about that intangible amount?"

"A. That is not included?"

Mr. Howard: Let him finish.

Mr. Frank: Go ahead.

"A. (Continuing:) That is not included and their \$165,000.00 which the company sets up as materials and supplies on hand and working capital and we regard \$100,000.00"Q. (Interrupting.) Although there was \$200,000.00 allowed in

the Street car case?'

"A. Yes, you see there was \$5,000,000.00 of property and practically double the operating expenses per annum for it, that you have here."

2340 "Q. Go ahead."

"A. This \$200,000,00 allowed in the Street Railway case, its proportion to the value of the property and the annual operating "Q. In spite of the fact, all of their money in this way — go ahead." expenses is less than \$100,000.00 for the telephone company."

Mr. Howard: Mr. Frank, I would like for you, if you don't mind to get in the record briefly, Mr. Lyndon, where that figure you set up varies from the books.

"Q. Go shead."

"A. So that instead of \$165,000.00 which appears on the books, I have taken \$65,000.00 less, \$100,000.00. The difference from the

"Q. (Interrupting.) Where does that appear on the books, Mr.

Lyndon, you say it appears on the books?"

A. Well, it appears on the document sent me by the accountants, as having come from the company's books."

"Q. It came from the company's Exhibit. That was a figure used

in 1917. The figure now is \$238,000.00."

"A. I will give you the amounts which appear on the company's books, as far as I have been able to determine them, from what the accountants sent me January, 1918 \$4,519,040.00."
"Q. January 1918?"

"A. January, 1918, or December 31st. I just take Janu-2341 ary to throw it over to January, 1918, one day's difference. The additions in 1918 were \$111,960.00. Therefore in January 1919 the property as shown by the books had come to \$4,631,000.00. The additions in 1918, as shown by the books cost, \$237,600.00. Therefore in January 1920 the book cost of the property was \$4,868,-800.00."

"Q. Now, was that without any working capital at all, wasn't it?"

"A. No, that included \$165,000.00 working capital." "Q. Now, what was the last figure Mr. Lyndon?"

"A. For January 1920?"

"Q. Yes, the total cost as shown by the books?"

"A. \$4,868,800.00, now that is obtained by taking the book cost 1915-1918 and adding the book cost of net additions for two years subsequent thereto. Now if the book cost of additions are greater than this cost figure—these last figures must tally with the books."

"Q. Have you finished your statement, Mr. Lyndon?"

"A. Not quite. Now, those are the gross amounts as shown by the company's books with the additions given as coming from the company's books as correct for those two years. Now, they include the following: Complete toll equipment; \$723,000.00 loss on Hous-

ton Home purchase; \$165,000.00, working capital \$268,-000.00 of aerial wire; \$11,400.00 of office furniture and fix-2342 tures allocated to Central office abd district offices, that is, in 1918, \$4,676.00 right of way. Those amounts are included in that complete figure of 1918, and, therefore, continue in for 1919 and 1920."

"Q. And all excluded by you?"

"A. No. Now, for approximate real values, the following corrections should be made: deduct the \$723,000.00 loss on the Houston Home Company."

"Q. Although Mr. Kelsey says it ought to be put in?"

"A. I don't care who says so, President Wilson or the Cabinet or anybody."

(By Mr. Howard:)

"Q. Mr. Lyndon, I would like to get those deductions there in consecutive order and continual order and then Mr. Frank, will you do

'nat and then question him about that?"

"A. (Continuing:) The first deduction is \$723,000.00 for the Houston Home purchase; the second deduction is \$65,000 from the \$165,000.00, leaving the working capital \$100,000.00 net. The third deduction-

"Q. (Interrupting.) That includes supplies?"

The third deduction is \$132,000.00 from the \$268,-000.00 of aerial wire as set up in the company's books, because in accordance with the company's own statement, which we had in 1917, that amount of wire was not there." 2343

"Q. You don't know what is there now?" "A. What is there now, we have taken as the amount there

in 1917, plus the net additions for 1918 and 1919."

"Q. In other words, whenever you can find a figure that is lower on reproduction, why use it?"

"A. No."

"Q. Go ahead."

"A. Whenever we find a figure that has any representation in physical plant, we find it impossible to apply it.

"Q. Can you imagine how that came about, Mr. Lyndon?"

"A. I really don't."

"Q. What would you say?"

"A. I really can't imagine how that would come about, that there was \$268,000.00 set up on the books and less than half of that amount of actual property, which we did not say it was less that half

the amount, but the Bell Company says it."

"Q. But you got it in that 1914 inventory and the 1914 inventory showed a number of other kinds of plants that were such in excess and the wire plant, the books were over the inventory and wasn't the explanation made to you at the time, that it came through attempt-

ing to get up the oooks several years before and arbitrary 2344 allocations made to Houston and that probably that was the cause of the books showing a greater quantity of wire then was actually used here and probably showed less of cable?"

"A. It might have been."

"Q. So that you take advantage of it to cut out \$100,000.00 of \$200,000.00 worth of our property without giving us credit for the

greater amount of cables that is shown here."

"A. The final figures are not based on 1914. These figures here, are the last figures taken from the company's books and go down to and include 1917. Now, that—now, these were taken right there—

"Q. (Interrupting.) Yes, were based on 1914?"

"A. No, we haven't done a thing-

"Q. (Interrupting.) As far as aerial wire, where did you get any figure on aerial wire, except in Houston,—1914."

"A. Oh, our figures in 1917 in the 1918 report-

"Q. (Interrupting.) All came from the 1914 inventory as far

as aerial wire is concerned, of course."

"A. I don't know that is true, but how would that make a difference? The whole of 1914, was priced on the actual inventory. If that is true, it wouldn't make any difference what sort of set-up had been made in the books."

"Q. Now, let's see, Mr. Lyndon, suppose in 1914 you had 2345 taken the aerial wire and the aerial cable from the inventory or taken the aerial wire and the aerial cable from the books, you would have got the figures for the sum of the two that was com-

parable, wouldn't you?"

"A. Yes."

"Q. But what you did was to take the aerial which the inventory showed was not in the plant, but you did not take the aerial cables which the inventory showed—of which the inventory showed there was an excess in the plant?"

"A. We had to-

"Q. (Interrupting.) Now, isn't that true?"

"A. No, it was—the 1914 report was a reproduction value."

"Q. Yes."

"A. (Continuing:) And regardless what the company had set up on its books as cost, the inventory would have corrected it, because we used the company's inventory and we used prices which, whether adequate or not, we had every reason to regard as adequate and those prices gave us certain values. Now, that was a reproduction value."

That was a reproduction value of those units that I testified about yesterday. So it was impossible for us to transfer, to take 1914, our valuation as the starting point, and then go from there on with the

books. We would have a mixed sort of valuation. That isn't what I did with the aerial wire; we took the book value of the aerial wire,—we took the inventory of the aerial wire,—we took the inventory of the aerial wire.

"Q. Yes, why couldn't you have taken the inventory value of the aerial wire, much greater than the books were?"

((A Deer that show so in any 1014 severt 9?)

"A. Does that show so in our 1914 report?"

"Q. I think so."

"A. Well, if it does, you certainly are entitled to it and in order that there might be no mystery about this thing we have taken the full book value and shown the specific deductions. Now, all this amount of money, there is \$132,000.00 that we put down as a deduction as which we thought ought to be made for aerial wire. the statements that you make are borne out, then there should be some possible credit on aerial cables."

With reference to the difference between our books and our findings, then, the next item is to deduct the \$11,400.00 office furniture and fixtures allocated. We should deduct that because, as we under-

stand it is not here in Houston.

"Q. Well, suppose it is there in Houston, now, Mr. J. D. Frank here is General Attorney and fourteen per cent is applied to the Houston Exchange, nearly one hundred per cent has been applied for the last three months, but if fourteen per cent of the time is applied to the Houston Exchange, ought not fourteen per cent of his office furniture and fixtures be applied to Hous-

ton?"

"A. As a general thing it might be so and there is another consideration, if the Southwestern Telephone & Telegraph Company did not exist at all and all the purchases and all the accounting and all the auditing and the entire executive staff of this company were followed up and was as it should be, how much more furniture than they have, would they need?"

"Q. Don't you know they would have at least five times as much

as they have allocated here in this set up?"

"A. This office furniture, these desks and tables and chairs and even in this era of high prices n-arly \$5,000.00 buys a great many

of them."

"Q. Well, if they have an organization here of executives, including a president or vice president and somebody to correspond with the General Manager and the various departments that are necessary to run a big plant like this one, don't you know it would cost considerably more in office space and furniture and fixtures than is allocated to the City of Houston in the present set up?"

"A. If this were a local company trying its best to make a dividend I don't believe it would have as many high paid officials on its payroll as \$11,000.00 of set up furniture would equip,

I don't think."

That is just an opinion. It is a question on which there may be some differences unquestionably, but it does not seem to me that with the staff that is maintained here and must be maintained here, and which requires only \$8,000.00 worth of furniture to take care of, that to put in \$11,400.00 was for, as a capital asset against this company, that is not within the shooting range of Houston and take the view that much would be required for an Executive Staff, competent to manage this plant independently hardly seems to my mind a justifiable conclusion.

I do not know that this company could save a great deal of mon-y by dividing up the State of Texas into a number of local exchanges like the City of Houston, and putting local organizations in to manage one of them locally instead of having a central organization at Dallas. If all the conditions are as they are indicated here, it

might, or might not be true. There is this about it. salaries paid might more than offset the interest in depreciation on \$11,000.00 worth of furniture, which simply to my mind does not appear to be a reasonable thing.

'Q. You just wasn't used to an organization that have a general

expense of this kind?"

"A. Yes, I think so; I think so."

"Q. Well, what experience have you had with corporations with much general expense?" 2349

Well, I was there some at the Edison Works."

The Edison Works is a local concern in that they operate in West Orange and they have the cement work eighteen miles away and they have other works four miles away. It is not going a thousand miles away, nothing except district offices, no manufactory.

\$12,000,00 was one item which I regarded as an amount in excess of what should be charged. Now, then the total of those items is \$936,000.00. Now, added to that or subtracted from that the cost of establishing business, \$75,000.00 left a total deduction \$861,-Now, if those deductions be made from the gross book values, we find as the corrected values that without depreciation, January 1918, \$3,658,000.00, January 1919, \$3,770,000.00, January 1920, \$4,700,000.00. Now, these are all about \$160,000.00 high, due to the fact that instead of taking the real estate at its cost, plus the change in value, plus and minus change in value, we took the real estate at the book value and at the book value at that time which was \$35,000.00 more, just to stick to the book values. Also, we have taken the deductions for the Houston Home Telephone Company at the amount of the set up, at the amount of the set up by the Southwestern Telephone & Telegraph Company of \$723,000.00,

when as a matter of fact, it was more than that. When you take the depreciated values at which they were put in, that accounts for the apparent descrepancy of \$160,000.00, between these figures and the figures in Exhibit No. 2, but they are close enough for practical purposes of computation. Now, the deduction for accrued depreciation, for depreciation to January 1918 was \$750,-

Now, deducting that from January 1918 values there remained as the net value of the plant, January, 1918, \$2,980,000.00.

"Q. Do you doubt, Mr. Lyndon, that the books-that the book entries of \$4,810,385.40 as put in Scott's Exhibit No. 10, and that was only up to October 1st 1919, I believe the figures you have are \$4,858,000.00."

"A. Yes."

It is my opinion that the books represent, and it is my opinion that the books should represent or show the actual cash expended in the City of Houston for all property work, overhead and every other This figure of actual cash expended is the money; minimum or maximum. It is the money spent. There is no minimum or maximum to a fixed absolute unchangeable amount.

Supposing that there were quite a number of expenses such as

interest during construction, engineering and general ex-2351 pense, that prior to 1908 and 1910 were not charged in the books then the company actually spent money for those It is true that if they were not charged on the books it would be out of the company's treasury, but would not be reflected in the books; anything that the company pays that were not written on the books means that the books show that much less assets than the company should have; there is no doubt about that, but if they were paid out of operations and charged to operation, then were taken care of in that amount. I understand that the reason these things are true is there has been quite an advance of art in bookkeeping in the last ten or fifteen years for public utilities particularly, and it is my understanding that the telephone company in common with other utilities has been trying to improve its bookkeeping,-trying to get more nearly in accordance with the facts, but it was never my understanding that the books would reflect less than the amount of money paid out, because money has to be accounted for. As to whether or not it might be accounted for on the company's books in the general office and still not be allocated to Houston, I doubt if an expenditure actually incurred in Houston would be omitted. see no reason why it should be. I mean intentionally omitted, of course, there are errors in keeping books. 2352

"Q. Well, suppose in 1905, just to suppose a case, there had been \$50,000.00 of construction put in the sub-station and that a fair engineering charge on that would be five per cent or \$2,500.00, and that under the system of keeping books at that time, nothing was put in at Houston, than the books at Houston would only show \$50,000.00, whereas it ought to show \$52,500.00,

isn't that possible?"

"A. What the fair engineering charge to my mind would be

would have nothing to do with it.

The actual engineering charge would be whatever it is, if it should be \$2,000.00 or \$3,000.00.

"Q. Well, say it is an actual engineering charge, and they failed

to put it on the books."

"A. Well, in several rate cases the question came up, we did not incur this engineering charge, but it would be fair to incur it."

"Q. We don't say that."

"A. I just want to say that, that the failure to incur it has probably been a burden on the public ever since because the thing is

not properly engineered."

"Q. In 1914 inventory, there were probably a few items where the inventory was more than the books, for instance, the central office equipment was \$8,000,00 more than the books, the aerial cable was \$34,000.00 more than the books, the underground

conduits was \$38,000.00 more than the books and the under-2353 ground cables \$52,000.00 more than the books. Now, if you are going to take the inventory as the starting point, why those figures should be used instead of using the books, oughtn't they."

"A. No, the books ought to show the two costs." "Q. But, they don't do they, Mr. Lyndon?"

"A. But the inventory there is a reproduction value. It simply showed as far as we were able to—

"Q. (Interrupting.) Well, the wire was a reproduction figure too,

wasn't it."

"A. Yes, every figure in there was a reproduction. In the 1914 report every figure in there is a reproduction figure. Now, they were the best figures, which we as engineers for a municipality that wasn't going to build any plant and everybody knew it, they were the best figures we were able to get."

"Q. Well, the figures that you use today are the reproduction

figures of 1914, aren't they?"

"A. No."

"Q. Well, what is it."

"A. The figures as shown by the books of the company."

"Q. Less the difference between your inventory and the book

figures in 1914?"

"A. Not less anything—oh, less the difference between the amount of wire in the unit prices they are not concerned now. The amount of wire on hand in 1914 did not correspond with the books, it was not there, the inventory showed it was not there."

"Q. But the inventory did show there were other items of plant there that were greater than the books showed and you didn't take

those into consideration?"

"A. There were other items which under the reproduction cost at the prices we were able to get showed a greater amount of money necessary unquestionably. But, we did not at that time, it is a subject, of course worthy of consideration, but I am not sure it is true now regarding the difference as accruing from the fact that less wire had been charged or rather more wire had been charged on the books than existed and less of cable and central office equipment. There is no rational explanation of that."

"Q. The difference between the books on aerial wire, there has been just about as much one way as the difference on other parts

of the plant was the other?"

"A. I don't remember about that. If you have looked it up and

that was the case, why, of course, it is.'

"Q. Well, coming down to the final figures, you take a figure less than three million dollars after you have adjusted it as being what you consider the adjusted present value, if I get your terminology——

"A. Less depreciation."

2355 "Q. Less depreciation as compared with an investment of the company of four million, nearly \$900,000.00 in the City of Houston."

"A. Some of that is not investment as we see it."

Mr. Howard: He has just gone all over that.

"Q. Can't you see my terminology well enough at least to say, our book entry is \$4,900,000.00, and that your finding is something—almost \$2,000,000.00 less than our book figures?"

"A. It is around a \$1,800,000.00 total and your book figures for all your expenditures new-

'Q. (Interrupting.) Yes, four million and nearly \$9,000,000.00.

"A. \$4,868,000.00."

"Q. Now, of course, if the plant has any value at all as a 'going concern', why that would have to be added to whatever the book

"A. Oh, certainly."

"Q. Now, I think we understand what your figures are now, Mr. Lyndon. Just why did you take six per cent with the telephone company instead of taking eight per cent, why didn't you set up at least one combination of eight per cent? Have you anything else to say except what you have already said about utilities bearing their part of the burden?"

"A. Nothing else."
"Q. Well, there is no reason to go into it then, if you 2356

haven't anything else."

"A. I have nothing else to say. That six per cent was set up as a figure, as a tentative figure, to see just what the result would be. Now, it is not a statement on my part at all that six per cent is the limit of the amount which a public utility should receive."

"Q. If you set up eight per cent, it would be considerably more,

wouldn't it?"

"A. It would be 33 1/3% more." "Q. It would be 33 1/3% more?"

"A. It was a tentative figure, to see just about where-

"Q. (Interrupting.) That is the gross figures would be about

thirty three and a third per cent more?"

"A. (Continuing:) Well, it would carry—yes, the gross figure would be that. Well, now that would be the net return, so that the net figure would be thirty three and one third per cent more."

But I am very definitely on record in a large number of cases, that eight per cent is a proper rational return and under ordinary conditions, for any public utility, and that seven per cent is a proper return until we get away from this period of inflation of wages and every other cost that a utility and an individual now suffers. I do not think that every increase in price should be passed on to the

consumer, or to the user of your service and then a continu-

ous flat eight per cent be maintained.

I did not hear the testimony here that you would have to have five hundred thousand dollars of new money the coming year if you would take care of necessary improvements in the city of Houston, but I believe it to be the fact. I do not see why you should have to pay more than eight per cent for that money. I do not know of any place where you can get it for less than eight per cent; we borrowed some in December for four and a half. I do not know whether or not you can operate on borrowed money for permanent investment in plant; other utilities seem to borrow money.

"Q. Well, just set up a financial scheme, if you don't mind, just show us how we can run this utility here where we have got a big cost we claim of a little less than five million dollars, and we claim we have a valuation here of around seven million dollars, just tell us how we can go out and borrow money to run this utility for the

next year?"

"A. That I don't know. I would have to have a great deal more information about the financial condition of your company than I now have to form any definite idea, but I have always been under the impression that a solvent corporation, particularly one that is under rate regulations, is allowed to earn a reasonable return

on the investment, as decided-and was solvent, could go out

and borrow money for needed improvements.

For the last four years for a part of the time you have been earning a reasonable return here and part of the time you have The part of the time that you have was the twelve months that the government had the lines. I do not know whether or not it earned it here, or whether it came out of the Bell properties somewhere else. I did not make an analysis of it, including that return that you received from the Government because it was no way to come to any conclusion about either the then existing rates or the future rates because that was a sporadic thing that was listed in it and then taken out.

"Q. But your 1918 report shows on the basis that you have there, that for that year or the year just previous, the year that you considered that we lost \$118,000.00 that is, the \$118,000.00 less than a fair return on the basis of six per cent or six and a half per cent, which was it you used?"

"A. Well, as well as I remember it was \$102,000.00 and I predicted that in the next succeeding year, you would be under about twelve or fourteen, maybe sixteen thousand dollars more net expense than you had been for the period on which we had reported, but it was over \$100,000,00."

It was over one hundred thousand dollars and that was on 2359 the basis of seven per cent. On the basis of eight per cent there would be twenty-four to thirty thousand dollars more added to the figure that I found there as a loss and it would be about one It would be about that if you hundred thirty thousand dollars. omitted totally the Government intervention. Just take it on five and two and it would be rational,-it would be roughly that, I think without making the computation, unquestionably a loss of over \$100,000.00. I don't know it to be true that in view of the increased cost of all classes of labor at the same rate that you would be losing considerably more at the present time that you did in 1918, but I regard it as probable; it sounds reasonable at any rate.

"Q. As I understand from your set up there, that where you find \$136,000.00 actual depreciation that was what you consider from a financial standpoint that the property was worth each year, worth less than that I mean, that was the decrease?"

"A. For that particular year, that decrease may grow greater as

you add property."

"Q. Yes, now that has no connection with a set-up for reserve

for replacements such as we understand it?"

"A. None. The first thing the public is concerned with and must reimburse you for; the second, the public has no concern with at all, it is a matter of your own financial decision as to what you will do with your money."

"Q. Just a word with reference to the Federal Income Tax that was thrown out by you as being not a proper charge, in the local expenses in the City of Houston, it would have to be thrown out

everywhere else too, wouldn't it?

"A. Certainly."

"Q. Now, you allowed it to the Street Railway Company, didn't

vou?"

"A. No sir. No, that was definitely protested against. That is one thing that I have never been able to comprehend, why an individual must carry a burden on his net income but a corporation can escape it by passing it to the public. I don't regard it as—

"Q. (Interrupting.) Now, on page 956, of the record in the Street Railway case, speaking about this very fact, the question was asked: Q. So that you yourself would not bear any real war burden, if you could help it, is that a fact? A. Possibly not, with respect to producing of personal incomes. I might disburse some of that income to carry some part of the war burden, as a matter of fact I am doing it, and am compelled to do it under the income tax."

"Q. And this corporation is likewise compelled, isn't it, the question about that, you have seen the books, you know that we pay some income taxes? A. Yes, that is true, but these taxes have been regarded by me as a part of your expenditures and all of my figures are based on your net returns after you get all of these costs paid." Now, that is your testimony in the Street Rail-

way Company case, isn't it, beginning at the bottom of page 956?"
"A. Yes, but this statement is probably absolutely true that they were included, but not that I approved their inclusions, that they

were put in simply-

"Q. (Interrupting.) Well, you did not even include them once, did you?"

"A. I don't remember, I think they were included."

"Q. Now, if you did not include them-

"A. (Interrupting.) Now, let's see, a question of whether I have ever in my life included an income tax for any corporation is here; I never have. I don't remember why they were included in this set-up. There is evidently, there must be some explanation somewhere in this testimony about it."

"Q. Well, just analyze the fundamental question involved a little

bit, Mr. Lyndon. Just why do you exclude it?"

"A. Because the tax is on net income."

"Q. Yes."

"A. And every individual that has any net income must pay that tax and must carry the burden. It is part of what 2362 he must do after he makes his money and pays all of his expenses and I cannot understand why the same rule would not apply to a corporation."

(By Mr. Howard:)

"A. Well, Mr. Lyndon, net income has to be determined before the tax applies, doesn't it?"

Of course, that is what I meant to bring out. It is the net income before the tax is applied and then the tax is applied to net income and the purpose of the public is to pay you a return on the net income, and then the Government takes an income tax."

"Q. All right, let's see if it wouldn't be just as long as it is broad. Assuming that ten per cent would be a fair rate of return to a utility, if you can assume that?"

"A. Yes."

"Q. And that one per cent would be the income tax. If it took ten per cent dividends to attract money into the corporation, isn't it a fact, that the man who had the money, if he was going to pay the one per cent out of the ten per cent would get eleven per cent instead of ten per cent for his money before he would turn it loose to the corporation?"

"A. I don't say that at all, because one per cent will be deducted

from him, wherever he puts his money."

"Q. Does the stockholders get any credit on account of the fact that this had been paid by the corporation, that the taxes have been paid by the corporation, before his dividend was paid

"A. As I understand that, the fact that the money is collected at

the source, does not relieve him-

"Q. (Interrupting.) Is there any money collected at the source?"

"A. I don't know the laws on that. I have always been of the belief that when the Government collected on income tax, on in-

come, it was done with it."

"Q. Well, suppose a corporation with \$100,000.00 capital had, free of everything else, \$11,000.00 except it had not paid its income tax and that income tax amounted to ten per cent or what would be called by the Government net income. Now, that would produce \$1,000.00 net income as far as the stockholders were concerned, wouldn't it, I mean \$10,000.00?"

"A. Nine-tenths of one per cent would be that, but I see what you mean. Yes, that would be true, if the Government took a

thousand it would leave ten thousand."

"Q. Now, just what is the difference between the Government taking \$1,000.00 and calling it income tax and it taking \$1,000.00 and calling it property tax, how do you differentiate between them?"

"A. This, that the net income of any individual or corporation is a thing that the Government takes a certain amount from and it is a variable amount and it may ultimately disappear.

It has grown to the dimensions it has due to extraordinary conditions, though-no individual escapes it, and individuals do escape those other taxes."

"Q. Now, isn't that true of the advalorem tax, everything you

have just said?"

"A. No, there are many individuals who have considerable income and who are subject to practically no other taxes than the

income taxes,"

"Q. Are you awars of the fact that in this State there are no exemptions at all, that everything is taxes, personal, realty and every sort of property, except, of course, Geovernment bonds or City Securities?"

"A. There are men who are making from twenty to twenty-five thousand dollars a year and who have not got any other kind of

property?"

As I stated yesterday the figures that I have worked out there in my exhibit No. 2 means that the plant, according to my theory of the cost value, went down by the amount of \$156,000.00 a year. That figure is the amount that you would have to have to compensate you whether you put in replacement or whether you did not. That figure is meant to give you the money to provide replacement, provide for them when the time comes. Whether replacements are put in or whether they are not, has nothing to do with the fact that the property you have has diminished in value that much and you have to have that much money from some source to keep your investment at 100% of its value.

Suppose that you had a pole that cost \$10.00 to put down, according to my theory of it, if it is going to last ten years or 12½ years, a certain amount ought to be collected each year to take care of that. Of course, if the people that made out these life tables that I have used apply it to 100% of the property and not to the depreciable, it would cause an adjustment of those figures in itself.

If you have a switchboard that cost \$100,000.00 and you want to set aside a reserve for replacement, regardless of any valuation question, on the theory that the switchboard comes out on an average of ten years, and that when it does come out, there is a 40% salvage leaving 60%, it would cost in 10 years in order to be sure that we would set aside enough you would have to set aside \$6,000.00 a year

to take care of the depreciation on the switchboard, that is 2366 on the straight line theory, which is the one I would use. And the same thing would be true of every other item of property. It is true that if your experience shows that for a num-

property. It is true that if your experience shows that for a number of years, six or eight years, that you had a realized depreciation of around ninety or one hundred thousand dollars a year, you would know that you would need more money than that to take care of large items like switchboards that would come out later. The property that you would be replacing in 1918 would, I should think, be on an average of less than ten or twelve years old. Whatever it would be, it would be an aggregate of various lives, something you would replace would have had a short life and others would have had a long life. So that, the reserve for replacement which ought to be set aside now if the plant has been going continuously eight or ten years ought to be considerably larger per year than the near realized depreciation. In other words, the realized depreciation, if it could be taken on any one part would be merely a measure of depreciation of property that according to my theory might be

something like ten or twelve years old, might be older, and it might not be so old. Possibly it would not be less than eight years old, but it is probable that you have situations in which you can set poles that are subjected alternately to dry and wet conditions that they will not last five years. You do find that sometimes That would be individual poles and would not be of a general character. The average would be ten or twelve years and some might last longer. Public requirements and inadequacy would tend to bring the average down, would tend to limit the life of the poles in a plant of this kind. It would be around twelve or twelve and a half years I should say. A plant standing still that was completed and 2367 had not been added to for a number of years would tend to get into a cycle so that you could determine pretty well what amount would be necessary to set aside for reserve for replacement, but that would be after a very long period of time only. There are

amount would be necessary to set aside for reserve for replacement, certain portions of a telephone plant, in fact, of any utility, that are much more expensive than other portions and the life of those units when once ended cover a heavier expenditure during that portion of the cycle than other portions and you would have to go through a period in which you practically wipe out the original equipment in order to get a fair average of a plant that was stationary, but it would be somewhat indicative after say ten years. But a plant that has been growing as has the Houston plant, just assuming our off figures for the sake of argument, from about \$200,000.00 in 1901 to the book cost now of \$4,800,000.00, evidently your realized depreciation would be applicable on an average to a plant that was somewhere in the range of from eight to twenty years. So that if you took your realized depreciation by years and determined what percentage that bore to the cost of the property on a basis of six years, eight years, ten years and twelve years before, it might throw some light on what was the proper percentage to set aside as reserve for replacement,it would be indicative, but the whole subject would have to be analyzed to see whether too high or too low, it might be either. It would simply be indicative.

"Q. Mr. Lyndon, I show you a compilation made by Mr. Hoag.
These figures have already been introduced in evidence. The
paper which I hand you will be copied and introduced in
evidence as an exhibit in the case, in column 1, in the number of years, 1901 to 1919, in column 2, is what is called the average
book cost which can be taken from the evidence in this case put in
by Mr. Scott. In column 3 is the amount of realized depreciation
by years beginning with 1909, back of which it is not possible to
get it, and in the next five columns is the percentage by years,
going back twelve years, ten years, eight years, six years and four
years. The realized depreciation for 1909 appears to be how much
by this exhibit?"

"A. Twenty eight thousand and twenty seven dollars."

For 1910 the realized depreciation, that is, the actual money spent for replacement is \$18,554.00. For 1911, \$52,568.00. For 1912 \$183,903.00. For 1913 \$121,397.00. For 1914 \$57,748.00.

For 1915 \$115,171.00. For 1916 \$157,372.00. For 1917 \$152,600.00. For 1918 \$74,662.00. For 1919 \$32,175.00. That is an average for the 11 years of \$90,380.00. The year 1913 the amount of realized depreciation in that year was \$121,397.00, applying that to the book cost for 12 years prior thereto, which would be 1901, the percentage is 42.2% of the book cost of 1901. For the tenth year it would be 27.8%; for the eighth year 20.8%; the sixth year 17.8%; the fourth year 11.7%. For the year 1917 it is 26.1%, realized depreciation in percentage down to 1919. For the 10th year 17.3%, for the 8th year 14.8%, for the 6th year 9.5% and for the 4th year $13\frac{1}{2}\%$.

For 1918, 10.2% for the 12th year, 8% for the 10th year, 2369 6% for the 8th year, 3.6% for the 6th year, and 3% for the

4th year.

For 1919, 3.7% for the 12th year, 3.4% for the 10th year, 2% for the 8th yar, 1.4% for the 6th year, 1.3% for the 4th year, making an average for the 11 years—

"A. (Interrupting.) 22.1% for the 12th year; 19.8% for the 10th year; 13.1% for the 8th year; 9.1% for the 6th year and 6.8% for the 4th year."

Those figures would indicate that in 1918 and 1919 there was not very much reconstruction work and I judge that was due to the heavy reconstruction work or replacement work that preceded in the two years immediately prior to that. That was during the war restrictions, when the Government wouldn't allow any building, but your replacements the two years prior to that were very heavy, and it is probable you brought the plant up to condition where replacements were not very much needed in those two years. That is the way it would look from the amount you spent,-the heavy amount you spent in the two prior years. If the evidence in this case by one of the witnesses was to the effect that you would have to spend \$500,000.00 here in the next year or two, just to catch up with the reconstruction requirements, that would make a five year period, practically, in which you have spent only about \$90,000.00, so it would leave the five year period at \$100,000.00 a year, and would be about normal. That would be about normal for this plant for five years. The two years past you have only spent about \$90,000.00.

"Q. It is \$106,000.00 spent in the last two years?"

In the last two years you have spent a little less than your average for the past five or six years. Whenever you take out this switchboard here and put in the automatic, you will have a very much larger expenditure than in any one year, and of course, that

would necessarily come at one time, substantially in one year, and equally you must have a fund to take care of it. Not a fund to equal the cost of the new equipment, but for the old equipment which you remove, less the salvage cost. So that, the larger the plant gets, the larger the amount that is necessary per annum to take care of the realized depreciation. In addition to the realized depreciation prudence would suggest that we set aside something to

take care of obsolescence and inadequacy and public requirements which we know will come sooner or later. So that the percentage that is set aside ought to be comparable to the investment which you have in the different items and related to the average life of the different items. The methods which I have used to compute the annual return you should have for depreciation is, to my mind, the only proper and rational one. It may be that the actual figure which I have obtained is not the best and most exact figure, if the life of the cable, overhead cable, can be shown to be shorter than that which I have adopted. The annual amount to be set aside depends on two things, and two things only,-the average life of the property the depreciation fund is meant to cover, and its cost; that cost must be returned to you within the period of its actual life, and the only proper way is to separate the whole equipment into individual items, that is, within a reasonable degree, and apply the average life and the cost to each one and get depreciation per annum for those items, and the sum of the total depreciation on the whole property. Mr. Hoag attempted to do that and found 6.33% as the proper

rate of reserve for depreciation, but that was not applicable to the depreciables. Not to the depreciable part of the property, but it was calculated on the depreciable part of the property and then allocated to the entire plant for convenience, and that means the entire plant has an average life of 15 years. That is the buildings, land, and cables which have as much as 40% junk value, and all the other items together, make an average life of about fifteen That seems to be rather low to me, it is, to my mind, impossibly low. This realized depreciation does not tend to prove that it is not too low. That realized depreciation, in order to be a real assistance and help in reaching a conclusion, would have to be divided into its component parts. We don't know from that whether a switchboard that has been in use fifteen years has been removed one year and raised the cost of that year, but proves the switchboard's life was fifteen years instead of twelve, or we don't know but what cables were allotted a twenty year life and have lived only twelve years, and be removed and brought that amount up. It has to be segregated into its component parts, and the date at which the equipment removed that year was installed. It costs money when you take it out, regardless of when it is put in. But in order to draw a conclusion for the future—there is no question about its relation to the past. I understand that the Bell Company, for the entire United States, is setting aside nearly 6% as reserve for replacements, I understand they are setting aside that sum of money. I also

2372 understand that the Government allowed 5.72% as reserve for replacements. Of course, the percentage would be different in accordance with the different kind of plant. It would be less on the distribution lines. The rate of depreciation on the lines which are not aerial would be less than would be the lines that are aerial lines, but the investment would be heavier. The rates would be less, but you would have a heavier investment, and therefore the smaller rate, applied to the heavier investment, will still make an annual depreciation rate which would not be so much less than the other one.

I judge it would be less, but of that I am not sure. The increase in cost of sub-surface conduits is very much greater, compared with the aerial. You might have a lower depreciation, but when you multiply the higher depreciation rate by the lower amount and the lower depreciation rate by the higher amount, you might get an amount

not so very far apart.

I cannot say that the Keystone Telephone Company is in a very prosperous financial condition,—I see some red ink there. In 1918, they apparently lost \$34.362.00 in spite of their low operating expense, and they made \$132,783.00 less than they did the previous year, and that is without paying a dollar of dividends for this past year. They might have paid some dividends the preceding year, having made more money.

On page 304, it shows that they have to pay taxes assignable to operations on account of the Federal Income Tax \$14,404.00. Taxes for the State of Pennsylvania \$10,219.00. Both of those taxes were

included in this report to the InterState Commerce Com-

2373 mission.

I do not recall what I have ever testified in any valuation case or rate case before any State Commission in the United States.

I am very sure at the present time that I never did.

I would estimate, as an engineer, that the proper amount for reserve for replacements would be somewhere between \$136,000.00 and \$148,000.00, and I would regard that as absolutely ample, to return your investment to you. Now, if you set up a different value. if you double the value of this property by carrying it in as reproduction cost and try to get back as a payment the reproduction cost instead of what was actually paid out, then that would not cover it. I would say that the figure would be \$136,000.00, with that probably increased by three or four thousand dollars to cover the possibility of a somewhat shorter life of aerial conductors than I assume. would say \$140,000.00 would cover it amply. If the realized depreciation for the past ten years averaged \$90,000.00 a year, and don't increase any for the next ten years, that would not leave \$50,000.00 a year to take care of inadequacy and public requirements. In this depreciation, the life assumed is not based on wearing out, but inadequacy, public requirements and obsolesence all are factors which determine the average life,-I will change my answer.

Yes, it is true that the \$50,000.00 is what you have to set up for possible obsolesence. In other words, the plant that you

are tearing out this year is plant that is somewhere between, ax, twelve, fifteen, may be twenty, possibly twenty-five years old. If you are setting aside reserve for replacements today, you are setting aside a reserve for replacements to take care of, not for the plant ten years ago, but the plant of today. If the plant is twice as great today as ten years ago, it would depend on what you were setting aside ten years ago and how rational it was, as to whether you ought to be setting aside twice as much today as you did ten years ago. The amount to be set aside is proportional, roughly, to plant. It is directly proportional if the plant is segregated into its separate items

having different lengths of life. It is proportional, absolutely, to the amount invested in those separate items.

Mr. Howard: You say that \$90,000.00 is the realized depreciation, and you ask if it only leaves \$50,000.00 for obsolesence and public requirements, and things of that kind. Isn't that a part of the obsolesence-isn't it a part of the obsolesence, and all that-isn't that taken care of up to that time to a great extent,-taken care of by realized depreciation?

Mr. D. A. Frank: Yes, sir, but takes care of property from eight

to ten or fifteen years old.

Mr. Howard: Don't all of those things enter into the life of the property, and when you replace property, haven't you replaced not only the wear and tear, but you have replaced obsolescence

and public requirement, and those things? 2375

Mr. Lyndon: The whole combination of causes requires the replacement. If the realized depreciation don't grow except in proportion to the plant and you set aside only \$140,000.00 a year as you estimate, and the realized depreciation amounts to only \$90,-000.00, leaving \$50,000.00, and you should happen to get in one year \$500,000.00 realized depreciation on account of switch boards, which is entirely possible if you change to the automatic, it would take ten years of depreciation to pay for that one item alone. That is the only reasonable basis to run a telephone plant on. In the first place, if you have to remove \$500,000.00 worth of equipment of one kind in one year, it doesn't follow that that same year you would do your usual \$90,000.00 worth of work anywhere else. Another thing is, assume that you had four or five years of your \$50,000,00 saved up and that you needed \$250,000,00 more to meet this extraordinary condition, the I. C. C. suggests that in case of extraordinary charges like that, that they be distributed over several years. That would be an extraordinary charge. Whenever you have a normal and usual charge of \$90,000.00 to \$100,000.00, and then under the same heading you suddenly get a cost of \$500,000.00, it would not be logical to set aside \$250,000.00 a year to take care of one possible sporadic item. In 1912 you had \$183,903.00 in realized depreciation in one year, which was 52% of the plant 10 years old, or 35% of the plant 8 years old, or 25% of the plant 6 years

old, or 19% of the plant 4 years old. You had that in 1912, but that, in itself, was only 100% more than the average. I do not think if you should set aside the reserve that I recommend that you would go into the hole further and further every year. As far as I can see, you would be accumulating a fund and that fund would ultimately be quite sufficient to take care of extraordinary

conditions.

As to what a reasonable per cent for reserve for replacements to be set aside on a plant twenty or thirty years old,-I do not think it is rational to apply percentage. I do not think it is the proper thing. Every plant will differ. For instance, as I have pointed out, a large percentage of the Keystone equipment is underground, larger than here and it would decrease the percentage. Take a plant like the entire Bell System, I should say that a fair average of reserve for replacements, taking the whole plant, real estate, buildings, and everything, and taking the original book cost, which is the amount of money that must be replaced. I should say that somewhere between three and three and three-quarter per cent of the whole thing would be a satisfactory figure in spite of the Bell experience that about six per cent is the right amount, because Bell experience has been the experience of a very rapidly changing art that has settled down, at least as far as the conducting systems are concerned. I know that the telephone industry is changing faster now than it ever has before due to the automatic. It may be that it is changing faster now due to hundreds of other things but I don't know

that, I have no knowledge of it as a general telephone user. The manifestation of it, either in character of apparatus turned over to the user or character of service which he gets, is still lacking. We have no indication from those standpoints, and any advance in the art should be felt by the user. The same thing is true of riding on a railroad train. Twenty-five years ago the railroad tracks would take you from here to Galveston, and today it will do the same, but today you can ride in a Pullman car, with greater comfort, and in those days you might have ridden in an ordinary chair car, or day There have been developments even in railroad building, although they are one hundred years old, and that development is being felt by the user; but, as I say, the development in the telephone art has not manifested itself to the user. The instruments that you pick up are, of course, part of the equipment and system. They manifest themselves to the user, and as I say, I see no difference between now and fifteen years ago, except that we got better service then than now.

As I have stated, the entire instrument, including what the A. T. & T. Company furnishes, is worth \$10.00 to \$14.00, that is, roughly. I have allocated \$2.70 for the instrument of the American Company and the other eight or ten dollars would be parts that you would have to buy. The Southwestern or the American Tel. & Tel. Company would have to buy those parts and they are part of the subscriber's set. They are charged up in that heading. When I say from \$10.00 to \$14.00 I am including the transmitter, receiver, and induction coil, the complete thing runs from \$10.00 to \$14.00.

2378 depending upon whether a wall set or a desk set.

"Q. Take an ordinary desk set like we are all used to,—how would you get \$10.00 worth there by counting the transmitter, receiver and induction coil at \$2.70?"

"A. The box, the ringer and the coil and the stand and the hook switch and all the stamped portions that go to make up the set."

I do not understand that the stand itself is furnished by the American Telegraph & Telephone Company. I don't know what the stand is worth. The little iron box, that is nothing but a little box four or six inches square and they are turned out in enormous quantities, there is no question about that. The bell is two little hollow pieces of iron, with a little nickle over it, it does not cost very much. It

might be that the most expensive part of the entire desk stand set is the transmitter, receiver and induction coil, but my idea is that the rest of the instrument is more than one-half of the cost of the entire apparatus, considerably more than one-half; the part which is furnished by the Telephone Company is considerably more than one-half of the total. The desk stand is the cheaper of the two, usually runs about 15% or 20% less than a wall set. I have been speaking of the desk stand. It is my understanding that at the present time that runs about \$10.80. The wall set runs from \$12.50 to \$13.00. I would figure that \$11.00 would be approximately an average in a plant the size of Houston, it would look that way from a casual glance. To determine it would be another thing.

Mr. Hoag in his appraisal on page 167 put in the figure of \$162,429.00 for the parts not owned by the American Telephone Company, which, on the basis of 26,000 stations, made \$6.25 per station, and Mr. Pennell put in \$4.25 for transmitters, receivers and induction coils, which makes \$10.75 per station, but it was based on a higher value for the portion owned by the American Telephone Company and a lower one for the parts furnished by the Telephone Company, the Southwestern Company. Now, I have no personal knowledge of what those things cost, except the statement of the American Telephone & Telegraph Company. As I have told you, I have investigated, and as far as my investigation went, my investigation indicated between \$3.00 and \$3.25 as the present charge by other companies for those parts. It is not my information that the market price of the Kellogg instrument today is around \$5.00. That is not the information I got from Mr. Kelsey, who I understand manufactures them, I know he manufactures some telephone apparatus, and if he does not I was under a misapprehension, but he ought to be somewhat informed as to their cost, and I am using his statement when I say between \$3.00 and \$3.25. His testimony on the cost of those parts is very much better than mine because he is in intimate contact with them.

Returning to that statement I say 3% or 3½%, somewhere between that would be an approximation of this plant, as near as I can get it, at the present time. On that basis, in 1909 you had a book cost of the property of \$1,031,000.00. According to my idea of 3% you ought to have set aside \$30,000.00 to \$35,000.00 a year. In

1910 the book figure was \$1,245,322.00. On that basis you

2380 ought to have set aside about \$36,000.00.

"Q. We actually spent \$18,000.00, so we would have had that year about \$18,000.00 in the reserve. In the next year, 1911, we had \$1,601,000.00. On the basis of 3% that would make about \$48,000.00 we ought to have set aside?"

"A. Yes, sir,—say \$50,000.00."

"Q. Say \$50,000.00,—and adding that to the \$18,000.00 for the year before, we would have \$58,000.00 in the reserve?"

"A. \$68,000.00 in the reserve."

"Q. And we actually had \$52,000.00 in realized depreciation, so that would leave \$14,000.00 in the reserve?"

"A. \$16,000.00."

"Q. That is correct. In 1912 we had \$2,072,000.00; now, at 3% on that,-you say 31/2%,-that would make \$70,000.00?"

"A. That would give you \$86,000.00."

"Q. But we had \$183,900.00, practically \$184,000.00 realized depreciation that year?"

"A. Yes, sir."

"Q. That would put us \$98,000.00 in the hole?"

"Q. We would have to go to the banks and borrow that to take care of the plant?"

"A. Yes, sir, and the interest would be part of the annual charge."

"Q. Now, then, the next year our book figure was \$2,350,000,00, and 31/2% on that would be-

2381 "A. \$81,000,00."

"Q. \$81,000.00. We owed \$98,000.00 and we spent in that year for realized depreciation \$121,397.00."

"A. That is \$219,000.00 behind on \$81,000.00 as a credit."

"Q. What do you get?"

"A. \$219,000.00 you are behind and \$81,000.00 as a credit. That is \$138,000.00 you are behind."

"Q. \$138,000,00?" "A. Yes, sir."

"Q. In 1914 we had \$2,501,000.00, which would make \$87,500.00, and we had a realized depreciation of \$57,748.00, which is practically \$58,000.00?"

"A. Yes, sir."

"Q. That would be \$196,000.00?"

"A. That would give you \$29,000.00 to the good to apply to the \$138,000.00 which gives you \$109,000.00 you are behind."

"Q. In 1915 we had \$3,088,000.00,—call it \$3,100,000.00."

"A. Then that is \$113,000.00."

"Q. That would be \$105,000.00?"
"A. Yes, sir, you are right."

"Q. In that year we had a realized depreciation amounting to \$115,000.00. That would put you \$10,000.00 further in the hole, or \$119,000.00?"

"A. Yes, sir."

"Q. The next year we had \$3,571,000.00."

"A. That gives \$126,000.00."

"Q. \$126,000,00,-but we had a realized depreciation of \$157,372.00. That puts you \$31,000.00 further in the hole and makes \$146,000 00 in the hole."

"A. Yes, sir."

"Q. Now, the next year there was a book cost of \$3,590,000,00,practically \$3,600,000,00."

"A. That is \$126,000.00."

"Q. And we had a realized depreciation of \$152,000.00, which puts you \$26,000.00 further in the hole, making you now \$172,-000.00 in the hole."

"A. Haven't we repeated on that \$152,000.00?"

"Q. No. sir. In 1916 we had \$157,090.00 and in 1917 we had \$152,000.00,"

"A. That is \$26,000.00 further, or a total of \$172,000.00."

"Q. In 1918 in that year we had \$3,591,000.00, which would be \$126,000.00, and a realized depreciation of \$74,662.00,—practically \$75,000.00."

"A. That leaves \$51,000.00 to the good."

"Q. Which makes \$121,000,00?"

"A. Yes, sir."

"Q. Leaving you in the hole \$121,000.00?"

"A. Yes, sir.

"Q. In 1919 you had \$3,705,000,00?"

"A. Call it \$3,700,000.00. That is \$129,000.00."

"Q. And you had a realized depreciation of \$32,000.00?"

"A. That is \$97,000,00 credit."

"Q. Which leaves \$24,000.00 in the hole?"

"A. Yes, sir." 2383

"Q. That leaves you \$24,000.00 in the hole, that is, you lack \$24,000.00 of having enough to take care out of that fund for reserve for depreciation,-that is, for your replacements?"

"A. Yes, sir. The 31/2% should be obviously somewhat more than that, because we get only \$127,000.00 for 1919 on 31/2%, and we

found \$136,000.00 for the actual depreciation."

"Q. That leaves you \$24,000.00 in the hole, short of making these

replacements."

"A. We take \$136,000.00 and we admit probably that ought to go up about \$4,000.00 after this detection of the short life of aerial cables, so that \$140,000.00 would be about proper for 1919, and the book cost is \$3,600,000.00 and something,—eall it \$3,700,000.00. It would be, really, 4%."

"Q. In this computation we are left \$24,000.00 in the hole,lacking \$24,000.00 of having a reserve for replacements at all?"

"A. Yes, sir, on the basis of 31/2%."

"Q. What has become of the \$918,000.00 of depreciation that you took off of these figures. We would lose that much; \$24,000.00; and what become of the \$918,000.00 you subtracted from the books?" "A. That is accrued, but not yet realized depreciation."

"Q. But haven't we got a right to collect from the public, as you

put it, an amount sufficient to take care of the \$918,000.00?" "A. You have. The idea is this: Whatever is paid in, no matter how used,-whatever is paid in as depreciation is amortization of that amount of property of the Company. The Company is not even required or obliged to replace its property. It can take

that money and go off with it if it wants to, because that is the Company's money given to it in consideration of the

public's having used up that much of the Company's apparatus." "Q. You think it would take 4% for realized depreciation, and then in addition to that, in order to take care of this \$918,000.00, we would have to have 4% or 5% more?"

"A. Hardly."

"Q. You subtracted it from our book value, our book cost, you have subtracted it entirely?"

"A. Subtracted the \$918,000.00, but we haven't gone over the whole period here of the Telephone Company."

"Q. But if the theory will work at all, it ought to work over a ten

year period?"

"A. No, sir; the only period over which it could work would be the complete period in which the longest lived property had passed

through its life."

"Q. Do you see the point I make, that on your theory, in setting aside 3½% or 4%, at the end of ten years we would be without a reserve for replacements, and there is \$918,000.00 taken away from our books, and we had known that ten years ago, we ought to have been setting aside enough so we would have that amount of money in our treasury to take care of the amount subtracted by the valuator?"

"A. You should have the property or the money,—there is no doubt about that, and the money might be employed in extensions and worked into capital account. That is perfectly proper."

2385 "Q. We would have to collect it in something we would call reserve for replacements, wouldn't we?—we would have to call it something?"

"A. You would have to collect it in the depreciation fund."

"Q. As a matter of fact, the \$136,000.00 you are talking about ought to be collected over and above the actual realized depreciation, ought it?—over and above the realized depreciation? Otherwise, if we should keep our plant up for forty years, the time would come when we wouldn't have any plant at all, on your theory?"

"A. That goes back to fundamentals. You get a piece of property and it goes through half its life; the depreciation on it is 50% and it has a much less value, but when you replace that property, take a depreciation fund and replace that property, it stands new and the accrued depreciation is removed from it. That is, there is no accrued depreciation on anything that has reached the end of its life and been replaced, because the thing that has replaced it is new. It stands without any age. The only thing that must be kept in mind is that it must be replaced only with money from the depreciation fund. Now, obviously, the public must furnish a sufficient amount of money to enable you to make continuous replacements."

It has got to be included in the rates. It is usually set up as a depreciation fund. That depreciation fund should be this sum of money: the amount that represents the deterioration in value 2386 of the property every year. What has happened here is that

when you built up your plant to the present book cost, \$3,705,000.00, and have taken out $3\frac{1}{2}\%$ to meet the realized depreciation, and at the end of the time you are \$900,000.00 worse off than when you started, that condition would not be fair, absolutely. As you have put it, it does not look fair, but let's get the facts. The facts are that the depreciation fund must be a sufficient amount, not only to make replacements, not simply to make replacements, but to cover each year the change in value that the plant suffers or undergoes, due to the fact that it has started to the end of its life.

Just like a human,—as soon as he is born he starts to the end of his life, no matter how long he may live.

"Q. In order to accumulate this \$900,000.00 and have that over and above this reserve for replacements we have been talking about,—back here in 1909, if it be presumed the plant started in 1909, we would have had to set aside something like \$130,000.00,—not quite that much, probably an average of about \$90,000.00 a year for the ten years over and above these replacements, in order to have such a fund as you have described, would we not?"

"A. No, sir. When you used the money to replace individual parts, those individual parts had then lost their accrued deprecia-

tion, disappeared."

This accrued depreciation is computed in this way: We had not the actual replacements, without which an accurate set up cannot be made, but we did assume replacements that were made at the end of the theoretical life of the property. We took that assumption, that property that we said had 8% depreciation, meaning

a twelve and a half year life. At the ending of that period,twelve and a half years, we assumed, not having the data, we assumed it was replaced, and you will see that poles, switch board apparatus and P. B. X's., and subscribers' stations, all of which are taken at twelve and a half year life, that the apparatus if placed in 1907, is given a zero depreciation and zero life today, on the assumption that in 1919 the twelve and a half years having elapsed, it was replaced and is new today. That is regardless of whether you did replace it or not. You see, in that case it was the only assumption we could make, and I believe that it was in favor of the Company. Now, I can tell you better by taking the actual replacements that you have here and making computations with those and seeing when these replacements were made, provided the replacements are divided intosegregated into the individual units. The data which we had here covered simply the total replacement. We don't know what they apply on or what they relate to. That is the theory of replacement. The theory of fixing a certain life for a plant and computing depreciation and setting it up as actual figures is, as far as I know, universal. I do not know any Commission that has not adopted it. I don't know about the Courts. I will cite you to the case of the Madison Gas & Electric Company against the Madison Printing Company. It was between 1906 and 1909 I know, because I used that case and all its principles in determining whether the consolidation between the Harrisburg Electric Light Company and the Paxtong Company would be permitted. I did not get the theory

tong Company would be permitted. I that he get at the table there. It is the only possible theory that I know of that has any fundamental basis. It is the only rational one that I can see. I don't know where I got the theory if I did not get it from that case. I have several elements of knowledge that are very definite in my mind, but I couldn't tell you where I got them or how they

became fixed.

"Q. You think that no Court or Commission finds value by taking an inventory and appraisal of unit cost and material prices and attempting to find it in the way we have in this case, but all of them, according to your opinion, universally, have set ups of the kind you have here, with theoretical life and assumption as to the ago of the various parts of the plant,—is that your opinion?"

"A. Yes, sir. You mean by your method, that of looking it over

and determining its condition 9:

"Q. Yes, sir. The method we have used, the method of inspection."

"A. It is so utterly impossible that that should have any bearing on anything that might be even remotely conceived of that I can't grasp the idea of any intelligent person, Court, citizen, or anything else accepting it as bearing on the subject. It is beyond me."

I do not know of any decision other than the one I have referred to that discusses the theory that I have mentioned. I have brought out here very clearly and definitely that obsolescence and inadequacy

are the fundamental factors which require removals and which fix the life of a plant; and any gentleman that can inspect anything and tell how soon it has got to be removed because of its then condition has a mentality that I am unable to understand.

Redirect examination.

Questions by Mr. Howard:

"Q. Mr. Lyndon, Mr. Frank this morning asked you how you would—he assumed a certain $3\frac{1}{2}\%$ depreciation annuity and had you make the computation based upon that and based also upon the experienced depreciation and I believed you arrived at the result that one yould cancel the other, did you not?"

"A. Following the computation, it means that a depreciation actually set up would have been \$28,000.00, less than the depreciation actually experienced over the period which we took the figures for.

That was for ten years beginning in 1910."

In the first place, the $3\frac{1}{2}\%$ was not the percentage that I found afterwards actually did apply. It was a guess made at the time for rather a rough approximation. I find that for \$3,660,000.00 and some odd thousand, the actual depreciation which I computed was \$143,500.00 as applying to the equipment and it was the replacement of the equipment only that we had considered. Now, that is approximately 4%. The \$136,000.00, substituted for the

2390 \$143,500.00, was a total \$143,500.00 to apply to the equipment less the increase in value of the land of \$7,000.00 a year. If one increases and the other diminishes, the net is the total sum to be furnished by the public. As Mr. Frank expresses it, if half the plant was in land that increases just as rapidly as the equip-

ment decreases, then there would be no change in total value, no depreciation allowed and no depreciation fund. I don't think that question has ever been submitted to the Court and I know no utility has that ratio of land and equipment. Another thing, Judge, another matter, collateral matter, was that the adjustment of the Houston Home purchase brought in a considerable portion of that depreciation. The Company bought,-that is, the present operating company bought the old Houston Home Company, which had practically depreciated, a depreciation that had accrued on that property was a portion of the \$918,000.00, in fact a considerable proportion. I understood that the Houston Home Company's property was put on there at the depreciated value, the final value as taken was the depreciated value. With reference to how these depreciations would add anything on account of the Houston Home Company's property, I will give you an instance: The Houston Home Company's pole line is set down in the calculation for pole lines as being added to your property in 1915, at its original cost value of \$66,000.00. That is in my tabulation. You set it up at \$59,000.00. I set it up at \$66,000.00. I then applied the age of the pole line and the depreciation rate and got the depreciation on that pole line that had accrued for that period. We are talking about both realized and accrued depreciation. That would add

about both realized and accrued depreciation, to my set up. But on the figure of the realized depreciation, there would not be anything added, if your figures were used, because of the fact that the property was put on there at the depreciated value. The realized depreciation might have been taken out when it was put on your books, but in order to be consistent in the method which I have used, I put down the original cost value of each item of the property, I never took the depreciated value. So that, in my set up I am not talking about the realized depreciation, but the accrued depreciation which had accrued but not yet realized.

"Q. You know, of course, that The Houston Home Company's property is taken out at the same figure that it is put on our books, that is, we don't put a pole on there, that we value at \$9.00, we don't take it out and charge \$17.00 for it, but we charge the \$9.00 when the pole comes out."

"A. 1 don't know what your method is, but it seems to me, what you should charge, certainly the appropriate and sound method would be to charge what that pole cost, not what you took it in at."

"Q. That is what is done under the Interstate Commerce rules?"

"A. If the pole cost the Houston Home Company, \$10.00 and you bought it for \$4.00, then you should take it out at \$4.00."

"Q. But it comes out at \$10.00."
"A. I don't regard that as sound."

"Q. That is the I. C. C., that is what they tell us."

(By Mr. Howard:)

2392 "A. Passing from that. If replacements had been deferred for a very considerable period over the time—

"A. (Interrupting.) A specific period, of course, can be selected in which a great many replacements at high costs had been crowded into a comparatively few years, which would be indicative of an average that did not actually obtain over a long period. The past ten years show an average, I believe, of about \$90,000.00. This is subject to computation and correction, but I think about \$90,000.00 a year. It is possible that if they were extended back to 1901, that the average realized depreciation would be considerably reduced and the average per annum related to the average investment per annum over the total period might be reduced. I can't say that it would without seeing the figures."

"Q. Well, now, as I understand you. Mr. Lyndon, you suggested the depreciation of this property in the sum of \$918,000.00 because you have estimated that the earnings of the utility have been set aside for the purpose of replacements, which exceeds the actually

realized replacements by about that amount?"

"A. Yes."

"Q. Now, if it is a fact that the company has not earned in addition to its fair return an amount in excess of the actually realized replacement, would you set such excess aside or is it reasonable to conceive of such excess, that the plant ought not to be depreciated."

"A. Substantially that, it is a matter of preference, it would depreciate the plant and set-up the loss under the head of "Cost of Establishing Business." The net returns or the net capital account of the company is not changed."

"Q. That would be your method, it would come out practically at the same place?"

"A. It makes identically the same capital account."

"Q. In other words, upon treating the matter of investment, for a certain amount of money-if a certain amount of money had been invested and the plant had worn out in parts and they had collected no more than enough money to keep the plant replaced in a reasonable way, you would not then suggest a further depreciation?"

"A. Certainly not. The idea of depreciation is that a sufficient sum shall be allowed the company to take care of its reduction in value. Now, if that reduction in value comes, which it inevitably does and then part of it is neutralized by replacement, then the difference between the total amount which has accrued and the reduction in that total amount by replacement is a difference which should exist in some fashion as a profit either over and above the profit and return or a repayment to the investor for the apparatus actually consumed in performing the services."

"Q. Let's see if we can actually assume; take a plant worth \$2,000,000.00 and you can set up a depreciation say arbitrarily of six per cent for the purpose of keeping up the plant and amortizing

the investment." "A. Yes."

"Q. If you run along operating until you get as much say as \$500,000.00 in that fund. Now, if the whole amount is kept invested in either extensions or replacements, will

there be any room for depreciation then? There will be then no deterioration will there?"

"A. No, sir, provided the extensions made with that fund are

not written into capital account."

"Q. But if they are written into capital account, for instance you take this \$2,000,000.00 and you get up a fund of \$500,000.00 and then no depreciation realized and you take that \$500,000.00 and add it to it and make extensions, you would then have a larger plant or a \$2,500,000.00 plant, what would be the relative amount of the investment?"

"A. The investment would still be \$2,000,000,00 if the \$500. 000.00 is written into the capital account, the books would show an investment of \$2,500,000.00 and a depreciation of \$500,000.00, making the net value of the plant \$2,000,000.00, which has been its net cost and has been its net investment. It shows that the fund for depreciation has been diverted for the purpose of profit."

"Q. And if you had to add that \$500,000.00 to the capital account and make it \$2,500,000.00, then you will have to depreciate it the \$500,000.00, because that was not the original investment, to get that to the original value of the property you have to depreciate it the amount that has been charged to the plant out of the replacement or depreciation fund?"

"A. Yes."

"Q. Well what relation has the depreciation fund to the accrued depreciation? By that I mean the amount by which 2395

the plant should be depreciated."

"A. The total amount set aside for depreciation, less the actual replacement is the reduction in the value of the plant. On that basis it would make but little difference whether set-whether the plant set aside two or three items as large as the real depreciation is, if it were not for the fact that very great amounts set aside form higher rates which in the course of years would be adjusted by a large portion of the plant account being amortized, therefore reduced and followed by a low rate so that the community within thirty years would get an average rate which would be correct, but the population during say eight or ten years would retain more-would be paying more than its share and the succeeding generation less than its share. It is a matter, if it be continuously considered as a forty year period, it makes scarcely any difference whether the depreciation fund is high or low, but the difficulty is the distribution of the burden in one case over one generation and the lightening of it on another."

"Q. Well, suppose, Mr. Lyndon, this set-up here of four per cent you use on the total value of the property as distinguished from the depreciable would not be sufficient to more than keep the plant replaced, more than meet the realized depreciation, would there be any depreciation then of the value of the property as you have ascertained

it here?"

"A. Yes, there would, a four per cent depreciation carried over ten years would amount to considerably more than the replacements2396 "Q. No, I am assuming, I don't care whether it is 4%, or 3% or whatever the amount is, if the amount that you have set up here and allowed will not more than take care of the replacements or realized depreciation, why should the property be depreciated?"

"A. It would not be."
"Q. It would not be?"

"A. It would not be, that is, as a matter of financial facts. As a matter of proper bookkeeping the property ought to be depreciated by an amount, which is based on the life of the separate individual portion and the failure to obtain that depreciation ought to be carried into the cost of establishing business, but the net amount that the company would still have would be same, I mean to draw interest on, would be the same as if there were no depreciation at any time."

"Q. Well, for the purposes now of getting a final conclusion upon this matter, I want to know whether it is your opinion that this \$140,000.00, is set aside annually for depreciation would be sufficient to take care of the replacements and to amortize this investment in

such way that the plant should be depreciated?"

"A. It will do it in such way that the plant will have to be depreciated to some amount. The original figure of \$918,000.00 is susceptible of being made a definite and accurate figure by a knowledge of all the amounts of money that have been expended for re-

placements in 1901 to the present time and it is then a matter of simple calculation to determine just how much the plant should be depreciated as a matter of fact.

(By Mr. D. A. Frank:)

"Q. As a matter of finance instead of fact, isn't it?"

"A. No, as a matter of fact. You see if you get \$10.00 a year or \$10,000.00 a year as depreciation, which amortizes that amount of your investment. Now, if you permit the piece of property that it protects to wear out and you don't replace it, you are in the condition of the man who has had his bond repaid, and you are done."

(By Mr. Howard:)

"Q. Well, Mr. Lyndon, just get your final value on this thing, it suggests itself to me now that possibly you are not in a position to give it, because whether the property should be depreciated in the amount you have formally stated \$918,000.00, can you get that data now?"

"A. The data for the past ten years are available; the data for the five preceding years, I don't know whether—they are not available here."

Mr. D. A. Frank: You can't get it al all. There isn't any such figures. The books are not kept back of 1918, so that you can't do it.

"A. (Continuing:) I am of the opinion without knowledge that the replacements were made and charged to maintenance, out of

operating expenses in 1899; I found that true in one utility and it is quite possible that it may be too."

Mr. D. A. Frank: I object to this statement of such a thing being made in another utility and charged-and charging us with it here.

'A. It is not a charge. The bookkeeping methods in 1910 were

quite different."

Mr. D. A. Frank: Well, it comes pretty close to a charge.

(By Mr. Howard:)

"Q. Are you satisfied with this set-up you have made here, whereby you say this property ought to be depreciated from something around four million to something a little over three?"

"A. No, the indications are from the data I have had that the amounts of depreciation based on four per cent with due regard to the appreciation in land and with due regard to the depreciation in that amount proceeding from the old property of the Houston Home Telephone Company, purchased by the Southwestern Telephone Company would not exceed half that amount. That is my judgment. I don't know without computation."

"Q. Can you take this data from the report of Mr. Frank as furnished the City, and everyone of these replacements and make that a definite calculation or are we under the necessity of leaving this matter of the amount this property should be depreciated somewhat

undetermined?"

"A. In a measure it will have to be undetermined, owing to the fact that nine years from 1901 to 1910, there are no data concerning replacement. If those were available, and perfectly definite,-rather a perfectly definite accrued depreciation amount could be computed

on the basis of setting aside of 4%, or on the basis of setting

aside any per cent that might be suggested." 2399

(By Mr. D. A. Frank:)

"Q. What would happen if the books had been burned up and we hadn't had any of those figures at all?"

"A. Well, we would just have to reach some general conclusion."

Mr. Howard: That is what he says he has done. He has tried to do the best he could, not having the books, but he says he makes that, but it is not accurate.

Mr. D. A. Frank: That shows the fallacy of his whole set-up.

Mr. Howard: But it don't show the fallacy; of course, there is a fallacy in all these things.

"A. There is no fallacy in the method of computing the interest on the note, but if you don't know the face value of a note, you can't do it."

Mr. D. A. Frank: If you don't know the face value and the time, you would be still worse off.

"Q. Those values, with a reasonable degree of certainty, could an approximation be produced?"

"A. Yes, an approximation could be made."

"Q. But the figures which you first have, I am speaking now, of

those, rather those that you have furnished us-

"A. It is the past history, that lacking the past ten years—that is lacking the past ten years, can be taken as some sort of criterion and from that, the previous history projected. That would be only an assumption because we have no means of knowing that the previous history—the history previous to 1910.

of knowing that the previous history—the history previous to 1910, was along the same lines as the history from 1910 to the present time, but in the absence of any data at all, something would have to be assumed. It might be that the assumption would come very close to the actual facts, or it might be it would depart from them,

but there is no option left."

Yesterday, after stating the amount of property that I found to be used in this plant serving the public here, upon two methods—one by accepting the Company's inventory of 1914, plus additions since that time, and the other by an apportionment of the historical or book cost, I found certain figures, approximating \$4,000,000.00, and I stated that that property should be depreciated on account of deterioration, but that the exact amount I could not tell. The depreciation would be a greater amount than \$918,000.00, computed with a subtraction from this greater amount of the total replacements. It is obvious, of course, that when a replacement is made the depreciation accrued disappears. If the amount reached in this manner, assuming that all the data were available and could be exactly computed, it is covered by the fund which the Company has on hand and which has been received from the public; then that becomes the true deduction from the value of the property. If

the Company has no larger fund than this amount, which it has received from the public, that then becomes the measure of the depreciation, because it would mean that the public had amortized that much of the plant,-had paid back the Company for its investment of that much of the plant. If the Company had not received a sufficient amount to cover the true depreciation, then the only depreciation which could be charged against the Company's assets would be the amount of the fund which it might have accumulated for the purpose of depreciation, and not the total actual depreciation. That assumes, of course, that all money in excess of a fair return, or 8%, has been carried into the depreciation fund. If there is no fund, and the Company had been making 10% and declared it in dividends, then it would be correct to set up the other 2%, regardless of whether it had been paid out in dividends or not, for the period of time which it had endured and converted into a depreciation fund, or the equivalent, and to set up that as depreciation deductible from the value of the property. Briefly, and theoretically, depreciation based on the life of the property should have an equivalent fund accumulated. If the Company has been unable to accumulate a fund, it is proper to reduce the value of the property by the amount which the Company

has not collected as amortization. It would only be an approximation as to the amount in which this property should be depreciated; in view of the nine hundred odd thousand dollars replacements, I should say that, including the Houston Home depreciated value, that the actual depreciation would run somewhere between \$250,-000.00 and \$400,000.00, but those are simply limits. It has to

be a matter of judgment, because we are without the data 2402 for actual computation.

Mr. D. A. Frank: Why don't you just assume it? Mr. Lyndon: That's just what I am doing, Mr. Frank.

Mr. Howard: Your Honor, I believe that's all the questions I have to ask of Mr. Lyndon at this time. He is preparing a statement showing an adjustment of the toll revenue, and later I will want to examine him on that.

Cross-examination.

Questions by Mr. D. A. Frank:

No this is not an assumption, there is no assumption about depreciation,-we all know that it happens. Actual depreciation happens,-theoretical depreciation happens,-all depreciation happens. I think there is no question about that, even with your own engineers.

"Q. But you found \$918,000.00 of accrued depreciation in this plant without looking at it?"

"A. That wouldn't have made any difference."

"Q. And without knowing that \$900,000.00 had been spent in replacements in the last ten years, you now say that there would still be \$250,000.00 to \$400,000.00 of depreciation in the plant?"

"A. You include the \$918,000.00 and assume replacements in

excess of your \$900,000.00."

"Q. But it is regardless of the facts?" 2403

"A. It is not regardless of the facts. The computations which make up the \$918,000.00, representing the accrued depreciation, includes, replacements estimated, which exceed \$900,000.00."

"Q. And regardless of the fact that the Supreme Court of the United States says-

"A. (Interrupting.) Regardless of the Supreme Court of the United States, or any other men. The Supreme Court is made up of humans,-not experts.

"Q. You put yourself above the Supreme Court as an expert?" "A. As an expert in my line of work. I think that there isn't a combination of the entire Supreme Court that can form as good judgment, and being under oath-

"Q. (Interrupting.) Although this is the second time you have ever testified in your life, and have never made an inventory in your life, and never read a single book on valuations from cover to cover?"

"A. Those are your statements, but don't happen to be true. I have told you that I read Whitten from cover to cover, including the preface."

"Q. And still you didn't recognize the articles quoted from Whit-

ten?

"A. I don't memorize books, and never have done that. If you mean by reading that you learn to 'parrot' if off page by page,—and besides, I am not bound by Whitten's views; he has just simply pointed out what they are, and some may be wrong and some I am sure are."

SOUTHWESTERN BELL TELEPHONE COMPANY, Plaintiff,

VS.

THE CITY OF HOUSTON et al., Defendants.

Præcipe.

To the clerk of said court:

The Clerk will please incorporate into the transcript of the record on appeal the following portions of the record which Plaintiff, Southwestern Bell Telephone Company, submits in addition to the rest of the record herein, for the consideration of the United States Supreme Court in connection with the appeal of Southwestern Bell Telephone Company:

(1) The following Exhibits and Abstract of Exhibits filed here-

with:

Plaintiff's Exhibits numbered thirteen (13) to twenty-three (23), inclusive, F. M. Hoag, witness; pages 2254 to 2265, Statement of Evidence.

2405 Plaintiff's Exhibits numbered thirty-one (31) and thirty-two (32), H. P. Topping, witness; pages 2266 to 2268, Statement of Evidence.

Plaintiff's Exhibit numbered thirty-six (36), Geo. P. Player, wit-

ness; pages 2269 to 2270, Statement of Evidence.

Plaintiff's Exhibits numbered thirty-seven (37) to thirty-nine (39), inclusive, C. A. Gates, witness; pages 2270 to 2274, Statement of Evidence.

Plaintiff's Exhibit numbered sixty (60), James E. Allison, wit-

ness; pages 2275 to 2286, Statement of Evidence.

(2) Plaintiff's Exhibit numbered eighty (80), representing changes in electrical current, F. L. Rhodes, witness; page 2287, Statement of Evidence.

(3) Plaintiff, Southwestern Bell Telephone Company's Statement of Evidence in support of its Assignments of Error, numbered as pages 2253 to 3084, inclusive, and filed herewith.

D. A. FRANK,
JOSEPH D. FRANK,
WM. H. DULS,
Solicitors for Plaintiff,
Southwestern Bell Telephone Company.

Service hereof accepted on this the 1st day of February, A. D., 1921.

W. J. HOWARD, Solicitor for Defendants.

Example- of Contingencies and Omissions in the Inventory and Appraisal of Telephone Exchange Property.

F. M. Hoag, Witness.

This Exhibit comprising eight typewritten pages, gives a list of 101 examples of Contingencies and Omissions applicable to the inventorying and appraising of Telephone Exchange Property. Illustrations are contained in that portion of the record relating to the witness' testimony on this subject.

PLAINTIFF'S EXHIBIT No. 21.

Cost of Establishing Business.

F. M. Hoag, Witness.

This exhibit is an estimate of the cost of establishing the business, based on an appraisel of the property made Oct. 1, 1919. On page 2 of the Exhibit it is stated:

"In addition to a bare physical plant, we have every item
2414 of value by which a live going plant exceeds in value a dead
or dormant plant. * * * Starting with a bare physical
plant, it would involve a large additional capital investment to reproduce the business, to convert the dead physical property into a live
going concern."

In ascertaining what it would cost to convert the dead physical property into a live going concern the exhibit estimates the expenses for three periods of time,

- 1, the preliminary period;
- 2, the construction period; and
- 3, the development period.

In the preliminary period expenses must be incurred for preliminary studies by experts of the telephone conditions in the community, of the size, growth and future prospects of the community, and of the location of industries and the like. Also legal expenses in con-

nection with the drawing of franchises and charters, and obtaining

rights thereunder.

In the construction period, which includes the time during which the physical property is being constructed, there are expenses of maintenance, of depreciation, of building up the organization of employees, and of obtaining subscribers.

In the development period, which includes two years from the beginning of operation, there are expenses resulting from losses or deficits due to the business not being up to normal, that is, to the fact that the normal number of subscribers is not ob-

tained until after two years from the time operation is begun.

For the preliminary period the exhibit estimates the expenses to be \$12,280.00; for the construction period, \$493,939.00; and for the development period, \$486,662.00; making a total estimate of the cost of establishing business of \$992,881.

The exhibit consists of 37 pages and gives in detail the data used

in arriving at the total estimate.

Stable and Garage Equipment	****	.19%	
Total Physical Property	****	100%	6.376%

Note.—The average annual rate of reserve installations, drops

and block wires is determined as follows:

The rate given in parenthesis is the proper rate, assuming that the installations, drops and block wires remain in service for their entire life. Owing to disconnection of service by subscribers, many installations, drops and block wires are removed or abandoned and charged to expense account at the time service is discontinued. It is estimated that about 80% of the installations, drops and block wires are treated in this manner. The rate is applicable only to the balance and therefore figured at 20% of the rate shown in parenthesis.

18.	Total physical property	1,794,124.00
	Total reproduction cost	\$7,886,182.20

In preparing our report on the present reproduction cost of this property, we have used an inventory furnished us by the Company, approximately as of October 1st, 1919. For all practical purposes, the inventory is as of to-day and for obtaining present reproduction costs we have applied prices so far as obtainable as of December, 1919.

Table I shows the results of our work as applied to the different classes of property. Taking up the items in order the following paragraphs are a brief description of our

methods in coming to the conclusion set forth.

Land.

(Item 1-Table I.)

In assigning our amount as the present value of the land in the property under consideration, we have adopted the figures as reported by local real estate experts furnished us by the company.

Buildings.

(Item 2-Table I.)

In assigning a present reproduction cost to buildings, we have used the opinions of local contractors, whose figures were also furnished us by the company.

Distribution System.

(Item 3-Table I.)

In making our estimate of the present reproduction cost of the distribution system, we have taken the unpriced inventory, furnished us by the Company and applied to each item or class of items, what in our opinion, would be a conservative cost of labor and material as of December, 1919. In making up these costs, we have used such

present prices for material as were obtainable from manufacturers and dealers and from a consideration of the later bills and vouchers in the files of the Company's records. Our labor estimates we based upon tables of wage costs kept on file in

Subscribers' Stations and P. B. Exchanges.

(Item 4-Table I.)

In obtaining our results on the item, we have used the detail inventory of the property and affixed costs obtained in the same manner as for item 3—Table I.

Central Office Equipment.

(Item 5-Table I.)

In making our estimate of the present cost of reproduction of the Central Office Equipment we have used a detailed inventory fursished by the Company to which we applied costs obtained from our less for similar installations adjusted to present day prices of the lements entering into the manufacture and installation of such quipment.

Overhead Construction Costs.

(Items 7, 8, 9, 10, 11-Table I.)

In estimating our Overhead on Construction Costs, we have used factors and percentages, which are in our opinion, conservative and which can be amply supported by the decisions of courts and commissions

missions.

In making up our figure-for Interest during Construction
and for Taxes and Insurance during Construction, we have
assumed a period of reproduction of two years for the physical
plant.

Office Furniture and Fixtures, Tools and Store Equipment, Stable and Garage Equipment.

(Items 13, 14, 15-Table I.)

As the cost of making detailed inventory and following changes of prices to apply in a reproduction cost appraisal on these items is out of all proportion to the importance of the amounts. It is customary to take for them the showing of the book accounts. This we have done in our report.

Working Capital.

(Item 17-Table I.)

The Item of working capital includes three elements: First, Cash necessary for operation. Second. The permanent balance of subscribers' accounts owed. Third. The stores and supplies carried. The first two elements we have included in a round sum estimate of \$125,000. The third element is taken from the books of the Company.

TABLE II.

Intangible Property or Cost of Establishing Business.

Total

7.

\$1,794,124.00

In estimating the cost of reproduction a given utility property, when such estimate is to be used as a measure of present value, it becomes necessary to take into account, not only the amount of capital necessary to pay for actual construction work of the plant, but, also to take into account the probable cost of obtaining the capital, of properly rewarding the promoters of the enterprise, of paying for legal and other organizations expenses, of building up the business to a point of reasonable return, and of accounting for probable deprivation of return upon capital during the period before the property becomes a going concern. This portion of the value of an established utility is variously known as Intangible Property or Cost to Establish the Business, or as Going Concern Value.

It is necessary to arrive at the estimate of Going Value by the method of probable costs, because the returns which actually give the value are, in rate or confiscation cases, in question, and, therefore,

cannot be used as a judicial measure of value.

2435 The following is a brief discussion of the items of Cost to Establish Business or of Going Concern Value as measured by costs, which in our opinion, should be included in present value as measured by cost to reproduce.

All of these figures we have endeavored to place at minimum estimates, yet the total amount to be added to physical property may appear large to those unaccustomed to the study of the real expense, other than for physical property necessary in the establishment of

any large enterprise.

If each item of estimate is taken by itself and analyzed, it will be found that an investor would have to consider each as a cost to him in creating such a property, and to those having knowledge of such costs, the percentage assigned to each cannot appear excessive.

Cost of Promotion.

(Item I-Table I.)

The beginning of any enterprise of the magnitude of the present property engaged in the Houston Telephone service, especially if it were to be produced as a whole, would require the services of men of considerable ability, to organize and place in motion the various forces required to successfully carry on the different steps in the creation of the plant and business.

The services of such men are necessary for initiation and initial management, and they are, when the enterprise is 2436 successfully carried out, the creators of value and are entitled

to proper reward.

The promoter usually receives his reward on a speculative basis. Sometimes it is exorbitantly high, sometimes he loses. In assigning \$50,000 as our item for this cost we have attempted to use a low fgure at which such service might be bought and paid for on a nonpeculative basis.

Cost of Initial Organization.

(Item 2-Table II.)

As an evident expense in creating any property similar to the one under discussion is the cost of preconstruction organization, including legal and attorney's expense. We have adopted in this case the round-figure estimate of \$25,000.

Capitalization of Initial Risk.

(Item 3-Table II.)

In the initial stage of any enterprise, before the ability to earn returns is established there is, of course, a very considerable element of apparent risk. In order to induce the investor to place his savings in such an enterprise it is necessary to hold out to him the prospect either risk, or to convince him that his capital will undergo an enhancement in value. Under the circumstances of the

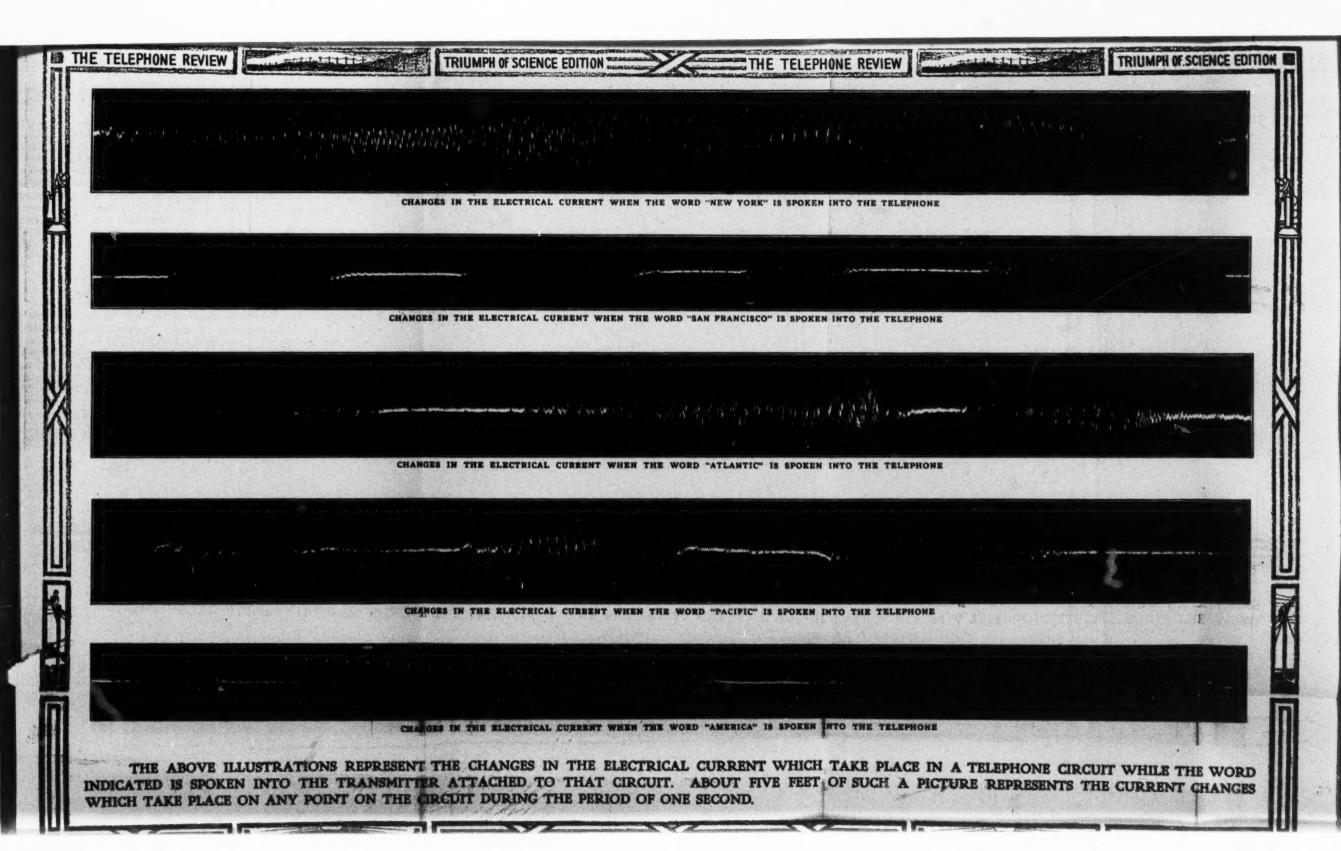

regulation of public utilities, it is certain that only a moderate or so-called reasonable return upon a determined amount of capital can be expected. It follows that any investor who is not being deceived, in placing his money in an enterprise, such as the reproduction of the Houston Telephone plant and service, would refuse to enter his capital unless he could be assured that he would be allowed to earn these moderate returns on a greater amount than he actually invests. This is, in short, the familiar financial fact of the necessity for selling securities in a new enterprise at a discount.

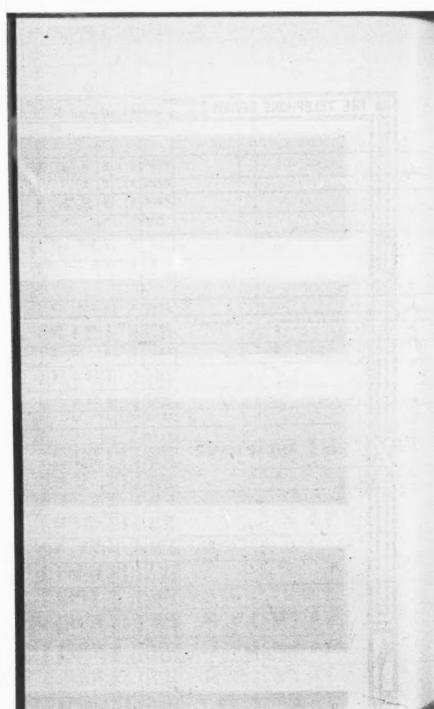

We have assumed in our estimate of the financial costs of reproducing the property under consideration that the investors would require the prospect or the right to have their capital enhanced at least 15 per cent to induce them to take the initial risk. This would mean a discount on the securities of only 13 per cent, i. e., they would sell at 87 per cent of par. Such a concession would be absolutely necessary to obtain the money for such a project and would therefore be a real and actual cost of reproduction. Under competent financial advice, no investment in such an enterprise would be made without a definite understanding with the regulatory powers providing for reimbursement for initial risk.

Initial Deficit.

(Item 4-Table II.)

In the reproduction of a Telephone system such as that of Houston, the business of the Company could not be expected to spring into immediate existence upon the completion of the plant. There would be a considerable period under the most favorable circumstances, when the investors would be deprived of a portion of a reasonable return on their capital. We have taken

for this period only three years and an average deficit of only 3 per cent, as figured on the cash items of reproduction cost. The probability is that a longer time and a higher per cent would be the actual result. This item is a well-established one in court and commission decision-.

Cost of Assembling Capital.

(Item 5-Table II.)

Money for building large utilities is not, as a rule, obtained from a single source. Through the medium of underwriters, investment bankers and brokers, the capital is gathered from many and widely scattered sources. The cost of this service is a necessary cost and is paid by the investor as a part of his investment. Unless it is to be confiscated, it must be recognized as a part of the capital in the service of the public. In this case we have placed the item at 3 per cent as a minimum estimate.

Cost of Attaching Basiness.

(Item 6-Table II.)

In building up the business of the Telephone Company, it is necessary to spend money to obtain subscribers. The average amount of this cost for each subscriber, is, or should be, charged to capital account when he is connected with the system just as is the cost of installing his telephone. It remains as a capital item until he is disconnected from the system. There is constantly engaged in the business as a part of capital a cost for each subscriber equal to the cost of procuring him as a customer.

The usual allowance for this charge is approximately four dollars per installation, but in this report we have used \$3.73 for the original cost and \$2.00 per station for the reproduction estimate.

Plaintiff's Exhibit No. 80 is as follows:

(Here follows Plaintiff's Exhibit No. 80, marked page 2440.)

A. E. Scott, a witness for the complainant, was recalled 2441 and testified as follows:

Direct examination

(Questions by Mr. J. D. Frank:)

My name is A. E. Scott and I live in St. Louis. I have already been sworn in this case. I am a statistician for the Southwestern

Bell Telephone System.

I have prepared a statement from the books of the Southwestern Telegraph & Telephone Company showing the original cost of the completed buildings owned by the Company in the City of Houston. These books show that the original cost of the Preston Building complete as of November 30th, 1919, \$201,097.68. The books show the original cost of the Hadley Building complete \$51,481.14. The books show the original cost of the Taylor Building, complete, \$22,-419.15. Both Mr. Hoag and Mr. Gates who have testified as to the value of the property in this case and have made appraisals, have included in their appraisal an item of working capital, in-

cluding supplies, amount- to \$238,818.00. They stated that they got that figure from the accounts. I am the man who

prepared that figure.

I have prepared an exhibit showing how I worked out this work-

Before introducing this exhibit in evidence I will explain to you what is meant by "Working Capital", what it includes or covers and why it is necessary to include that in a valuation of a property. In addition to the physical property of a concern, a business needs capital other than that, to meet its current obligations, provide an adequate supply of materials and stores a sufficient amount of cash to maintain and retain its credit; it is known by various names; some people call it "Liquid Assets," "Current Assets," "Quick Assets," and other similar titles, but it is capital in liquid or variable form, to meet the current needs of a company. I have some definitions here of experts and commissions; I would like to read one or two of them.

Mr. Robert H. Whitten, in his book of "Valuation of Public

Service Corporations," page 287, states:

"This working capital includes stores and supplies on hand and sufficient funds in addition to bridge the gap between outlay and reimbursement." Robert H. Whitten is an expert electrical engineer.

Mr. Howard: Mr. Frank, I might say there is no contention on the amount-we are not contesting the facts of it, there must be some working capital and supplies that is undisputed.

Well, some of these definitions show or outline the method of obtaining a Working Capital, which method I have followed and justify the method I have used. I would like to read a few of them to get that in. Mr. C. L. Corey in a table on rates for gas service read before the Nineteenth Meeting of the Pacific Coast Gas Association and printed in the American Gas Light Journal October 21st, 1911, page 260, gives a more correct statement, in which he says:

"From the amount of working capital usually carried by such companies, and from the amount that is required by other similar public utility corporations, it appears that, as an average for the year, a sum equalling the accounts receivable and cash on hand, less the accounts payable and consumers' advance payments, is a reasonable allowance."

Another expert in the case of Peoples Gas Light & Coal Company of Chicago, which was another rate case, says that "the best information as to what constitutes a reasonable allowance for work-

ing capital, is supplied by the balance sheets showing the current assets and current liabilities." That is exactly what I have done.

Mr. Hammond V. Hayes in his book "Public Utilities, Their Cost New and Depreciation," at page 230, says:

"The items to be included in working capital are supplies of all kinds, cash for current use in sufficient amounts to insure economical and safe operation of the plant, and the balance between bills and accounts receivable and accounts payable."

Here is the opinion of the Wisconsin Railroad Commission in its Report, Volume 5, at page 316:

"Plants which are running, or in actual operation, must have working capital as well as fixed capital. In this case the latter, or the fixed capital, is largely represented by the cost of reproducing the plants, while the working capital is, in part, represented by the figures given in that table for "stores and supplies." The stores and supplies there given, however, do not represent all the working capital the plant requires. Plants of this kind, the same as practically all other business enterprises, must have on hand a reasonable cash balance and other current resources in order to

operate economically and effectively. That this is the case is almost self-evident. Just what sum represents a fair amount for working capital, is nearly always a matter of judgment, and to this there is no exception in this case."

In another case, the Wisconsin Railroad Commission says "Working Capital consists of supplies of all kinds and cash for current use and may also include other items. It is necessary as any other part of the Investment."

The Public Service Commission of New York for the First District, case of Mayhew et al. vs. Kings County Lighting Company,

11 P. S. C. R. First District 659 (1911) stated:

"A Gas Company must purchase materials and supplies, must pay its employees, it must distribute its commodity to consumers in advance to payment for such service. This requires a fund ordinarily called 'working capital.' It is reimbursed from operating receipts from time to time, but originally is provided from capital."

The Maryland Public Service Commission in re Chesapeake & Potomac Telephone Company (rate case) P. U. R. 1916–C, at page 953, in the instruction of the appraisers issued in this investigation, defines "working capital," as follows:

"Working capital is the amount of cash and supplies, or without available assets, readily convertible into cash without pecuniary sacrifice, reasonably necessary to be kept on hand by the Company for purposes of meetings its current onligations as they arise, and enabling it to operate economically and efficiently. It should be taken to embrace such stock of materials and supplies as is reasonably necessary to enable the company to make repairs and minor replacements chargeable to plant, without unreasonable delay or expense, and to meet operating contingencies and emergencies not taken care of by other reserves or allowances, and generally should be a sum reasonably sufficient to bridge the gap between outlay and reimbursement."

"Q. Now, you have one definition there from some court before

you, Federal court?"
"A. Yes, I have a definition by Judge Hough in the frequently referred to case of Consolidated Gas Company vs. City of New York, 157 Federal 849, in which he says:

"That phrase means the amount of cash necessary for the safe and convenient transaction of a business, having regard to the owners' ordinary outstandings, both payable and receivable; the ordinary condition of his stock of supplies in hand; the natural risk of his business, and the condition of his credit; and unless these matters, and perhaps others, be looked into, no comparison could be drawn between one business and another, or even

between those of the same general nature."

That is what the experts and the commissions and the courts have said about the subject.

I have prepared an exhibit showing how I determined the amount of working capital for the City of Houston.

Mr. J. D. Frank: We offer that in evidence as Plaintiff's Exhibit No. 41.

(The Document referred to was thereupon received in evidence, marked Plaintiff's Exhibit No. 41 and is as follows:)

2448

PLAINTIFF'S EXHIBIT No. 41.

A. E. Scott, Witness.

The Southwestern Telegraph & Telephone Company.

Working Capital for Houston, Texas, September 30, 1919.

Total Working Capital for	or Houston	\$238,818.49

2449 In determining the amount of working capital I went to the books of the Company and made a study of the actual working capital used for the first nine months of this year, 1919.

I will now take this exhibit and explain it to you. The heading there, it says "Average Monthly Balance for 9 months ending September 30th, 1919." By "Average Monthly Balance," I mean I have taken the balance in certain accounts which are listed below at the first of the month and at the end of the month and determined an average for the month. I did that for each of the accounts after each nine months and then made an average for each account for the nine months by taking an average of these averages, (That is what we termed, "an average of averages,") and developed these facts: The actual cash on hand or in banks, the average amount for the nine months, was \$522,005.16. All of these figures are for the company as a whole. The Employees' Working Funds,—those are the funds which we advance to employees out of the current bills, some of the employees have perhaps \$5.00 and some perhaps several

hundred. That is for the purpose of carrying on the business of the Company, the small amounts are paid from the general cash fund but the large amounts are paid in the field. They are required to turn in vouchers showing just how much of this money is spent and then are reimbursed from the general fund. The total of that is \$51,512.16. The average amount of accounts receivable due from subscribers and agents,—that is the amount due for telephone

2450 service,—is \$376,696.96.

"Subscribers and Agents," is the title of the account as provided for by the Inter-State Commerce Commission. At one time we used to have agents, we would take our accounts in a certain town and charge them up to an agent and he would be charged up with the total amount of it, and would charge it back in turn. There is not very much of that done now. The accounts receivable from system corporations amounts to \$184,273.47. That is the amounts due from various telephone companies. A "system corporation" is a misnomer. That is the account name provided by the Inter-State Commerce Commission but it involves not only system telephone companies but all companies. That is principally toll business.

Accounts receivable from Miscellaneous Debtors. That is ac-

Accounts receivable from Miscellaneous Debtors. That is accounts receivable from all others than items from subscribers or telephone companies; principally from the Western Union Company, I think. That amounts to \$56,214.41. The materials and supplies \$583,981.88. That is the average amount of materials and supplies we had on hand in the State of Texas at various points. Prepayments, \$40,256.56. Those are such prepayments as are made, such as insurance, which are not chargeable to the current month in which the expense is incurred. If you buy insurance, you may pay a premium for two years or three years or five years; instead of charging up all that expense to the expense account at the

time, we charge it to the prepaid account and from month to month as the expense becomes applicable, we charge off these amounts and credit the prepaid account. Insurance is a very good example of it. Also the rent. We pay rent in advance. The total, of these items, gives what the Inter-State Commerce Commission describes as "total working assets," \$1,814,940.60. From the working assets, we have deducted working liabilities. In other words, we do a certain amount of our business on credit. We owe people, as well as people owing us. So, in order to get at the nature of the working capital, we have got to make allowance for the amounts we owe others. One item is "Audited Vouchers and Wages Unpaid, \$22,021.08;" that represents the amounts of bills that have been approved and should have been paid but were not paid at the end of the month.

The total working liabilities is \$253,520.57. Deducting the Liabilities from the Assets, we get the net working capital for the company, which is \$1,561,420.03. That is the actual working capital which was used by the Company for the State as a whole during these nine months. I took these nine months because I was studying the problem back in October or November when the nine months period figures were available. Certain working capital can be

allocated to an exchange directly on the basis of fact. Certain other amounts must be allocated on some other sort of a pro rate or

Of the amounts that can be allocated from proportion. 2452 subscribers and agents, we know that so much is applicable to Houston, so much to Dallas, and so much to San Antonio, etc. We know that the prepaid directory expense is applicable to some particular town and the total they amount to in the case of accounts receivable is \$376,696.96; the prepaid directory amounts to \$10, The total, \$387,428.87. That is for the State as a whole,

directly allocated working assets.

This item, "Service Billed in Advance," we don't have any of that at Houston, but throughout the territory and the smaller towns especially we have farmer lines. We bill them for a year in advance; in some cases three months in advance; in other cases, that is an amount which we have billed and which we have not given service and it is a liability because we must give that service. Deducting this "Billed in Advance" cost and all other items which are allocated directly to Exchange, deducting that, we get a balance of \$1,186,-That must be apportioned on some basis other than fact, because, we can't apportion it directly to an exchange. The basis I have used is the plant cost basis, taking the plant of the company and the plant of Houston, getting the relation between the two and determining what that per cent is and applying that per cent to this unapportioned article. The book cost of the plant as of Sep-

tember 30th, 1919, of the company was \$27,027,766.32, that is for the physical property only, and the book cost of the Houston property as of the same date, physical property only was \$3,816,587.60. Dividing the Three Million Eight Hundred Thousand by Twenty-Seven Million, Twenty-Seven Thousand, we get 14.121%, practically 14% applicable to Houston. Applying this per cent of 14 and a fraction per cent to the million one hundred and eighty-six thousand, we get an apportioned item of \$167,489.16. We have in addition to that, the direct items at Houston. That is, the accounts receivable from subscribers and agents, \$69,285.44, and a prepaid directory expense of \$2,043.89. Adding these three items, we get the total working capital for Houston of \$238,818.49. The working capital is carried for the Company as a whole, that is, for the State of Texas, and a certain part of it is allocated to each exchange, based on the actual facts. All of these figures are actual balances as shown by our books.

The reason that working capital is carried for the State as a whole instead of having a certain amount of each particular exchange as a part of the working capital is, we find it very much more economical to handle our cash account in one general fund, make all payments from that, instead of having a cash account at each exchange to meet its current needs and such emergencies as may arrive.

We have a sample of what may happen in an emergency 2454 case. The 1915 storm here, there was a great deal of property destroyed here. I believe the loss was something like Fifty or Sixty Thousand Dollars. They had hurry calls for cash and materials, in order to rebuild the plant and put the plant in proper condition to operate. We simply called on the State to spend the money as fast as we could spend it and drew material from all over the State in order to repair the damage that we had had at Houston. If you had had an individual company here and if it hadn't had sufficient cash and materials on hand to meet an emergency such as that, we would have had to have a great deal more working capital than where apportioned on the basis of a State proposition. By having these funds and these supplies available for the State as a whole, it makes the Working Capital less than it would be if we carried it or attempted to carry it or had it located in each particular exchange.

Cross-examination.

(Question by Mr. Howard:)

This Twenty-Seven Million plus, the book cost of the plant, September 30, 1919, that includes all of the physical property of the plant of the Southwestern in the State of Texas. That is the book cost. That includes pole lines and all. We apportion under this part a certain proportion of our toll property to the plant. The book cost of the Houston property is about fourteen per cent of the entire investment in Texas.

"Q. Mr. Scott, why wouldn't it be a more direct way to get at your supplies and working capital, or at any rate at your working capital, you have to have a certain amount of supplies on hand for the use of this plant or where they can be used for this plant, and it takes a certain amount of supplies monthly to handle it and keep the plant operating property, doesn't it?"

"A. It takes a certain amount to meet the current needs."

There is not very much difference between working capital and material and supplies. If this was just one concern disassociated from all these other plants we would probably have a warehouse where we could store such reasonable supplies as we consider advisable to meet the current needs and such emergencies as might arrive. We do not use the working capital to meet the pay rolls, that comes out of current capital, but we use it for operating expenses and the usual additions.

"Q. Well now, on that particular part of the set-up on working capital, as distinguished from supplies, a great many of them would be carried separate."

"A. This could have been set up as a separate item. It

would make no difference."

"Q. Now, taking just what is strictly known as working capital that can be pretty well determined, more directly determined by an examination of your operating expenses than it can in trying to apply it in a percentage way to your investment, can't it?"

"A. No, sir. In addition to meeting your current expenses, you would need to have cash on hand to take care of your current construction items, small current replacements; your expenses wouldn't

give you all the current working capital you need, you couldn't get it from your expense account."

The maintenance account does not cover any construction work. That would give you simply your maintenance and repair work. In addition to that, you have got-you will have supplies in your warehouse to meet that, and you will have to have cash on hand to pay people who furnish you supplies. Some commissions and some experts have used six weeks supplies and six weeks expense and two months pay-rolls. The average monthly expense at Houston are in the vicinity of \$80,000.00 a month at the present time. That is incidental expenses. Some commissions have used a per cent of the revenue as a basis, but that has not worked out right in all

cases. It might work out right and it might work out wrong. In a recent case in Missouri, I figured it out in this method, the Commission used an arbitrary per cent method and we came

within a fraction of a per cent in the amount of over Seventeen Million Dollars that was involved. That was for the State as a

whole.

None of our collections in Houston are in advance. We bill them in advance but billing them in advance and paying them in advance are of course different. Probably about 40 or 50% of the bills are paid by the 10th of the month, that is, exchange bills. That item of \$69,000.00 here shows the Houston direct item of Accounts Receivable from subscribers. That is no estimate of any kind. That shows that we had on an average nearly \$70,000.00 outstanding on the first of each month or at the end of each month. Now, you take the tolls; you see, we bill on the first of the month for the exchange items, but we are 40 days behind on the tolls, because the toll bill is 40 days behind at that time and by the time they pay the bills you are getting up close to 60 or 70 days behind, when they pay the toll

In showing the Houston Exchange as 14% of the entire investment, that includes toll equipment. That figure Three Million, that includes all property that we carry as exchange property; it does not include any toll outside property. It does not include anything that is used exclusively for toll purposes

with the exception of the Central Office Equipment.

"Q. Well, that is about all that is used exclusively for toll business, isn't it?"

"A. No, you have a total amount of outside business."

"Q. When you say "outside"——"
"A. (Interrupting.) Outside of the central office." "Q. You don't mean outside of the central office?"

"A. No, I mean, outside of the central office, that is what we speak of, outside plant."

This Three Million Dollars includes about \$76,000.00 of toll property. That is the amount of a switch-board, toll switch-board. I have worked out what percentage this working capital bears to

the reproduction cost figure used by Mr. Hoag in his appraisal and

it is 4.2%. In this file of authorities which you have in this case, it shows that the average allowed by commissions and courts in telephone cases has been over 5% of the reproduction cost.

This working capital is not a part of the fixed Capital, it is in

addition to fixed capital.

2459 "Q. In the Exhibit No. 10 which you put in this case, you have total cost of the property as shown by the books on September 3, 1919, as \$4,810,385.40. Then, in your Exhibit on Working Capital, you have book cost of the plant om September 30th, 1919, Houston, \$3,816,587.60. I just wanted you to explain

the difference in those figures."

"A. Well, I have excluded in this Exhibit 41, the intangible capital item. I think that working capital is associated with physical property and I have eliminated the intangible entirely, both from the company figures and from the exchange figures. It wouldn't have made much difference, I could have put them in, but it wouldn't have been strictly correct and I omitted it, that figure Three Million, Eight Hundred Thousand, \$3,784,000.00, plus the furniture and fixtures, tools and store equipment, and the stable and garage equipment." I might mention that this method of allocating working capital to exchanges has been accepted by practically, by all the commissions that we have to deal with in the State- of Missouri, Kansas, Arkansas, and Oklahoma. We have presented hundred- of cases to them in this same form and they have acc-peted them in every case.

2460 Mr. F. M. Hoag, a witness for the complainant, was sworn and testified as follows:

Direct examination.

Note.—The testimony of the witness, F. M. Hoag, as to his qualification, experience, etc., are set out herein on pages 915 to 921, inclusive.

I made an inventory and appraisal of the telephone property constituting the local telephone exchange in the City of Houston. That inventory was started as of September 11th, 1919. The actual field work was started on September 15th, and completed October 15th. The inventory was made as of October 1st, 1919. I have prepared a statement showing just what was done in making the inventory, and I have placed in evidence a copy of the statement as to how the inventory was made.

(Thereupon that paper was received in evidence and marked exhibit No. 12. That Plaintiff exhibit No. 12 is transmitted herewith in exhibit file.)

The inventorying, the counting of the various items of plant which go to make up the Houston Exchange property was a pretty sizable job. The field work was started on September 15th and was com-

pleted as of October 15th, 1919. Attached to this paper is a white paper map which shows the organization of the inventory forces. By referring to that map, you will notice that experienced telephone men and telephone engineers were employed in the making of

the inventory. The work was divided between pole and wire, 2461 aerial cable, underground conduit, underground cable, central office equipment, private branch exchange equipment, sub-station equipment and installations, furniture and fixtures, stable and garage equipment, which includes the motor vehicles, land and buildings.

This chart shows that there were approximately 35 men employed, that is, 35 skilled telephone men employed in the making of the inventory, and most of those men had had previous experience on inventory and appraisal work. The years of service of each one of

the men I have shown on the chart.

Just to indicate, on the pole and wire work I had C. W. Broyles, a Division Construction Foreman, in charge of that work, and he has had 15 years' service with the Telephone Company. Under him, on the pole and wire work, was R. C. Matthews, an Engineer, having had ten years' experience; C. H. Demitz, who was an Installation Foreman, having had twenty years' experience. All of these men were familiar with the property which they were inventorying, and they were selected on account of their familiarity with the particular type of property which they were inventorying.

On the aerial cable work, we had L. E. Cox, an engineer in Houston, who has had 13 years' experience, 13 years' service with the Telephone Company. E. W. Parham, a cable foreman, who has had 13 years' experience. On the underground cable and conduit work, we had Cable Foreman W. H. Ashley, who has worked for the Telephone

Company 14 years, and all of that time on underground cable and conduit work. The same kind of men we used throughout in the making of the inventory. On the Central office equipment and inventory, which is a very difficult job to do, we had ex-

perienced Telephone equipment engineers.

Central office equipment is that portion of the exchange Plant in the central office buildings, such as the switch boards, the frames, the storage batteries, charging generators, and ringing machines. In other words I am speaking of Exchange buildings, such as the Preston Building here and the Hadley Exchange Building. Central Office Building, yes, sir, and the Taylor Exchange Building. On the Private Branch Exchange equipment, which we inventoried on the same basis as we did our Central Office equipment, we also had experienced telephone engineers, that being a rather difficult portion of the plant to inventory. We could not have just picked up any and all kind of men to make this inventory because none other than experienced telephone men could have made it. use some men who were not familiar with the telephone business but they were used to open man-holes and pull tape lines and things of that sort,-they were used merely as laborers.

In explaining how I proceeded in making a count of this property I have some exhibit here that I would like to show in connection

with that.

The Telephone Company maintains in Houston record maps on which are shown the various types of plant which go to make up the distributing system, that is, the poles, wires, cables, conduits, and other portions of the outside plant. Those maps were divided into

sections, each section numbered, and a field man furnished with a particular section in this form. I have a complete copy of one of those maps,—I have them for each type of

plant.

This one shows a portion of the underground cable system. is a portion of the underground cable system in the Hadley central office district. This is section No. 717. That portion of that map would be cut off and placed on a board in like manner as this small section is here. Then attached to that is a Tally Sheet. This was placed in a field man's hands. He went out on the ground and actually counted or measured that part of the property. He entered under the various headings on these Tally Sheets what he found in the making of that count. If he found things that didn't show up on the record map, he entered them on his map and also on his Tally Sheets. In other words we cut this map to pieces and put the various portions in the hands of these men we were using to make the inventory, and they went out and then checked the property in accordance with this map. If we had something on this map which did not actually appear in the plant when they went out there,-if the men didn't find it, it was not entered. The first two or three days a field man was sent out to make his inventory, he was accompanied by experienced inventory engineers, who drilled him very carefully as to how to make his count, how to make his inventory. After that for a considerable length of time a 100% check was made of all his work by these same experienced telephone engineers. I mean that they checked all of his work for a certain period of time. When he had completed one of these sections and turned it in then they would go out there the next day or the day after and check it in detail to see that his inventory was accurate. When the field man's work

2464 Was reasonably accurate, which would be developed of course by that 100% check, then after that a 20% check was made on all of the inventory work done by each field man. These field men did not know what portion of their work was to be checked.

This part shows a portion of the aerial cable inventory, and that is a portion of the underground cable, that is underground conduit and this is pole and wire. Those boards were actually turned over to the field men in that form. They took these pieces of maps and made their check and as they came to each particular item of property they entered it on the map and also on the Tally Sheet,—on both of them, the map and the Tally Sheet. If their map showed that we had a certain piece of property in a certain portion of the town, when the man reached that portion of the town and they didn't find that piece of property it was not inventoried, it was not counted, but if they found a piece of property in a certain locality which did not appear on the map that was included in the inventory, it was counted. That method was followed throughout the inventorying or counting of the distributing system. All poles were inventoried. Ordinarily

the men making the pole and wire count were sufficiently skilled to tell what the size and specification of a pole was, that is, as to its heighth and its dimensions. However, each field man on the pole and wire count actually measured each tenth pole and if there was any doubt in his mind as to the size and heighth and dimensions of the pole, then he measured every pole. In general, the men were sufficiently familiar with that character of material so as to be able to determine from sight what the respective sizes were, but in

a case of doubt they climbed every telephone pole, if they had 2465 any doubt about it at all, they climbed that pole to ascertain its real size, and you will notice on the back of that pole and wire board a specification showing the sizes of poles and their classification, which served as a guide to the men counting or inventorying the poles. The accessories, pole accessories, such as cross-arms, braces, pole steps and other similar items were actually counted. The aerial cables were measured by drawing a tape line along the ground beneath the cable. The men who did the aerial cable work, the aerial cable inventory work, were skilled and could invariably tell the size of the cable. However, if there was any doubt in their mind, they measured the cable, and also, of course, had the records to go by as a guide. The underground conduits and cables were measured by carrying tape lines along the ground immediately above the conduit lines, between manholes and from the man-holes to ther terminus of the subsidiary conduits. That is, they carried a tape measure from one pole to the other in measuring aerial cables. We did not measure that at the top of the aerial cable but simply measured along the ground beneath the cables which did not give accurately the length of cable from one pole to another because an aerial cable when strung is strung with a certain sag. To explain: A telephone cable is leadcovered and it is quite heavy. It is impossible to string it absolutely tight. The usual pole span is about 110 feet. The strand supports the aerial cable after the cable is spliced, sags. The average sag in a 110 foot span for say, an average sized cable, is 8 to 10 inches.

Therefore in measuring the cable by laying the tape line 2466 along the ground, the sag, the additional length of the cable as represented by the sag was not included in the measurements. That has been included in the inventory,—I have included it in contingencies and omissions. That is one of the items going

to make up contingencies and omissions.

The measurements of the underground cable, were, of course, fairly accurate; the distance could be accurately measured between the man-holes, and then all the cables in the man-holes were actually measured, as was also the size of the man-holes. In addition, the type of construction of the man-holes was noted, as to whether it was concrete or brick. The size and kind of cover and frame used on the hole was noted and recorded. All subsidiary conduits, that is, the iron pipes which lead out from the man-holes to buildings or to poles were measured in like manner as to main line conduit and cables, as was also the cables in those subsidiary conduits.

An explanation of a man-hole. Man-holes are necessary in underground cable construction in that the length of cable which can be

placed is limited to about four or five hundred feet. Man-holes are also necessary to permit of distribution being made. It is a sort of a vault or cellar down underneath the ground, so that we can splice our cable together, where the main line cables are spliced together and where the branch cables which lead to the poles and to the building are spliced to the main line cables. The aerial wire was not meas-Instead, the spans of aerial wire were counted and then five hundred spans measured and the total amount of aerial wire in the

plant apportioned on the basis of those five hundred spans that were measured. I think that gave me an accurate measurement of the wire in the City because the length of the pole spans is fairly uniform. Drop wires were measured and averaged in like manner. That is, the drop wires were counted and some four hundred drops were measured to determine what the average length

of all drop wires was.

The distributing system is that portion of the telephone plant connecting the telephone central offices with the subscribers' premises, that is, all of the lines, poles, cables, etc., which radiate out into the City for the purpose of serving the subscribers. It includes the underground cables, the aerial cables, the pole line, the block cables, the poles, the drop wires, the building cables, and everything to the

subscribers' premises.

With reference to how we counted other portions of the plant: The central office equipment,—we maintain records of all our central office equipment in the State Engineer's Office. were brought to Houston and checked carefully and an actual count and inventory made of the central office equipment in the Houston Central offices. All of the cable in the switch boards was carefully measured. When I tell you that there are over 306,000 feet of one type of switchboard cable in the switchboard in the City of Houston, you can appreciate the necessity for carefully measuring and carefully counting all of central office equipment. There were 3,000 sub-stations inspected. By sub-stations I mean telephones, including the wiring and the protector and the ground rod,-that is the lightning protector, which connects with each telephone.

We have a portion of the City of Houston served direct by underground cables and telephones served direct by underground cables don't have protectors, ground rods, and lightning arrestors installed in that wiring is not exposed. We inspected carefully 3,000 of the total of the 27,000 sub-station installations in the City and applied, used that as representing the average of the remaining number of stations. We were very conservative in making those estimates. First, we eliminated all of the telephones which were served by direct underground feed and did not include with

those telephones the ground rods and protectors, that is, the arresters, When I referred a few minutes ago to drop wires I meant the wire which runs from the terminal box on the pole down to the house,in order to reach the subscriber. The drop wire is the wire from the last pole to the subscribers' premises; the line wire is the wire strung along from pole to pole.

With reference to the land, I consulted the Company's records as

to the land which was owned in Houston and also consulted the deeds for such land. Then in addition, I actually measured each lot with a tape line on the ground and checked it against the deeds and against the records. I did not include in this inventory, only that land which is used or usable for telephone purposes. I did include that portion of the property which is used or usable but I have eliminated three parcels of land which are owned by the Telephone Company in Houston and the reason I excluded those was because they are not necessary and are not now being used and cannot be used in the future for telephone purposes, and therefore I did in-

2469 cluded those in my inventory or appraisal.

One of them is a lot and a building which is the old Houston Home Telephone Company automatic telephone office in Houston Heights. The second one is the old Taylor Exchange, Taylor Central office Building, and lot, on the corner of Center and Taylor streets, just off Washington Avenue. The third piece is a small store-room yard or lot owned by the Houston Home Telephone Company on Heiner Street.

I have not included in my inventory any of the toll property. We made a careful inventory of all of the toll property within the Houston exchange area and excluded that from the inventory. We excluded all of the toll central office equipment, the toll test boards, the toll cables, underground and aerial, all of the toll poles and all of the toll work, together with the cross arms and accessories.

We have no toll cable on local exchange poles. We have, however, toll cable in the local exchange conduit lines and that has been cared for by allowing, by crediting the Houston Exchange with the rental value of the duct space occupied by those toll underground cables. That is, I have credited to this local exchange property a rental for that portion of the local exchange property which is being used by the toll property, and we have likewise debited the Houston local exchange with the contact rental charge for certain local wires which are carried on the toll poles. I did not just make up that rental figure myself, that is our standard rental charge made to all wire using companies, like the telegraph companies and oil com-

2470 panies. It is what we call our schedule A, it is our regular charge. In other words, whenever we have toll lines running on local exchange tolls, we credit the local exchange with the same rental which is paid to us by the Western Union Telegraph Company or the Postal Telegraph Company or any other wire Company which is using our poles,—for an amount similar to what we pay to those companies whenever we put our lines on their poles.

With reference to our record inventory here, we made a check to determine whether the inventory was accurate and correct, we made a 100% check, that I spoke of previously and the 20% check was

carried right straight through.

There was no chance for duplication of our properties. If I sent one man out in a certain portion of southeast Houston to do some work and I had another man out in that same territory doing some work, there was no chance of their going over each other's territory and counting the same property twice. You will notice that those

maps that I showed you mounted on the boards have been cut with a pair of scissors and the man only covered that portion of the property which was shown on those maps. He didn't get off that map, and the map being cut that way, there was no chance for duplications.

Other than toll property there is no other property in the City of Houston which is used in the operation of the local exchange which has been excluded from my inventory. I have not included all parts of our telephone instruments in my inventory,—I have excluded the transmitters and the receivers and the induction coils on telephones. I have also excluded the station installations,

2471 that is, the wiring connecting the hotel private branch exchange stations with our underground cables. There are some 2,600 of those, and that wiring is owned by the hotels and therefore it was excluded from the inventory. The reason I have excluded from my inventory the transmitters, receivers and induction coils is because they are not the property of the Southwestern Telegraph and Telephone Company but they are owned by the American Telephone and Telegraph Company, and we are using them under a licensee arrangement. The American Telephone and Telegraph Company owns the patent on those things, and we have a contract with the American Telephone & Telegraph Company,—that is the Southwestern Telegraph & Telephone Company has this contract known as the "Four and One Half Per cent License Contract" by virtue of which they have the right to use these articles, and not being the owner of these particular items of property, I have not included those in my inventory but they have been ex-

Questions by Mr. J. D. Frank: You have a copy of the inventory?

Mr. Howard: Yes.

cluded.

Mr. J. D. Frank: We desire to offer in evidence this inventory and have it marked as Plaintiff's Exhibit No. 13.

(The document was thereupon introduced in evidence and marked Plaintiff's Exhibit No. 13, and said Plaintiff's Exhibit No. 13 is transmitted herewith in exhibit file.)

Mr. Howard: Do you introduce them as two separate exhibits, this explanatory—

Mr. Frank: That explanatory exhibit is No. 12 and this other exhibit is No. 13.

The Master: That was mentioned when I first heard this proposition discussed.

Mr. Howard: I do not know that it was ever undertaken to agree, except at the time of the merger ordinance there came up a discussion and they couldn't get together. The Master asked in regard to some agreed valuation and I said I think the only time whenever an attempt was made to get together on a valuation was when that merger ordinance came up.

Mr. J. D. Frank: I don't know, Mr. Howard: I couldn't say,

I think I can clear up what was in your mind. I think the City has had a check made of this inventory and someone might have made the statement that there might be no contest as to the inventory or as to the quantity of the property, but so far as the value-

Mr. Howard: The City hasn't yet checked it. Mr. J. D. Frank: The City hasn't yet checked it?

Mr. Howard: No, we haven't. We are rather assuming that you have made a correct inventory. We are not disposed to question your inventory very much.

In my inventory I included all of the local property owned by the Telephone Company. We excluded the transmitters and receivers and induction coils on the telephones which were owned by the American Telephone & Telegraph Company. also excluded all of the dead drop wires, that is, drop wires and the wiring on subscribers' premises which was not in use. Our system of accounting is such that when a telephone is disconnected, the drop wires and the wiring on the premises is charged off the books. Therefore, those were not inventoried and not counted. That is, if we had wires on a house that did not have a telephone I excluded that from my inventory. We also excluded the land and the buildings which the Company owns in Houston which are not being used at present or which are not usable for telephone purposes. We further excluded a considerable amount of wiring which we have called "station installations" which are owned by the hotels in Houston for connecting the telephones in the hotel rooms to the private branch exchange switch boards. The Southwestern Telegraph & Telephone Company does not own that wire. There are 2,200 and some odd such installations.

In inventorying a piece of property of this magnitude it is impossible to include everything in your inventory, there is necessarily some omissions. I spoke yesterday of not being able to include in the aerial cable lengths, the sag of the cable in the spans between Thinking about that a little bit, there are approximately 10,000 spans of aerial cable in the City of Houston, and there is at

least 6 to 12 inches of cable in each span, due to the sag, which was not measured. So there is somewhere between eight and ten thousand feet of cable which could not and

was not inventoried.

In looking around over the plant since I have completed my inventory, I have come across things that have been omitted from my inventory. We found in checking up portions of the field count, we found poles, terminals, lengths of cable and other things that were omitted. I will treat those matters when I come to the subject of omission and contingencies.

Mr. J. D. Frank: Mr. Howard, have you a copy of this Chart?

Mr. Howard: This map? Mr. J. D. Frank: Yes, sir.

I have a map showing the organization of the Southwestern Telegraph and Telephone Company in the State of Texas. It shows the territory covered by the Southwestern Telegraph & Telephone Company in this State. This Company operates in the State of Texas. The State is divided into four divisions.

Mr. J. D. Frank: Now, wait just a minute, Mr. Hoag. We desire to offer this map in evidence as Plaintiff's Exhibit No. 14.

(The map was thereupon received in evidence and marked Plaintiff's Exhibit No. 14, and said Plaintiff's Exhibit No. 14 is transmitted herewith in exhibit file.)

Northeast Texas Division, the Northwest Texas Division, the Southwest Texas Division and the Southeast Texas Division. The Headquarters for the Northeast Division are at Dallas, for the Northwest Division at Fort Worth, for the Southwest Division at San Antonio and for the Southeast Division at Houston. A complete division organization is maintained at each of the headquarters. The divisions are in turn divided into Districts, the Southeast Texas Division being divided into the Galveston, Beaumont and Houston Suburban Districts. The headquarters for the District men who handle the Galveston and Houston Suburban districts is Houston and the headquarters for the District men who handle the Beaumont. This map shows the District lines in the Southeast Texas Division, but not in the other divisions.

I have prepared a chart showing the division organization of the Company, this map consists of three pages, showing the Traffic Department Organization, the Plant Department Organization, and

the Commercial Department Organization

Mr. J. D. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 15.

(The chart referred to was thereupon received in evidence and marked Plaintiff's Exhibit No. 15, and said Plaintiff's Exhibit No. 15 is transmitted herewith in Exhibit file.)

The organization is what is known as the functional organization, that is, the Traffic Department is charged with the operation of the plant, the rendering of service; this first sheet shows the

2476 Traffic Organization in the Southwest Division. That pertains to your operators and the actual handling of telephone calls, the actual furnishing of service to the subscribers. You will notice that there are 1002 employees in the Southeast Texas Division. The Plant Department is charged with the construction of the plant and the maintenance of the property, including plants, buildings, toll lines, the distributing system, etc.

The next one is the Commercial Department who are charged with the responsibility of collecting the money, rendering the bills, doing the book-keeping, etc. We have certain portions of the property here in Houston which is used by this Division organization and that has been included in the inventory, but only a portion of it has been charged against the Houston Exchange. I have made

due allowance in my appraisal for that portion of the property

which is used by the Division Organization.

Now, turning to my inventory. The three main divisions of the Telephone property in the City of Houston are, first, the land and buildings, second, the distributing system, uncluding the central office equipment and the station equipment; and the third is the miscellaneous items, such as furniture and fixtures, tools and store equipment and stable and garage equipment. I have subdivided those three main divisions into eight sections. Number one is land; that is the first section of the inventory. Number two is buildings. Number three is the distributing system. Section four is the central office equipment. Section five is the station equipment. Section six is furniture and fixtures. Section seven, tools and store

equipment. And eight, is stable and garage equipment. 2477 In order that you may better understand the property which enters into this inventory, I have compiled a list of photographs illustrating the various pieces of property. I have a bound

volume of that.

Mr. J. D. Frank: I desire to offer that in evidence as Plaintiff's Exhibit No. 16.

(The voulme was thereupon received in evidence and marked Plaintiff's Exhibit No. 16, and said Plaintiff's Exhibit No. 16 is transmitted herewith in exhibit file.)

I have made an appraisal of this Houston Plant and in making that appraisal I used the inventory as the basis of the appraisal insofar as the quantities of plant are concerned. I took the various quantities and then worked out what each particular item of the property would cost if I were reproducing the exchange.

I have prepared an exhibit showing my unit costs and materials

prices.

Mr. Frank: I believe you have a copy of that haven't you, Mr. Howard?

Mr. Howard: Yes, sir.

Mr. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 17.

(Thereupon said document was received in evidence and 2478 marked Plaintiff's Exhibit No. 17, and said Plaintiff's Exhibit No. 17 is transmitted herewith in Exhibit file.)

The materials prices cover the prices of the materials as used in the appraisal. The unit costs cover labor cost and also the incidental cost. In appraising this property I have used material prices which are an average of 1918-19 prices, which prices are lower than present day prices by from eight to twelve per cent. I made my appraisal as of October 1st, 1919, but did not use the prices which were prevalent at that time, but I used the average 1918-1919 prices. Those prices are from eight to twelve per cent lower than the prices which were prevalent on October 1st 1919, and even lower than that on certain classes of plant. For example, our central office equipment material has increased in price since October 1, 1919, approximately fifteen per cent. That increase in price went into effect as of November 1, 1919 and I have not used prices which were prevailing on October 1st, 1919 and since that time prices have still further increased. As I testified before, the prices which I used were eight to twelve per cent lower than the prices which were in effect as of October 1st, 1919. The prices on my central office equipment are approximately 27% lower than the present day prices. That is on account of this increase on November 1st, 1919. In making the appraisal of this property, estimating the reproduction cost new of the property, I have

been trying to arrive at the present value of the property, and I wanted to be conservative as to the cost and prices which I applied in the appraisal. In addition, I have felt

and still feel that there will be a general stabilizing in so far as business generally is concerned, which will make for increased the efficiency, that is, a greater production, and which should result in some decrease in the cost of work, and in the prices of material. I do not expect any material reductions to be made, either in cost of work or in prices of materials, but I do expect that this general stabilizing will produce some slight reductions, and I have considered those things in the building up of the cost and prices, and in making

up the appraisal.

I am proceeding on the theory that it would require a construction period of three years in which to reproduce this property. I have selected that number of years because, first, that is the economical period of construction, in that to reproduce this property in a less period of time would mean the working of our force possibly three eight hour shifts; that is, either sixteen or twenty-four hours a day. That, of course, would not be economical. Again, even by working a great deal of over-time I do not believe that would be possible to reproduce this property in less than three years. I mean to testify that in my opinion it would be impossible physically to reproduce it in a less period of time.

With reference to whether this property would be reproduced piece-meal or whether the various pieces of property would be under construction at the same time,—about what would have to be done

to reproduce the property is the following:

2480 First, the land for the central office building would have to be purchased. Before that land would be purchased careful studies would have to be made to determine the telephonic development in the town. That is, the determine where the subscribers which you would connect would be located. After that was determined, then you would also have to study your towns to determine where the future grouth would come. Those studies are necessary and are made in the daily exchanges throughout the State. They are necessary to permit of our intelligently engineering and constructing our telephone properties. After those studies were completed then an effort would be made to purchase land as near as possible to the wire center. By getting at the wire center we can effect considerable economies in constructing our plants. After the land had been purchased then architects would have to be employed

to design the buildings, to plan the buildings. Those architects would have to know, of course, the dimensions of the land, and would also have to consult with our engineers, in that they would also have to know, in addition to the dimensions of the land, the equipment which was to be installed in the buildings. After the architects had completed their plans then we would call upon contractors to bid on the construction of the buildings. The contract for the construction would be let and the buildings would have to be constructed, within two years from the time we started making our preliminary studies and investigations in the town. Those buildings would have to be completed at that time to permit us to install our switchboards. At the same time that we placed our contracts for our buildings

the same time that we placed our contracts for our buildings we would also place orders for our central office equipment,

in that it would take about a year to eighteen months to manufacture and assemble the equipment. After the buildings were completed, then the equipment could be installed in those buildings in about a year. It could not possibly be installed in any less time. While the buildings are being constructed and the central office equipment was being manufactured and installed in the building the underground conduits, the pole lines, the cable plant, that is, the distributing system, would also be constructed. necessary to build the underground conduit plant as soon as possible, in that the conduit has to be laid before the underground cable can be ordered. The underground cable is ordered by section lengths; that is, the lengths between man-holes; and the conduit necessarily has to be constructed before the lengths of cable can be ordered from the manufacturer. Simultaneously, of course, with the construction of the conduit, the installation of the underground cables would be carried on, with the pole line construction and the aerial cable, and other parts of the construction of the distributing system. I would say that this three year period of time was most conservative. It is my best judgment that there is nobody other than the Bell Telephone Company that could reproduce this property in three years. That is based on some twenty years' experience and my observation of what other telephone companies do, and my knowledge of what the Bell Telephone Company can do. That is because we already have an organization in existence and better qualified to do that work than outside firms. We have a highly trained and

efficient organization. We know how to do work. We have arrangements with the manufacturers of telephone equipment, ap-aratus and material, which would make it possible for us to get out material and equipment in a very short space of time, and

also to construct the property quickly.

As I stated it would take a year or eighteen months to manufacture that central office equipment because the manufacturers do not earry that equipment in stock. You must remember that this central office equipment in the Houston Exchange represents over \$1,000,000.00, and no manufacturer would carry an investment of that size. All of that equipment is manufactured according to specifications. All equipment and practically all material which

go into the construction of the plant are manufactured under specifi-

eations, telephone company specifications.

I have considered what material would cost in the future in order o do this work. I have given that consideration, but the prices of material which I have used are average 1918-1919 prices, and not prices which may or may not prevail in the future. In my udgment, as I explained before, I am expecting some slight reluctions, and therefore, I feel that the 1918-1919 prices should pply. My judgment to date does not appear to be good, however, n that there have been material increases in the prices since October st, that is, since I have made my appraisal there have been actual

increases in the costs of materials.

483 As I testified this morning, my appraisal was made as of date, October 1st, 1919 and I also testified that the prices of naterials which I used in my appraisal were from 8 to 10% lower han the prices which were prevailing on October 1st, 1919 and has due to a further increase in the price of central office equipment n November 1st, 1919, the prices which I have used in my apraisal were about 27% lower than present day prices,—that is, n so far as central office equipment material is concerned. We have ver \$1,000,000.00 worth of central office equipment in Houston. he central office equipment constitutes about 24%, over 24% of he total cost of the telephone property in Houston, and in arriving t what it would cost to reproduce that particular part of the lant, I have used prices which are 27% lower than present day rices.

The labor costs that have been used in the appraisal are 8 to 0 per cent below the labor cost as of October 1st, 1919. Since ctober 1st, 1919, there has been increases made in rates of pay, that the labor cost as used in the appraisals are 18 to 20% below resent day labor cost. I am speaking of wages of employees here in louston, that is, lime men, cable splicers, installers, central office en and other classes of employees who have to do with the work reproducing the property. I did not know on October 1st, 1919 nat the cost of the materials concerning which I have testified would crease and neither did I know on October 1st, 1919 that the wages of the employees whom I have mentioned would be increased.

184 I have carefully analyzed the cost of work as done by the telephone company; I have analyzed over two and a half milon dollars' worth of work done in Houston in the last five years,at is, telephone work, that is work done in the Houston Exchange. a addition I have analyzed something over five million dollars' orth of work done in other parts of Texas. I have also read the ewspapers, read many technical periodicals, and in addition have insulted with people who have to do with the construction, operaon and maintenance of properties similar to the telephone propty. I consulted with Mr. Neiswanger, the Chief Engineer of the exas Powwe and Light Company, operating some 78 electric light operties in the State, and in addition operating several hundred iles of high-tension lines. Mr. Neiswanger has charge of all the gineering for that company and in addition has charge of the construction of the plants. The material used in the outside portion of the Texas Power and Light Company's plant is similar to that used by the Telephone Companies, that is, they use large quantities of poles, cross-arms, hardware, suspension strand, and similar material to that used by the telephone company. Their central station plant, is, of course, different from the telephone company's property. Mr. Neiswanger has had occasion to carefully analyze costs and prices and his best judgment was that in so far as the distributing system portion of the electric light company's plants were concerned, that prices and costs had increased between 50 and 60 per cent as compared to the prices and costs which prevailed in 1915. In so far as the Central Station portion of the electric light plant is con-

cerned, he had found that the prices and costs had increased in excess of 100%, the reason for the difference being that the central station portion of the plant, that is, the dynamos, generators and other equipment is manufactured equipment. That is true also of the telephone company's plants. The telephone property represents in so far as costs are concerned, or splits up, in so far as the costs are concerned, into about 70% labor and 30% raw material. In other words, a switch board installed in a central office in Houston represents about a 70% labor cost and about a 30% raw The labor costs that I have used are about 8 to 10% material cost. lower than the labor costs which were prevailing on October 1st, 1919. The study which I made first here was with reference to labor and material,-it covered both of those items. The reason I used labor costs lower than the labor cost at the present time was because I wanted to be conservative in my appraisal. I have previously explained my reason for using the prices which I did use on material and said that I expected a general stabilizing of business, which would result in increased production, that is, greater efficiency, which in turn would tend to reduce the prices of material. The same thing, I felt, applied to our labor costs, in that during the war we lost large numbers of people and the efficiency of the force is not so great as it will be in the future, which is due to the fact that the present force that we have are not as experienced as the men that we forme-ly had, and we have had to train these men as we go along to take the place of the experienced men who left and went to

I have talked to various contractors about this matter; I have talked to people connected with the Telegraph Companies and the consensus of opinion of all of those men was that the costs were from 50 to 75% greater and the prices were from 50 to 75% greater than those prevailing in 1915. Most of those men felt about as I did, that as business stabilized we would get greater production, greater efficiency out of the men, and that that would result in some slight reductions as to costs. Neither they, nor we, expect any reductions in the rates of pay. I mean by that, first, I have been connected with the telephone company over 20 years and during all of that time there has never been any reduction made in any rate of pay which was once established. In addition to that, there has been an increase in the rate of pay from year to

year. By "rates of pay" I mean wages and salaries. I have also read various techincal magazines and periodicals which treat of this subject and which give the opinion of the leading economists and leading engineers of the country and the consensus of opinion is that we will probably never go back to pre-war prices and that the present prices will prevail for a period of 15 to 20 years. When I have testified that in my opinion there will be some stabilization of the prices of material and the cost of labor, I was discussing the United States as a whole, and that is my opinion with reference to these matters as to the whole United States, that is what I had in mind. However, I do not expect that stabilization to take place as quickly in Texas as I do throughout the United States, and the reason for that is the considerable oil activities in the mid-continent

field and the northwestern portion of the State of Texas is bringing into Texas something in excess of a billion dollars per year. That amount of money brought into the State is bound to affect prices and costs, is bound to keep up the present high prices and costs. That applies especially to labor costs and I would say that the effect of that would be felt in the City of Houston. It must be felt in the City of Houston. The Texas Company, whose headquarters are located in Houston, are very active in the mid-continent field and we feel it in that whenever the Texas Company wants a good telephone or telegraph man, they take him away from us. We educate him and then they hire him and that forces us to

constantly add to the wages of our employees.

At the time I made my appraisal of this property on October 1st, 1919, I considered that the prices I used were most conservative and that was before I knew that the cost of certain materials would increase and before I knew that it would be necessary to make a further increase in the wages of certain employees of the Company. It was my best judgment and the best judgment of the people I discussed that matter with was that there would be no further material increases in prices and costs. As I thought then and as I say now, the appraisal which I made on that date was very conservative and if I had known of these increases which were to be put into effect I would not have used the same prices which I have used with reference to material and labor costs, I would have used high prices and

higher costs. I think that I have been more than conservative in my judgment as to what prices should be used in deter-

mining my unit costs of material, labor etc.

There is another item that enters into my unti costs in addition to the price of material and the cost of labor, and that is the incidental expense, that is, the teaming and hauling charges. That is included in my appraisal. By teaming and hauling expense, I mean the moving of material on the job, the transportation of men and teaming expense and motor-vehicle expense incident to the placing of aerial and underground cables, the motor-driven pumps which we use in pumping out manholes and other similar things. Our system of accounting as to the cost of work is such that it is possible to determine what the incidental expense amounts to in like manner as it is possible to determine what labor costs are. That system of

accounting is prescribed by the Interstate Commerce Commission, and that is what I have followed. In connection with the analysis made of the several million dollars' worth of work to determine labor costs, an analysis was also made of the incidental expense which was incurred. In other words, our records are such that we can tell jsut exactly how much incidental expense we have incurred in building any particular piece of work.

Mr. J. D. Frank: Your Honor, we will now take up the specific items in this exhibit entitled "Unit Costs and Material Prices." This is Exhibit No. 17, and I would suggest that when we are dis-

cussing any particular item here, if there is any part of this matter which you don't understand, or if there is any part which Counsel for the City do not understand, that they just ask questions about it then, as that will probably save considerable repetition when we come to cross-examination. If there is anything that you do not understand, why just feel at liberty to ask any questions that you desire to ask.

Mr. Howard: All right, Mr. Frank.

The first few pages of this Exhibit are taken up with the index, but they are not numbered. The first heading is "Item," meaning the particular kind of material. The second heading "Spec. No.#, means specification number; that is, the specification number under which the material is manufactured. The third heading is "Unit." That indicates whether it is one pound or one hundred pounds, or one foot or one hundred feet, or a thousand feet of whatever it is. The fourth heading is the "Price." The first items is "Anchor, Everstick," is Anchor Everstick 8 inch." It is called a No. 8. It is an 8 inch Everstick Anchor. I have figured out the price on one particular anchor, the price of the material on one particular anchor of that type. On this sheet, the price on this material, price list sheet, the price as shown here is \$1.03, that is the price of one single 8 inch Everstick Anchor. I got that price; In determining material prices, we analyze the prices of material for Houston covering some million, -over one million dollars' worth of material. The prices were taken from the bills. On page 33 is shown in detail the unit cost of the 8 inch everstick anchor in place. On page 33 that

taken in labor cost, incidentals, material cost, etc. On page 2 of my exhibit the second paragraph covers 22 gauge type "TA" Lead covered, that is, lead antimony sheath, paper indulated, cable. The first item is "15 pair cable." It is manufactured under specification No. 3356, and the price of \$120.50 is the price per thousand feet, that is, the price is 12 cents per foot. I got that figure of \$120.50 from the bills for cable which have been purchased in Houston,—that is what we have actually been paying for cable here in Houston. You understand that is the average 1918-1919 cable prices and not the present day price on that cable.

On page four of my Exhibit the first item there is "Conduit, Fibre," three inch. The price is \$6.92 per 100 feet, or 6 cents per foot, that is, upper duct foot. The 10 pin Fir Cross-Arm Manufactured under specification No. 3838, the price is \$79.13 per 100,

or 79 cents each. Those are not the present day prices. I might add that all those prices are not the prices of that material in Houston. Certain of this material is priced f. o. b. Houston; certain of it is priced at the factory or at the woods. Those things are plainly

shown in the detail of the unti cost.

Page six of my exhibit deals with the prices of poles. The 14th item on that sheet is a 30-foot, Class "B" Northern White Cedar Pole. The pole is covered by specification No. 3254. The price is that pole is \$6.01 each at Escanaba, Mich. I take that price at Escanaba, Michigan because that is the point at which White Cedar Poles, Northern White Cedar Poles are concentrated, and that 2491 is the price at which there was a superscript which the stress of the price of of

2491 is the price at which they are billed. In addition to that price, the telephone company has to pay the freight charges. That is where we get practically all of our poles, and there is no other place where we could get them. There has been a steady increase in the price of poles for the last 15 or 20 years and my explanation of that is that the supply of poles is decreasing and the consumption or demand has been steadily increasing which tends to make the prices higher. I am not sure whether there has been any reduction in the prices of poles since the signing of the Armistice but I don't think there has been. The prices of poles at the present time are materially higher than were the prices of 1915, the price has increased between 30 and 40% in that period.

On the bottom of page 6 is the item of Western White Cedar Poles. The first pole is a 25 foot 6 inch, and the specification is the Northwestern Cedarmen's association; that is abbreviated here as NWCA. The price of that pole \$3.81 as given is the price of that pole f. o. b. Houston. These poles we acquired in connection with the Houston

Home Telephone Company's property.

The next item, Page 7, is creosoted pine poles. The first pole is a 25 foot c, specification 3885, and the price of the pole \$4.53 is the price f. o. b. Beaumont. The reason I figure out the price f. o. b. Beaumont is because that is the way in which those poles are billed to us. We, in addition to the price of the pole, have to pay the freight. There is a creosoting plant at Beaumont and the poles are purchased from the International Creosoting Com-

pany who have a large plant at Beaumont.

We have one item on this same page that is rather an odd item. It is railroad rails. We use railroad rails, we purchase them locally, second-hand railroad steel, and use them in the construction of manholes, as reinforcing for the roof of manholes. The price given of \$2.50 is the price per hundred weight and is the price which we have paid for the rails locally. We purchase those from the railroad here in Houston, from either the street railway or the steam railroads, anybody that we can get the second hand rails from.

On the next page, page 8, we have lead sleeves, all sizes. The price per hundred weight is \$11.11. The sleeves are sold by the pound. We purchase them by the pound. They are not sold by size. In building up the unit costs, you will see that the number of pounds

of lead sleeves is shown.

We talked yesterday of the large underground cable boxes. On page nine we have an item of a 404 paid F. X. box completed without fuses, \$277.60; that is the box itself. I got that price from the bills covering purchases of 404 pair F. X. Cable boxes and that is the average price that we pay for that particular character of property during the years 1918 and 1919 and that is less than present day prices.

On page ten we have the wire, 17 Copper Clad paired insulated wire, an example of which we have on one of these boards.

493 It is a steel core wire covered with copper. That is manu-

factured under specification No. 382 and costs \$15.28 per thousand feet. In the spring following the signing of the armistice there was a considerable drop in copper prices. That is due, I understand, to the considerable quantities of copper which the Allied Governments had accumulated in connection with their prosecution of the war and that reduction in price prevailed from early in the spring until about August at which time the price started going up. It is to-day up to around 23 cents. That may not be exact but it is approximately correct. Copper is a commodity, the price of which has always fluctuated to a great extent. Years ago we have paid as high as 27 cents for copper; ten or twelve years ago we paid as much as 27 cents for copper. If I remember correctly, we paid that for copper in 1908 or 1909. There was always a considerable fluctuation in the price of copper. During the recent war the government fixed the price of copper. The price of copper had gone up to some thing over 35 cents previous to the time the government established a price of 231/2 cents, which was the price of copper at the time of the signing of the Armistice, and immediately after the signing of the armistice, or shortly thereafter, the price of copper went down and that is explained on the theory that a large supply of copper was released, or that is my understanding of it. The prices have gone back up now to about where they were at the time the Armistice was signed. On page 11 of my Exhibit No. 2 there is one item of Booths,

2494 Brownell Booths, that is a No. 10 Booth and the price is \$31.00 each. Another item is silk and cotton switchboard cable, No. 22 gauge, 100 pair and the price is 80 cents per foot; another item is silk and cotton lead covered cable, 100 pair and the price is 53.7 cents per foot. That all comes under the heading of station equipment.

On page 12 we have connecting blocks, Type 6A, the price of which is 45 cents each. We have a similar type connecting up in that little wooden box on that board. We have condensers, Type

21E that costs 75 cents each.

On page 15 of my Exhibit an explanation is made as to the freight rates which have been applied. The first item is poles; Northern White Cedar Poles are shipped from the woods, the originating common point of shipment being Escanada, Michigan. They are shipped to Houston in carload lots and the freight rate per hundred

weight is 51.6 cents. The next statement below that first sentence is,—the actual freight not used as was shown as total freight per

car and not per pole, that is, the freight rates, the amount of money which appeared on the bills as being the freight rates was for the complete carload shipment of the poles and the freight per pole was determined by getting the weight of the poles and dividing the total amount of freight. Also was determined by getting quotations as to freight rates from freight agents, and in that connection in my effort to determine what the freight rate would be from the woods to Houston, Texas, I interviewed the General Freight Agent of the T.

& P. railroad in Dallas and a freight clerk in another freight 2495 office in Dallas. They have the freight rates of course for all of the State of Texas. Those quotations were simply used as a check to be sure that the freight rates which we had applied were correct. The freight rate on creosoted poles from Beaumont is 10.4 cents per pole. I got that information from the bills, I took actual shipments of poles and figured out how much that was, and those were the freight rates which are in effect at the present time. There has been no reduction in freight rates and so far as I know there

Mr. Howard: There has not been any increase, has there, since October 1st 1919?

Mr. J. D. Frank: No, I don't think there has.

have been no increases.

The next item, cabling, in getting the freight rate on that particular piece of property, I took the actual freight rate shown on the bills, except for Types AA and pure lead sheath cable, for the Types AA and the pure lead sheath cable shipped from Hawthorne, Illinois, in carload lots at 61 cents, 61.3 cents. I might say that such pure lead sheath cable as we have in Houston was acquired when we took over the property of the Houston Home Telephone Company, and we secured such prices as we could on pure lead sheath cable and applied those prices. We haven't purchased any pure lead sheath cable for many years and the prices used is a price which would apply seven, eight or ten years ago. I don't think there is any pure

2496 lead sheath being sold at the present time. The price of the cable is the price of the cable at the factory, at Hawthorne, Illinois, in addition to which the Telephone Company has to pay

freight from Hawthorne, Illinois, to Houston.

The next item is Vitrified Clay conduit. The actual freight was shown on the Western Electric Company's bills, otherwise conduit shipped from factory at Brazil, Indiana, to Houston in carload lots, at 43.9 cents per hundred weight. Most of the Vitrified clay conduit which we purchase is manufactured at Brazil, Indiana. Then in addition to the price of that material, we have to pay the freight rates from Brazil, Indiana, to Houston, Texas. Other types of conduit which we have are sewer tile, iron pipe, which in general are purchased locally and I haven't figured out any freight rates for that.

The next item is Creosoted cross-arms which are shipped from Texarkana, Texas to Houston in carload lots at 20 cents per hundred, 20.7 cents. The International Creosote Company has a creosoting plant at Texarkana for creosoting these cross-arms. We purchase

these particular items of property at Texarkana and then pay the freight on them to Houston, Texas.

On miscellaneous material I have not figured out the price of freight on those. On such items as wire strand, hardware, etc., the bills for the material show the prices f. o. b. Houston.

Northern White Cedar Poles. They show the minimum dimensions of Northern White Cedar Poles. In purchasing these poles the producers are furnished with the specifications and the poles have to conform to the specification requirements. The twenty-five foot Class C pole has to have a top circumference in inches of 18¾ inches and has to have a circumference 6 feet from the butt of 30 inches. A 40 foot Class C pole has to have a top circumference of 18¾ inches and a circumference six feet from the butt of 40 inches.

On page 17 of my Exhibit is shown the unit cost of Northern White Cedar Poles by sizes and class. The first item here is a 15 foot C Pole. That follows after "Size and Class." Next comes the weight in pounds, the 15 foot C Pole weighs 100 pounds; the price of the pole is \$1.03. That is shown in my material prices over in the first part of my exhibit. The freight on the poles is 52 cents, which, in accordance with our previous set-up making the total cost of the pole, that is, the material only, f. o. b. Houston, \$1.64, after including supply expense. The supply expense is the expense incident to the making of the requisitions for material. It is the expense of handling of material, the receiving it, the distributing it, the unloading of it from the cars, the handling of it in the storehouses and in the yards, the rent, light and heat at the storehouses. It also covers the shrinkage, wastage, breakage and loss of material while in the storehouses or in the yard. We have a storage

vard in Houston and have men to look after the storage yard, have to have men to unload the material when it is shipped in and to care for it, to disburse it that is, to load it on the teams and send it out to the work. That comes in under supply expense,that is a part of the supply expense. All of the property does not pass through the warehouse or storehouse. The Central Office equipment,-there is no supply expense charged on the Central Office equipment. In making my appraisal of the Central Office equipment I have not included anything for supply expense. There is no supply expense charged to the Central Office equipment. That for the reason that the central office equipment is contracted for with the manufacturers, they to manufacture it and to install it and the Telephone Company does not have to handle that material. Sometimes the vitrified clay conduit pass through the warehouse and sometimes it goes direct to the job. A certain amount of the conduit goes into the warehouse and storeyard, but the greater portion of it goes direct to the jeb. However, there is supply expense in connection with that, it has to be ordered, it has to be accounted for and has to be handled. There was introduced in evidence vesterday or the day before, the uniform system of accounts for Telephone companies as prescribed by the Interstate Commerce Commission.

The Interstate Commerce Commission gives a definition of supply expense. That definition is in section 704, on page 78, "Supply Expense." Charge to this account or to appropriate sub-accounts all expenses (except insurance and taxes) incurred directly

in connection with the purchase, storage, handling, and distribution of materials and supplies and stationery. It includes (1) the pay and expenses of purchasing agents, managers of stores, clerks, and laborers; (2) rents paid for stores; (3) cost of lighting and heating; (4) undistributed transportation charges; (5) discounts recovered through prompt payment of bills for materials and supplies when such discounts cannot be assigned to the particular bills; (6) overages or shortages in the materials and supplies account disclosed by inventories which cannot be assigned to specific accounts; and (7) the estimated depreciation on materials and supplies due to breakage, leakage, shortage and wear and tear."

To go into this a little more fully, the first item set out by the Interstate Commerce Commission here is "the pay and expenses of purchasing agents, managers of stores, clerks, and laborers;" that is applicable to the Houston situation. In considering what it would mean to reproduce this property, I have considered what it would actually cost in the way of supply expenses to handle the very considerable amount of material which would be used. There would be over two million dollars' worth of material, considerably over two million dollars' worth of material on which a supply expense would be incurred. I have estimated that it would require the services of about 15 people to handle those supplies, and that in addition we would have to rent yard space and either construct temporary store

houses or rent store houses. In addition to that, the reason I have used the 6% as our supply expense is that for several years the average supply expense incurred by the Telephone Company has run at approximately 6%. That is what it has actually been costing us in Houston and in the State of Texas to handle our supplies. I have made a careful study from the records of the Company arriving at that expense. The supply expense fluctuates from month to month and from year to year. It is sometimes in excess of seven or eight per cent and has been as low as about five per cent, but the average supply expense has been 6%. At the time we took an inventory of the material in the yard we found that we were short whatever amount of vitrified clay conduit that had been broken and we would have to charge off the supply expense the value of that breakage, the value of that conduit which was broken, As I stated, there is some of our property, some of our material which does not pass through our store-room and on which we charge a supply expense of 6%, because we have to order that material. We have the expense of preparing the requisitions, that is, our superintendent of supplies has to order, has to originate those requisitions and we have to handle that material when it is received. In other words, the storage of this material in our store-room is merely a part of the supply expense. I have taken the average supply expense for all of our material, and have considered the various things that enter into our supply expense and have gotten an average of 6%.

That covers all of the different kinds of material used; that supply expense is not apportioned in our accounting of poles or cables, or other individual items of plant. We actually have that expense here in Houston every day, and that averages I have made a careful study of the records of the Company and have gotten that information and I consider that that figure of 6% is a most conservative figure. I know that other engineers in arriving at their unit costs include this item of expense. They use a supply expense figure of from 5 to 8 or 10 per cent, but in an effort to be conservative, and also in that the supply expense has been 6% for a number of years I have taken 6%. I know what it actually does cost. Then taking the price material and adding thereto the freight on a pole from Escanaba, Michigan to Houston, Texas and then adding a supply expense of 6% you get a total cost of \$1.64 per pole for the 15 C Class. For the 30 foot B pole, which weighs 473 pounds the price of the pole at Escanaba, Michigan is \$8.46, the freight on that pole is \$2.45, making the total cost \$10.91. Adding to that the supply expense makes the total cost of the pole f. o. b. Houston \$11.56. These poles do not all weigh the same. On page 17 you will note that poles vary in weight according to their length and class from 100 up to 850 pounds each. The 15 C pole is listed here at 100 pounds but those poles do not always weigh exactly 100 pounds, that is the average weight that we take and is based on a specification pole. Of course, some of the poles are larger,-none of them are smaller. At the bottom of the page is the following: "Note: Cost of poles at Escanaba, Michigan. Cost of material for butt treatment not included in this unit." I showed you on this board what the butt treatment was. "Labor and Incidental costs for placing and hauling not included in this That is treated in another part of this Exhibit, on page 23. The rest of those pages between page 17 and page 23 are taken up with the price of poles and supply expense and freight charges to Houston on the different sizes and classes of poles. The 30 foot B or thirty foot C class of pole predominates in Houston. On page 17 is the one I spoke of a few minutes ago. The 30 foot C, the weight is 375 pounds. The cost of the pole is \$6.01. The freight is \$1.94 plus the supply expense which makes the total cost of the pole f. o. b. Houston, \$8.43. The 30 foot C Pole, if that be the predominating

set poles in Houston, something like 8,000 of them.

On page 23 of this exhibit is labor and incidentals. "Labor includes the unloading, shaving, framing pole, that is, cutting the pole and roofing it and drilling a hole through it, the locating and digging the hole," the setting up of the pole, the back filling, the temping and the supervision. By the word "unloading" there, I mean the unloading of the poles from the wagons when they are hauled out. A considerable portion,—the greater portion perhaps of the poles are hauled direct to the job. By "shaving" I mean that the poles come with a considerable amount of bark on them and they

pole in Houston and I think it is,—there would be over half the total number of poles in Houston of that class. There is over 8,000

have to be shaved before they can be set. They are shaved with a draw knife. I don't know whether the City Ordinances of Houston require a pole to be shaved before it can be put up in Houston,—I don't know what the Houston City Ordinances are. I know that it is customary for the City to have an ordinance which requires that the pole be straight and shaved.

Mr. J. D. Frank: I think those are the facts, in Houston that the City Engineer requires this shaving to be done.

Mr. Howard: I think there is an ordinance requiring it to be

painted.

Mr. J. D. Frank: Well, that is what I had in mind to develop, the painting of the poles. When it came up, the City Engineer, I believe, stated that all poles should be shaved.

By the term "framing the pole" is meant cutting a roof on the top of the pole so that the pole, which comes with a flat roof, if the pole was set that way, then water would stand on that roof and would cause decay. Therefore, the top of the pole is roofed to drain it and to prevent decay. That is, it is trimmed up so that it is shaped just like the roof of a house. Other framing consists of drilling or boring a hole in the pole and flattening the face or the back so that a cross-arm may be attached. In other words, we cut a little square

place in the pole so that the cross arm will fit in tightly 2504 against the pole. Then, after you have prepared that place to put your cross-arm in, you bore a hole through the pole there so the bolt can go through and attach a cross-arm to the pole. If that framing was not done the cross-arm would not fit tightly against the pole and would get out of line. The locating means measuring and determining the point at which the pole shall be set. The digging of the hole speaks for itself. The setting of the pole means placing the butt of the pole in the hole and raising the pole up into a vertical position. It depends upon the size and the length of the pole and the particular location at which it is being set as to how many men it takes to raise one of those poles but ordinarily about six men are required for that. A long heavy pole set in a location hard to get to might require as many as 10 or 12 men. By "back filling" is meant putting in the dirt after the pole has been put in the hole, and by "tamping" is meant packing of the earth solidly around the pole by means of tamping tools so that the pole will not get out of line. We have particular tools for that purpose. This item of supervision is the extent of superintendence. It includes that amount of money which is chargeable against constructions, that expense of the supervising force up to the General Manager. It includes such items as salary of the Division Superintendent, the General Superintendent. This item of average labor per pole, \$4.30 is the average labor for all of the different kinds of poles which we have in Houston. I arrived at that average by analyzing the cost of pole work. Our accounting is done so that we can-

2505 not determine what the labor cost of a 25 foot pole may be against a 40-foot pole. All labor costs incurred in connection with pole construction are charged to what is our 11-C account; that

is, the pole account. That "C" means construction which is a code that is prescribed in our system of accounting. Those records are made at the time the work is done by the workmen, when working alone; and by the gang boss where there is a gang. He turns in a daily report of the work done, the number of hours which he and his men spent on each kind of work. A gang boss might have a gang of 10 men. They may work five hours on pole constructions and 3 hours on cable construction, and he would turn in his daily report showing what part of the time he has worked on constructing poles, and what time he has devoted to working on the cables, so that when the job is completed we can tell exactly what it cost to set the poles and what it cost to set the wires or stretch the cables or whatever they were doing, but we cannot tell what it cost to set a 25 foot pole or a 35 foot pole or a 45 foot pole. That account is not kept separate as to the various sizes of the poles but it is just taken for the poles as a whole. I am not sure that the average cost for setting a 35 foot pole is greater than it is for a 25 foot pole. This average price that I have here per pole is for setting poles in the City of Houston and that is based on the average cost of doing this work for the vear- 1918 and 1919.

This incidental expenses down here includes teaming, dis-2506 tributing, and other miscellaneous expense items not covered under material or labor. The incidental expense is reported in like manner as is the labor expense. If a team were hired at \$7.00 a day it would be paid for by voucher, and would be reported as incidental expense, and in case that team were used on the pole con-

struction, it would be incidental expense, 11-C.

Street car fare incurred by men who were working on pole work would be reported in like manner. I do not think of anything else in connection with that particular item of expense that I wish to dis-

cuss.

On page 24 of my exhibit I have the unit cost of Pole Line Miscellaneous, which means the painting of Poles and the butt treating of Poles; also the cost in place. The painting per pole requires an average of four pints of paint per pole. The butt treating of poles requires an average of two and one half pints of dead oil of coal tar. The cost of material is shown, plus the supply expense, and the labor cost of painting and the butt treatment, which total gives the cost in place, that is, the total cost of painting the pole or the total cost of butt treating the pole. This figure four under "Painting Pole" is the number of pints of paint required to paint the pole. The figure 2.5 under "Butt Treating Pole" is the number of pints of dead oil of coal tar or carbolineum required to butt treat the pole. The cost of that is shown opposite "Cost in Place." That shows the cost of Painting under the heading "Painting Pole" and over at the

2507 right hand side that shows the cost of "Butt Treating" a pole.

My exhibit shows with reference to the cost of the solution which we use in treating these poles that the carbolineum f. o. b. Houston costs 54½ cents a gallon, or 6.81 cents per pint. Dead oil of coal tar f. o. b. Houston, 38 cents a gallon, or 4.75 cents per pint. Carbolineum is one preparation for treating a pole and dead oil of

coal tar is another preparation. We have estimated that 85% of the butt treatment poles were treated with Carbolineum and 15% were treated with dead oil of coal tar. "Labor" includes the cost of treating and painting the poles and the supervision of doing this work. The incidentals include,—in this case it includes the brushes used in the applying of the dead oil of coal tar and the carbolineum.

Page 25 shows the cost of poles cribbed and poles set up in sidewalks. It shows the poles cribbed with concrete. The cribbing was explained yesterday. The material, is \$10.48, f. o. b. Houston. The labor at \$3.10, the incidentals and the total gives us the cribbing in place at \$15.31. The prices of that concrete and that material

were obtained from the bills.

This item, "Poles set in sidewalks" is explained first, the walk has to be cut before the hole for the pole can be excavated. Then after the pole has been set and the earth tamped in around it, the sidewalk

has to be repaired which requires the concrete and cement, and I have considered the cost in place and the cost of mate-

rial in doing that particular kind of work. We have only applied this cost where we could see that poles had been cribbed. Ordinarily, a pole cribbed with concrete, all of the concrete is below the surface of the ground and you cannot tell whether a pole has been cribbed or not. On two or three poles in making our inventory, we found that the concrete extended above the ground and therefore we included that cribbing. There was a considerable number of other poles cribbed which we could not determine were cribbed at the time the inventory was made. At my heading "Poles cribbed with concrete" I have a little star there and down at the bottom is a little star explaining that 1.6 cubic yards of concrete was used at 6.55 per cubic yard which makes \$10.48 for doing the work on one of these poles, cribbing one of these poles with concrete. I arrived at that figure by determining the size of the hole and estimating the quantity of concrete used. Ordinarily I can tell from the size of a pole as to what the size of the hole was originally and that is what I did in arriving at this figure of 1.6 cubic yards.

The next item, page 26, is "Unit Cost—Pole Line—Accessories." That shows the cost of wood and iron pole steps per 100 steps. I have figured out the cost of galvanized iron steps, f. o. b. Houston cost 7.377. The total material cost of the step, of the 100 steps with the supply expense included is \$7.82; the labor is \$5.25. The labor is the labor of placing the steps on the poles and I figured that it

cost \$5.25 to put 100 steps of those galvanized iron steps on poles. In placing the pole steps, the pole has to be drilled;

that is, a shallow hole has to be drilled; then the step is driven in, one end of the step being fettered like a fettered drive screw. The step is driven almost all of the way in and then turned about three times so that it will stay in the pole and we estimated the amount of time required to step a pole and applied those estimated costs.

The wood steps f. o. b. Houston are \$2.23½ per 100. The nails—we use a long wire nail to attach those steps to the side of the pole, cost \$1.162 per 100. The total cost of the material, including the

steps and the nails is \$3.60. The labor of placing the steps is \$4.35, which added to the incidental cost, makes the total cost \$9.10, or 9.1

cents per wooden step in place.

The next item on page 27 is "Pole Line Accessories—Cross Arms." "Cost in place." The 10 pin arm is the arm generally used. The cost of that arm at Houston is 79.1 cents. The miscellaneous material that goes with the arm is 86.6 cents. The miscellaneous material is the braces and bolts, making the total cost of the material with the supply expense included \$1.756. The labor of attaching the cross-arm is \$1.05 which with, the incidental expense added makes the total cost of the arm in place \$3.156. We have some 5,500 of those cross-arms in Houston, of different sizes, and the average that

I have used here is the average cost of putting a cross-arm on. We have determined the cost of each cross-arm of each par-

ticular size and there is quite a little difference in the cost of the material. The 4 pin cross arm costs 32.9 cents f. o. b. Houston, the miscellaneous material that goes with it costs 47.6 cents, which with the supply expense added makes the total cost of the material The labor cost of placing a 4 pin cross arm has been estimated at 75 cents, which with the incidental expense added makes the total cost of the 4 pin arm in place \$1.80 as against a cost of \$3.15 for the 10 pin arm. I have been speaking of the fir cross-A 10 pin creosoted cross arm f. o. b. Houston costs 76.1 cents. That is not f. o. b. Houston, that is f. o. b. Texarkana, with the freight added which amounts to 11.3 cents plus the miscellaneous material which goes with it, the braces and bolts, etc. amount to 86.6 cents and adding to that the supply expense, makes the total cost of the material f. o. b. Houston \$1.844. The labor for placing a 10 pin creosoted arm has been estimated at \$1.05, which with the incidentals added, makes the total cost of the creosoted arm \$3.24.

The cross-arms on page 28 are double cross-arms. Where a number of wires are terminated, a single arm ordinarily will not hold the wires and therefore two arms are placed. Those arms are bolted together so as to make them strong and rigid. That is the type of arm which is dealt with on this page. That is the two cross-arms

bolted together and we call those double arms. I show on 2511 this exhibit the cost in place of those particular kinds of cross-

arms. The 10 pin double arm, the fir arm, the cross arms f. o. b. Houston are \$1.522. The miscellaneous material that goes with those arms is \$2.13½, which with the supply expense added makes the total material cost \$3.94; the labor of placing those arms is \$2.45 which with the incidentals added makes the total cost of the

double arm in place \$7.09.

Page 29 also has reference to cross-arms. That is miscellaneous material. On the previous pages I spoke of miscellaneous material costs. Page 29 sets out in detail what the miscellaneous material is that goes with the cross-arms. The msicellaneous material required with a 10 pin cross-arm consists of 10 1½ inch by 8 inch locust pins. It requires 11 6-D nails to fasten the pins in the cross-arms. It requires a cross arm bolt, that is, a bolt which is placed through the center of the arm and through the pole to hold the arm in place.

It requires 2 ½ inch square washers. It requires 2 ¾ inch by ½ inch carriage bolts. Those are the bolts that are used to attach the braces to the arm. It requires two ½ inch round washers. Those are the washers that go under the head end on the carriage bolt. It requires one lag screw, which is used to fasten the braces at the pole and requires two 30 inch braces. Those are the braces which extend from the pole out to the arm to help hold it in place. All of the miscellaneous material for a 10 pin arm totals 86.63 cents.

I have figured out the actual cost of each item of the mis-2512 cellaneous material. The last figure under each column

shows the total cost of that miscellaneous material.

On page 30 of my exhibit I treat the miscellaneous material necessary in connection with double arms. That is treated the same as

the other miscellaneous material.

Page 31 shows the cost analysis of back braces and brackets, the cost in place, each. The back brace is an iron brace used where you have a considerable strain on an arm and is placed as a reinforcement to the arm. The cost of the 9 foot angle iron galvanized back brace in Houston is \$1.28. The miscellaneous material which goes with it costs 12.4 cents, which with the supply expense added makes a total cost of \$1.4844. The labor cost of installing an angle iron back brace has been estimated at 75 cents, which with the incidental cost added makes the total cost of the back brace in place \$2.33. You will note on each of these pages immediately below the total cost in place an entry "Cost used." That means the cost used in the appraisal. Many of those items total fractions of a cent and those fractions have been eliminated in applying these costs in the appraisal. If it is less than half a cent I knock that off and if it — more we add it. In this particular case we eliminated the .44 cents.

Page 32 is a detail of the miscellaneous material used in connection with the back braces and with the brackets, which shows how we arrived at the cost of the miscellaneous material.

The miscellaneous material that makes the back braces consists of four 3% inch by four and one-half inch carriage bolts, and four round washers, and the total cost is 12.04 cents.

Page 33 is a continuation of our pole line accessories. This page deals with anchors, that is, anchors without the guys attached.

One kind of anchor which is used is the Everstick patent anchor, a sample of which we have on the board. The cost of the 8 inch Everstick anchor is shown on the first page of your material sheets. The cost of the rod that goes with that anchor is shown here as .793 cents. The miscellaneous material which goes with it is \$1.03, which with the supply expense added makes a total cost for all the material of \$1.93. The labor cost of installing it is \$2.25. To install an Everstick anchor, it is necessary to bore a hole in the ground at an angle in line with the pole which is to be guyed to the anchor. A large dirt augur is used for that purpose. The hole is bored about seven feet deep. After the hole has been bored the anchor is inserted, the Everstick anchor proper being placed solidly against the bottom of the hole. A heavy tamping bar or digging bar is then used to

expand that anchor, that is, to drive the two sides of the anchor into the firm earth on either side of the hole. After that is done the hole is filled and tamped. And that is what is meant by the \$2.25 labor cost. It depends wholly upon the character of the earth as to the average time to put one of those anchors in place in the

average time to put one of those anchors in place in the 2514 ground. In a heavy, black, dry gumbo it might take a man half a day. In clay soil a man might install one in a hour, or even in 45 or 30 minutes. I have taken the average cost of doing this work. I have estimated that cost by consulting our records as to what it has actually cost in Houston for doing that kind of work. Compared with the cost of doing this kind of work in other parts of the State, as to whether that is a low or high figure, well, this is rather a large state, and you have many different kinds of soil. All excavation work in Houston is quite expensive on account of the kind of soil, and on account of the large amount of water in the soil, and the considerable rain fall here.

Page 34 also deals with anchors. That is the detail of the miscellaneous material, which go- with the anchor. I figured that out just as I figured out the cost of miscellaneous material in connection with the cross arms. All of the costs are built up in detail, showing

how they were arrived at and what they are.

The item treated on page 36 is line guys. That is the guy wire only, cost in place. One item there is a 6-M strand that is a 5-32 inch suspension strand with a strength of 6,000 pounds. The cost of the strand f. o. b. Houston is \$1.82, which, with the supply expense added makes the total cost of the material \$1.93. The labor cost of placing that guy is \$2.75. To place such a guy it is necessary to employ skilled linemen, who have to climb the poles, who have to place around the pole at the place where the guy is

to be attached a strain plate, and usually guy hooks. The strand itself is very stiff and hard to handle. It is difficult to wrap it around the pole. After it has been wrapped around the pole it is then made up; that is, the end is fastened to the guy proper by means of a three bolt buy clamp. The same process takes place where the guy is dead ended on the succeeding pole, a line guy being a guy which extends from one pole to another. The total cost in place of one of those line guys is \$4.98. We cannot use just ordinary labor in doing that kind of work. That requires skilled labor, and requires special tools for handling that steel strand, and requires blocks and tackle to pull the strand up. It simply cannot be laid up. If it were it would not do the job for which it is placed, for which it is intended. That is, it would not hole the pole for which it is to be the guy. Therefore, a set of block and tackle has to be used to pull it up, and the salary of the men who do that work is considerably in excess of the salary of the ordinary laborer.

Page 37 of my Exhibit shows the unit cost of pole line accessories, and covers guy clamps, strain plates, poles, shims, guy hooks, and strain insulators. A pole shim is a form of strain plate. The present strain plate which is used is this small galvanized piece of metal, about four inches wide, by eight inches long, a sample of which I have on the board. Before we used that type of strain plate, we

used other kinds of strain plates, which we have called pole shims, and that is what they were generally called years ago. The guy hooks are the hooks placed on either side of the pole to hold the guy strand in place, to keep it from slipping down the pole. The strain insulators we saw in one of the photographs yesterday, where we had a guy on private property, with a strain insulator in it, where the guy was exposed to electric light wires.

A 3 bolt galvanized guy clamp, f. o. b. Houston, costs 21 cents. The strain plate of 4 inch by 8 inch galvanized iron costs 17.12 cents. The pole shims costs 2 cents; the guy hooks, galvanized, cost 12.64 cents, and the strain insulators 14.77 cents, and I have added on to the cost of the material the supply expense of 5% and that gives the

total cost of it.

On page 38 is an item "guy guards." A guy guard is a-it might be best described by calling it a wooden box, or an iron box or pipe, which is placed around the guy wire at the ground line. The guy wire is small and is a little hard to see, and the guy guard is placed to prevent people running into the guy wire. It has been the experience of the Company that where they do not have these guy guards they have a good many accidents, people running into them, and even with wooden guy guards and the guy guards painted white they sometimes run into them. The three piece wood painted guy guard, f. o. b. Houston material costs 60.7 cents. The miscellaneous material in connection with that is 4½ cents, which with the supply expense added makes the total material cost 69.1 cents. The labor of installing a guy guard is 65 cents, which with the incidental

expenses added of 25 cents makes the total cost of the guy

guard in place \$1.59.

We have in the Houston plant approximately 990,000 feet Fifty pair cable per 1,000 feet, f. o. b. Houston is of aerial cable. \$191.90 and the cable loss per thousand feet is 1.91 dollars (\$1.91). What I mean by cable loss is this: I have explained how cable splice is made. The two ends of the cable are brought together and overlapped about two feet. Then to make the splice the workmen strips the lead off the cable and connects the wire on the right to the proper wire on the left. He necessarily cuts half of the wire coming from either way, and in making the estimate of this loss we have credited the cost of the cable with the junk value of the copper and the lead which are removed when the splice is made, and have figured the loss as representing the difference between the cost of the cable new-that is, we charge the difference between the cable new that is cut off in the making of the splice, and the salvage value. We have instructions which we issue to employees which are designed to prevent the waste of that material. We are very careful. The lead and copper, of course, have a considerable junk value and we are careful in getting that into our warehouses so that we can sell it. We try to get the men to take care of it.

The miscellaneous material per thousand feet of fifty pair cable Add to that the supply expense makes the total material cost for fifty pair cable per 1,000 feet f. o. b. Houston,

\$211.52, or a cost of \$21.15 cents per foot. We have approximately 990,000 feet of aerial cable in Houston.

Page 40 is similar to page 39, with reference to an analysis of cost, it is a different size and different kind of cable. I have treated our miscellaneous items of expense which go along with that cable on This is the miscellaneous material per thousand feet of the material. First, we have estimated the number of splices per 1,000 feet of cable, and in the case of fifty pair cable we have estimated 21/2 splices per thousand feet. That estimating is quite accurate, in that our aerial cable records show where the splices are in general. The material in the case of the fifty pair cable consists of fourteen and a half pounds of lead leaves, necessary to make those splices, that cost \$1.61. That is not \$1.61 per pound but the total. The muslin which is used to wrap around the wire splice after it has been completed and before the lead leaves has been placed over the splice, we use one and one fourth yards of, which cost 261/4 cents, the cost of the muslin being 21 cents per yard. We could not use a cheaper cloth than that because a cheaper cloth will tear after the wires are spliced together they bulge out larger than the lead there, and strong cloth has to be used to bind those wires together and make them as small as possible before the lead sleeve is placed over

the splice. Then six pounds of solder would be used in mak-2519 ing the joints. That is for the purpose of closing up the lead sheath on the cable at the place where the splice is There are two wiped joints at each splice. The cost of the solder would be \$2.2272. There would be four pounds of paraffine used in boiling out that splice. The splice is boiled out twice and sometimes three times, and the cost of the paraffine would be 44.32 cents. There would be 11/2 gallons of kerosene used in the furnace to heat the paraffine and to heat the solder. We use a kerosene stove for the purpose of heating this, and in as much as all of this work is done out in the open air we have to have a special type of kerosene furnace with which to heat our solder and our paraffine. There would be four pasters used, which would cost 68/100 of a cent. The pasters are pieces of paper which are wrapped around the lead sheath of the cable and wrapped around the lead sheath, which is placed over the splice immediately adjacent to the point where the whipped joint is to be made. That is done to prevent the hot solder from adhearing to the lead excepting at the point where the joint is to be wiped. There are 270 5/32 inch cotton sleeves used, at a cost of 12.9 cents. Those cotton sleeves are used to cover the wire at the point where it is spliced, and they make the insulation of each wire continuous.

There are 8/10 of a pound of tallow candles used. That is used as a flux on the lead sheath and on the lead sleeve at the point that the joint is wiped, at a cost of 1.16 cents. There is 2/10 of a pound of soft soap used per 1,000 feet that being used at the time

2520 the cable is placed. There are 25/100 feet pf marlin used, at cost of four cents, the marlin being used to tie up the cable we splice. Marlin is a heavy twine, treated with a preservative. That makes the total cost of the fifty pair cable, of the miscellaneous material per 1,000 feet \$6.4479.

Page 47 of my Exhibit is the Unit cost of aerial cable, and is an

analysis of the freight per 1,000 feet of cable, and taking again the fifty pair cable the cost f. o. b. factory is \$200.00 per 1,000 feet. I am speaking of fifty pair AA, 22 gauge. The cost of that cable f. o. b. the factory is \$200.00 per 1,000 feet. The shipping weight of that cable is 1,755 pounds, which includes in addition to the cable itself the weight of the reel, the large spool on which the cable has to be wound, and includes the lags placed on the outside of that reel to protect the cable. The freight at 61.3 cents per hundred weight is \$10.76, making the total cost of fifty pair 22 gauge cable, f. o. b. Houston \$210.76. I have figured that freight from Hawthorne, Illinois to Houston, Texas. After the cable is taken off of the reels those reels are returned, if in good condition, to the factory. The reels are charged to the Telephone Company at the time they are shipped out and the Telephone Company is in turn credited with the value of the reel when it is received back at the factory. All of that on page 47 is an analysis of the freight per 1,000 feet of various type of cable.

On page 48 of my Exhibit is shown the unit cost of aerial cable, the labor and incidentals. The labor includes the boring of the holes in the poles to place the bolts on which the hangers are supported, which in turn supports the suspension strand, which holds the cable; the placing of those bolts, and of the washers and clamps, the placing of the messenger strand and of the cable rings, that is, the rings in which the cable itself is suspended from the messenger wire; the setting up of the cable reel, the removal of the lags from the reel, the greasing and the pulling of the cable, the splicing and testing of the cable, splicing terminals to cable, and the necessary supervision. That amounts to 9.9 cents per foot, and that labor cost represents the same thing as the average cost applied to poles represents, in that our accounting is so handled that we cannot determine, or we cannot differentiate between the difference of the labor cost of 25 or 50 from 100 pair, or any pair cable. But this is the actual cost per foot of stringing this cable. The item of incidentals includes the deliver of the cable, the messenger strand, of the bolt, of the clamps, and other hardware splicing and other material and tools, returning empty reels and other tools to the storehouse or yard, and all teaming and miscellaneous expense not included under material or labor. That amounts to 9/10 of a cent per foot of cable. The total labor and incidentals amount to 10.8 cents per foot. The total labor and incidentals of the underground dips amounts to 20.1 cents per foot which is higher than the aerial cable. Included in that cost is the cost of laying the

2522 aerial cable. Included in that cost is the cost of laying the pipe up the side of the pole and placing of the pipe underground, and the second pipe up the succeeding pole.

I now turn to page 49 and will give you an analysis of the cost of constructing the messengers. This is material only. In that the labor cost as applied to the aerial cable covers the cost of the placing of the strands themselves. The material cost per 1,000 feet of 6,000 pound strand is \$20.47. The miscellaneous material that goes with it is \$2.84, which with the supply expense added makes the total material cost \$24.71 per 1,000 feet, or 2.47 cents per foot.

We have miscellaneous material which accompanies the construction of these messengers. The miscellaneous material that goes with the 6,000 pound strand is a suspension clamp, one bolt, which costs 70.35 cents per 1,000 feet. The suspension clamp, the three bolts, costs 65.4 cents per 1,000 feet, there being three of those used in 1,000 feet. The 2½ inch square washers, of which there would be twenty used per 1,000 feet, costs 46 cents. The "A" bolts used, of which there would be ten, cost 87.8 cents per 1,000 feet; making the total cost of the miscellaneous material \$2.8375 per 1,000 feet of strand.

On page 51, cost of labor and incidentals of the aerial cable. That is on messenger extensions. We have included the cost of placing the suspension strand, but where aerial cable is not placed,

2523 that is, where they have messenger extensions shown on page 51, then we have considered the cost of placing the messenger, the extension, strand itself only, and that labor cost is 1½ cents per foot of strand, which includes boring holes, bolts, washers and clamps, and placing strand, and the necessary supervision. The incidentals include the delivery of the messenger strand; that comes on reels; the delivery of the bolts and clamps and the other material,

and the tools necessary to place it.

We have been figuring out the cost of miscellaneous material in connection with the poles, and also miscellaneous material in connection with the cables. I have samples on that board. This is a strain plate, a four by eight inch galvanized iron strain plate. These are different kinds of suspension strands, and also are used as messenger strands, or as guy strands. This smaller strand is a 6,000 pound strand; that is, it has a tensile strength of 6,000 pounds. The next size is the 10,000 pound strand, and the next size is the 16,000 pound strand, the 16,000 pound strand being used for supporting large size cables, and for holding heavy strains when used as a guy. This is a "B" bolt; that is, it is a double unit bolt. This is an "A" bolt, that being a single unit bolt. I spoke of an "A" bolt in connection with the suspension of the fifty pair cable. The bolt would be placed through the hole; a 21/4 inch square washer would be placed beneath the head of the bolt, a second 21/4 inch square washer would be placed on the opposite side of the pole, beneath this

this hanger, or one of these hangers, anyway, because on the fifty pair cable it would be this small single hanger. That portion of it would go right on the bolt, then the suspension strand would be placed in this hole in the hanger, and this nut turned down, and the hanger would clamp the suspension strand. This is a thimble. When the guy is fastened to the anchor rod, that is the anchor rod, and this is the eye of the rod, where the guy strand is fastened. This thimble is inserted in the eye of the rod and the strand bent around it. That is done to prevent the constant vibrations wearing through the strand. With the 16,000 pound strand this large thimble is used. This is an iron bolt, the end which goes into the pole is threaded, like a fetter drive screw. It is partly driven and then turned in. This is a wooden pole step, and these are the nails used

for fastening the wooden pole step to the pole. Those nails are about six inches long. This sixty penny is six inches long. This is a 2½ inch square washer, which is used against the poles, on the bolts. This is the three bolt guy clamp which is used on the strand to make it up, to fasten it where it is carried around the pole. This is a bracket, placed on the pole of on a house. The paired insulated wire is supported on this small portion of the knob, which is on the bracket, and tied. There is always some vibration, and it is, therefore, necessary to support the two wires which make up the pair of the insulated wire. Those wires are not tied on each side of

that knob. The it alated wire tie is made on one side. bare wire when placed on an insulator is tied on both sides. This is a guard which is placed on the side of a pole where there is a considerable off center pull. A heavy aerial cable which is suspended on a messenger, the messenger in turn being fastened to the pole with one of those clamps, the pull might be away from the pole. If we had a very large cable, say weighing about 5 pounds per foot, if anything happened so that strand got loose and dropped the cable, it would probably do a great deal of damage. So where we have a heavy pull we place one of those guards. Then, if anything happens to the hanger, if the thread on the bolt strips, this guard we expect to hold the cable and prevent it from doing any damage. All of those items are miscellaneous material, used in connection with our pole construction. There is one other item of material that I spoke of two or three times, which is small, but quite important. That is a dowel pin, which is inserted in either end of a vitrified clay duct. There is a little collar on the pin. There is a hole in the wall in the end of the vitrified clay duct. This little collar prevents that dowel pin from going away back in the hole, so that half of the pin goes into one length of duct and the other half of it goes into the other length, and that helps to maintain the two lengths of duct on the same level.

On this other board here I have some of the miscellaneous items of material used in connection with cable construction.

These are rings which are placed on the suspension strand to support the aerial cable. This is the large sized ring used for large aerial cable. The cable lies in the ring in that manner (illustrating). These are smaller sizes. This is a different type of cable This portion of the ring is placed over the strand and clamped, and the cable lies in here. These are smaller types. This is a galvanized iron pipe, used as subsidiary conduit. This is solder used in wiping joints. This is a wooden pin, which goes into a There are ten such pins in a ten pin arm. This is a galvanized iron cable rack, which is placed in a man-hole to support underground cables. Immediately above that rack is a cable han-That hanger hooks into this rack, and it extends out at right angles to the rack, and the cable rests on the hanger. These are clamps used for clamping the cable in buildings or along the outside walls. The clamps are also used to support cables in man-holes, on poles and other places. There is a hole down here which permits us

to place one of these rings to carry block wire which may parallel the cable line.

On page 52 of my Exhibit is miscellaneous aerial cable material. clamps, strain plates and shims, and safety straps. First I might say that the cost of placing this material, the labor cost, is included in the cost of placing the aerial cable. On this particular sheet only the

price of the material is shown. We have one item here of a three bolt clamp; the price f. o. b. Houston is 21 cents, which with the supply expense added makes the total cost of a three bolt clamp in Houston 22.3 cents. The four by eight inch galvanized iron strain plate costs 18.2 cents, f. o. b. Houston, including the supply expense. I have a note down here saying "No. 1 safety strap includes cost of two drive screws." Those screws are used to fasten

On page 53 is shown "Rings and Hangers." The large wire ring that was just shown on that board was a three inch Neverslip ring used for supporting aerial cable. Those rings cost \$20.17 f. o. b. Houston,—that is, per thousand, which with the supply expense added makes a total cost of 2.14 cents per ring.

the safety strap to the pole.

Page 54 is Aerial cable, different types of terminals. We have shown a No. 14 type, galvanized, 16 pair terminal on our board. That is sometimes called terminal blocks, but improperly so. It is the terminal. Terminal blocks means just that in large blocks. The 16 pair galvanized cable terminal is known as the 14-C. cost of the terminal f. o. b. Houston is \$6.01. The miscellaneous material that goes with it costs \$2.86 which with the supply expense added makes \$9.40, total material cost. The labor cost of placing the terminal is 40 cents. Skilled labor has to be employed to place those terminals. They have to be mounted on the pole at a

certain distance from the aerial cable. When mounted on buildings they have to be mounted at a certain height and in a certain location in relation to the cable. The incidental expenses added to the labor and to the material makes a total cost of 14-C 16 pair terminal in place of \$9.88. We have about five thousand of

those terminals in the Houston plant.

Page 55 and also page 56 is with reference to the same class of property. Page 57 shows the miscellaneous material that goes with the Cook type of terminal. In that miscellaneous material there are 2.2 pounds of lead sleeves, used for the terminal splice. There is half a yard of muslin used; 31/2 pounds of solder, 21/2 pounds of parra-fine, a gallon of kerosene, 2½ pasters, 55 cotton sleeves, 6 style A bridle rings, those bridle rings being installed when the terminal is installed, and to carry the wires leading out from the terminal; two long saut clamps, two galvanized screws of one type and four of another, three tenths of a pound of candles, and fifteen feet of marlin, making a total miscellaneous material of the cost of \$2.8568, that goes with the terminal. We have figured that the average terminal splice is a splice into a 100 pair cable. That note on the bottom of this page 57 is worded: "Average 100 pair splice per terminal—all size terminals." We have terminals in 25 pair, 50 pair, 200 pair, 300 pair, 400 pair, and 600 pair cables. There are two wiping, and the 50-50 is soldering; that is, soldering with an iron. The wiping material is coarser than the other metal.

The 40-60 solder is 40 per cent tin and 60 per cent lead. The 50-50 solder is 50 per cent tin and 50 per cent lead. You cannot

wipe a joint with the 50-50 solder. The tin runs.

On page 59 of my Exhibit I treat No. 61 protectors, which is a lightning protector used to protect the plant against lightning. That is not the type of protector which we saw yesterday, the kind used in residences. The protectors generally used in residences is the No. 58 type. There are other types, but that is the one generally This is a protector which is placed at the end of an aerial cable, at the point where the open wire enters the cable, and prevents lightning going into the cable and burning it up. The protector mounting costs \$3.40; the protector block, No. 19 blocks, cost 50 cents; No. 20 blocks, 50 cents. The micas, No. 11, cost 55 cents; the carriage bolts, used for fastening the protector and mounting, cost five cents; which with the supply expense added makes a total cost of a No. 61 protector, amounting, including the equipment, to \$5.30. The labor cost of placing this is 50 cents, the incidentals cost 13 cents; making the total cost of the No. 61 protector in place \$5.93. The No. 61 protector is mounted out on the cross-arm. It requires skilled labor to place them.

On page 61 of my Exhibit I have an analysis of the cost in place of bond wire. Bond wire is wire connecting our under-

ground cables with the negative bus bar at the Houston Electric Light Company's Plant. It is a bond wire installed to return to the Houston Electric Light Company the stray electrical currents picked up by our underground cables. We have some 211,000 circular miles of stranded return wire here in service, and 259,000 circular miles stranded of cable. The cost of the 250,000 f. o. b. Houston is \$294.80 per 1,000 feet. The miscellaneous material is \$1.45 which, with the supply expense added, makes \$314.03 per That is a very large stranded copper wire with a heavy waterproof insulation. The labor cost of placing is \$30.00, which with the incidental cost added makes a total cost per 1,000 feet of \$345.53, or a cost per foot of 34.6 cents. That is used only where needed to return the stray electrical currents which our underground cables pick up to the electric Light Company's Plant. of \$30.00 for labor is explained by reason of the fact that is a very heavy wire to handle. That wire is strung aerially along the poles to the Light Company's plant, and is connected through a subsidiary pipe into one of our man-holes, at a point close to the Light Company's plant. It is run both underground and aerially. There is some miscellaneous material that goes along with that bond wire, and that is complete on page 61. We have only a small amount of that wire in the plant.

On page 64 of my Exhibit I have "cost of line wire in place." No. 17 copper clad twisted pair wire, of which we have over 2,000,000 feet in the Houston Plant. The wire cost \$15.28 per 1,000 feet f. o. b. Houston. The miscellaneous

material cost 56 cents per 1,000 feet, and with the supply expense added the total cost gives \$16.79 as the total cost of the material. The cost of placing is \$6.35 per 1,000, which, with the incidental expense added makes the total cost of the wire in place \$24.34 per

1,000 feet, or approximately 2½ cents per foot.

An analysis of miscellaneous material is shown on page 65. the No. 14 bare iron line wire we use exchange line insulators. Those are small, pony, glass insulators, which screw on to the pin in the cross-arm, to which the bare wire is attached. The iron tie wire The total cost is used in fastening the line wire to the insulator. of the material is \$1.96 per mile of wire. There are 2,135,000 feet of No. 17 twisted pair line wire in the plant. That wire is supported on 12,142 iron brackets. On each bracket there are two 4 groove knobs, making a total of 24,284 knobs at \$21.24 per 1,000. are 934 iron brackets with one 4 groove knob, at \$21.24 per 1,000, making \$19.84. The 24,284 knobs at \$21.24 per 1,000 makes \$515.80. There are 20,055 No. 4 knobs, which are attached to the pole on a cross arm with a 3½ by 20 flat head screw, No. 20 flat head screw, which costs \$11.56 per 1,000, making a total for these To go with those are 20,055 screws at \$12.58 per 1,000, of \$231.84. making a total cost of \$252.29. The total cost of that material is \$1,019.77.

Page 66 shows the cost of drops in place; that is the wire 2532 from the pole to the subscriber's premises. The No. 17 twisted pair wire costs f. o. b. Houston \$1.42. The miscellaneous material that goes with it costs 10 cents per drop which with the supply expense added makes a total material cost of \$1.61. The labor per drop is \$1.06, which with the incidental cost added makes

\$2.97, total cost of drop in place.

Page 67 shows the items of miscellaneous material that goes along with those drops. The number 4 porcelain knob costs \$1.16 per 100. The No. 16 three inch flat head screws cost \$1.26 per 100. The house brackets cost \$6.11 per 100—a small, galvanized iron bracket. The stove bolts with which to fasten the brackets cost \$1.07 per 100. The two groove porcelain knobs cost \$2.12 per 100. The 1½ inch No. 14 wood screws cost 41½ cents per 100. The number of units of each of those kinds of material is shown under the heading "Twisted Pair," and the total cost of 10.31 cents is shown also under that "Twisted Pair."

On page 70 immediately under the "vitrified clay multiple tile" heading is a second heading, showing the number of ducts. Opposite that heading are the figures, 2, 3, 4, etc., indicating the size of the duct run. Under the heading "6," that means a six duct run, and the costs per 100 there represent a six duct run cost per 100 feet. I mean by a 6 duct run a duct which has six holes in there for placing

cable. The conduit f. o. b. Houston costs \$54.36 per 100 ft.

2533 The breakage on the vitrified clay conduit has been figured at 2%. The conduit is ordinarily shaped and hauled direct to the job. There is always a considerable amount of breakage, and our experience has been that a 2% allowance for breakage is a fair allowance. I mean that every time we construct 100 feet of this duct we

break 2 feet, have a loss of 2 feet. That is not a duplication of the breakage which occurs in the supply expense. The only breakage which is charged to the supply expense is the loss, the shrinkage, etc., which takes place on the material which is in the supply house. The majority of this material goes to the job direct. If we were putting in some of this duct out here on McKinney and had laid 200 feet of it and broke four feet in doing that, that would be charged to the job. The foreman would have received the full amount of conduit, and when he finished up he did not have any conduit left. He might have a few pieces of tile scattered around in the street somewhere. He would simply report the total amount of that conduit as laid. There is nothing that can be salvaged out of that broken duct because vitrified clay multiple duct is very brittle and has to be handled with considerable care and there is a considerable breakage on all jobs. That comes from Brazil, Indiana.

The next item is concrete. That is the concrete used to enclose the vitrified clay duct. Before the duct is laid in the trench a concrete base is laid. That base is from 4 to 6 inches thick. Then the duct is laid on the concrete base and concrete poured over and

around the top and either side of the duct, and tamped in in good shape. The idea of putting all of that concrete around the duct is because the underground conduit construction is initially very expensive, and we expect it to last many years, and the concrete encasement is built to prevent the vitrified clay duct from interference by other people excavating in the street, and also to insure a permanent structure. At times the earth washes out from beneath, and with a good concrete foundation under it and concrete

encasement, the ruct becomes self-supporting.

The next item is miscellaneous material, \$2.28 per 100 feet. That makes a total of \$86.09 for 100 feet, without including supply expense. It makes a total with the supply expense of \$91.26. The labor cost for laying this duct per 100 feet is \$119.00 which includes the cost of excavating, the placing of the duct, the mixing and placing of the concrete, the back filling and the supervision. Those trenches are about 2 feet wide, and the depth varies. The minimum depth is, to insure a clearance above the top of the duct, of 30 inches to the street level. We encounter obstructions, water pipes, sewers, and other things in the streets, and sometimes have to lay the conduits twelve or 15 feet deep. That is because there is some obstruction there which prohibits our laying the duct fairly close to the surface. We do not lay the duct any deeper than we have to of course. The incidental expense is \$18.00 making the total cost in place of a 6 duct line per 100 feet \$228.26 or \$2.283 per foot. There is

2535 a miscellaneous material item that goes along with that and it is shown on page 79. For the 6 duct run, which is the 6th item on that sheet we have considered only the most economical way in which that duct could be laid. A 6 duct run should be laid two wide and three high. I mean that the six ducts are two wide and three high. The overall area in square inches is 285 square inches, which with the area of the six duct conduit itself deducted leaves 117 square inches, which in turn means the area of the encasement, or the

amount of the concrete, 168 square inches, or 1.17 square feet, which in turn leaves 117 cubic feet of concrete per 1,000 trench feet, or 4.33 cubic yards. The cost of the concrete is \$6.55 per yard, and for the

six duct run there is \$28.36, which is about 31 yards.

Page 80 shows the number of yards of burlap used with vitrified clay multiple tile. I might explain that the burlap is used for wrapping the conduit at the joint, and to support the mixture of neat cement which is laid around each joint to prevent any mud or gravel getting into the duct. Another item is the dowel pins used where the two lengths of the duct are joined together. Those are the only miscellaneous material that go to make up the vitrified clay.

Page 78 is the unit cost of underground conduit main and details of the concrete and mortar. The mortar is used for laying the manhole box and the concrete is used in the trench as a base for

2536 the conduit, and also as a complete encasement for the con-In addition, it is used for the roofs of man-holes and for the bottoms of man-holes. Under the heading, "Man-hole Bottoms Trench" is "1-3-6." That is the concrete mixture, one part sand, 3 parts cement and 6 parts gravel. For manhole walls and tops we use a different mixture, $1-2\frac{1}{2}$ and 5, and the mortar is a mixture of sand and cement only, 1 to 3. This table is worked out on the basis of 100 cubic yards of tamped concrete. To get 100 cubic yards of tamped concrete requires 150 cubic vards of loose material. There is a shrinkage when cement and sand and gravel is wet and there is also a considerable wastage; when the concrete is mixed out on the street, the cement gets wet and there is a good deal wasted from the mixing boards. All the engineering hand-books recognize those two factors. We have allowed for a 30% shrinkage and a 5% In other words in order to produce 100 cubic yards of tamped concrete we have to have 150 cubic yards of the ingredients to use, of the loose material, and this table shows how the cost of the cubic yard of concrete is arrived at. The amount of cement used, the amount of yards of sand, the yards of gravel, and that is reduced on this page to the cost of a cubic yard of concrete. I got the prices of the cement and concrete and gravel that I have used from the Houston dealers, from the bills from Houston dealers. purchased locally in Houston, of course.

2537 Page 81 shows the cost of concrete encasement per 100 trench feet of fibre conduit. In the case of the six 3 inch fibre conduit, the overall area in square inches is shown. The area of the six 3 inch ducts is deducted and the area of the concrete encasement is thereby arrived at and in turn the number of cubic feet and the cubic yards of concrete required to enclose the duct and the

cost is shown on the basis of \$6.55 per cubic vard.

Page 83 of my exhibit covers brick manholes, the cost in place of brick manholes. Those bricks were purchased locally, in Houston, and I have taken Houston prices on those. And the covers and frames that go with the materials of course, are manufactured locally. This sheet details the cost in place of different types of manholes, shows the quantities of material, the prices of the material and the labor cost.

Page 94 of my exhibit covers the cost of the material used in the manholes, that is, the manhole frames and covers; the pulling in irons, which are the v-shaped irons installed at either end of the hole, used in connection with the pulling in of underground cable; the conduit plugs,—which are the wooden plugs used to block up the ducts which are not in use to prevent the water carrying into those ducts a deposit of silt and mud, and also to prevent to as great an extent as possible the accumulation of sewer and illuminating gas in the hanholes; the cable racks are galvanized iron racks which have

been shown here, which are placed on the walls to support the cables; the manhole ladders are u-shaped pieces of iron placed

in the walls of the larger manholes.

The first item is the frames and covers, the 21 inch round cover, the unit cost is \$8.95. Those covers and also the iron frames that go with them are manufactured and purchased locally, that is, they are manufactured in Houston and we purchase them from Houston dealers.

Page 95 is a detail of the cable run-ways in the Hadley and in the Preston Central Office Buildings. One of our photographs showed the underground cable vault, the underground cables entering the Preston Central office building, and shows an iron run-way and iron rack on which all of those cables are supported. Sheet 95 gives in detail the quantities of material and the cost of those run-ways.

Page 96 is underground conduit subsidiary, cost in place, per trench foot. Those pipes are purchased in Houston. Page 101 of the exhibit shows the cutting and restoring of pavement over manholes. We have five different kinds of pavement in Houston that we have to cut and restore in constructing these manholes. They are bithbulithic, brick, creosoted blocks, macadam and cement. The second heading is the square yards of pavement which has to be cut and also restored when manholes are constructed. We have to cut 9.5 yards of pavement and have to restore 9 yards. The rea-

son we restore less than we cut is because we have to excavate a hole the full size of the man hole which has to be constructed and finally however, the opening in the manhole is whatever the dimensions of the cover used on the manholes are. fore have to restore pavement over all of the excavation, excepting We therethat portion represented by the size of the cover. The cost of cutting was estimated by us. We had a good deal of that work and know what it costs. As I have testified we have about 700 manholes in Houston, all of them are not under paving, however. The cost of restoring per square yard those paving costs, were obtained from the Houston City Engineer's office; and in restoring pavement in Houston, we have to first put up a bond before we can excavate in any of ets. That bond is to insure proper restoration of the pave-The money is not returned to us until after the repairs to the streets. ment. the pavement have been inspected by the City Engineer's office. Next, where the paving company contracts, covering the maintenance of the paving, have not expired then they insist, of course, on making the repairs. We ordinarily handle the restoring of pavement through the City. That is, under the ordinances of the City or

under the rules of the City Engineer's Department we are not permitted to restore this paving ourselves. We are permitted to restore some of the older brick pavement ourselves, but often in those cases we have to get permission from the City Engineer to do that. He

has charge of all of the paving, of course. That is in order 2540 to see that the City may see that the streets are kept in proper condition. Page 103 is underground 22 gauge cable, the material, per 1,000 feet, that is, the cost of the material f. o. b. Houston. I will give you an analysis of one particular piece of cable, Fifty pair cable, the cost of 1,000 feet f. o. b. Houston is \$191.19. The cable loss, which is the splicing loss and which loss has been explained, is \$1.91. The miscellaneous material, that is, the splicing material, clamps and other things, all of which has been detailed in connection with aerial cable, the cost is \$7.71 per 1,000 feet, which with the supply expense added makes a total cost of \$212.86, or 21 cents a foot. Out to the left there, "cost used per foot" \$221.29, is incorrect. That first 2 is an error, that is a typographical error; the cost used is 21. That is, it should be 21.29, and not 221.

Page 108. That is silk and cotton insulated lead covered cable, used for terminating the paper insulated cable on the main distributing frames in the Central Office or in buildings. The paper insulated cable cannot be exposed to the air. It absorbs moisture which destroys the insulation resistance. The silk and cotton cable is formed up, after being boiled out with a mixture of beeswax and parraf-ine and is shellacked and baked and will not then absorb moisture. That silk and cotton cable is spliced to the paper insulated cable and it is sealed so that the moisture cannot get into the

paper insulated cable.

2541 Mr. J. D. Frank: You have there, cable loss, 5%. I have noticed on some other types of cable that you have a cable loss of 1%; on another size, cable loss of 2". Now, why is it that

you have a difference there in that cable loss?

Mr. Hoag: On other types of cables, the loss is made up of the loss incident to splicing and the loss is determined by the number of splices, and — this type of cable the loss is greater. First, the junk value of the lead and copper is out of all proportion to the initial cost of this cable. The initial cost of the cable is high as compared to other cables with a like number of cable pairs, due to the special silk and cotton insulation. Then, in forming up the silk and cotton cables, connecting them on the main distributing frames, the wires have to be cut, on 20 pairs, the frame requires the top 20 pairs are 11 feet away from the lead sheet and in the case of 100 pair cable that means that 20 pairs would be cut off about 2 feet shorter than the top 20 pairs and the wastage is considerably greater than in the making of the splice where only a 2 foot lap is made and only that amount of wire cut off.

Page 109 is the detail of the material required per splice. I have

explained that in connection with some other type of cable.

Un page 113 is a freight analysis of the freight cost per 1,000

1313

feet of underground cable, different sizes of cable. That sheet shows the cost of the cable f. o. b. the factory. It shows shipping weight in pounds per thousand feet, the freight rate per 100 pounds and in turn the cost of the cable f. o. b. Houston. Th. cable is shipped from the factory, in general, from Hawthorne, Illinois

As I testified yesterday the cable comes on reels and the reels are returned to the Manufacturers and we are given credit for that. The cose of the reel is not included in the unit cost or in the appraisal. Only the cost of the cable is included plus the freight that has to be paid on the reels. The reel is returned to the manufacturer and during the time it is in the Telephone Company's hands it is in the supply account. The supply account is debited with the value, the cost of the reel, and is in turn credited with the cost of the reel when it is returned. Some of those reels, of course, are broken, and that is one of the things that goes to make up the supply expense in that when a reel is broken, then the cost of the reel is charged as supply expense. In other words I haven't included in my cost of cable here anything for the value of those reels other than the money which we would have to spend as freight charges, plus the cost of such reels as would be destroyed and as might be included in the supply expense. The 6% supply expense cares for those things.

Page 114 is a 22 gauge cable stub. In one of our photographs was shown a main under-ground cable in the man-hole and a stub, that is, a smaller cable placed into that main underground cable and carried by the side wall of the manhole

up close to the roof.

Page 121 shows the cost of the miscellaneous material in connection with underground subsidiary cable, different sizes of underground subsidiary cables. The 100 pair cable, the cost per splice is \$2.21, that is for the miscellaneous material which we use in making

that splice, and the cost per 1,000 feet is \$19.01.

Page 123 is underground cable subsidiary, protected type, terminals. We have shown pictures of the large F X cable box mounted on poles where the underground subsidiary cables terminate and where aerial cables are connected to the underground cables. 404 pair F X cable terminal, the material for the terminal f. o. b. Houston is \$277.60; the miscellaneous material is \$77.90; with the supply expense added, the total material cost for one of those 404 pair F X terminals is \$376.83. The labor is \$72.00. That labor includes the placing of the box on the pole, and the making of the splice in the box. With the incidental expense added, which covers the hauling and other miscellaneous expense, the total cost of that 404 pair F X box is \$455.58. It requires skilled mechanics to put those boxes in place and connect up the wires to the boxes. requires two or three linemen and a helper to mount the box on the It requires a first-class cable splicer to do the splicing work pole. with the box.

2544 Page 130 covers pole seats and pole balconies, the cost of these items in place. The pole seat is used with a smaller sized protected terminal. The No. 52132 is mounted with the 50

pair terminals. The cost of the seat is \$5.50. The labor cost of mounting it is \$1.00 and the total cost with the supply expense and incidentals added, of the seat in place is \$7.48. The pole balcony, which is a large balcony used with the larger sized terminals on which men stand when working in those boxes, costs \$8.55 at Houston, and with the miscellaneous material, the supply expense, the labor and the incidentals added, costs \$14.59 in place. I have included as the cost of labor in constructing one of these boxes the sum of \$4.50. The way the balcony is mounted, the balcony is made up of two angles iron legs which are attached to the pole and supports the under part of the floor; also of the angle iron frame around the floor and of the iron rail around the balcony to prevent a man stepping off of it. One man cannot put one of those boxes by himself, it takes at least two linemen and a helper. A block and tackle has to be employed to pull the balcony up on the pole, and then it is fastened to the pole by means of two iron bolts. That is, the bolts are fastened through the pole. It takes these men to erect one of these balconies two to two and a half hours. Of course, they spend some time getting to the job and some jobs might take a half a day and some might be done in an hour and a half. It takes something

like three men to do that work, requires two linemen. They have to be mounted on a pole some distance from the ground.

Page 133 is underground cable subsidiary, block cable, 22 gauge; cost of material per 100 feet of 200 pair cable cost f. o. b. Houston per 100 feet \$60.96. The cable loss amounts to \$2.44. There are a considerable number of splices in block cable. That is cable that is fastened onto the wall or the roof of buildings. miscellaneous material is \$7.46, which, with the supply expense added makes the cost per 100 feet of 200 pair block cable, material

only, \$75.11, or 75.11 cents per foot.

Page 140 is underground cable, house, that being the cable which is installed within the buildings. That sheet treats with the material cost of house cable per 100 feet. The 100 pair cable costs \$35.324 per 100 feet, f. o. b. Houston. The cable loss per 100 feet amounts to \$1.766; the material, miscellaneous material costs \$12.88, and with the supply expense added, makes the total material cost for a 100 pair house cable \$52.968 per 100 feet, or 52.97 cents per foot. We have a considerable quantity of that material in Houston.

Page 154 deals with the station equipment, with the ap-aratus and the cords, protectors; that is, the telephones themselves. The first item is No. 20-B desk stand. The cost of the stand is \$1.40; the cost of the cords that go with the stand, the No. 450 cord, is 59¢,

with the supply expense added, makes the total cost of the 20-B desk stand, including the cords, \$2.10 each. There are various other items of equipment that go along with that. The next item is No. 73-A Sub-set. A sub-set is a different type of set from the desk stand. The cost of that set is \$3.85, and the total cost is \$4.081, including the supply expense. No. 58-A protectors, that is the type protectors used at the subscribers' stations. That is to protect the station and premises against the lightning. The total cost of that, of the material is 68.4 cents. There are other types used.

Page 160 is a part of the station equipment, the private branch exchange. This sheet covers the frame work. The frame work of the private branch exchange is the iron work and cabinet work only. In the case of a No. 4, 320 line capacity, private branch exchange, the cost of the frame work, including the supply expense, material, labor and incidentals is \$362.30. That is the cost in place. That frame work is not a complete private branch exchange switchboard. There is other material that goes along with that and is treated on the following pages.

Page 162 is line and position equipment which goes with the private branch exchange. I will give you an analysis of the cost of the items. The subscribers' line circuit with the relays

2547 included is the wiring, the connecting lugs, and other equipment which goes to make up that circuit and which is installed in the private branch exchange switchboard. The cost per subscriber line circuit is \$1.082. The cost in place is \$1.147. The remaining items on the page are of different kinds of circuit, the different circuits requiring different kinds of equipment and wiring.

Page 164 is station ap-aratus, private branch exchange, special ap-aratus cost in place. The first item is a No. 46A repeating coil, which is installed in each of the private branch exchanges. material cost is \$7.00 f. o. b. Houston which, with the supply expense added and the labor cost added makes the total cost of 46A repeating coil in place \$8.141. This exhibit entitled "Unit Costs and Material Prices" does not show the detailed cost of our central office equipment. We have not included that in our unit cost and material prices because in purchasing central office equipment the equipment is contracted for installed. The order is placed with the manufacturers to manufacture and install that equipment. It is handled on a contract basis in like manner as a building would be The detailed cost of the Central office equipment is, constructed. however, included in the appraisal, and the prices of all of the material, the quantity and the insulation costs, all detailed costs are shown in the appraisal. We do not purchase the various items going to make up those switch-boards, but we purchase those by a 2548

2548 contract under the terms of which the boards are assembled and installed in our buildings. That is shown in the appraisal. In arriving at our unit costs and material prices I have not included what is known as overhead charges in those prices. Overhead charges are the expenses of the General Manager and Vice-President and other Executive Officers of the Company,—in other words, general superintendence and engineering expense. Interest during construction is the third item. Those are the only three items of general expense which we have used. That is treated in the appraisal.

Cross-examination.

(Questions by Mr. Howard:)

The inventory was made under my direction, and by my force, whereby we counted or otherwise ascertained the property and listed it in the inventory I have offered here in evidence as an exhibit, and

then I applied to that inventory, and as set up there, the unit prices as I found them to be and as set up in my other exhibit here.

In making this inventory I just excluded the property not used or usable for telephone purposes. Briefly that was the Houston Home Telephone Company lot and Building, the lot and building acquired by the Southwestern when they took over the Houston Home Telephone Company in Houston Heights at Harvard and 5th.

A small lot, 20 x 20 which was a store room lot owned by the Houston Home Telephone Company, and the old Taylor Central Office lot and building at the corner of Center and Taylor Streets. Those three pieces of property. I also excluded all the dead drops. That is the wire that is not connected to working telephones, and also the wire in the buildings that are not connected to working telephones, and in residences, it being our practice in our accounting system to charge that part of the property off at the time the tele-phone is disconnected. Also the transmitters, receivers and induc-tion coils which are not the property of the Telephone Company, the Southwestern Telephone Company. Also the furniture and fixtures used by the District men who have their headquarters here in Houston was excluded in that those men have no supervision over the Houston exchange. I did not consider the long distance because I was considering only the Houston local exchange property. All the long distance property has been excluded, and that is long distance switch boards, the toll underground cables, the toll poles and wires and cable boxes, all parts of the long distance plant, including the toll test boards and telegraph equipment and other associated apparatus. That property, of course, is all owned by the same company and is just a difference in the way you inventory and account we charge it to, a matter of classification and segregation. The property I have excluded as performing long distance toll purposes has been used exclusively for long distance tell service. Every

telephone in Houston connected to the Houston Exchange might be used for long distance purposes as well as local pur-In fact a great many of them are used. I inventoried all of those lines and those exchanges and those lines leading to individual telephones and included all the buildings, the exchange buildings, four of them in the City. There are four exchanges but there are only three central office buildings because the Capital Central Office equipment is is housed in the Preston Central Office building. There are four central offices, but three central office All those Central Office Buildings are used by the long buildings. distance tolls in that long distance calls when completed over a subscriber's telephone, passes through the central office equipment in those buildings. There is no long distance equipment in the Taylor Central Office building, nor in the Hadley. All of the long distance switch boards and equipment is in the Preston Central Office building. It is necessary that they have a house for this long distance toll apparatus and that apparatus is quite considerable and quite expensive. The business done and the revenues received from the long distance service is very extensive, and amounts to a great deal of money in the course of a year.

"Q. If the earnings were pooled of the long distance service and of the local exchange, the long distance service originating here, and formed one general fund, have you any idea about what proportion the revenues received from the long distance

service would bear to the whole fund?"

"A. No, sir, that is an accounting matter, and I did not go into The auditor handles that branch of the matter. That is Mr. All the lines, the individual exchanges, the individual telephones are all ready to receive long distance service, and to carry on and transmit a long distance call to the subscriber, and do it whenever the subscriber has a long distance call. The telephone company has for years advertised to the effect that each tel phone is the center of the system. There are over seventy-eight thousand places in the United States that can be reached from any local telephone connected with the Houston exchange. They are a part and are used in that long distance service and help to produce the long distance revenue, every individual telephone. It depends of course, on the number of calls, the particular individual subscriber received. Some are very active in handling and carrying on long distance service and some are very seldom used for that purpose. All of them are equipped and ready for that service at all times, but if this is a proper answer to your question: The development of the local telephone rate was carried on simultaneously with the development of the local telephone exchange. I mean the rates for local telephone service were developed as the local telephone exchange was developed. for long distance service were developed along with the development of the long distance lines, and in my judgment the rate for a long

distance call is between the long distance switch-board. 2552 should be. In my judgment is is not from the originating individual subscriber in San Antonio to the individual subscriber in Houston. My opinion is that that rate is from the long distance switch board in San Antonio to the long distance board in Houston. In other words, it is chargeable only to the long distance and those earnings are necessary to carry the long distance calls. is by no means a donation,-transmitting the calls and carrying them to the long distance central office and delivering them from the long distance central office in Houston to the subscriber. means in the nature of a donation. The local exchange is credited with a percentage of the long distance earnings. The earnings from the long distance line,—that is, a percentage of those earnings is credited to the local exchange, that percent, in the case of Houston, being 25%. That 25% cares for the cost of completing those long distance calls in the Houston exchange. Every individual telephone is available for handling long distance calls, they advertise that fact and are proud of it and they are used. That is the practice and custom. The Preston Central Office Building here houses the long distance equipment. But in the inventory we only apportion a por-tion of the furniture and fixtures used in the handling of the business of the Houston Local Exchange. However, we did inventory the entire building and inventoried it as the property used in the local

service. We also inventoried every individual or local tele-2553 phone, and every sub-station as the property in the local service. All of the property inventoried in the Houston exchange is necessary in the rendering of local telephone service in the Houston Exchange. Also it is necessary in rendering first class upto-date long distance service, it is to the joint interest of both of them

to-date long distance service, it is to the joint interest of both of them. "Q. All this wiring and local sub-stations, and conduit and all this splicing and poles, and everything of that kind is a joint enterprise, and they are used in that way, so then it becomes a matter of accounting, which I understand you didn't go into, to try to segregate and show how much of the property is used on one, and used on the other, if you had to make a division between the two as to earnings and expenses?"

"A. No, sir, the answer to that is the answer which I gave you just previously, which is to the effect that all of the property inventoried in the Houston Exchange is necessary in the rendering of local telephone service in Houston. There could be no sub-division made."

"Q. You answered the question a while ago that it was all necessary also to an up-to-date, first class long distance service. You couldn't have first class long distance service in this City to-day without those very things that are being used in the local service."

"A. We couldn't have any long distance service in Houston without telephones."

To a great extent the local exchanges are the feeders and the 2554 revenue producers for the long distance enterprise. I can

remember when the telephone came into existence. The telephone would run through a town and the people would go in there and talk over the long distance exchange, and would get their messages in that way, and it was used very seldom, very extra-ordinary for a man to use long distance telephone service before they had exchanges, and then the business progressed and the exchanges were built up, and people began talking to their neighbors and to their wives, and then they began to feed the long distance lines because naturally the easier you make it for people to talk long distance the greater the amount of business you get from them. So then, we get back to the original proposition that they are mutually beneficial to one another, the long distance helping the local exchange, and the local exchange helping long distance, but I wish to reiterate that the property inventoried is all necessary for the local, exchange serv-It is necessary for long distance service, also, long distance service can be rendered without the local telephone exchange. It is also true that a very good local service could be carried on in the community without the long distance service. So that it comes right back to the point that they are mutually beneficial, one to the other.

I made this inventory and supervised it and know that it is pretty thoroughly made, and as nearly as these things can be, it reflects the facts and condition of the property, and the amount of different things. By the term unit cost and material prices I mean

the cost of labor and incidentals. I applied the 1918-1919

average prices of material. I got the 1918 average by going to the original bills for the different kinds of material as shown in the inventory. In most cases it was purchased for Houston exchange, but there were some items of material, of course, that had not been purchased for Houston during that period and we therefore used other bills. The company as a whole had occasion during those two years to purchase more or less nearly every kind of material going into a telephone plant.

"Q. Even after getting that, you found that during those two years at certain places and certain times you had to purchase certain material and to employ certain labor, and incidental expense in in-

stallation. How did you get that?"

"A. I might answer that by telling you that I have considered all different kinds of work done in Houston and in other places in the State. For example: In the cost of underground conduit construction I analyzed one complete job which I supervised in San Antonio in 1917, and the cost of that work complete was 9 cents per duct foot of conduit. The work was handled under very favorable conditions in the South end of San Antonio. Mexican labor was plentiful, the material was received in time, the work went along extremely well, and was hurried, and the cost was comparatively low. In

Beaumont there was completed during the latter part of 1918, or the early part of 1919 a considerable amount of underground conduit work done in connection with the etsablishing of the new Beaumont Central Office. That work was handled during a rainy period, and a trench caved in and they had lots of trouble, and labor was scarce and that job cost 37 cents per duct foot." The other one I spoke of cost 9 cents per duct foot.

Those were two. I carefully analyzed many jobs on that same basis, and used my best judgment in applying the labor cost and the incidental cost which has been used in this appraisal, being careful to be conservative and to make those costs normal costs. cavating, of course, was com-on labor. Brick masons were employed in constructing the manholes and skilled men in laying of the conduits. Our regular construction foremen and assistant foremen were employed in handling the work. Practically all that excavating is com-on labor, the actual digging of the trench. I did not get the unit of cost of com-on labor upon 100 yards or per vard on excavation or per cubic foot by adding 9 to 37 and dividing it by 2 but I considered those two jobs together with many other jobs, and exercised my best judgment as to what that work would cost in Houston. I don't know what quotient I finally got as the basis for that unit of work, cannot answer that off-hand, but I have the figures of course. The prices for material that I applied to this inventory were prices that prevailed either in 1918 or 1919, when

the particular kind of material had been purchased during those years. You understand, of course, that in this Houston Exchange plant there are certain items of material of different designs, and we have not purchased the particular kind of material for maybe eight or ten years, and in arriving at prices on those

kinds of material I went back 8 or 10 years and used the old prices. Those prices might have been brought up to date, but they would have been materially higher than the prices used. To that extent only my statement that it is made entirely by 1918-1919 is incorrect. Some part of this plant may have been in service here for 20 or 30 years but I don't know that as a fact. I am not in a position to state the percentage of plant that was added per year. I did have a memorandum showing the per cent that has been added for some nine years prior to this time but I do not appear to have the particular memorandum I was looking for here. I can tell you this, and these figures are approximately correct, that the gross additions to the Houston Exchange for the last five years were about three and Those are gross additions, actual expenditures of one half million. money. I got that information from the accountant. take us back to about September 1914. I don't know what period of that five years these additions were made.

Mr. J. D. Frank: I will explain, Mr. Howard, that we intend putting that in later. We will cover that fully.

In 1917 the United States entered the War and prices ad-2558 vanced quite rapidly in this Country, but prices have been advancing for many years, sort of an upward trend, perhaps a certain per cent a year from year to year. If I remember correctly that sharp advance in prices and costs was first reflected about March, 1917, just before the United States entered the war, and created a great demand for American material and American labor. manufacturers and industries were put into competition with the cost plus ten per cent basis of the government and there was a very radical charge, and run up to 100% in a great many instances, and in many instances it exceeded that. There have been some reductions in those prices, but in general they are prevailing today I should say. In other words it is definitely known that the entering of the European War by this Country brought about a radical advance in prices of both material and labor and nobody disputes that. And those prices, brought about by a specific cause, more or less prevail today. I cannot tell you off-hand how much of this plant was constructed prior of March 1917. Mr. Frank has just told you that that would be submitted, and if it is submitted, it will show the gross additions by years, I assume. What I have tried to do, Mr. Howard, is to prepare a conservative, careful estimate of the reproduction cost new of this property at this time.

2559 "Q. I understand. What I want to know is, in connection with that, or incidentel with that, if you made a study of the percentage of this plant as to when it was constructed, how much of it was constructed since 1917, and practically how much of it was constructed prior to 1917, and in what years those additions were made?"

"A. To determine the reproduction cost new of this property at this time I prepared this inventory. I counted the property and I

found out what property was here-

"Q. (Interrupting.) I understand that. My question was, if in connection with that, or incidental to it,—I understand your main undertaking was to inventory this property correctly and apply to it unit prices and material cost to see what it could be built for under prices prevailing in 1918-1919. That was your chief undertaking, as I understand."

"A. My chief undertaking was to determine what the reproduc-

tion cost new of this property was as of October 1st, 1919."

That is what I have done and that is all there was to it. I made this inventory and applied these prices to get at the reproduction cost new at this time. The question you asked as to whether I made that investigation or not, wouldn't enter into this job and this is the job which I did. I know something about when this plant was built in this way: In 1905 or 1906, I was sent to Houston to do the field work incident to preparing plans covering outside construc-

tion work for the Houston exchange. At that time in the section of the city south of McGowen Avenue and west of 2560 Fannin Street, all the subscribers connecting into the Houston Exchange in that section of the City were connected with that one 50 pair aerial cable. Since that time we have built large, heavy pole lines, and we have replaced those, and that 50 pair cable, with large aerial cables and large heavy pole lines. We have also later replaced those large heavy pole lines and heavy aerial cable with underground conduits, and at this time we have underground conduits, extending over into the new Montrose addition. In 1905 I did a very substantial lot of work on this plant and have been doing it every since continually, during 1906, 1907, 1908, 1909 and 1910,-right along each year. Since 1917 we have completed certain of that south end conduit but I can't answer how much off-hand. I can look it up for you and tell you, however. We have also completed the Harrisburg road conduit from Milby street to about Yoakum, or beyond, a distance of about a mile and a half, and have, of course, done a large amount of other work. Since 1917, I cannot state approximately how much additions have been made to the plant, in actual cost, I cannot answer that off-hand.

I have been intimately associated with construction work all over the state of Texas for many years, and have known from year to year about what work cost, and about what prices 2561

of material were.

"Q. Can you answer this question: If you could get an average of prices prevailing during the years of the construction of this plant, get the prices at the time the different constructions were made, get the average of those unit costs and material prices-"

"A. (Interrupting.) You mean starting to-day and working

back for a number of years?"
"Q. This plant was built at a certain time, and there is probably some record of it, the books of the company should show it, that a certain amount of work was done each year and what the work was. If you could get the history of the construction, and the history of

the prevailing prices at those times and get the average cost of the plant, of constructing the plant?"

"A. Such prices and costs might be prepared, yes, sir."

That would necessarily be an estimate. Estimates enter into all construction work. I don't know whether the prices upon which I am theoretically reconstructing this plant are 25 or 50 or 200% above the prices that prevailed as the plant was constructed. I don't think the prices would be double. Prices on telephone material have not doubled since 1914. Some items of material have gone up 120 and 130%. I testified yesterday, or the day before, that in general the prices of material had increased, materials which are used in the outside distributing system between 50 and 60% since

about January 1915, and previous to 1915 prices had shown a steady, normal up-ward trend, but there had been no material increase in prices previous to that time from year to year. There had been a normal up-ward trend but not an abrupt change.

As I have stated prices have advanced since I made this appraisal, which was made as of October 1st, I don't know what caused that. Since October 1st business has been in a rather unsettled state, for some time, it has been particularly unsettled between the period of this date and the date of October 1st, but I question whether that would have affected prices. It might affect production, but I do not know that it would affect prices. It is not a fact that anything that limits production, and limits distribution and makes difficult distribution operates almost certainly upon prices, as certainly as the law of gravitation. It might have just the reverse effect. Manufacturing plants throughout the United States have had to cut down on account of the fuel shortage. The railroads have been unable to transport a considerable quantity of the manufactured material which has been offered to them, and that has resulted in some manufacturers not being able to work full time. Labor is the big thing that enters into the cost of the manufactured article. It might be true in the case of a contractor that a man that undertakes to furnish certain equipment at a time when he doesn't know whether he can get coal and a time when he don't know

risks.

"Q. These men are virtually in the position of a contractor. They either are going to make this stuff for you, or have it made. In either event, the stuff they have on hand the price will be reflected on it just the same, because it is to take the place, or stand in the place of an article that is to be manufactured?"

whether he can get material transported to him, is bound to add something to insure against those hazards and those

"A. I don't quite see that, no sir. A contractor who took a contract to put up a new building and to complete that building in a certain specified time, might add something to the contract price of his building to protect him against delay in shipment of ma-

terial, and that sort of thing."

"A. Take a man that has a stock of shoes on hand, and he bought them at a certain price level and he had a good profit on them, but something happens, he finds out it is almost going to be impossible to get leather, or would be very difficult to get it, won't that hazard be immediately reflected on the price of shoes that he has on hand?"

"A. You are speaking of shows. A very good friend of mine, Mr. Graham Payne of Dallas, who is in the shoe business, I have discussed the matter of fuel shortage with him, and I asked him what it had meant to his business, and he said it meant nothing other than he couldn't get the shoes he wanted. It has not affected prices."

2564 "Q. I was using shoes more as an illustration; that is the natural thing, if a man has on hand any stock of goods, has them so they are available to him, and he knows it is going to be hard to replenish that stock, those conditions are ordinarily reflected in the price of the stock he has on hand, are they not?"

"A. You are talking about supply and demand, and that does

have its effect on prices.

The question where the fuel shortage and a lack of rail facilities is responsible for any increase in prices in telephone equipment and material since October 1st, 1919,-I question that. prices are determined on telephone equipment apparatus like switchboards, is about as follows: The Manufacturer of that equipment keeps accurate cost data. They build that up and examine it frequently, and then in entering onto contracts for the delivery of the manufactured central office equipment from time to time they know what it has been costing them, naturally take into account what it might cost them in the future and set their prices accordingly. They do not change prices often.

"Q. Right there. That is what you apprehend they did,-what they have got to do. Then, when they are confronted with a condition like this, and they have got to quote prices on central office equipment, they will say "in addition to these things we have

recorded here and have before us and know with reasonable certainty, we are confronted with this unusual and extraor-2565

dinary condition: We have to figure whether we will be able to get this material, and whether the railroads will be able to run, and whether the manufacturer will supply us with this material, the different elements to go into the Central Office switchboard, what they are going to charge us," and then aren't the bound to add something to take care of those unusual conditions?"

"A. In the case of Central Office equipment that could not be done."

"Q. Didn't I understand you to say the other day that Central office equipment was manufactured largely upon such specifications?"

"A. Yes, sir."
"Q. Their quotations are based largely upon specifications?"
"A. They are based upon the manufacturing cost, plus the cost of

raw material."

"Q. The Manufacturer would gave to take into consideration in making quotations, during the period of the coal strike, the then conditions, and would have to consider them in making their quota-

tions?"

"A. In central office equipment material the change in prices was put into effect as of November 1st, 1919, was probably decided upon months before, for the reason that those prices are sent out in the form of a printed catalogue to telephone companies all over the

United States, and those catalogues were received during about the middle of October, and was a notification to the telephone companies to the effect that these prices would apply on and after November 1st. That is stamped on the catalogue and those catalogues cover a multitude of equipment and apparatus, a large amount of stuff. And just the work of compiling the cost data would take weeks, and probably months."

This coal strike did not come on over night, I have forgotten the exact date it started. In my judgment the reason for the increase in the prices is the labor cost and I base that on the fact that the rate of pay has steadily been going up. To get good men and hold them you have to pay a great deal more to-day, everybody does, you have to pay a great deal more than you used to. There has been an increase of 10% in the rate of pay put into effect in Houston by our company since October 1st. I wasn't considering the girls, I was considering the men, linemen, cable splicers and that class of men who would have to do with the reproduction of this property here. Company has been raising the rate of pay regularly about every ninety days. The rate of pay for the telephone manufacturing people has been going up steadily just as ours has, and just like the carpenters and plumbers and brick-layers. There has not been any talk of reduction during the last six months, but quite the reverse. The carpenters and brick-layers and plumbers and electricians and other people are continuing to ask for more money. Our daily papers tell us the railroad brotherhoods are demanding more

2567 money. The last large general raise for railroad men was to the shop employees, which, as I recall it, was about six months ago. I don't think the question of whether the manufacturers are going to get coal or transportation and that sort of thing affect the

price of central office equipment material.

I said that the gross expenditures since 1915 were approximately three and one half million dollars but I don't know during what period those five years that was done, how much was before 1917 and how much was since 1917.

Redirect examination.

(Questions by Mr. J. D. Frank:)

The local plant is not charged with any of the long distance equipment and I have segregated all of the long distance equipment in making my inventory of the property. If there were two telephone plants in Houston and one was so equipped that the subscribers could use it for long distance service, and other was not so equipped so the subscribers could use it for long distance service, certainly the plant

which could render the long distance service in addition to the local telephone service would develop the local business faster. An example of that is the American Telephone plant at Dallas as compared to the Dallas Manual Telephone Plant. Before the

Dallas American Telephone Plant was consolidated with the Manual Plant they had in service approximately ten thousand local subscribers, while the Manual Plant had in service,—the Manual Plant being the plant which had the long distance connection,—some twenty-seven thousand subscribers. It is a most distinct advantage to a local company to have this long distance connection.

Mr. Howard: Right there, Mr. Frank; Suppose you ask him, if you don't mind, if there were two long distance concerns operating through Houston, and one of them had a local exchange and the other did not, which would develope the faster?

Mr. Frank: Go ahead and answer his question. Mr. Hoag: The one with the local exchange.

It certainly is a mutual benefit, both to the long distance service and the local service to have those connections. This local exchange receives a part of the earnings from the long distance business on account of this connection but that matter will be handled by the accountants when they get the revenues and expenses.

With reference to a comparison of common labor in San Antonio, Texas and Houston, Texas,—the price of common labor at San Antonio is considerably lower than at Houston, in that there are a very large number of Mexicans in San Antonio. The price of

common labor at Heaumont, Texas compares with the price of common labor at Houston, it is just about the same.

The Southwestern Telegraph & Telephone Company has been compelled to pay those increased prices for material which it has been purchasing, that Mr. Howard has been asking me about. I can't tell you what part of the increased prices is due to the war and what part formally would have taken place had there been no war. There has been a steady upward increase in prices for a great many years, even prior to the beginning of the war. Prices of material fluctuate like the prices of stock and bonds, the price of copper is one material which fluctuates greatly. Other material the prices do not fluctuate to so great an extent.

A circumstance of the kind Counsel has asked me about, a coal strike does not have any material effect upon the prices of material of this kind. It would be reflected at a much later date. The manufacturers of central office equipment purchase very large quantities of raw material in advance and they are given information about what quantity, or the different types of equipment that will be required in the future. The telephone company prepares a year, or eighteen months in advance, and sometimes three years in advance, their estimate of material required so as to permit the manufacturer to secure the raw material and to manufacture the apparatus and

equipment. My understanding is that that coal strike has been settled. The price of Central office equipment has not gone down since the coal strike was settled. As I have here-

tofore testified there has been a constant upward increase in general That affects the cost of material in that approximately 70% of the total cost of the equipment apparatus material used in a telephone plant is manufactured, and the rate of pay of labor has a great effect upon the prices of that material, greater effect than any other one thing. In other words, if you purchase a switch-board costing \$100,000, say \$70,000 of that price fixed by the Manufacturer would be due to the labor, or the cost of the labor involded in the construction of that particular board, and \$30,000 of it would be represented by the material which went to make up that particular switch-board, the raw material. Therefore it is a fact that this constant up-ward increase in salaries is bound to influence to a great I have not heard of any general extent the price of these materials. reduction in the salaries of employees throughout the United States in the last six months or within the last four or five years. I have heard of many increases but no reductions, and they are still clamor-This Plaintiff does not know of any way of reducing ing for more. the salaries of its employees. In my twenty years' connection with the Telephone Company I have never known of any rates of pay being reduced after they had been established. Counsel has asked me if I was so familiar with the prices of materials at the time addi-

tions were made to our plant that I could figure out by years 2571 what the average cost of our plant was. If I made such a computation it would not give me the cost of reproducing this exchange at the present time. I started out on this to make an estimate of what it would cost to reproduce the Telephone Plant in Houston at the present time, and so far as this part of my testimony is concerned I am not considering the original cost. As I testified previously I came to Houston about the year 1905 to do some field work here and at that time there was some 10 or 12 subscribers here.

Mr. J. D. Frank: According to Exhibit No. 10 put in by the witness Mr. A. E. Scott, there were something like 4,569 subscribers in Houston at that time. That is for 1904. The figures for 1905 are 5,343 subscribers, and according to the books of the company at that time the cost of the plant which had been placed up to that time was something like \$614,000.00 in round numbers. Then there has been a considerable portion of this plant added since that time, hasn't there.

Mr. Hoag: Yes, sir.

I have been more or less familiar with the prices of material during that time. In making a study of what prices have been during the last few years I have considered some seven and one half million dollars' worth of work, about two and one half million dol-

2572 lars' worth of which was here in Houston. In arriving at my unit prices, I made a study of these prices which have prevailed in the last few years, I considered the material prices for several years, and the labor costs for several years. I made a study of the present day prices of materials and the present day costs of labor and considering those facts together I have come to my conclusion as to what prices will probably prevail in the future.

In 1905, according to the exhibit referred to a while ago, there were something like five thousand telephones in Houston, and at the present time there are approximately 27,000 telephones in Houston; it has multiplied more than five times during that length of time.

Cross-examination.

(Questions by Mr. Howard:)

It is generally admitted that the more subscribers you have the more expensive it is to furnish service per telephone. Those improvements in the way of conduits whereby we carried so many lines and other improvements tend to minimize that difference in cost. That increasing cost as the plant grows up, and the number of people served, would be much more noticeable if you would have to string the lines on poles the way we used to do, or when we had a

little cable that would carry only 40 or 50 pairs of wire.

2573 As each telephone was added the increased cost was much more noticeable than now when we handle them by the im-

proved conduits.

Redirect examination.

(Questions by Mr. Frank:)

The cost of additional construction is not the only thing that enters into it. As the number of subscribers increase, the cost of construction to reach them also increases. In a small exchange serving probably 500 subscribers the cost might be \$75.00 per station, whereas some of the larger exchanges, such as Houston, might be \$250.00 or \$300.00 per station, or even in excess of that. As the number of subscribers increases the value of the service to each particular subscriber increases due to the fact that he can reach more subscribers, and the expense of handing the increased number of calls also increases.

Cross-examination.

(Questions by Mr. Howard:)

That expense per subscriber depends largely upon how densely the community is settled, it depends on many different things. It depends upon the area covered, actual construction cost, the labor cost, and many other things. You pay less for labor in the small towns than you do in the large towns.

I have prepared an appraisal of the property constituting the Houston telephone plant, based on my inventory, and in preparing that appraisal, the quantities of property as shown by the inventory were used, and to those quantities were applied the unit costs and material prices, as shown by Exhibit 17, which is the material prices and unit cost exhibit. In the case of the land, estimates

as to the reproduction cost of the land were obtained from Mr. George L. Wilson, a Houston real estate man, and his figures were used. In the case of the building estimates, as to the reproduction cost of the buildings we obtained from contractors and architects in Houston, and those figures applied. In the case of Central office equipment, the prevailing equipment prices as of October 1st, 1919, which in effect are 1918-1919 prices, were used, and the contract prices covering the installation of that equipment for the same period, that is, 1918-1919 were applied to cover the cost of installing. For furniture and fixtures, the costs of that equipment, as shown by the company's records were used. That was done in that we would have difficulty in securing present day prices, and we desired to be conservative. The same things applies to the tools and store equipment, and to the stable and garage equipment.

I now desire to introduce in evidence my apprisal and I will

mark it Exhibit No. 18.

(Thereupon said exhibit was received in evidence, and marked Plaintiff's Exhibit No. 18, and said Plaintiff's Exhibit No. 18 2576 is transmitted herewith in Exhibit File.)

That is the appraisal prepared by me.

George L. Wilson, a witness for the complainant, was sworn and testified as follows:

Direct examination:

My name is George L. Wilson. I have lived in Houston since June 1st 1914, and have been engaged in the real estate business, buying and selling property and making loans on real estate. It has been my exclusive occupation. As to my qualifications that enable me to judge as to the value of real estate in Houston, I may state that real estate has been my sole occupation all my life. I was born and brought up, you might say, in a real estate office, in my father's office at Joliet, Illinois, and I operated there and at Chicago, and while in Chicago on two or three different occasions I have been appointed by different courts to appraise property for receiverships, and cases of litigation. I do not recall now what courts they were.

It has been several years ago, but the most of the property was located on the south side of Chicago, and since coming to Houston I have been following real estate and loan busi-

ness, and I have been called on by private investors in several instances to appraise real estate for loans, and in one instance I was called on as a witness, expert witness, but never was put on the stand in that perficular suit. That was the only suit I was ever called on here ouston.

I hav real estate office here in Houston, located at 617 Union National Bank Building, and have had that office ever since I came to Houston in 1914. I haven't had that particular office, but have been in the same building ever since then and operated in real

estate here in Houston since that time, 1914.

I am familiar with the property which the telephone company owns on Fannin street, between McGowen and Dennis. scribed as Lot 8 in Block 3, 621/2 feet by 100 feet on the east side of Fannin street, between McGowen and Dennis, and is known as the Hadley Central Office property. I am familiar with that piece of property. I appraised that piece of real estate, the 62½ feet by 100 feet, east side of Fannin, south of McGowen at \$4,000, or \$64 a front foot. I am familiar with the values of property in the vicinity where this land is located. I arrived at this value on a basis of a sale in that community. Further down the street, about, I would say 250 or 300 feet to the south, Mr. Paul sold to Henry Cook 371/2 feet by 100 feet-

2578 Mr. Howard: I don't think we will contest that value.

Mr. Duls: You admit that value is correct? Mr. Howard: Yes, sir, I am willing to admit that.

I am familiar with the land on which part of the Hadley Central Office building is situated, described as Lot 12 Block 7, 50 x 125 feet deep on the north side of Dennis, 100 feet east of Fannin street.

Mr. Howard: Where is it located, Mr. Duls?

Mr. Duls: If you will turn to page 18 of that appraisal, Mr. Howard. It is located on Dennis, between Fannin and San Jacinto.

I placed a value on that of \$3,200. I arrived at it on the basis of it being 25% deeper than the lot on Fannin Street, and in my opinion is only worth about 75% of the Fannin Street property.

Mr. Howard: \$3,200.00?

Mr. Wilson: Yes, sir.
Mr. Howard: We will not contest that either, at this time the fair market value.

I am acquainted with the property on which the Taylor Central Office building is located in Houston Heights, they being described as lots 11 and 12 in Block 247, it is 100 x 132 feet.

2579 Mr. Howard: Located where?

Mr. Duls: On the northwest corner of Harvard and 8th streets in Houston Heights.

I have placed a figure of \$1,250.00 as the fair market value of the corner lot and \$1,000.00 the inside lot or \$2,250.00 for the gross value.

Mr. Howard: We do not contest that either.

Mr. Duls: Counsel admits that that is the correct fair market value of that property.

I am familiar with the property which the company has purchased for the purpose of erecting the Harrisburg Central Office. That is the located on the northeast corner of Harrisburg Boulevard and Yoakum streets. I am familiar with that, known as lots 11 and 12 and 13 in Block 23, 150 by 150 feet deep. I placed a value on the corner lot of \$1,100.00, and each of the two inside lots at \$850.00, or a total of \$2,800.00 for the three lots.

Mr. Howard: I don't know anything about that, but I expect it is fair.

I based that on a sale across the way. A corner lot across the street sold for \$900.00, and that lot sets diagonally Harrisburg, it comes into the Boulevard at an angle and the purchaser of that lot in order to erect a building on his lot has got to face it diagonally with the street, and that sale was made for \$900.00, and the property of the telephone company is across the street from

2580 it, and has south and east exposure, and you can erect your building square with the world as I term it, and the result is I attached a value of \$1,100.00 for the corner lot, in other words \$200.00 more than the lot across the street sold for. I based all my estimates on sales in the community as bearly as I could find any. That is one method by which I ordinarily determine the value of property. Real estate men use that method of determining values practically exclusively, although in some instances they use the revenue, but on land without improvements they consider sales in the community as a fair criterion on what a piece of property is worth.

I am acquainted with the property owned by the telephone company on the northeast corner of Texas and Robert street-, 125 by 100. I placed a value on that property, I believe of \$4,500.00. There were no sales in that community by which I could be guided, and I had to exercise my own judgment as to what I thought I could sell it for. I believe I could sell it for \$4,500 for this reason, that it has a value, a commercial value in addition, by reason of being located on the railroad tracks. I would place a value of \$3,000.00 if the property was not adjoining the railroad right of way, and I add 50% increase on that by reason of its locality, merchantability. In other words a great number of persons want to buy a piece of property adjoining a railroad because they want to use it for warehouses, and it is close to the tracks. The fact of its being close to the railroad tracks gives it added value. That property is known as Lots 1 and 2 and a half of lot 12 in Block 650.

2581 I am familiar with the piece of land which the telephone company owns, located on the northwest corner of Capital and San Jacinto Streets, 125 by 125. It is known as lots 1 and 2 and a half of lot 3 and one half of lot 11 in block 70. I place a value of \$198,437.50 on that land. I arrive at that figure in this way: On December 31st 1918 the Flake estate sold Edward Larendon the corner of Texas and San Jacinto for \$50,000. The size of that lot is 50 by 100. Your property has 25% greater depth, and I also added 25% by reason of its location. Corner property usually carries in the eyes of the investor about 25 to 33% more than an inside lot value, but of course both of these being corner lots, each of them has the same corner influence. I simply used 25% additional on account of four lots being 125 feet deep as against the Larendon lot being 100 feet deep, and in addition to that I added 25% additional value

by reason of its location. I value the corner of Capitol and San Jacinto 25% more, square foot by square foot than I do the corner of Texas and San Jacinto, by reason of the influence of the Episcopal Church and the fire station across the way. A church or a fire station in a business section has a very decided influence on its value. You have got to carry the shopping element beyond a long stretch of vacant property, and unless you have got a very active site, unless you have something to draw them to that locality, that influence is On the other hand I arrived at that value from a different. About two years ago I was appointed by J. H. Landgreen of felt. Galveston, together with A. B. Kelley and Louis Lobit to value the property directly across from the telephone company 46 by

2582 100 fronting on Capitol, and at that time belonging to Mr. Bailey. That was on the south side of the street and faces north, directly opposite the telephone company's property on Cap-We placed a value on that of \$1,000.00 a front foot, and that was 100 foot deep, and an additional 25% to corner influence, plus 25% from the fact of the company's property being 25 feet deeper, and it comes out identical from both those sources. So that I was

confirmed in my judgment as to the fair market value.

My appraisal of this land is made on the basis of it being the land alone, and without consideration of the improvement on the land. I did not take into consideration the value of the improvements at

all, but merely valued the naked land as it exists, as land.

In stating my qualifications I testified that I was also in the loan business, loaning money on real estate. Loans are made on business property in Houston at usually around 6%; that is well located busi-You might say down-town property. ness property. That is the standard universal rate, 6%.

With reference to loaning money on residence property in Houston, it would depend entirely upon the locality. On south end property where it is usual to loan about 50% on the property, you can reasonably figure on 7%. In the Heights and the Fifth ward you

would have to figure 8%.

2583 The rate is entirely based on the merchantability of the property. How much the man, in the event he had to acquire the property under foreclosure, what his probable chance of selling it immediately and getting his money out of it. I don't think I could place a loan on residence property for less than 7 per cent on a basis of 50% of its value. And these loans I have been speaking about would be first-lien loans absolutely.

Now, with reference to farm property. I am making one loan now of about \$30,000.00 out near Genoa on the basis of seven per cent. Ordinarily farm property runs between seven and eight per cent. made one loan of one hundred thousand dollars near Webster in February on the basis of eight per cent. That was February 1919.

On unimproved farm property the rate is eight per cent on that, but it all depends entirely on the location. The rate on cattle ranch property in Harris County wouldn't be any different, it would be around eight per cent. The Federal Farm Loan Bank, however, is making on improved land loans on the basis of five and one half

per cent, forty years' time, but the private investor never would agree to make such a rate. I never have been able to make a rate like that, never have been able to get the money at that rate. The investor will not loan his money out at that low rate. In one instance, I had a client, Mr. John Kaillard of Goose Creek, he makes all of his loans at seven per cent. I made a loan for him of ten thousand

dollars on the 23rd of December at eight per cent, but on 2584 South end property he has been making recently a seven per

cent rate. He used to make it at 6, but he said at the purchasing power of the interest on the basis of six per cent he couldn't get along with it, and he had to raise the rate one per cent.

I do not make any loans on oil property, as such. I have made a loan on prospective possible oil property at Goose Creek. I made one loan down there for six months, on Mr. Holliday's land——

Mr. Howard: I don't think this record should be encumbered with instances of individual loans Mr. Wilson has made. He has already stated the general rate from a good many stand points.

The risk usually determines the rate of which a loan on property is made. What they call the moral hazard, the personal element, and then again the possibility of selling it in the event the lender has to take it in. In other words the merchantability of the property, and the accessibility of the property. You take property away from transportation and away from roads, it will naturally take a higher rate than property that is readily accessible. The risk is decidedly an important element.

I have been speaking of first-lien loans. Second lien loans, the rate that will apply to those loans depends largely upon the amount of underlying first liens. If you have got a loan of fifty or sixty

2585 per cent on first mortgage, your second loan is going to cost you a lot of money. In but one instance I have confined my-self exclusively to first lien loans? By the term "A whole lot of money" I mean that probably a short time loan will draw eight per cent, and as high as ten or fifteen per cent.

Cross-examination.

(Questions by Mr. Howard:)

In the pawn shops they sometimes charge as high as ten per cent a month.

Redirect examination.

(Questions by Mr. Duls:)

He doesn't have any land as security, all chattels.

S. B. Houx, a witness for the complainant, was sworn and testified as follows:

Direct examination.

(Questions by Mr. Duls:)

My name is S. B. Houx, and I live in Houston, Texas and have

lived here eleven years.

I am a general contractor, connected with the American 2586 Construction Company, in Houston, I am the president of that concern. My company has occasion to figure on plans and specifications for buildings and contract work, and while I do not make the estimate on the contract jobs, I always pass on the final figures. The clerks under me made up the figures and submit them to me, and I pass on them. The estimators take off the quantities and I do all the pricing, practically all of that, and my company bids on the figures that I make. In other words they bet their money on my judgment.

Mr. Howard: We admit he is competent and qualified to estimate

buildings, and is a competent contractor.

I am familiar with the telephone buolding owned by the Southwestern Telegraph & Telephone Company on the corner of San Jacinto and Capitol, and I have figured what it would cost to reproduce that building. I estimated that I could reproduce that building for \$294,560.00. I made that estimate on September 24th, 1919. I used the prices of labor and material current at that time, September 24th, 1919, and arrived at a figure of \$294,560.00. At the time that estimate was made I had before me the estimate that was made at the time the contract for the building was let, the estimate of the quantities of materials. We did not need the plans and specifications. We had exact estimates of the quantities of material going into the job. We used our estimate sheets on the quantities that we used in making the bid at that time, and applied the present day prices of labor and material to those quantities. In making my estimate I went at it in the same way I would have gone at it if I was going to bid on the job of constructing that property. I

2587 went about the work in the same way,—the same way in which we submitted our original bid. I would not take the job of constructing that building today at the prices I used in making my estimate, because prices have advanced since that estimate was made. When I say prices have advanced I mean the prices of

all material and labor.

Mr. Howard: Since September 24th, 1919?

Mr. Houx: Yes sir.

I have examined this building over here and find that it is good construction and found it to be in good condition. It has been well maintained.

These papers I have before me are the estimates of these quantities of material and cost of this building, and I will preserve them so

they can be examined at any time. The estimates have been preserved since the bid was made in 1911.

Cross-examination.

(Questions by Mr. Howard:)

I did not construct that building, and I don't know what it cost, but I know what the low bid was. The low bid was \$149,900.00. The building was constructed by the Fred A. Jones Company. I practically doubled that bid in September last year.

Redirect examination.

(Questions by Mr. Duls:)

2588 I don't mean to testify that I know what it costs to build that building, I didn't say I knew that. I said I knew what the low bid was.

R. L. JACOBE, a witness for the Complainant, was sworn and testified as follows:

Direct examination.

Questions by Mr. Duls:

My name is R. L. Jacobe and I have lived in Houston about 25 years. I have been engaged in the electrical business about 20 years. I am in business for myself, a member of Jacobe Bros. Electric Company, a firm composed of myself and my brother. That has been my principal occupation since my stay in Houston, about 20 years.

that is, a contracting and working for electrical business.

As to my qualifications for estimating contracts for wiring and electrical work, well, I have done everything in electrical contracting, from office boy to estimator and manager of a contracting company. As estimator and manager I have estimated and superintended the work of most of the large buildings in Houston. That covers it I guess. For instance, the Carter Building, the Southern Pacific office building, the post office building, the Houston Belt & Terminal Company, nine-tenths of the schools of Houston. I esti-

mated and superintended and contracted for the main building of the telephone company, and Hadley Exchange, your Preston Exchange, and your Hadley Exchange, and the Ex-

change at the Heights, the Taylor Exchange.

I have made an estimate of what it would cost to reproduce the wiring work in those buildings. I made an estimate on September 24th, 1919, and the estimate on the Preston Building was \$5,570.00. The estimate on the Hadley building, on the same date, was \$1,624.00. and on the Taylor building \$800.00. In making my estimate I took the estimate that I had made, my original estimate on the plans and specifications and took the prices of labor and material as

of that date, September 24th, 1919, and added that to my original figures, and that is the basis of my estimate. These figures that I have testified to represented my best judgment at that time, based on my experience and knowledge of the business as to what it would cost to reproduce the wiring in all three of those buildings at that time. I would not take the job today of doing the wiring in those three buildings at the prices that I estimated on the 24th of September. I would not do it because of the advance of prices of material and labor. They have advanced since that time, but I hope they are not going to continue.

Cross-examination.

(Questions by Mr. Howard:)

I wired those buildings when they were constructed but I do not recall what the charge for the wiring was at that time, but I would judge that they were approximately a third less than the figures that I gave you, just about a third. I think as close as I can

recollect it, that is about the way it worked out at that time.

In my work of estimating I attempt to keep my unit prices up daily, don't you see, with the market, both labor and material. At the time I made this estimate I used the prices that were in effect that date. That would be the scale as fixed by the Electrical Union as far as the labor is concerned. The labor scale then was \$7.00 a day. I don't remember when these buildings were built here. The labor scale today is \$8.00 a day.

Mr. Dudley O. Lane, a witness for the complainant, was sworn and testified as follows:

Direct examination.

Questions by Mr. Duls:

My name is Dudley O. Lane, and I have lived in Houston about four years and during that time I have been engaged in the plumbing and heating business exclusively. I have been doing the estimating for plumbing and heating institutions for the last 35 years. I have done some work on school buildings here, and some of the large apartment houses here, that is, new work on them, and outside of Houston I have done a good deal of large work. I am connected with the firm of Lane and Clifton, I am one of the owners or proprietors.

I made an estimate of what it would cost to reproduce the heating and plumbing in the Taylor Central Office building of the 2591 telephone company, and I have those figures here. The cost of heating was \$2,399.91, and the cost to reproduce the plumbing in that same building was \$1,717.34, according to my estimates. That is my best judgment based on my knowledge and experience of the business of what it would cost to reproduce the heating and plumbing in that building.

Cross-examination.

Questions by Mr. Howard:

I think I made that estimate in the latter part of September. I have been in Houston for four years. I don't know whether the Taylor building was built before or after I came here, but I have known of it for some time. I had occasion to go over there two or three times in the last two or three years so therefore it has been

three years or more to my knowledge.

There has been a very marked advance in prices of material, both material and labor, in construction work since 1914. In plumbing work I should say it has about doubled. That is, in materials. Labor I think we were paying about \$6.00 a day for plumbers' labor, that is, 1914, and about \$9.00 per day today which is about a 50% advance in labor. About 100% in materials, and 50% for labor, in some instances. The same thing applies to heating, about the same thing, possibly.

Redirect examination.

Questions by Mr. Duls:

2592 I would not take the job of installing the heating and plumbing in that building today at the prices I figured in that estimate because of the advance in prices of materials. In some instances prices have advanced at least 20% since I made that estimate. Labor has not advanced since last September.

B. W. WARREN, a witness for the complainant, was sworn and testified as follows:

Direct examination.

Questions by Mr. Duls:

My name is B. W. Warren, and I have lived in Houston about 25 years. During that time I have been engaged in the contracting business, plumbing and heating, and that is my occupation now. I am connected with the firm of Warren & Company. I own that company. With reference to my qualification for doing contracting work involving heating and plumbing and for arriving at the correct amount of the cost of that work, well, I have always done all the buying and estimating of all the work up until last month. I have got a young man I am breaking in as an estimator, but I have always done it myself, until it got so it got too much that I can't do it all. I take the jobs on my bid, and we try to arrive at a cost plus a percent that we work on. We keep a record cost of

the different jobs we do, until the jobs are finished, usually, to see what we have done. I did the plumbing and heating in the Post Office building, the Court House, the Carter Building, Rice Hotel, S. P. Hospital, and I don't know, two or three build-

ings at Rice Institute, I believe. I also did the work in the Hadley and Preston Exchange Building. I have made an estimate of what it would — to reproduce the heating and plumbing in those two buildings. I made that estimate last year, some time, I think it was in September, I am sure it was. I made it on September 20th, 1919. My estimate to reproduce the heating in the Preston Building was \$22,176.00, and to reproduce the plumbing as it is in that building my estimate was \$13,293.45. The Hadley building proper, that was estimated at \$10,424.10. That includes plumbing and heating in that building.

Mr. Howard: Did your estimate set up by Mr. Houx include these items?

Mr. Duls: No, it did not. I should have had him testify to that, but I didn't.

I have not go- the details of my working sheets on this work, we destroy them after we fill a book, you know. Sometimes we carry them a while, and then again we clean up, we destroy them. Those figures represent my best judgment as to what it would cost to reproduce the heating and plumbing in those buildings.

I would not take the job at the cost I have estimated to reproduce it, I could not do it, because there have been too many advances since then in material; in fact all material except pipe line, that is wrought iron pipe. All other pipe and fixtures have advanced, well, as high as 25%, labor and everything else. I think we went to paying \$9.00 per day for labor, but I don't know whether there has been an advance in that or not, but I am sure there have been advances in the material prices. I don't remember when the labor advance was, but I think it was last August.

Cross-examination.

Questions by Mr. Howard:

I put the plumbing and heating in this building when it was originally constructed, but I do not remember what I charged for it. I charged much less than the estimate I made to put it in as of September, but I could not approximate the difference; a great deal of difference though. There's 100 to 150 per cent on some materials. Radiation for instance advanced in the six months twice 7½ per cent. Some material I put as high as 50%. Taking practically all the material, taking it all together and averaging it, it would average around 100%, I believe. In 1914 we were paying \$6.00 a day then, and we are paying now \$9.00, an advance of 50%. The cost estimate that I made was based upon September prices.

2595 Albert Baring, a witness for the complainant, was sworn and testified as follows:

Direct examination.

Questions by Mr. Duls:

My name is Albert Baring. I have lived in Houston since 1901, and I have been in the general contracting business during that time. I have been an independent contractor, doing jobs on my

own initiative and own responsibility.

As to my qualifications that enable me to judge the cost of constructing buildings, well, I have built several buildings here in the town. I built the City Hall Annex, Walker Smith's warehouse down here, I am building the Pittsburg Plate Glass Company's building now, the Hirsch Apartment and numerous other buildings here in town I have erected. I have made estimates of what it would cost to construct these buildings and then I have put in my bid for them where my bid has been accepted and constructed them.

I have made an estimate of what it would cost to reconstruct the Hadley Building of the telephone company, and also the Taylor Building. The figures that I have arrived at does not include any plumbing or heating or wiring or anything of that sort. I was requested by the architect to make an estimate of those buildings and leave out the heating, plumbing and wiring. For the Hadley Building I arrived at the figure of \$73,301.00, and for the Taylor

Building \$29,944.00, those figures represent my best judgment based on my knowledge and experience of the business 2596 as to what it would cost to reproduce those buildings at that I think it was in November somewhere, November 14th, that I made my estimate. I would not undertake to construct those buildings at the prices I estimated it would cost to reconstruct them in November 1919 unless you would add the difference in the material and the labor, whatever it has advanced since that time. Labor and material have advanced. For instance: brick masons, I am notified now, that on the first of April, they are going out for \$11.00 a day. We are paying them \$9.00 now. I do not remember what we were paying at the time I made my estimate, but they want \$11.00 from the 1st of April on. Common labor I paid at that time \$3.60 a day. The carpenters expect to go out for a dollar or two dollars more, I don't know how much it will be. The painters are out now for a dollar raise. Material prices they raise any time. You can't buy nothing unless you get it right now. If they take the order they will tell you they take the order and see if they can give it to you for that price, and sometimes they will keep it for thirty days, and then they will write you and tell you they can't furnish it at that price. In making my estimate I took into consideration the quality of material that is now in the building.

Cross-examination.

Questions by Mr. Howard:

I am building a building now which I took under competitive bids three months ago. Right now, I am not figuring to take con-Everything I take will be on a percentage basis now. 2597 We have gotten to the point now where contractors can't take it any more upon a certain specific price. I did not construct either of these buildings originallu, but I happen to know when they were constructed. I was figuring to get the Hadley Exchange because I was building the Hirsch Apartments within a block, out on McGowan Street, and William Miller & Son beat me \$500 on the contract. I bid on it but I was not the lowest bidder. That was \$28,000.00 without the addition. That addition was built later. In making this estimate here I went ahead and took off all my quantities over again and took the building as a whole. addition was not quite 100 per cent of the Hadley Exchange. think my bid originally on the Hadley Exchange proper, without the addition, was \$28,000.00, and the addition I wanted \$14,000.00 for it; would have been \$42,000.00, and I put the reconstruction of the whole thing now at \$73,000.00, that was in November; it is not quite 100 per cent, but it is about 100 per cent now. And it has got to the point now that if I valued these properties in April it would still be higher if we have to pay the increase in cost of materials and labor. Down here on the Pittsburg building fellows gave me prices on my gravel at \$3.70; and when it come to delivering it they would not deliver any, and I had to go out and pay \$5.00 a yard for it. The cost of constructing this building is pretty nearly double of what the cost was in 1914. The man that constructed the building beat me about \$500.

Redirect examination.

Questions by Mr. Duls:

would have to pay for materials today, prices that I would have to pay if I was going to reproduce the building. I do not look for any decrease in the prices of labor any time soon because I think it is an unknown thing for labor to go down; it never has gone down. Of course I don't know what it will do between now and April. I have never known of labor prices decreasing any considerable extent, not since I have been in business. There was no work done on any of these buildings in 1919, on the Hadley and Taylor building, there was no work actually done, the building was built and had been built for several years. There was only one little addition made to it, and I believe I done that myself, I believe in 1915 closing in that little outside stairway, amounted to \$150.00; that was the only addition I know of.

Mr. Duls: Now, Your Honor, there is one other witness we want to use, Mr. Perkins of the Otis Elevator Company. We want to get him to testify what it would cost to reproduce the elevators in the Preston Building.

Mr. J. D. Frank: Mr. Hoag has included his estimate in his

appraisal.

Mr. Howard: That is all right, then. Introduce the estimate. Our main contention is it didn't cost you that. You will admit it is practically 100 per cent higher than it cost you, will you?

Mr. Duls: No, I don't know what it costs. 2599

Mr. Howard: Well, whatever it is, I don't care anything

about that.

Mr. Duls: This is a letter that was written by Mr. Perkins to the Telephone Company in response to a request about what it would cost to reproduce these elevators. He states in this letter it costs practically \$19,000.00. Do you want us to have Mr. Perkins?

Mr. Howard: No sir.

Mr. Duls: I want the record to show that Counsel does not object to this testimony.

Mr. Howard: Well, we will agree that if you had brought him up

here and had him duly sworn, he would swear to that.

Mr. Duls: You agree that he would have sworn that it would have cost \$19,000.00 to reproduce the elevators in the Preston Building.

Mr. Howard: I don't know whether he estimated it correctly or not, but I admit he was in that business and has made the estimates

just as these other men have.

F. M. Hoag, a witness for the complainant, was recalled for further examination and testified as follows:

2600 Direct examination.

Questions by Mr. J. D. Frank:

Page 1 of my appraisal shows the summary of the appraisal. It shows the reproduction cost of the various items entering into the telephone plant in Houston, Item 1 is "Land." I have used \$215,-187.00 as the figure which would be the cost of reproducing that land at the present time. The details of that appear on page 10 of the appraisal. That is Mr. George L. Wilson's estimate of the reproduction cost of the land and I have adopted the valuations placed on the land by him. In my judgment it is the correct valuation of the land at the present time, and is a very conservative estimate. That is for all the land used and useful in the Houston Exchange, and is the value of the land only, without the improvements thereon.

The second item in my appraisal is item No. 2, on page 1 "Buildings." I have found the cost of reproducing the buildings owned by the company of which are used and useful in the operation of the Houston Exchange to be \$476,550.00. That is the total of the estimates as prepared by these contractors in Houston as to the reproduction cost. A summary of that is shown on page 23 of the appraisal. I should like to add that the last three items on that page, that is, items D, E, and F are estimated costs of certain small buildings which we have in Houston, Item D, being our garage building on the Preston lot, Item E being a garage and storeroom on the rear of the Taylor lot, and Item F being a small frame building on the Texas Avenue warehouse lot. \$1,000.00 is the estimate I

made of the cost of reproducing the garage buildings on the 2601 Preston lots,—that is our estimate of the cost of reproducing that building at the present time. That estimate is based upon information furnished by the local telephone people in Houston. That garage building has been constructed piece-meal, and it was rather difficult to get at anything like an exact estimate of reproduction cost. I should say that the figure which I have adopted is a low figure, it is a low figure I should say, off-hand.

The next item I have here is the one-story frame building on the Taylor Central Office lot, used as a garage and storeroom, and I figure the cost of reproducing that at the present time would be \$500.00. That estimate was made in like manner as was the esti-

mate covering the garage and is probably low.

The next building is the frame building on the warehouse lots \$250.00, that estimate was made in the same way, and is perhaps

somewhat lower.

Now, as to the other buildings, the Preston Central office building, the Hadley Central office building, and the Taylor Central office building, I have adopted the estimates made by these various contractors. The Preston building was constructed about the year 1912, but I do not know the exact date. The original Hadley Central office building was constructed about 1910, and the addition was built about 1914, or the early part of 1915. The Taylor Central office building was constructed either the latter part of 1913 or the early part of 1914. That is, it was completed at that time.

2602 I am familiar with other central office telephone buildings throughout the State of Texas, and have prepared an exhibit showing the cost of other buildings throughout the State in com-

parison with the cost of these buildings in Houston.

Mr. J. D. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 19.

(The paper was thereupon received in evidence and marked Plaintiff's Exhibit No. 19, and said Plaintiff's Exhibit No. 19 is transmitted herewith in Exhibit File.)

Mr. Howard: Now, really what is the materiality of going into the question of the value of your exchange all over the country when you have gotten evidence as to the value of your buildings that

you have constructed in this Exchange.

Mr. J. D. Frank: The object of the testimony is for the purpose of showing that the value that has been placed on these buildings is a conservative value. We want to show what it cost in general to construct buildings of this kind, and we think that the evidence is very material, and very relevant in this connection.

Mr. Howard: If your Honor please they have proven not only in a general way, but in a specific way and in some detail the value of

this real estate here. The valuation as they have proved them, have not been attacked, and I think it is very doubtful that they will be, and I suggest that considerable time might be saved by at least with-

holding the value of these other buildings. I don't appre-

2603 hend that they will be attacked.

The Master: I regard, Mr. Frank, the statement of counsel as an invitation for me to accept these valuations just as they are put on just at this time.

Mr. J. D. Frank: With that understanding, we are willing to

waive this.

The Master: Do I properly understand you?

Mr. Howard: You properly understand me. My proposition is this, that at this time at least there has been no attack made upon what it will cost to reproduce these buildings, if they were to be reproduced now. Of course I will not be understood as saying we are not going to see what these buildings cost, what they cost.

The Master: Oh no, certainly not.

Mr. Howard: I don't imagine that we still attack these values and at any rate it occurs to me that this line of testimony, it would be time enough to enlarge upon this question after we did make some attack, if we do at all, which I do not think we will do. I do not want to be committed to this transaction until we do. They stand in the record now unattacked. If some attack is made upon them—

Mr. J. D. Frank: If Your Honor will permit me to say just one word in answer to that. I don't think Mr. Howard is in a position to attack anything that we are putting in at this time. What we

want to do is to establish the value of these various pieces of 2604 property, and I think this evidence is certainly very material and very relevant for the purpose of showing that this is the value of the property. Now, if he don't intend to attack anything, why that is a different proposition. I can't tell what he is going to

attack when we get through, but it is up to us to introduce our record and introduce our relevant testimony—

Mr. Howard: Not cumulative testimony.

The Master: I think that the evidence would be clearly admissible in the event that there was any controversy as to these facts that are sworn to. That is my idea about it. But, if, on the other hand, they are not contested by the city in any way I feel like while I am not bound by Mr. Hoag's testimony, he being an interested witness, it would be at least strongly persuasive that the facts stated by him are true, and that being true, you have made out as to that a prima facie case.

Mr. Howard: And upon this question it has been sworn to by disinterested witnesses, the values have been fixed by disinterested

witnesses.

The Master: Yes.

Mr. Howard: And unless I can attack those values Mr. Frank, which I doubt very much we will be able to do, and which I will say now we have no present intention of doing—

Mr. J. D. Frank: Well, if you have no intention of attacking the

values, I admit that the testimony is irrelevant,

2605 Mr. Howard: Well, wait until we do attack them, before piling up testimony on them. That is just in the interest of

time.

Mr. J. D. Frank: The thought has just occurred to me that perhaps we would save time in the long run, and that it might facilitate matters for Mr. Howard, if he cross-examined the witness as to these various items of property as they go in. I know that he certainly would be in a better position to cross examine him, and bring out the facts and if Mr. Howard cares to do so, as I finish up each particular item of this property, I would be glad to have him go ahead and cross examine the witness, and then if he wants to make a general cross examination after we get through, he can do so.

Mr. Howard: It suits me all right. I have no cross examination upon the question of land, what it is reasonably worth now, I have no cross-examination because it strikes me that you have gotten it about right, from my best judgment of present prices, so upon the land

item I have no cross examination to make.

Mr. J. D. Frank: Well, that will be all of our evidence on the buildings; do you care to cross examine the witness upon that?

Mr. Howard: No, not upon the buildings. They have been proven up. I don't hope to elicit anything on cross-examination.

In this summary of my appraisal I show the cost of reproducing those buildings, and that price in there as the second

item on my summary of appraisal is \$476,550.00.

The next item in my summary of appraisal is Item No. 3, the distributing system. I find as the cost of reproducing that particular piece of property, \$2,488,660.00. The details of that are shown on page 38. The first item on page 38 is 3-A, Exchange Pole Lines. On page 39 we show the detail as to the unit cost of material of poles. A 30-foot Class C pole which appears on page 39 is priced at \$8.43 each. By turning to page 17, of Exhibit No. 17, which is the unit cost and material price book, the 30-foot Class C pole is shown on that page, the cost of the pole, the freight and the supply expense, totalling \$8.43. On page 42 of the appraisal, the labor and incidental cost is applied to all poles at an average price of \$4.89 each. That average price is used for the reason that our accounting and reporting is such that it is not possible to differentiate in the cost between the different types and kinds and sizes of poles. Page 23 in the Material Price List and Unit Cost Book shows the detail of the labor and incidental cost which go to make up that \$4.89 unit cost as used. I have taken up one of the items all the way through showing how I applied my material prices and unit costs. That would give you the total cost of the pole in place, and I have treated all the other items of the Distributing System in the same manner as I treated On page 42 of my appraisal I show there the total number of poles and the labor cost for those poles, the total number that.

2607 of poles and the labor and incidental cost has been applied to the total number. There are 17,258 poles and the labor and incidental cost as applied is \$4.89 for each pole. That includes the incidentals. That makes a total figure for the labor and incidentals of \$84,391.62, and I have already explained how I have

applied material price to that. The final total cost of all the poles in place, including the material, the freight, the supply expense, the labor and incidental cost for the 17,258 poles is \$287,130.44. In addition to the \$4.69 labor and incidental cost we have added for poles set in private property \$1.00 each, there being 897 poles on private property. I figure that is what it would cost to set those poles on private property, in excess of the average \$4.89 cost. I also figured that it would cost for setting poles in the cement walk and cribbing poles with concrete.

I have on page 38 a summary of the Distributing System, and that sets out the various items of property entering into the Distributing plant and also sets out the cost of reproducing those various items? I get as a total figure for the cost of reproducing the total distributing plant in the Houston Exchange \$2,488,660.00. It is the third item on page No. 1, the summary sheet of the appraisal.

Mr. D. A. Frank: Do you care to ask him any questions about that. Mr. Howard?

Mr. Howard: No, I think no. Just a moment, Mr. Frank.

Cross-examination.

2608 Questions by Mr. Howard:

I have a statement taken from our records as to the gross additions made to the Houston Exchange since 1910. The total amount of gross additions to aerial cable, which is a portion of the distributing system is \$518,558.00. The aerial wire, which is another portion of the Distributing System, the gross additions total \$336,750.00. That is since 1910. I cannot give you that as to how much has been added since 1914. It is totalled since 1910, and the totals would have to be worked over to give you the totals since 1914. That can be furnished you at a later period.

Redirect examination.

Questions by Mr. J. D. Frank:

I will furnish that to Mr. Howard.

Mr. Howard: That is all I have to ask him about, except did he testify before as to what prices, how he got these unit prices and cost of materials?

Mr. J. D. Frank: Yes.

Mr. Howard: 1918, was it, the prices that prevailed in 1918 or 1919.

Mr. Hoag: 1918 and 1919, in general.

The next item appearing in the summary of my appraisal is Item No. 4, Central Office Equipment. I estimate the cost of re2609 producing that part of the property in the Houston plant at \$1,156,480.00. The details of that appear on page 69, that is the Summary of the Central Office Equipment and the details follow on through to page 166.

I will take one particular item to show you how I arrived at the cost of reproducing that part of the property. On pages 70 to 108 of the appraisal is shown the detail as to the quantity of the equipment in the Preston and Capitol switchboards, also the prices of that equipment are shown, and finally on page 108 are shown the other costs, installation costs, etc. which enter into the installing of the equipment in the Central Office. The prices as applied to the detail of the quantities of equipment are 18-19 catalog prices, which prevailed as of October 1st, 1919. On page 108 is shown the cost of installing. The first figure, the first total figure on page 108 is \$473,664.45. That represents the cost of the material at the factory. The second figure is \$23,209.53. That figure is for special designing and drafting. The reason I have included an item of that kind in estimated cost is because after the telephone company places the order for the equipment with the factory, it is necessary for the factory to do a certain amount of special designing and drafting, in that each telephone building is different, and the equipment has to be designed and constructed for the particular buildings. In other words, we can't just say to the factory, ship us a switch-board down here, we have got to give them an idea of what we want, and special designing and drafting has to be done for the purpose of supplying that equipment,-or making that equipment fit in the particular telephone build-

2610 ing, in which it is to be installed, yes sir. That doesn't mean special designing and drafting of the material itself. It means the designing and drafting necessary to make that equip-

ment fit into the building in which it is to be installed.

I get at the total material cost, that is, the material with the special designing and drafting added \$496,873.98. The next figure is freight and cartage in the amount of \$17,390.56, which covers the freight and cartage from the factory to Houston, and to the Central Office building. The next figure is \$237,008.42, which is the installation cost, that is, the laber, traveling expense, board and lodging and other incidental expense incurred in the installing of the equipment in the Central offices.

The foregoing items, that is, the items of special designing and drafting, freight and cartage and installation costs are contract costs and with the prevailing contract prices for this kind of work

for 1918 and 1919.

The next item is the telephone company labor and that amounts to \$1,748.25, and covers the cost of certain work which the telephone company had to do, the running of jumpers, and the main distributing frame and similar small work that averages about 15 cents per line, that is, in addition to the contract cost.

I get at the total cost of the Preston Unit \$752,985.21. The other Central Office units have been built up in like manner.

2611 The summary of central office equipment is on page 69 of my appraisal. I get as the total cost of repreducing this part of the property \$1,156,480.49, which is the fourth item on page 1 of the summary sheet of the appraisal.

Cross-examination.

Questions by Mr. Howard:

This special designing and drafting item is done by the factory. Mr. Howard: You get at this cost, you, for instance on page 108 here, where you have the Preston Central office equipment, you detail the labor and material per unit, and then total it, and you get a total of \$473,664.45, but that is merely for constructing the equipment, and this special designing, you say, is made for the purpose of making the equipment for the exchange building?

Mr. Hoag: It is a factory expense, yes sir, which is incurred in connection with all central office equipment installations. In getting the equipment ready for installation, after the order is placed, then the factory have to do that special designing and drafting. The freight and cartage is based on actual contract cost for the years 1918 and '19, what it would cost to handle that much equipment. We handled equipment in 1919, we are doing it continually. That is we handled some in 1919, not anything like this volume of cartage. These prices were based on several hundred thousand dollars worth of work during the years 1918 and '19.

We did enough to know what the actual charges were per 2612 certain units and then applied it to the number of units that we have in this entire equipment. That is the way we arrived at it.

Mr. Howard: This installation charge \$237,008.42, it is nearly half, just about half—

Mr. D. A. Frank: Not quite a third.

Mr. Howard: About half the cost of the material, is it? Mr. D. A. Frank: Yes, it is about a third of the total cost.

The Western Electric Company in general does that work for us on all Western electric equipment. That is labor and the incidental expense that goes with it, the bringing of the installation crews to the jobs, the railroad fare, some of the board and lodging, of course, and the installation, after this equipment is manufactured, and shipped and ready to install, the installation charges are about 50% of the total material charges. That is in the case of central office equipment, and is occasioned by the fact that it requires skilled labor and is very difficult to install. In the Houston Preston central office equipment, I should estimate that there are over a million soldered connections that have to be made by this installation crew after the equipment has been placed in the central office building. It has to be assembled, all of the cables have to be They all have to be laid in individlaid in those switch-boards. ually, laced together, formed up.

I made a study of the prices and not only paid 2613 attention to the prices for 1919, but I considered prices for several years. The two major elements that enter into all of this construction is labor and material. I have not made any comparison with reference to how much material charges compare with those in 1914, and do not know,—I have not made any

comparison. The material used in central office equipment is detailed on Page 7,-starting on page 7, but the principal material used in central office equipment is the switchboard cable, probably constitutes 35% of the total cost of the material. I cannot answer off-hand how much cable has advanced since 1914, and could not

even approximate it, but would have to look it up.

The last item here, Telephone Company labor, is labor performed by the Telephone Company after the equipment arrives here, and during the process of installation. After the Western Electric Company has installed the equipment, after they have completed their job, then before that equipment can be actually placed in service it is necessary for the telephone company to do a certain amount of work. One thing the Telephone Company does before accepting the job is to make a complete test of all that equipment.

I don't know anything about where the money comes from to pay for anything, and cannot tell where the money came from that paid this item of \$1,748.00. Where the money comes from means

nothing in connection with the cost.

Mr. Howard: But it would mean considerable, though in the final value of the property as you carried it out and set it up here for the purpose of making a rate, would it not?

Mr. Hoag: As I understand you, what you really mean to question is whether or no it is a capital charge or operating charge, not where the money comes from.

Mr. Howard: That amounts to the same thing, if the money comes

out of operating expenses, it would not be a capital charge.

Mr. Hoag: But, it just reverses, it is a question of what you charge the money to, not where the money comes from. In a case of this kind the money is charged to the capital account, that is, to the cost of that equipment. Now, after that equipment is installed. and is in service then we have a gang to maintain it, clear trouble as it develops from day to day, repair switch-board cords, and do other similar repair work; that expense is charged to operation, that is, to the maintenance account, and is not charged to the capital This expense of Telephone Company labor would be charged to the 17-C account, which is the central office equipment capital account, in that the expense is incurred in connection with the construction of this equipment. These books are kept in accordance with the Interstate Commerce Commission rules. rules do not permit the carrying as operating expense of a great many items that partake of renewals and replacements, not of a great many About the only item that I think of off-hand, is the "Subitems. station Removal and Change Charge."

They do permit that 2615 to be charged as an expense, as an operating expense.

ever in connection with that charge the cost of the material, that is the value of the material which is removed when a telephone is removed clears through the regular capital account. If it is set up as maintenance and paid out of operating expense each year and is earned and passes into operation, it does not find its way into capital account, but, I say, the labor cost and incidental cost in connection with sub-station removal and changes is carried as an operating expense, but the value of the equipment which is removed is cleared out of the capital account at the time it is removed. That is necessary.

Mr. Howard: You mean where it is junked property?

Mr.Hoag: It does not make any difference what becomes of it,—

Mr. Howard: What is taken out of capital account?

Mr. Hoag: If a subscriber orders his telephone removed or cut off, the telephone might be taken out, in which case the value of that apparatus would be charged out of the capital account. That would be necessary to keep the capital account straight, but the expense in connection with the substation removal and changes, that is, the labor expense, incidental expense is an operating expense. That is the only item that I know of where the Interstate Commerce Commission permits of that method of handling.

The Telephone Company labor in connection with the Central office equipment installation is, after the equipment has 2616 been installed, has been completed, the foreman on the job

would advise the Telephone Company that it was complete and was ready for them to take over. Before the Telephone Company took it over, they would test it, and inspect all of the equipment, which is a pretty sizeable job. In addition to that the Telephone Company would run the jumpers on the frames. I think I have explained the way the outside cables terminate on a frame in the central office, and the way the switch board cables terminate on the other side of that frame to connect the line. At any rate it is a process they go through to see the way the thing is going to work. I feel sure that it is not handled in the maintenance account, but in a job of this kind where we are installing new work, the labor in connection with that would be charged to the 17-C account which is the capital account for central office equipment.

Redirect examination.

Questions by Mr. J. D. Frank:

Under great pressure and as an emergency measure we might install the central office equipment that we have here in the Houston Exchange in nine or ten months, but to install it in an economical manner would require approximately one year.

The next item in the summary of the appraisal is Item No. 5, Station Equipment, and I show the cost of reproducing that property as \$318,685.00. A detail of that is show- on page 167. I will pick out one particular item and explain how I found that cost. On page

168, one of the largest items is a No. 20 A. D. Desk Stand;
2617 that is the ordinary desk telephone. The price, as shown, is for the material, \$2.85. One page 154 of the material price list and unit costs is shown the material cost on the No. 20 A. L. desk stand, that being the fourth item on that page. The cost of the set itself is \$2.10 with the cords and the supply expense added, makes a total cost \$2.85. On page 156 is shown the detail cost of station installation. The cost of the desk stand and the other parts

of the station apparatus on page 168 is for the material only. The labor cost of installing that apparatus is included under the heading "Subscribers Station Installations" on page 169 of the appraisal, and the detail of that is shown on page 156 of the unit costs. That labor and incidental cost is \$3.20 per station. We have 17,732 of those desk sets in the plant. The total cost of reproducing those 17,732 sets is not shown in the total, but the total cost for the station apparatus is shown which is \$84,962.86. That is for that portion of it on pages 168 and 169. I have a summary of the station equipment on page 167 and the total is \$318,685, which is the fifth item on the summary sheet on page 1 of the appraisal.

On page 169 of the appraisal under the item "cost in place" I have the figure 20 cents, but that is an error and should be \$3.20, making a total cost of \$78,336. The total shows that this is in error.

Mr. Frank: We would like to have that corrected in the copy that has been introduced in evidence.

The Master: The copy that I have? Mr. Frank: Yes, page 169 of the Appraisal. 2618

The Master: Shall I make the change? Is that the idea?

Mr. Frank: Yes sir.

Mr. Howard: Down at the bottom "Ground Clamps," what is that? That is smeared too.

The Master: 14,980 here, the second one on the page.

Mr. Hoag: That is 7830. I am not quite sure about that second figure there. If I may I can correct them later. I have now figured it out and the correct figure is 720 instead of 7830. That does not figure in all the apparatus which is connected with the telephone sets. It does not include the receivers, transmitters and induction coils. As I have previously testified I excluded those because they are owned by the American Telephone & Telegraph Company.

Now, adding up the lands, buildings, distributing system, central office equipment and station equipment, I get a figure as the cost of reproducing those particular items of \$4,655,562 which represents the bare physical property, exclusive of the furniture and fixtures. tools and store equipment and stable and garage equipment. Those particular items which have just been mentioned are treated further down in my summary.

I have not included any overhead charges in estimating the cost of repreducing those particular parts of the plant. Neither have I included any overhead charges in my material charges and 2619

unit costs in arriving at the cost of reproducing those particular parts of the plant.

The next item which appears on my summary of appraisals is

"contingencies and omissions."

Omissions might be grouped under two or three heads. human omission due to failure to count or list all of the multitude of parts which go to make up the property. The intentional omissions such as the extra length in the sag of the aerial cables. I have testified that the aerial cables were measured along the ground beneath the cables, and the sag was not taken into account.

sary omissions, as in the case of hidden property, such as the concrete cribbing of poles which does not appear above the surface and is therefore necessarily omitted. The contingencies are things which might happen, possible but uncertain things which might happen in the construction or reproducing of such a plant, such as accidents, floods, bad weather, mistakes, fires and other similar things.

I have prepared an exhibit showing examples of contingencies and

omissions.

Mr. Frank: We offer that in evidence as Plaintiff's exhibit No. 20.

(Thereupon said exhibit was received in evidence, and marked Plaintiff's Exhibit No. 20, and said Plaintiff's Exhibit No. 20 is transmitted herewith in Exhibit File.)

In fact I used a figure of 3 per cent which is 3 per cent 2620 of the cost in place of the physical property, exclusive of furniture and fixtures, tools and store equipment and stable and garage equipment and that gives me in dollars and cents \$139,667.00. The general statement on the first page of the exhibit is important. that it deals with things that means a good deal. The first item: "Nothing is included in the appraisal for either casualty or public liability insurance during the construction of the property. 2. No allowance has been made for fire insurance during construction on building, equipment, supplies and so forth. 3. Slow delivery of material and in some cases wrong kind of material shipped, often causes delays in the work and necessitates rush shipments of material by express in order not to hold up the work. 4. Supplies are damaged or lost in transit which delays on the work until the item can be found or replaced. 5. Workmen are severely handicapped and there is much delay due to rain, storms or extreme heat and disagreeable weather. On a bad day considerable time is lost either closing the work and taking proper precaution to protect the work and the public waiting on the job until the weather is favorable to progress."

I will take up a particular item of property and show how these

omissions and contingencies enter into it.

On page 2 of the exhibit, under the heading of "Land." first item is the "cost of Searches." That has not been included in the appraisal. The cost of searches has not been included in the appraisal. By the term "Cost of Searches," I mean that before this property could be purchased it would be

necessary to search the records to be sure that they could acquire clear title to the property. In other words the examination of an

abstract.

Item No. 4 on page 2 covers the fences and side walks which would be added to the property. None of those things have been taken into consideration in the appraisal of those lots. We have sidewalks and fences at all of the lots, we have drives and other concrete and curb work which costs considerable money, and they have not been included in the appraisal.

As an example: the Preston lot has a fence along one side and along the rear and it has a drive into the yard, concrete drive, and it has a concrete wash stand for the use of the garage people in

washing the cars. It has a curbing around the lawn on the front part of the lot, and none of those things have been included in the appraisal.

Item No. 5 under "land" is the "Resodding lot at completion of building." That we have done in all cases in Houston, and that has not been included in the appraisal. The land is torn up and

it is necessary to resod that after the building is put on it.

Under the heading of "Building" item No. 3 is the "Omission of awnings, screens, etc." We discovered that we had omitted that after we had compiled our inventory and they are not included,

although they are used on all buildings.

2622 Item No. 4. is "Increase cost of installing certain conveniences after building has been completed." It, of course, is always necessary, and has been necessary in the case of the Houston building to add some wiring and other similar things after the buildings were completed, just as a man always has to add to his residence after he has it completed by the contractor. I might add that I found a day or two that in the building up of our appraisal that we had not included in the reproduction cost of the buildings any architect fees. That amount would amount to some \$24,000 on the basis of paying the usual 5 per cent to the architect. That was an unintentional omission, and was not included in the estimated cost of reproducing those buildings at the present time. The contractor merely furnished me an estimate of what it would cost to reproduce the building at the present time, and I adopted that without adding anything for architect fees. Five per cent is the customary architect's fee for designing and superintending a building, and that would amount in all to about \$24,000. was not included in my appraisal, but I did not intentionally omit that, it was merely an oversight which I did not discover until a few days ago. If I started in to reproduce that building at the present time I would actually have to pay that money.

Under Central Office Equipment, Item No. 1, is the omission of certain items of furniture, floor covering and office fixtures. It is almost impossible to count and inventory those things without omitting certain things. Item No. 3, it is some times necessary to

employ local skilled labor for cabinet work and refinishing damaged cabinets, after it is turned over to us complete by the contractor. In connection with the installation of the considerable amount of Central Office Equipment and apparatus

the workmen always damage those things, and it is always necessary to refinish them.

On page 3 of the exhibit, Item 10, "Omission of certain extension bells, protectors, ground rods, switches, jacks, push button, buzzers and other inconspicuous or special equipment," which is not easily

seen when making the count or inventory.

Under "Pole Lines" the first item is the abnormal cost of excavating. A. Hard digging, and B, fluid soil. There is little or no hard digging in Houston, but this wet soil adds materially to the cost of excavating. I might say right there that our unit costs—I think I have said this before—represent the normal unit costs, and do not

take into account these excessive costs. Item No. 6, "No allowance has been made for the cost of stenciling poles." That was not included in the appraisal. Item 10. "No allowance made for poles wrapped at butt." It is necessary to protect the poles from teams and traffic to prevent them being broken, and that was omitted from the appraisal.

Under "Aerial Cable" Item No. 1, "No allowance has been made for increased length due to sag of cable suspended." In Houston there are approximately 10,000 strands of cable, almost one million feet, sup-orted on suspension strands. The average sag of each

strand of cable must equal 15 inches; on the basis of 12 inches, however, that is 10,000 feet of aerial cable which has not been included in the appraisal. The average size aerial cable costs right at 75 cents per foot, and that would mean in turn

approximately \$8,000 omitted in that item.

On page 6, under "Underground Conduit" Item 6, "work done out of regular hours to avoid interruption of street traffic." That is a very real thing in the down town section of Houston. It is becoming almost impossible to work, to open manholes and do other underground work during the day time on account of the traffic congestion, and it costs considerably more to do the work, of course, on an overtime basis than it does during the regular hours. We have to pay the men overtime when they work after night time, and in addition their efficiency is considerably less at night than at day time. In estimating the cost of reproducing this plant, I have estimated the cost under normal conditions and made no allowance in my unit costs and material prices for doing some of this work out of the regular hours.

On page 7, under "Underground cable," the first item is "water in manholes, gang delayed while this was being pumped out or bailed out." That is a very real source of expense in Houston. Our conduit system stands full of water most of the time, and it is necessary to not only pump out the system before we can work in the manholes, but it is also necessary to pump and bail out during

the time the work is being carried on.

On the last page, Item No. 6, "Delays to gang on account of gas in manholes, which has to be removed before work can proceed." Illuminating or sewer gas is always present to a greater or less extent in underground conduit systems, and we have to use electric blowers when the gas is bad, and make other special arrangements before the men can work in the manholes. things cost money. One other example of contingencies and omissions not connected with telephone work, but a very real example of what contingencies and omissions mean, are the slides which were encountered in the construction of Panama Canal in the Culebra Cut. An engineer estimating the cost of that cut at this time, not knowing about those slides and the enormous expense which was entailed to clear them, to clear the canal, certainly would not include that in the estimated cost of reproducing the canal. actually have these other matters that I have mentioned in connection with the construction of telephone property, and I am not merely conjecturing as to these various things. There is not an item listed under the head of contingencies and omissions in this exhibit, but what I have experienced at some time or other in the doing of telephone work. I have been in the telephone business for 20 years, and am speaking from experience when I say these various things happen in the construction of telephone property.

I used a figure of 3 per cent of the physical property for contingencies and omissions. I did that because I have read over a large number of commission and court decisions in connection with rate cases, and in all cases allowances were made for contingencies and

omissions. The allowances made varied from 2.97 to 5 per 2626 cent depending upon the kind of property being appraised,

and inventoried, and also to some extent upon the care which had been exercised in the making of the appraisal. I know that such an allowance is generally made by other engineers usually from 3 to 5 per cent, 4 per cent probably represents an average allowance. Therefore I would say that the figure of 3 per cent was a very fair figure.

Mr. J. D. Frank: If Your Honor please, I would like to refer to six or eight cases—it will not take more than five minutes showing the allowance made in other cases.

The Master: Go ahead.

(Thereupon Mr. Frank presented some authorities to the Master.)

Cross-examination.

Questions by Mr. Howard:

"Q. Mr. Hoag, this item of omissions and contingencies, that is usually brought into play when one goes out to estimate the cost of producing a plant that is to be constructed."

"A. In connection with determining the reproduction cost of the

property.'

"Q. But when you have the plant already constructed, and there is nothing to do but make the count, it is a question of making an accurate count, is it not?"

"A. That is practically impossible."

"Q. Don't engineers recognize such a thing as compen-2627 sating errors in making an inventory? In other words, all the errors are not against the company and tend to increase the cost of construction?"

"A. In our inventory of the Houston Exchange property, we didn't find in checking the field men that they had duplicated but

three items, as I recall it."

They will not duplicate to the extent they will omit. I don't know that engineers often make an allowance for compensating errors that tend to reduce the cost offsetting the errors that increase the cost. That may be a careless way of engineering, but not an ac-

curate way of engineering. I have made a considerable number of inventories and appraisals, and it is just as I tell you you, practically impossible to make a complete count. No, you are not just as liable to count eleven thousand poles as you would nine thousand poles when you go out to count ten thousand poles because in the making of inventories we take special care to see that there can be no duplication. We try to see that we get them all in, but we do not succeed. It is easier to guard against duplication than it is to guard against omissions.

Mr. Howard: Although you have got conditions before you and looking at them. This is not like if we had no telephone company, and you went out entirely relying upon estimates and plans to reconstruct the plant, you have got nothing to guide you at all in that case, but in a case like this you have got the whole plant, and all you have to do is to look at it. It will take some time, but you will

devote that time to it.

Mr. Hoag: Yes sir, but as an example. I a short time 2628 ago tried to list all my household furniture for insurance purposes, and had to go over it four times before I had included in that list what I thought constituted all of the furniture and that is a very simple inventory. I am sure I did not get down any of the furniture twice. It would be a natural mistake if I had a great deal of furniture to list a lot of these small articles, count them once and set them aside and somebody else come along, especially if two or three men were working on it, but it is much easier to check duplications than omissions. You would have to go on the ground and do all the work over again. I did not add this three per cent because the Commission thinks it is a very good thing to do, but I did it because I think it the proper and fair thing to do. I did not do it without regard to the Commission, I considered the Commission and Court's ruling, the Court's findings. I made the percentage low, 3 per cent instead of 5 per cent, because I felt we had a very careful inventory of this plant and I am reasonably sure we did not duplicate anything.

"Q. When you are estimating the cost of reproducing a plant, you do not assume that the sun is going to shine every day in the week, every working day in the week, and there is not going to ge any over time, or that there is not going to be some trouble to be confronted, do you? When you make the estimate you carry that into your labor cost; don't you?"

"A. These labor costs are built up from actual experiences, actual performance. I have previously testified that I neither used the highest cost nor the lowest cost, but that I used my best judgment to obtain normal costs, eliminating abnormal costs

which I found existed in connection with the actual performance on certain jobs, which jobs I am familiar with. I eliminated from many of these jobs which I was familiar with the abnormal costs, the best way and the most accurate way for caring for these omissions and contingencies is in the manner in which we have attempted to care for them."

"Q. To assume in your construction you are not going to run into difficulties, and going to get your labor on the minute and your operators will always be on hand promptly, and there will be no rainy weather, no hard ground, and no liquid ground, and there will be no cave-in you will eliminate all those contingencies and when you get through you will add 3 per cent?"

"A. No sir, what you have said would mean figuring the cost of the work at the lowest possible expense. You assume that all con-

ditions would be ideal. I do not assume that."

In setting up this cost of reproduction I took my labor cost and material cost under conditions that actual experience has demonstrated attend this character of construction, with the abnormal costs eliminated. I testified previously that in the case of one job of underground conduit construction in Beaumont, it cost us nearly 30 cents, or 35 cents per duct foot.

"Q. My suggestion is, Mr. Hoag, and I expect that will be confirmed by your experience, that one particular instance does not create conditions of construction. We all know that at times,—like you cited the Panama Canal, there are times when one runs into conditions that reduce what appears to be a very profitable contract into a losing contract, but upon the other hand you are apt to run into conditions that are even more favorable than those upon which the estimate is based?"

"A. Yes sir, and I said that I tried to get on the middle ground."

That is a compensating element, but in building up these unit costs, I had to consider both the jobs that cost the least amount of money and the jobs that cost the most, and had to exercise my judgment as to what represented the normal cost, and that is what I have done.

I applied this omission and contingencies to the land because of services in connection with the land.

"Q. You first cite the cost of what you call searching, or getting the abstract or examining the title. Did you figure what 3 per cent on something over two hundred thoustand dollars' worth of land was? Wouldn't you get a total of something like seven thousand dollars for errors and omissions in buying two or three little pieces of land?"

"A. 3 per cent has been applied to the physical property as a

whole."

"Q. But you segregate them and undertake to justify the

2631 three per cent charge?"

"A. No sir, the physical property as a whole. If dealing with land only the percentage would be reduced, and if dealing with the distributing system only the percentage would be materially increased."

"Q. You wouldn't undertake to justify a 3 per cent omissions and

contingencies charge on buying this land, would you?"

"A. Land only, no, sir."

"Q. And articularly you youldn't undertake to justify them

upon land that had probably been bought at 50 per cent of its present value?"

"A. I am dealing with reproduction cost."

"Q. That is true, but I am asking you about applying these omissions and contingencies. You wouldn't like to have that stand as a fair example of omissions and contingencies the way it has been applied to this land?"

A. Not to the land individually. It has been applied to the total amount of property, physical property, and if you separate them you might says that one-half of 1 per cent is applicable to the land, and

6 or 7 to the distributing system."

"Q. The logical way would be to separate such items as land, when it amounts to \$200,000 and upon which there can be no errors

- and omissions—eliminate that item entirely?"

 "A. No sir."

 "Q. The possible cost of omissions and errors in buying a piece of land amounts to practically nothing, and can amount to very little."
- "A. It amounts to several thousand dollars in Houston, the side-walks, the curbing, the lawns, the fences, the drives, all 2632 of which things have been mentioned."

"Q. We are using telephone costs. We are not building a winter

garden, we are building a telephone company?"

"A. All those things are necessary on that land."

"Q. And you are willing to let it go down as a fair test of your idea of errors and omissions, that something like seven thousand dollars is a very fair amount to apply to this item of land?"

"A. I have certainly not said that."

"Q. You said several thousand dollars, what do you mean by that?"

"A. Probably \$3,500."

"Q. You would regard that as fair-you are willing to let that go in as your idea of omissions and errors \$3,500 on this land?"

"A. That may or may not be correct; that is a guess."
"Q. Take the next item, "Building." These building These buildings were built upon competitive bids, were they not?"

"A. Yes sir."

"Q. What has the telephone company got to do with, or what does it care about errors and omissions as regards these buildings?"

"A. I mentioned one big item, and that was the architect's fee, which has been omitted, and that in itself amounts to \$24,000." "Q. What other engineering expense beside the architect,

do you have?"

"A. Our engineering. It appears in this appraisal, but it does not contemplate the design of the building. They lay out the floor plan, and that floor plan is given to the architect who really designs the building."

"Q. Can an architect design a telephone building?"

"A. Yes sir."

"Q. Then if you did the engineering work and charged it up as engineering, there was no omission of the architect?"

"A. Architectural work and engineering work are two very different things."

"Q. Both brands of engineering?"

"A. But as used in this appraisal the engineering is telephone engineering-

"Q. Interrupting.) You mean preparing the plans, that is a part

of the architect's five per cent, for preparing the plans?"

"A. The architectural portion of it, but there is engineering expense in connection with those plans on the part of the telephone company, their engineering department."

"Q. That is getting up the building plans?"
"A. No sir."

"Q. If you have planned just how a building is to be constructed, that is all the contractor has got to do it from, those plans?'

"A. If I may explain what our engineering department does with the building plans before the architect starts to design the building. The telephone engineer lays out his floor

plan; he determines first the amount of business he has to care for, that is, to determine the amount of equipment which has to be placed. The operating conditions are determined, how that equipment shall be placed, and gets those things together and makes up the floor plan, showing how he wants the equipment arranged, and simply turns that floor plan over to the architect, and says, "this building has to have a strength of 300 pounds per square foot of floor space because we are going to put an enormous weight And "we want it seven stories high, and we want these ceilings of a certain heighth so we can place the equipment in the building when we get it. Now, knowing these arrangements, and knowing what we want, you design that building," which the architect then does. Two separate and distinct jobs."

"Q. He gives the architect the floor plan; then he doesn't have to

duplicate that work?'

A. Yes sir, most certainly he does in connection with his designing of the building. This little floor plan which our telephone engineer gets up cannot be used by the contractor. It takes the architect's detailed plans."

"Q. That would be a \$25,000 "little floor plan"?

"A. You are again trying to apply the four per cent to one par-

ticular item."

"Q. You say four per cent is your engineering expense, and that it has nothing to do with your architect's fee," and you say that little floor plan would cost you four per cent of a half million dollars, or twenty-thousand dollars, wouldn't it?"

2635 "A. I previously explained to you that these percentages are based on the total physical property, as a whole."

This item of 4 per cent which I have set up to engineering is by the telephone company's engineers. They are in the employ of the company, the regular corps of engineers, but they are not paid out of the operating expense each; engineering expenses are charged to the The Southwestern Telephone Company has a capital accounts. corps of engineers attached to its payroll all the time, but their expenses are not charged to operating expense, but are charged to fixed capital account, the salaries of all engineers. The engineers do not go about the plant all the time looking at work and maintenance and keeping the plant up and things of that kind,-not in general, the engineering has to do with the construction, primarily, but not altogether. I am reasonably sure that the salaries of the engineering corps of this company are not paid out of operating expense, but the accountant can tell you positively that engineering is not a part of the designing or planning of this building, which is ordinarily the work of an architect. I have explained previously that a certain amount of engineering is necessary before the architect can design The one who owns the building has, in some rough the building. way, to tell the architect what he wants before he can start the building, but in connection with telephone buildings it cannot be told in a rough way, it has got to be told in detail. I do not think it would take \$10,000.00 to get in draft what they wanted before the architect

can go to work. I have previously explained that the con-2636 tingencies and omissions expense of 3 per cent was applied to the total amount of the physical plant as a whole, and the same thing applies in the engineering, the actual engineering expense, considering buildings only, might be less than four per cent, but the engineering expense on another class of plant like the Distributing System, might exceed and would, exceed four per cent. Four per cent is not a good allowance even for that. Allowances generally made for engineering vary from four to six per cent. It might run as high as six per cent on a particular class of plant, it might exceed six, it might run as high as eight or ten. In this set up I have allowed four per cent for engineering, including the buildings, that is a composite figure. The engineering on land might run less than the engineering on buildings. I have got the land in here too so that it would bring it up about an average of four per cent for all classes of plants. I would not figure that four per cent would be about right for buildings, but I figured four per cent would be right for all classes combined; our engineering has been costing us four per cent for a number of years in the State of Texas. of architects was not a contingency, that was an omission. If I had not happened to have mentioned that item of architect- I would not have been without an example because in the exhibit that was submitted attention was called to many other things. Another concrete thing is some special railings that has been added on the stairways

in the Preston Building, from the seventh floor down to the 2637 first floor. I don't know exactly what that railing costs, but it is expensive. In addition there has been wiring added and many other things. I do not think of any compensating things on the other side that might offset some of this as applied to the buildings, but I have thought of the matter in a general way.

I have taken the figures of the American Construction Company in constructing these buildings and accepted the estimates as prepared by the contractor. The American Construction Company did not build this Preston Building, the Fred A. Jones Company built the Preston Building. I got Fred A. Jones to make the estimate upon

the cost of reproduction and that will be submitted by another engineer. The Fred A. Jones Co. has made the estimate on the cost of reproduction and it will be submitted by another engineer. I would not say that this estimate has been made by the highest bidder that bid upon the construction of the building because I don't know that the American Construction Company was the highest bidder, but presumably it was higher than the lowest bid. It would depend on how the estimator worked as to whether or not if they carried their relative proportion of estimating into the reproduction, whether there would be a lesser estimate than the American Construction Company has made. It is possible that if this reproduction was let out now on competitive bids, there would be bids lower than the bid that I have accepted just as it actually was when we constructed the build-

ing, and it is also possible and probable that there would be 2638 higher bids. If this would be let out on the lower bid, I don't

see that it would compensate a good deal for these omissions, which I have set up in favor of the company. This estimate that we have used is an estimate of the reproduction cost of the building at this time as made by the American Construction Company. I cannot answer as to whether we got that on competitive bids, the way we constructed the building that it would necessarily follow that we would let the American Construction Company reproduce it, I could only answer that after seeing all the estimates prepared by other contractors. I couldn't answer as to whether or not we might find by getting a lot of competitive bids that we could build this building for less than the American Construction offered to build it, I could not answer that without seeing the other estimates, but of course it is a possibility.

"Q. I am asking you if the American Construction Co., when you actually built this building were excessive in their bids, that their estimates actually carried the cost of the building beyond what you

actually built it for?"

"A. I don't know that."

"Q. You know they were higher than the company bid it?"
"A. I assume that they didn't for they didn't get the job."

"Q. You are willing for the assumption to go in the records. So that, if you carry it through, you take the two estimators on the building, and their idea of how they should do it, and their shortcuts and economies in building run along the same way as they

did in 1914 when the building run along the same way as it did in 1914 when the building was constructed, the Jones Company would build the building for less than the American

Construction Company?"

"A. Your question will be answered when your estimate of the Jones Company is submitted in evidence. That will be done by

another engineer."

"Q. But it won't be done by the same man who built this building, they will come in by men who have been employed by the company to go out and make estimates; all of these estimates do come in that way?"

"A. These estimates represent the best judgment of the men who make them as to the reproduction cost of the building at this time."

If we were going to reproduce this building at this time, I would accept that estimate, that bid which was prepared first by the most responsible contractor, a contractor who we can be assured would do a first class job, and second, the contractor who made the best estimate, that is, the best bid, that might be lower or it might be higher.

"Q. Get the question this way: If you wanted now to put up another building just like the one you have got down there, would you ask a certain lot of contractors, tell them that you would like to have their estimates of the cost of reproducing that building, so that they could come up here and testify in this hearing for you.

and that they would be paid a reasonable sum for making 2640 up their estimates, and they went out in that way and you

got those figures from them in that manner, would you, if you wanted to build another building like that just across the street from it, take their figures as a basis, and contract with them upon the basis of those figures for constructing the other building?"

"A. I am not sure that I follow you.

"Q. But don't you know you wouldn't do it, don't you know that you would say, "Here, gentlemen, I am going to construct a building, now all you all get down and get your pencils and get them well sharpened, and get to work, get these bids down to where you are going to do business with me," and they would get busy in a different manner, you know that as a practical man, don't you?"

"A. I don't know that."

I don't know that, they have testified or the American Construction Company man testified that this was their estimate of the reproduction cost of this building at this time. It wouldn't be possible for me to go back of that man's statement without going through his figures in very great detail.

"Q. I am just asking you that question, would you accept figures that are gotten up in this way and contract with the contractor upon those figures, or upon any of them made in that way with the idea

that they just estimate a building and come in here and tes-2641 tify to it, would you do it as a practical engineer, and as a man that was trying to conserve the interests of your employer?"

"A. As I understand the way those-

"Q. I didn't ask you that."

Mr. D. A. Frank: I want to object to Counsel's method of interrogating the witness; whenever he asks the question, I think the witness has the right to answer the question.

Mr. Howard: That is very true. Upon the other hand, Your Honor, I suggest that when Counsel asks a question and the answer as he started to make it is not at all responsive.—

Mr. D. A. Frank: I don't see how Counsel can determine whether the answer is responsive or not.

(The question was thereupon read to the witness.)

The Master: Now, Mr. Hoag, answer the question as directly as may be under the circumstances and you will be permitted on cross-examination or otherwise to explain the answer fully.

"A. Yes sir, I would accept those figures, in that it is my understanding that those figures have been prepared in like manner as they would have been prepared if the contractors were bidding on the construction of those buildings.

"Q. And that would satisfy you, would it, Mr. Hoag?"

"A. Yes sir."

"Q. And is the utmost effort that you would make in order to get the building constructed as cheaply as possible?"

"A. A comparison, of course, would be made between the bids, between the estimates as submitted by the various contractors

and then-"

"Q. (Interrupting.) Now, just one more question and we'll pass from that? Then you would be as well satisfied with bids—with figures and conclusions of cost of construction made by contractors who go out under employment to say what it reasonably cost to reproduce the buildings for the purpose of testifying in court, that you would be as well satisfied with those figures as you would with figures made by contractors who were anxious to get the job of building, knowing that it would be less than—"

"A. Yes sir—"
"Q. Well, the—"

Mr. D. A. Frank (interrupting): I ask the court to permit the witness to go on and make the answer as best he can.

The Master: Read into the record exactly what Mr. Hoag has to

Sav.

"A. Yes sir, I understand that those estimates have been prepared in like manner as bids would be prepared covering the construction of those buildings."

I think it is human nature to prepare them as carefully in this method as they would when they knew that their profits or

2643 less in construction depended upon it.

When I spoke yesterday about the sag of the wire as an instance of omissions and contingencies I was speaking of the aerial cable, and that also applies to aerial wire. Aerial cables are purchased by the foot, and they do not stretch any,—not appreciable, no sir. If these cables are spread over a cross-arm of a pole today and you go out there a year from today there will be a slight give, of course to the supporting strand upon which the aerial cable is placed. However, our standard specifications covering the initial placing of aerial cables specifically provide that they shall be strung with a certain sag, that is to prevent the excess strain being put upon the pole structure and upon the supporting strand which carries the cable. If you add that sag to the space between the two points you will have the real length of the cable employed. The amount of sag could not be added to the lineal feet, it would have to be estimated. But that is not the usual way to do it. I cannot say

which way would be the more accurate. We know the sag is there, but we would have to estimate as to the amount of the sag.

Redirect examination.

Questions by Mr. J. D. Frank:

Those contractors who have made estimates of the cost of reproducing these buildings were not requested to make those estimates just for court purposes, but they were requested to make esti-

2644 mates of reproduction costs of these buildings. The request was made through Mr. Gottlieb, or to Mr. Gottlieb, of Sanguinet, Staats & Gottlieb, architects, and he in turn requested these various contractors to make the estimates. I don't know whether or not the gentlemen knew that they would be called upon to testify in this case when they were requested to make these estimates.

Counsel for the City has referred to omissions which may not have occur-ed but it is a fact that a great many of these things were unintentional omissions, but those omissions do not constitute the only thing that is included in this figure of three per cent, which I use here. The intentional omissions such as have already been mentioned and the necessary omissions, such as concrete cribbing around poles. That cribbing is placed beneath the surface of the ground and usually cannot be seen. In inventorying this Houston plant, we knew that we had a large number of poles that were cribbed beneath the surface, but only in two cases did the concrete cribbing appear above the ground, and therefore there were only two poles inventoried as being cribbed with concrete.

I testified that in addition to the architects' fees, amounting approximately to \$24,000.00, which was unintentionally omitted from my appraisal, that various other things have been added to the people, among other things, the extra railings on the stairway in the Preston Building. Railings are on each floor, and on the stairway

from the first floor to the seventh floor, the stairs are arranged in flights, there are three flights between each floor, and the railing parallels the stairs. We are not undertaking to mention all the things specifically which have been added to the building since the building was constructed, but we have tried to cover it in a general way in the exhibit which was submitted among other

things which might have been or were omitted.

The usual practice among engineers with reference to the valuation of contingencies and omissions is to apply the percentage in the same manner as I did, to the total amount of physical plant, and not to subdivide it under classes of plant. I could have worked this out as to each particular piece of property, that could have been done, and if I had worked it out in that way contingencies and omissions would amount to one-half of one per cent or one and one-half per cent on the land, but of the Distributing System it might amount to seven or eight per cent. What I have done is take the average on the property as a whole instead of confining it to one or two specific points. I should like to say something in connection with contingencies and omissions. This telephone property, the

Houston Exchange, is scattered over a very considerable area. A man might go out into a field with ten thousand dollars and scatter them over that field. Then he might start and gather up those ten thousand silver dollars. It is certain that he would not gather up more than ten thousand silver dollars and it is fairly certain that he would gather up a less number, but, I think applies in the case of this property, this plant.

2646 Mr. Howard: If he made an accurate search, he would

get them all, wouldn't he?

Mr. Frank: He would have to hunt a long time, too. It is the same with my inventory here. I started out and made it the best I could, but I know from actual experience that you are never able to count all of the property entering into a plant of this magnitude. I did not make an allowance of three per cent in this case just because the commissions were accustomed to making allowances of this kind, I did not do it for that reason. I assume that the Commissions make allowance for engineering, in that they have been advised by high-class technical men who understand what it means to construct and design property, that engineering expense was necessary and that engineering expense was always incurred in the construction of property. The Commissions and Courts must have been advised relative to Omissions and Contingencies in the same manner. All first-class engineers make allowances for those.

With reference to this engineering for building. The engineer does not just advise the architect what must be done and then wash his hands clean of the whole matter, the telephone engineer in connection with building construction first prepares the preliminary floor plan showing the general arrangement of the building. After that, the architects design the building in detail, that is, they prepare the working plans from which the contractors make bids, and by which the contractors construct the building. The engi-

2647 neers also supervise in a general way the building construc-

tion work as it progresses. They in turn approve payments that are made from time to time as the parts of the building are completed, and are constantly dealing with the architects and the

contractors during the construction of the building.

Counsel has asked me as to whether or not the salaries of the engineers are paid out of current revenue. That has not got anything to do with my estimated cost of reproducing this exchange, where the money comes from to pay those engineers does not make any difference. What I am doing is estimating the cost of reproducing this property at the present time, and I am assuming that all of it is new construction, and the charges as made, that is, the cost of reproduction as prepared, represents the charges that would be made to the capital accounts. The engineering work in connection with maintenance is very very limited, and consists really of only advising the operating and maintenance people. Engineering does not enter into the maintenance of the plant to any considerable extent. The engineering that I have been speaking of here is all engineering with reference to new construction, and is the

engineering expense which is added to the capital accounts. The question of how it is charged does not enter into this case at all because I am estimating the cost of reproducing the Exchange,—everything is new capital.

With reference to letting the contracts for building these buildings to the lowest bidder, we do not necessarily let a job of that kind to the lowest bidder,—we also have to take

into account the responsibility of the bidders.

Mr. J. D. Frank: Now, if Your Honor please, I want to take up at this time the exhibit which we started in to explain yesterday with reference to the comparative cost of other buildings. At that time Counsel objected as to these details, and stated that he thought that he wouldn't go into the question of building and so on.

Mr. Howard: I haven't gone into it. I have limited myself specifically to these contingencies and omissions. I haven't attacked Mr. Jones' valuation. I haven't attacked the valuation of these buildings you have set up there, that he has made, I am attacking merely the element of contingencies and I say that as an off-set to these contingencies, there is in all probability and would be a compensating element in having plants let by the lowest bidder. I haven't yet attacked the cost of these buildings as set up in this estimate.

Mr. J. D. Frank: It seems to me, Your Honor, that Mr. Howard has very, very vigoriously developed the fact that a lower figure should have been used as to the cost of reproducing these buildings and I now ask for permissions to go in and show that the figures which he has used is a conservative figure and with that purpose in view, I want to take up that exhibit and show the actual cost

2649 of other buildings is as throwing light on this subject.

Mr. Howard: For the purpose of saving time and expense of encumbering this record, I will further insist that I will not attack the prices of those buildings as set up here. Mr. Jones or the American Construction Company has set up certain costs of this building. He has not set up any additions. Now, in addition to that they come on here and want to add 3% more. I have simply undertaken to show that that 3 per cent ought not to be added because there are compensating elements that off-set those things. While he might take those prices—this price and accept it, nevertheless, if they could have gone out and gotten competitive bids which would probably have been low enough to off-set those omissions that they set up in other ways. Now, furthermore, I object to it and I am doing this only in the interest of time and of the record, that it is not a proper way to prove values what the buildings cost in Fort Worth where the excavations are different and the freight charges are different and everything of that kind or what it might have cost to build one in San Antonio, is not evidence of what it would cost to build a building here where it is susceptible of being shown by direct evidence what the cost of building a building is and it would not be admitted before a jury or a court, sitting as a trier of fact. Of course, this is before the Master and not before the Court. A great latitude is allowed to receive all those things and

exclude them as material, yet this bearing is being prolonged, it promises to be very lengthy and all these things that tend to prolong it, I say should be eliminated where it is not competent testimony, particularly where we have not attacked this value

set up by Mr. Jones.

Mr. J. D. Frank: I will state that if counsel concedes that this is a reasonable valuation of those buildings, I will not press my point but unless he does, I want to come in and show and I think that the testimony is very relevant for the purpose of showing that the estimated cost of reproducing these buildings is a conservative figure. We have built other buildings similar to these buildings. We know what the cost of those buildings has been and I submit that that is very material in considering the proposition as to whether or not the estimated cost of these buildings is or is not conservative.

Mr. Howard: I don't think we would be bound to admit it, Your Honor. We haven't attacked it and they have direct proof in here

as to the value of these buildings, as this record rests.

The Master: The value of the buildings in San Antonio and Dallas would have in my judgment but slight weight but I am inclined to think, as far as evidence is concerned that it might have some slight circumstantial evidentiary weight and if they insist, I will sak them to put it in as briefly as may be

will ask them to put it in as briefly as may be.

Mr. Howard: I suggest, your Henor, that as a very primary predicate for the admission of this kind of testimony

at all, it must be shown that the conditions are similar.

Mr. D. A. Frank: We expect to do that, Your Honor.

Mr. Howard: And that the conditions at Dallas, Fort Worth and San Antonio, and those places, of necessity are not similar.

The Master: The conditions to a degree are similar to a slight

degree.

Mr. Howard: But they have got to show they are substantially the same before that testimony is admitted. I just submit it would be error to admit it in a trial before a jury because the conditions cannot be shown to be substantially the same, because they are far removed points, there is nothing to indicate that the same prices attach to material or attach to labor, or that the character of excavations for buildings are similar.

Mr. J. D. Frank: Well, we expect to show that.

Mr. Howard: It can't be shown and the conditions are such that they can't—in other words, they can't show what it cost to build a building in Dallas at a certain time as bearing upon the reasonable value of constructing buildings here. It is not proven that way. Isolated cases of what it cost to build buildings

2652 are not evidence of value. There are so many necessary elements that could enter into it. The way to prove value is to prove it by men who are familiar with the construction of buildings in the community under substantially the conditions in which the building in question was built and when that is done they have applied the most direct and logical way of making the proof and it is not proper, it is not the best evidence, and it is not proper evidence to try to fortify that by evidence that has only at

most a very remote bearing upon the question, and that is particularly true when the value as has been established by this direct evidence has not been in any way attacked. So, if we go into the construction of all these buildings in Dallas, it is liable to take a day to go into all those things. If we took only 20 minutes, I wouldn't object to it, but it is opening up a field for a whole lot of

this long drawn out and useless detail.

Mr. D. A. Frank: The long drawn out discussion is on the part of the Attorney for the City. If he had just kept quiet, we would probably been through with it by this time. The question is not the weight of the testimony but the admissibility of it. Your Honor hit the nail on the head when he said it might have some evidentiary weight. It is up to us to show that the conditions are similar. If the conditions are dissimilar, it can't be very much, but it certainly is admissible. Then the weight of it is for Your Honor to determine after it comes in. We offer the testimony because Mr. Howard has

directly attacked the figures which are presented by a gentleisa man whom he did not cross examine, and we were led to believe at that time that he wasn't going to attack him.

The Master: Just a moment, gentlemen, my view of it is that it might be perhaps admissible if we were trying this case before a jury and the weight of it would be entirely for the jury and we can probably get it in while we are talking about it. I would rather make a mistake by letting it in.

Mr. Howard: If it is, I will have no objection but I will be happily disappointed if they do, judging by the precedent that has gone

before.

Mr. J. D. Frank: I could have it in in less time than he has been arguing it.

This is Exhibit No. 19 and this Exhibit shows a comparison between actual costs of Central office buildings constructed in Texas and since 1914, and the reproduction cost of the Houston buildings as used in this appraisal. I have figured out the reproduction cost per cubic foot of the Preston building, and it figures 56.8 per cubic foot. As to how that compares with the cost per cubic foot in the State of Texas at this time,—we haven't a building, we haven't constructed a building of this same type of construction. We have built this year, however, a new central office building in Beaumont, which is a two and one-half story reinforced concrete building, about one-third the size of the Preston Building, and the cost of

2654 that building per cubic foot was 52.4. This Houston building which is a seven story steel and reinforced concrete structure, and a much finer building than the Beaumont Building was 56.8 per cubic foot. The Beaumont building is really comparable with the Hadley Central office building. The Hadley Central office building, the estimated cost of reproduction is 45.7 cents per cubic foot, as compared to an actual cost of the Beaumont building, a like kind of building at 52.4 cents. That Beaumont building was constructed,—completed in June 1919. That cost something like seven cents more per cubic foot than my estimate of the cost of reproducing the Hadley Exchange building in Houston. My estimate of the

cost of reproducing the Preston building is 4.4 cents per cubic foot greater than the cost of the Beaumont Building which was completed in June 1919, which is accounted for by the difference in type and kind and size of the building. I might call attention to the fact that the Hadley building has 186,237 cubic feet, and the Beaumont building has 189,000 cubic feet, indicating the like size of the two buildings. The Preston Building has 623,000 cubic feet. larger the building gets the more it costs per cubic foot as a rule, in that the foundation work, which is one of the very costly things in connection with building construction is, of course, very much greater for a seven-story than for a two-story building.

Cross-examination.

Questions by Mr. Howard:

2655 I do not think that actual cost is the proper way to get at the value, but I think it is one of the things to be considered in determining value along with many others. I don't know how to obtain the actual cost of these buildings We have no accurate record of the actual cost of these properties. We don't get anything we don't pay for, of course, and we don't pay out anything that we don't put on our books, but it has only been during the last four, five or six years that our accounting system has been such that we really have built up costs which amount to something. That Beaumont building was practically the same construction as the Hadley Building.

Mr. J. D. Frank: In connection with the next item of engineering, Your Honor, I would like to refer to a few cases on that. will only take about three or four minutes. I just want to show the allowances that have been made in a few other cases.

(Whereupon, Mr. Frank read to the Master authorities covering the next item of engineering.)

Mr. Howard: Mr. Frank, I assume that you are reading these things in order to direct the mind of the Master to certain things that the evidence may develop. Would you mind stating to him that there has been a change in the manner of charging overheads since the year about 1910, that prior to that time a great amount of the engineering was taken care of by the manufacturers to furnish the plant equipment, and was carried to a great extent in

2656 operating expenses, and it was only upon late construction that this 15% overhead was allowed, where it developed that the construction has taken place as of the present time, that these overheads have been allowed, but that on prior construction where it has been allowed at all, it has been allowed at a lesser rate.

Mr. J. D. Frank: If those are the facts, I don't know it, and I

could not make that admission.

Mr. Howard: You don't know about that?

Mr. J. D. Frank: No, sir, I don't know about that. I would be glad to be educated.

Mr. Howard: As long as these theories are being suggested to the Court, we suggest the theory that this plant was not constructed at the present time, that the greater part of it was not constructed at the present time, that a great part of it was constructed in the latter eighties, some part of it in the nineties, and it has been added to ever since; that during the course of that construction, a large part of it was taken care of by the manufacturer, that the engineering services were not called for, and were not used as they are in present day construction, and also that they are largely taken care of by way of operating expense which the company has earned.

Mr. J. D. Frank: I think you are in error about that.

Mr. Howard: Well, I am just suggesting that to the Master to have in mind.

2657 Mr. J. D. Frank: I don't see what that would have to do with the present cost of reproducing this property.

Mr. Howard: Your plant was not built in 1919, it was built prior to that time.

Mr. D. A. Frank: You are confusing cost with reproduction cost.

Mr. Howard: Well, they all run together. Upon that proposition too, we are submitting this entirely new theory that you won't find any city like this without telephone service at this date when you start in to build the plant up. I would like to have you keep these matters in mind because we will discuss them later on.

Redirect examination.

Questions by Mr. J. D. Frank:

The next item after Contingencies and Omissions is Engineering

First, the Interstate Commerce Commission prescribes that engineering expense shall be charged as follows: that appears on page 79 of the Interstate Commerce Commission's Uniform System of Accounts for Telephone Companies" That exhibit that I am referring to has been introduced in evidence and is exhibit No. 11.

The Interstate Commerce Commission defines "Engineering Expenses" as follows and provide that it be handled as follows: Account No. 705. "Engineering Expense. Charge to this account or to appropriate sub-accounts all expenses for engineering so as to show separately the follows: (1) Salaries and wages; (2) personal and incidental expenses of engineering department employees; (3) rent paid for office and (4) office expenses. This account shall be cleared by apportioning the total expenses to operating expenses and fixed capital accounts on the basis of service rendered, as determined by the actual time devoted to particular jobs or on an equitable basis fixed by the officers of the company." The reason I have taken the figure of four per cent, is because our engineering has been costing us in the State of Texas for a number of years. It is customary for valuation engineers to include an item of this kind. I have read over a good

many commission and and court decisions, and it is customary to

allow from four to six per cent as engineering expense. Five or six per cent is the usual average allowed but it is the practice among engineers to allow for this item. Therefore, I would say that this four cent which I have used is very conservative and represents what our engineers have been actually costing us. Four per cent which I have allowed for engineering, of the physical cost of the property would equal \$191,890.00. If I were starting in to reproduce this property it would cost fully that much for engineering expenses in connection with the value of the physical property. Engineering is a very necessary part of the work of constructing

any property of this kind,

One small item, for example, of the economies which are 2659 effected by careful and intelligent engineering would be in the case of the construction of say, an aerial cable. It appears to be a very simple matter to string a 100-pair ærial cable on a pole line in some sections of the city, but as a matter of fact before that cable is placed, a careful study is made of the amount of business to be had in that section of the city at this time, or at the time of construction, and a very careful estimate is made as to the amount of business which will be had in that section in the future, thus it is determined the amount of cable which shall be placed. 100-pair cable placed aerially costs approximately 50 cents per foot A 200-pair cable placed aerially costs approximately 86 per foot in place. Two 100-pair cables, placed aerially would cost a dollar as compared to 86 per foot for the 200-pair. That, of course, is due to the two suspension strands, and the work of placing the two cables as against the cost of placing but one. if the engineering is properly done, carefully done, intelligently done, then the proper sized cable will be placed. If there is enough business to be served by this aerial cable to warrant placing a 200pair cable, the 200-pair cable would be placed originally at a cost of 86 cents per foot. If somebdy simply guessed at what was required in that section of the city and said a 100-pair cable would serve, then, at the end of the year they might have to place the second That, I think, is a good example in a small 100-pair cable.

way of the economies which can be effected by intelligence engineering. Of course, there are many large problems in a multi-office exchange, such as is Houston, relative to the location of Central offices and things of that sort, and the time when central offices shall be established, etc. which are big, and which if the engineering is carefully done means great savings. The engineers make a study as to how much construction should be placed in any given territory, and then after they have made their study they draw up the plans and specifications of how that work should be done, the working plans, the detailed plans, we have general specifications which cover the work in a general way. Their duties are not ended when they make up those plans, they do not just turn it over to the construction people and they say "Here are the plans, do it in this manner", but after the work has been completed they make inspection to determine that it has been properly done, and makes the Construction Department correct any defects in like manner as we would make a contractor correct any defects in the case of building construction. They make inspection of the building while the construction is in progress. I have not included anything in my unit cost, and in figuring the cost of reproducing this physical property heretofore in engineering.

The next item of expense is "General Expense." I have used two per cent of that would amounts to \$99,741.00.

The Interstate Commerce Commission in their Uniform System of Accounts on page 74 of the issue of January 1st 1913 defined "General Expense" as follows: "General office salaries." (That is salaries of general officers). This account should include the salaries of the Chairman of the board, President, Vice-President, Secretary, Treasurer, Comptroller, General Auditor, General Manager, General Superintendent and all other officers whose jurisdiction extends to the operations of the company as a whole". This is defined "General Expense." If I may explain a portion of the general expense is charged to the cost of construction, that is to the capital accounts. A portion of the general expense is charged to the maintenance account, a portion of the general expense is charged to the operating accounts; that is subdivided in that way.

This two per cent that I have included here is not general expense, that two per cent is that portion of the general expense which would be chargeable to the capital accounts. In other words that is the amount of general expense which is incurred in making entirely new construction. The general expense as a whole is greater than two per cent. We have other general expense in connection with the operation and maintenance of the plant, but that is not included in this. I take this figure of two per cent because that is what our general expense has been costing us for some years in connection with construction work. That is confined solely to new

construction.

Cross-examination.

2662 Questions by Mr. Howard:

The Interstate Commerce Commission sets up how we can keep our accounts, and to what different items shall be charged. They have a general heading as to the expenses. This particular heading is "General Expense" and then they go on and prescribe how that General Expense shall be charged. General expenses include the officers of the company, from the general manager, on up including the legal department, and the president of the company, the general auditor, and other similar people, also including the clerks which they have in their offices, the rent for their offices and other similar expenses. This two per cent is two per cent of the estimated reproduction cost of the physical property. The Interstate Commerce Commission in their Uniform System of Accounts does not in any case say how much of the general expense or engineering or other expense shall be charged to any account. A certain portion of the general expense goes to construction. I have fixed that in this case,

at two per cent, in that that is the amount of general expense which has been charged to construction for a number of years by our company.

"Q. What is your two per cent here based on, in your set up?"

"A. It is two per cent of \$4,987,038.00."

"Q. You have applied the two per cent to the entire construction instead of to the general expense, haven't you?"

"A. No sir, this general expense which we are applying-

"Q. (Interrupting.) How is that?

"A. This general expense which we are applying to construction, this is a portion of the general expense.' 2663

I have explained what general expense is. It being the expense of the general manager and other officers of the company, vice-president, president, their clerks, office forces, etc. That is what general expense is, also the legal expense. A certain per cent should be charged to construction account, and in this instance I have applied two per cent of the estimated reproduction cost of the physical prop-That is what the Interstate Commerce Commission provides that the general expense shall be estimated in a fair way to the different accounts, one of which is the construction account. mary sheet shows that I have applied two per cent of the cost of the physical property, two per cent of \$4,987,038.00 as being the general expense which would be incurred in connection with the reproduction cost of this property.

"Q. Now, why do you do that now, Mr. Hoag, there are certain general expenses that you have defined, such as the salary of the president, the salary of the clerks, the salary of the attorneys and the salary of the engineers, a certain general expense?"

"A. Yes sir."

"Q. Then a part of that is what goes to construction account, a percentage of the entire cost of construction?"

"A. Yes sir."

"Q. Where do you get any foundation for applying a certain part of the entire cost of construction and adding it to

the construction account?"

"A. I have previously stated that for a number of years the general expense incurred by our company has equalled two per cent of the cost of construction, and I have therefore applied two per cent of the cost of construction in this case."

"Q. For instance now, you take a—well, we are building this building here at \$300,000.00, what is two per cent of \$300,000.00?"

"A. The application of general expense to a particular class of plant cannot be made. It has to be made to all of the plant as a whole, in like manner as does the engineering expense, and contingencies and omissions."

Our general expenses are a fixed definite amount, but they vary from month to month, of course, they cost a certain amount of money each year, and that amount of money is spread over opera-

tion and construction. I did not say a moment ago that in my judgment two per cent of that general expense should - allocated or charged to the construction account, I did not say that.

"Q. Well, that is the thing we are trying to get pro rated and charged to the proper account, isn't it, is the general expenses in the construction cost?'

"A. Yes sir."

"Q. All right then, let's keep to the text of the thing that 2665 we are trying to get apportioned. We are trying to apportion the general expense to certain accounts?"

"A. Yes sir."
"Q. Now then, if you didn't say two per cent a while ago should be carried to construction account, what part of that general ex-

pense should be carried to construction account?"

"A. My statement a while ago was this: That for a number of years the amount of general expense which has been charged to construction has equalled two per cent of the cost of that construction."

And that would not be regardless of whether we constructed a million dollars one year and fifty thousand the next. We are charging a certain per cent of the general expense to the construction account, and that amount of general expense which has been charged to the construction account by our company for a number of years has equalled two per cent of the cost of that construction.

"Q. But why bring in the construction item at all. We have, got fixed, definite, general expense, such as your President's salary, and such as your legal expense, and we know what they are. Then we know that a certain part of that should go to operating and the greater part, that is the part that these officers' time is taken up largely with, the operation of their plant, the business as it goes on

from month to month, and from year to year, that is in the 2666 operation of their plant, that is where their energies are largely

concentrated."

"A. No."

"Q. Then, if you figure out how much goes to maintenance, how much goes to construction, how much goes to the other sub-heads, that may be set up and then in your judgment, how much of that should go to the construction account?"

"A. The amount which I have shown here and which I have

previously explained.'

"Q. Why should it vary at all?" You have got those fixed charges that follow through the year, and what difference will it make what what part of any year this construction is done, those charges are fixed, those officers are there to serve every year, and if they construct five millions or two millions in one year, it don't tend to increase your general expense?"

"A. I might-

"Q. (Interrupting.) Does it, Mr. Hoag, it don't tend to increase your general expense one dollar, does it?"

"A. No sir, but I will explain that. During any period of time, when a large amount of construction work is under way, then the percentage as applied, that is, the amount of general expense as applied-

'Q. (Interrupting.) Well, why-Well, if you will let me explain it, I will tell you why.

"Q. Let's see that we keep together. You have already stated that regardless of the amount of construction in any

particular year, the general expense remains fixed, that's true? The general expense remains fixed, but the percentage as applied to construction or to maintenance or to operation varies in proportion to the amount of construction and the amount of opera-

tion and the amount of maintenance."

"Q. But if I get you now, in valuing these plants, you have got a lot of officers whose salaries will run \$60,000 in a certain year. and they will run that way whether you build two million or five hundred dollars of construction that particular year. That expense You have got that as a fixed expense. Then you must have that expense regardless of whether you construct one million or two million in a certain year, that is a fixed charge that you can't get rid of, then if perchance one year you build two million dollars of construction, then you take away from that fixed charge that's go to be paid, you take two per cent of that or a certain per cent of it, you charge a certain per cent. or a greater per cent of it up to construction. We are going to assume that these men are busy with construction and we will charge it up to construction, although you haven't spent a dollar of expense, that you haven't spent a dollar more-

Mr. D. A. Frank: I object to his question because he is talking about something entirely different from what the witness is. This is a reproduction theory, and this is an estimate by the

witness as to what the general expense would be in repreducing this property; in other words, the question of general expense in a reproduction figure is the estimate by the witness of what the expense would be for general expense regardless of the present organization, that is to say, that there would be general expense here if an individual started out to build this plant here, he would have that expense regardless of whether the telephone company has it or not, so that it is immaterial how the money is charged up.

Mr. Howard: If you carry that sort of thing in and ask to make a return on it, I will discontinue my examination, if you ate asking that your return value be augmented by that sort of thing, I with-

draw it, and I won't pursue the examination any further.

Mr. D. A. Frank: The light seems to be breaking in on you. Mr. Howard: No, if that is this utility's idea of fairness to the

public, I withdraw my question. Mr. D. A. Frank: It is not a question of fairness, every engineer that makes a valuation always makes a valuation of what this

Mr. Howard (interrupting): You rose to an objection and I have withdrawn same.

2669

Mr. D. A. Frank: Well, but you have some innuendo in your withdrawal.

Mr. Howard: Well, the fact is, I have withdrawn it.

Mr. D. A. Frank: Well, the fact is, that it is always charged, it is a legitimate charge.

Mr. Howard: That's all.

Redirect examination.

Questions by Mr. J. D. Frank:

It is a fact that we would have this expense if we started in to reproduce this exchange, it would reequire a certain amount of time of the officers of the company, and I know from actual experience in the telephone business in the past that it has actually cost equally that much to do construction work.

The next item is furniture and fixtures. I have taken \$19,894.00 as the figure in my appraisal to represent the cost of reproducing the furniture and fixtures in connection with the Houston Exchange. That is shown in detail in my appraisal. The summary is shown

on page 191 and the detail is on the following pages. The 2670 items included are those as listed on page 191; first, the local furniture and fixtures; the second item is the district furniture and fixtures; that has been excluded in that those furniture and fixtures are not used in the Houston Exchange. They are located here in Houston, but are not used for the Houston Exchange, and therefore I have excluded it.

The third item is the Division office furniture and fixtures. Only that portion of the Division office furniture and fixtures has been

included which is used for the Houston Exchange.

The next item is the proportion of the General furniture and fixtures in the general office at Dallas, chargeable again to Houston Exchange, the Houston Exchange representing approximately 14 per cent of the total telephone property in the State, and this figure of \$7,412.40 is 14 per cent of the total cost of the general office furniture and fixtures. I get a total for furniture and fixtures of \$19,894.21 which is item No. 6 on the summary of the appraisal sheet.

The next item, No. 7, is tools and store equipment, and I have charged up \$11,638.00 for that item. That is shown in detail in

my appraisal at page 264.

To show how I arrived at that figure, I might read this if I may, it explains fully. An inventory and appraisal of the tools and store equipment actually in Houston was made, but as these are

2671 not used exclusively in Houston, and as others in the State are available for use in Houston as well as elsewhere, we have taken a proportion of the tools and store equipment of the State applicable to Houston on the basis of the ratio of the book value for the State to the book value for the Houston Exchange. At the time I made my inventory there were something like \$8,000.00 worth of tools on hand in Houston. I have included in my appraisal \$11,637.54, and that is explained thus: Any of

the tools in the State of Texas are available for use in Houston. In like manner any of the tools in Houston are available for use anywhere in the State. At the time the inventory was taken in Houston, there were a considerable amount—a considerable quantity of tools generally used in Houston that were being used in other places in the southeast Texas Division. At times we will have as much as twenty or twenty-five or thiry thousand dollars' worth of tools in Houston, depending upon our activity; at other times we will not have as many.

If we didn't have these tools available for use in the various exchanges we would have to have all these tools in Houston, and it means a considerable economy insofar as the tool expense is concerned. If we had taken an inventory of this property in 1915, after the storm down here, if it had been taken at the time of the storm, or immediately after the storm, we would have had forty to fifty thousand dollars' worth of tools, in that we shipped in tools

from all over the State to handle the work incident to restoring the the service and rehabilitating the plant. 2672

Cross-examination.

Questions by Mr. Howard:

"Q. Those tools would cost you a great deal more now, wouldn't they, than when you bought them?" I say, the reproduction value is a good deal more than the tools actually cost, is it not?"

"A. No sir, I have previously explained that includes all furni-

ture and fixtures, tools and store equipment-

"Q. (Interrupting.) Well, if you say no, that satisfies me.? "A. (Continuing:) And stable and garage equipment."

Redirect examination.

Questions by Mr. J. D. Frank:

In other words I haven't figured the cost of reproducing these tools, but have used the actual cost of them as shown by our records.

The next item is stable and garage equipment, and I have included for stable and garage equipment \$10,219.00 and that is shown in detail in my appraisal beginning on page 286. I set out in those pages just what stable and garage equipment we have in Houston We have stable and that is used for the Houston Exchange.

garage equipment located in Houston, which is used outside of Houston, and is not included in my appraisal. I have not 2673 estimated the cost of reproducing this stable and garage equipment, but we have taken the actual cost as shown by our records.

Mr. Frank: Why have you taken the actual cost of your stable and garage equipment, your tools and your furniture and fixtures. Mr. Howard: We'll admit your item there, Mr. Frank, we'll ad-

mit the value is correct. Mr. J. D. Frank: All right, sir, I will withdraw the question. The next item is taxes during construction for which I have included \$101,720.00. That covers the taxes that would have to be paid on the physical plant during the construction period before the plant as a whole was completed. On page 2 of the appraisal and also page 3 is shown the amount of money which would be expended by quarterly periods during the construction period. I have taken three years as the construction period, which in my opinion would be the most economical period for reconstructing the plant.

On page 2 the first item is \$235,118.00, that covers the purchase of the land in the first quarter of the construction period. In the second quarter an expenditure of \$147,854 for underground

conduit, and an expenditure of \$5,040 for right of way would be made. In the third quarter expenditures would be made for buildings, underground conduits, right of way, tools and store equipment, stable and garage equipment, the total of those would be \$374,546. The expenditures are built up in that manner throughout the whole three year period, and on page 3 the total expenditures for the entire period is shown as \$5,128,530. On page 5 is shown a recapitulation of the expenditures for plant during the construction period, divided by quarters; also is shown the average amount of physical plant in place by quarters, and the amount of taxes which would be paid on the physical property. My estimate is based as to the amount of taxes upon the actual taxes paid for Houston for the year 1919 which amount is \$73,237.38 which covers State, County and City ad valorem taxes, and in addition covers the salary of the telephone inspector employed by the city, but paid for by the telephone Company. It also includes a franchise tax and a special school tax. I haven't the detail of that here, but those two items amount to some \$3.035. This does not include the Federal taxes, and of course, there being no income, it does not include gross receipts taxes, because you have no gross receipts,—this is a property tax wholly.

The reason I have included such an item as that in my appraisal is because the money would have to be spent, that is, the taxes would have to be paid from year to year, as the plant was completed, as it

was constructed, and those expenditures have been added to 2675 the cost of reproduction. I have made my estimate on the taxes which have actually been paid, and it is customary to make an allowance for this item. Engineers usually make an allowance of that kind, and it is also made by Commissions.

Cross-examination.

Questions by Mr. Howard:

I applied to these values the taxes assessed under the laws of the

State of Texes, and this municipality.

Mr. Howard: Then, if the law of the State of Texas and the City of Houston have assessed these taxes, assess-taxes only upon property on hand at the beginning of the year, you wouldn't apply it to this, would you?

Mr. Hoag: There is one error on page 4 that has been made in

building up the taxes paid. It was assumed in this study that these taxes would be paid by quarterly periods and as a matter of fact what you say is so. They would have been paid at the end of the year covering the amount of property on hand at the beginning of the year, and that error which I discovered day before yesterday means that we have included in this amount of \$101,720 for taxes a sum of \$4,000 which would not actually be paid, and that total is wrong to that extent, \$4,000

It is set up by quarters on page 4. We have assumed that we would pay for the first year, taxes in the amount \$420.00,

but those taxes would not be paid, or rather we have assumed \$401.00 for the first quarter, \$1,090.00 for the second quarter, \$2,016.00 for the thrid quarter and so on. Those taxes would not be paid until the first of the year. Those taxes would have been paid at the beginning of the succeeding year because that property would be on hand, on the first of January. That first year the taxes as shown would be moved up one year and the second year would also be moved up one year. I will go over that computation and check it carefully. This has not been based on an assessment at full valuation. We simply assumed that we would pay the same taxes as we actually paid for the year 1919 regardless of what the assessment was. I will re-compute that item on the Texas mode of assessing taxes.

Redirect examination.

Questions by Mr. J. D. Frank:

I will go over that and then take the stand at a later date and

straighten out that error on page 4 in the appraisal.

The next item in my appraisal is interest during construction, and I have included for that item, \$453,360.00. That is shown in detail on page 5 of my appraisal. On page 5 is shown the quarterly addition to construction, and the average amount of physical property in place by quarters, and the interest was applied to those

average amounts. That is carried through for the three year construction period. The first quarter we would have \$235,519 expended, and we have assumed that we would have that expenditure for half of the period, and have therefore taken the figure \$117,760.00 as representing the average amount of physical property in place for that quarter, and have applied to that interest at the rate of six per cent per annum. In other words we have not assumed that all of that property would be in place throughout the first quarter, but the property is built up as time goes on.

The reason I have taken six per cent as the rate of interest is on account of the four and one-half per cent licensee contractual arrangement which the Southwestern Telegraph & Telephone Company has with the A. T. & T., the Southwestern can get money from the American Telegraph & Telephone Company at 6%. In other words, I don't think we could go into the open market and get that money at 6%, and therefore I consider that figure conservative. The last quarter I treat in the same manner as the first quarter. During the last quarter we would add to the construction a total of

\$161,776, and that has been divided and added to the average amount of physical plant in place, as built up during the previous quarters, so that during the last quarter we would have in place \$5,149,362.00 worth of plant, and interest on that at the rate of six per cent would be \$77,240. I show as the total interest dur-

2678 ing construction \$453,360.00.

I have made a very careful study of how this money would be expended and when it would be expended, and that is shown in detail on pages 2 and 3, starting with the three year construction period, which I have considered as being the most economical period of time in which to reproduce this property, in that if a longer time was spent in reproducing the property the money invested would be lying idle, would not be earning anything for a greater period. And a shorter period would mean the expenditure of considerable amounts of money in that a great deal of overtime work would have to be done. During the first quarter of this three year period, in this study I have assumed that the land would would be purchased. That would necessarily have to be first, in that, until the land was purchased the building could not be designed, and neither could the underground conduit lines be laid out, or any of the construction work started. During the second quarter a very considerable amount of conduit material would have to be purchased, and tools and store equipment purchased, and stable and garage equipment purchased. During the third quarter it has been assumed that previous to the third quarter, during the first and second quarters, immediately after the land had been purchased that architects and engineers had made up the plans for the building, and that the work of construct-.ng the building had been started, and it was assumed that during the third quarter a payment would have to be made on the

buildings, in that a portion of the building construction would be completed. It is also assumed that a considerable 2679 amount of pole material and pole like work would be completed during that quarter; that underground conduit work would be continued, that additional expenditures would be made for rights of way, and that other tools and store equipment, stable and garage equipment would be purchased, in that they would be needed as the construction work increased. A second payment on the building was assumed for the fourth quarter, and a considerable amount of pole work, aerial cable work, underground conduit work, and other work would be done during that period. I have worked that out as to all of the other quarters. I have carefully made these estimates as to how much money would be spent during each quarter, and just where it would be spent. In preparing these estimates a skeleton lay-out was made, a pencil lay-out, to show how the work would proceed, when the material would be ordered, when it would be installed, covering each class of plant, and these expenditures are based on that careful study. I have not assumed that I would have to have all the money at the beginning of the construction of the plant, but we have assumed that we would get the money from month to month as it was required, and on page 5 we have plainly shown we have only charged interest on the money as it was expended. In other words we haven't included any item of interest of any money which might be lying idle. This interest during construction is not confined to money expended on the physical property itself, there are other expenditures made than the expenditures incident to the construction of the physical plant, and in this particular study the interest is confined to those expenditures made for constructing the physical plant.

Cross-examination.

Questions by Mr. Howard:

I think it would take three years to build a plant like this. is a matter of judgment, based on a very considerable amount of experience. I have assumed in this study that the construction would be carried on simultaneously. That is, while the building would be being built that underground conduit construction would proceed, and while the central office equipment was being installed in the buildings after they would be completed, that underground cables would be installed, pole lines constructed, aerial cables placed. The buildings certainly could not be designed and completed in less than one year. The manufacturer of the central office equipment after the order was placed,-and that order could not be placed until after the land was purchased,-could not be completed in less than a year. There is always some delay in connection with land purchases. Before this land could be purchased, we would have to make a study and determine the location on which we would wish to purchase the land. I have never built a plant like this up at one time, from the ground up in a city of 150,000 people, not a

plant of this size, and I never saw one built complete. 2681 has never been done to my knowledge. The whole thing is an estimate, but I would not say that it is a guess, but it is based on a very considerable amount of experience and good judgment, it is not a guess. I feel very sure that if I was called upon to reproduce this plant that I could do it in just the way that I have outlined in this study. Taking your assumption that this town had been behind the times, and had no telephone service, and I started in to give it one, I would go ahead and build the plant up to the very last finishing touch before installing any telephones, or furnishing any service. We would begin to install telephones in about the eighth quarter, that is, during that period we would begin to place the private branch exchanges and that type of station equipment which requires a considerable time to install. Then, in the ninth, tenth, eleventh and twelfth quarters we would be installing telephones and other station equipment. We would not begin at all before the eighth quarter, and would not provide any service until the end of the construction period,-no service at all. It would not be practical to build the plant in units so service could be furnished, and we couldn't furnish service at all until the whole thing was completed, because we couldn't operate a switch-board that wasn't connected up and that wasn't completed. We couldn't operate a switch-board without a storage battery, and all the other apparatus. Of course this plant we have here now took over three years to build, and we never discontinued service at any time. It has required some twenty-five or thirty years to build this plant which we have at present. As a matter of fact we have reconstructed this plant several times during that period. We started in with a small magneto switch-board and then installed a larger one, and again a larger one, and later installed the common battery, and later we installed a branch office; that is in addition to the down town office we installed one in the residence district, and later we installed another, and we expect to continue in that manner. To reproduce this plant as a whole there is no practical way of furnishing service to the people in less than three years, the whole thing would have to be built first, reproduce the Houston Exchange.

"Q. You mean if you were just starting out to see how much it could be done for, and were just concerned with it as you are now, as a theory, to see how much it would cost to reproduce it, it would be done that way, but I am talking about a concern that is not theorizing about it, but honestly wants to go to work to replace the telephone plant with a view of making money. How would they do it?"

"A. In identically the way in which I have built this up."

The time could not be shortened. Anybody who was reproducing this plant other than the Bell Telephone Company probably would take from four to five years, in that they haven't the efficient organization. This estimate is based upon the Bell

efficient organization. This estimate is based upon the Bell Telephone Company's managing it, on the Southwestern Telephone Company reproducing the property. This property might be reproduced in two years, but to reproduce it in two years would cost a very considerable amount of money. I doubt whether it could be reproduced in just two years. It might be reproduced in two and one-half years, but the building could not be completed, the equipment manufactured and installed in less than two and one-half years, but to complete it in two and one-half years would mean working probably three shifts of men, twenty-four hours a day, or mean working two shifts twelve hours a day. The total working time would have to be extended to twenty-four hours instead of eight, and that would require three shifts of men. It would mean excessive cost for all the work which would hardly be justified.

"Q. I see you figure this interest at three per cent, the average time, 6 per cent per annum, on account of the A. T. & T. Company's beneficial services enabling you to borrow money at 6 per cent. It wouldn't be any trouble to get money at six per cent in this community without the good offices of the A. T. & T. Co., would it?"

"A. My best judgment is that a business of this sort, paying the nominal returns which a telephone company does pay, could not even be financed in this State, in that money in this State in general, I am advised, earns more than 6 per cent. I am acquainted with, and have talked to banking people, and business people.

"Q. (Interrupting.) You proved here yesterday that the pre-

vailing rate is six per cent?"

"A. That is the rate on certain classes of loans."

"Q. These are good loans with the A. T. & T. and the Bell System behind it, it would be a pretty good loan, pretty good security,

wouldn't it?"

"A. It means the expenditures—investment of some seven million dollars and I have not included in this appraisal any brokerage fees, any promoting fees or anything of that sort, and those expenses would certainly be incurred, which I have not included in this appraisal. Those expenses would certainly be incurred in case the financing was arranged outside of the Bell Company, and would in effect increase the interest rates on the money.

"Q. It would increase the bonuses that the men who financed it would get, wouldn't it, and they are usually financed by the parent concern, by the mother of them all. She usually looks after them, and furnishes this money. It would just go to enlarge her profits a

little bit."

"A. I don't know just what you are referring to."
"Q. The A. T. & T. Co. owners the whole thing?"

"A. It is my understanding they own most of the stock."

"Q. They own this company?"

2685 "A. Most of the stock."

"Q. When you talk about the Southwestern Telephone Company doing this, and the A. T. & T. Co. doing that, it is like a man taking money out of his right-hand pocket and putting it in his left-hand pocket, because he owns the money in both pockets?"

Mr. Frank: This is an argument on the law; a legal conclusion.

"Q. Eliminating this quarter method that you have set up here, this question of quarters you set up, approximately will this amount

to six per cent upon one-half of the period of construction?"

"A. Approximately, yes sir. Something less than that. There are two ways of figuring that interest. One would be to take the m-an time, that is one and one-half years and apply nine per cent interest to the total money. The other thing to do is what I have done in this case, and apply the interest as the expenditures were made. The greater amount of money is spent in the latter portion of this three years, so that will result in a hittle lower interest charge than would be the case if the mean time were used. This seems to be the fairer way of applying it."

Redirect examination.

Questions by Mr. J. D. Frank:

We could install those telephones earlier than the eighth quarter, but it would not be desirable, in that the telephones would be installed in the business houses and residences and other places and they would not be in service and would be damaged. It would not be good economy to install those telephones along the first, second or third quarter, in that a considerable number of them would be installed where they would not be later used, people mov-

ing and business changing, and in addition to that we would have to be charging up interest on that work while it was lying idle. In estimating the time it would take to reconstruct this property I proceeded on the theory that I wanted to get the exchange to operating as soon as possible in order to begin to derive revenues from it.

This property could be reproduced in two and one-half years, but in my judgment it would cost more to reproduce it in that time than it would in the three year period, and also we would not get as good a job. In order to reproduce it within that short length of time, we would have to work men at night time, as well as day time, and when we work men at night, we have to pay them time and a half for overtime, and also we would have to ship in a considerable number of skilled men. We would have to have more men on the job than we would have if we did the work in the three year period, and that, of course, would entail considerable expense. We would have

to make special arrangements for lighting to work outside at night, and do many other similar things. In my best judgment an independent engineer or construction company could not come in and reproduce this in three years, and I doubt whether you could get a contractor or engineer to take the contract to reproduce this property in less than four to five years. Basing my judgment on my twenty-four or twenty-five years of telephone experience, I would say that three years was the least possible economical period of time which even the Southwestern Telegraph &

Telephone Company, with its organization, could reconstruct this plant.

Page 1 of my appraisal shows that the total reproduction cost of

the physical property is \$5,683,610.00.

Up to this point I have valued or appraised the physical property only, and in my appraisal of that physical property I have not included any increment because the property constituted and assembled and established plant doing business and earning money. I have not included anything other than the cost of the physical property.

The next item in my appraisal is item No. 9 of the first page of the appraisal, "Cost of Establishing Business", or "Going Value".

In what is known as the Houston Exchange in addition to the fair physical plant, the company also has property which is just as costly and just as valuable. We have the records of our property, of the accounts, we have out routines, we have specifications,

2688 we have our subscribers, thousands of contracts, and thousands of accounts have been opened, we, in addition, have an organization of some 665 skilled employees working harmoniously together and rendering service. In making my appraisal I consider that it would cost more to reproduce the Houston Exchange than the cost of the physical plant. I have estimated the cost of establishing business, or going value at \$992,881.00. I have an exhibit which shows how I arrived at that figure.

Mr. Duls: We'll introduce that, Your Honor, as an exhibit, Plaintiff's Exhibit No. 21.

(The document was thereupon received in evidence and marked Plaintiff's Exhibit No. 21, and said Plaintiff's Exhibit #21 is transmitted herewith in Exhibit File.)

The first six pages of this exhibit covers in a general way what would have to be done to establish the business. For convenience in determining the cost, the period of establishing the business has been divided into three parts, (1) the preliminary period, (2) the construction period, and (3) the development period. The preliminary period, the detail is shown on Page 1 of the exhibit, and the summary appears on page 7. I am now talking about "A" on page 7, and pages 8 and 9 represent the detail of "A". I arrived at an amount of \$12,280.00 as the total expenditures during the premimi-

On page 8 is shown the expenses during the nary period. preliminary period, the expenses first covering the preliminary investigation, and second, the legal expenses. On page

9 that is detailed.

In making this preliminary investigation I could not take any ordinary man off the street and set him to work on it, but I have estimated that it would require three experts, that is, three firstclass telephone men. Those men would have to be something more than telephone engineers, they would have to be high-class trained telephone men. I have arrived at \$7,280 as the cost of your preliminary investigation as made by those men and by their assistants.

I have another item under "A" detailed legal expense, and the detail of that is shown on page 10. I have estimated that the total legal expense would be \$5,000. That expense would be incurred by attorneys who would have to confer with the city authorities to obtain and draw up a franchise, to draw up and file a charter, and to furnish general legal advice in matters of organization and so forth. I would have a seven million dollar corporation to reproduce, and I have arraived at the attorney's fees of \$2,500.00. I arrived at that after conferring with our legal department, and we estimated that as being a conservative amount of money that that expense would cost. That includes expense of organizing the com-

pany, and obtaining the franchise and things of that sort. I arrived at the charter filing fees by a letter written to the Secretary of State at Austin asking what the charter filing fees would be for a six million dollar concern. The Secretary of State advised that a fee of \$2,500.00 would be made, and in addition to that about \$1,500.00 would be charged as a franchise tax. I have not included in this exhibit anywhere any other sum for obtaining

a franchise.

Now, the second period, the construction period. That is shown as item "B" on page 7 and covers the expense during the construction period, which includes building up the organization, attaching the business, maintenance and a reserve for replacement. pages from 11 to 20 inclusive show how I arrived at the figures for that period, and page 11 gives the summary. I arrived at a total of \$493,939.00 as the amount of expense that would have to be incurred during the construction period. In my judgment a man who was reproducing this exchange or a company that was reproducing this exchange, would have to make provisions for that sum. In other words it would be a part of the capital that he would have to provide in building the exchange. This all represents money which would be expended during this period in establishing the business.

I will now take up the different items that enter into this period and explain how I arrived at the cost for the different ele2691 ments. Item No. 1 on page No. 11 is the cost of getting subscribers. I mean to say by that that it costs money to get subscribers here in Houston. That is explained in some detail on page 12. The cost of getting the subscribers is made up of advertising, canvassing and expenses incident to the making of the contracts for the service. That has been estimated at \$4.00 per station, and that was based on records kept by the Commercial department of the company as to the cost of securing subscribers. That is based on actual cost record. I have arrived at a total sum for the cost of getting subscribers during that period of \$53,888.00, and the details of the cost of getting subscribers is shown on page 12.

The second item on construction period expense is "Building up of the organization". I allowed \$45,434.00 for that and the details are shown on page 13 of the exhibit. It costs a very considerable amount of money to build up an organization. If I were going to reproduce this property I would have to have an organization to operate it. We are actually spending money at the present time building up our organization. We are continually training operators and the cost of training operators averages \$65.00 each in Houston. To train operators we have to maintain instructors and schools and when a young lady is first employed, she couldn't of course be placed and trained at the switch-board. She couldn't answer calls, couldn't complete connections, and she has to be put through

the school and taught how to operate. By school I mean that we have a teacher there and other operators that show these young ladies how to operate and train them so that they will be efficient operators when they go on the board. We have a school principal. We have special rooms, we have dummy-switch-boards, we have instructors, and it cost money to train those people as part of our organization. It would cost money if I was going to reproduce this exchange, and we would have to have capital provided to take care of the expense of training those employees. The details are shown on page 13.

The next item of expense is item No. 3. "The development of Records, Routines, etc." I mean to say that we would have to have records and routines if we were reproducing this exchange, we would have to have a considerable number. I have a few such records and routines here. These that I show you are the plant's instructions, they are routines and instructions. I also have an exhibit listing those records and routines. These records and routines are essential in the operation of a telephone exchange, we could not carry on an exchange without such records and routines. The details of how I arrive at the cost of reproducing these records are shown on page 14 of the exhibit.

Mr. Duls: Before we go into that the details of that, I want to introduce, Your Honor, as Plaintiff's exhibit No. 22. This is an exhibit which lists the routines and instruction. Some of them,

I understand, would be necessary in operating an exchange.

We introduce that as Exhibit #22. And this lists the records which are essential to the operation of the exchange and we offer that as exhibit #23.

(Thereupon said exhibits were received in evidence, and marked Plaintiff's exhibit #22, and Plaintiff's exhibit #23, and said plaintiff's exhibit #22 and #23 are transmitted herewith in Exhibit File.)

I have estimated that the cost of reproducing those records and routines is \$9,500.00. Some of the details of which are shown on That estimated cost of reproducing those records and routines, we considered because pf printing, the cost of distribution, the cost of making forms, etc. As a matter of fact, to originate all of those records, bulletins, etc. would probably cost fifty to seventy-five thousand dollars. In my allowance for this titem, developing records and receipts, I have allowed an amount which will take care of the printing and distribution of the records and routines, on the basis that the Southwestern Telephone Company were reproducing this property, and that they had already done all of the preliminary work, all of the work necessary to originate all of these records and routines. In other words I have not included any amount for the origination and inception of the records and routines. Those records and routines were in part originated by the American Telephone & Telegraph Company, and in part by the Southwestern Telephone Company. There are general records and routines

2694 which are applicable for all telephone companies. There are others which are prepared and used only by certain companies. That is a part of the service which we receive under this four and one-half per cent payment. If I were reproducing this

exchange I would have to have these routines and records.

The next item of expense during the construction period is No. 4. the first directory cost. We would have to have a directory to operate an exchange the size of the Houston Exchange, and I have allowed \$3,000 for that. The details of that are shown on page 15. I conferred with our directory department, and they gave me the figure of \$3,000 as being a most conservative estimate of what the cost of issuing the first directory would be. I have allowed that directory expense in the twelfth quarter because the directory would not be required until that time. I have divided this up into twelve quarters just as I did in taking the three years construction period, and estimated the interest during construction.

The next item is No. 5, general supervision, and that is explained on page No. 16 of the exhibit. The total amount that I arrived at for that expenditure was \$11,131,000. This item is an item of capital expenditure that the company reproducing this exchange would have to incur aside from any cost connected with the physi-

cal property, and that has been so explained on page 16 of the exhibit. I have said that on maintenance this expense has already been included in connection with the other items.

There is no duplication of this general expense.

The next item is No. 6, "Plant Maintenance". The details of that are shown on page 17. I have allowed as the total amount for maintenance \$68,370.00. I might explain that maintenance on a telephone plant would start at the time the various classes of plants were installed. The maintenance would not be as high on a plant not in operation as it would be on one that was in operation, and in arriving at this maintenance cost, the fact that this plant would not be in operation has been considered, and the maintenance cost reduced accordingly. That amount is a capital expenditure that would have to be met during the construction period. The property would not be operating or it would not be earning.

The next item of expense during the construction period is item No. 7 "Reserve for Replacements." The total amount allowed for that item is \$283,119.00, and the details are shown on pages 19 to 20. The reserve for replacement has to start as the various classes of plant are completed in like manner as does the maintenance. Item No. 8 is the amount of interest which has been applied. That totals \$20,007.00. The interest has been figured at six per cent per

annum, based on the quarterly expenditures. There is no duplication in that. The interest that I allowed in the previous case was on the construction of the physical property, on the money expended in the construction of the physical property. This is money expended in the establishment of the business, so there is no duplication here in having another amount

of six per cent during the construction period. To sum up I have found \$493,939.00 as the total amount that would have to be expended during the construction period in establishing the business,

that being item "B" on page 7 of the summary sheet.

The third period is period "C," on page 7 of the exhibit, the "Operating Deficits during the Construction Period." That total amount of deficits is \$486,662.00. It has been found that in the establishing of telephone businesses that the normal number of telephone subscribers are not secured for a period of some two to three years after the business was then established. That has been the experience of everybody who has been engaged in the telephone business who has had to do with the establishing of telephone businesses. I have taken the two-year period as being the period required to get the normal number of subscribers which we could expect in this exchange after the end of the construction period. Those subscribers would come in 75 per cent of the total in the first year, and 25 per cent in the second year, so that, I estimate that at the end of the second year of this development period after I had begun operation that I would have a total number of subscribers of the exchange. The

details of my figures are shown on the remaining pages of the
2697 exhibit beginning with page 22. Page 22 shows in detail the
operating deficits during the two year development period.

I mean by "Deficit," I mean by that "Operating deficit." The

deficit is that amount of money, is the difference in the amount of money between the revenues earned by the exchange and the expense plus a return on the investment. During the development

period, the expenses exceed the revenue.

I have used an eight per cent return because that is considered as the minimum return which should be earned by a business of this kind. I took eight per cent because it is the least amount that should be earned in an enterprise of the kind, the Telephone Company is. That represents my best judgment as to what this business should earn.

On page 37 of the exhibit I should like to read: "We are seeking to determine the deficits during development period which would be incurred in reproducing the Houston Exchange. The deficits are computed as the amounts per quarter by which the Exchange during the two year development period falls short of earning at the rate of eight per cent.

"If in our calculation of gross revenue for the several quarters during this development period we take as a basis \$795,937, the actual revenue of the Houston Exchange for the first three quarters of 1919,

it would produce abnormal development deficits, for those 2698 revenues are abnormally low, being derived from rates which with a full number of subscribers would not pay the bare

expenses of the Exchange.

"We can work out the normal development losses to be expected in reproducing such an exchange by assuming more normal rates, or a gross revenue which is such that with the full number of subscribers it would amount to eight per cent on the property after the

expenses were paid."

In other words we haven't used the actual revenue which obtained during this period in 1919. If we had used that actual revenue, the deficits during this development period would be considerably in excess of those which we have developed. We have assumed that this exchange would make an earning that is, that the rates would be such, so that at the end of the development period at which time the exchange would have the full or normal number of subscribers, that then the revenues would be sufficient to pay all of the expenses, and an eight per cent return on the investment.

These pages in this exhibit, detailed sheets, show the method and also the figures according to which I arrived at my total cost for the cost of establishing the business or "Going Concern Value." Then

they can be checked by an auditor or engineer. To sum it all up then, in my judgment it would cost to re-establish the business, on top of the cost of reproducing the physical plant the sum of \$992,881.00.

Cross-examination.

Questions by Mr. Howard:

The cost of establishing this business is \$992,881.00. This estimate was rather carefully worked out and was not applied on a percentage basis, but the details were carefully worked out. The

details with reference to attaching the business are shown on page 11, the summary of expense during the construction period of three years. No, I do not start out with the theory of reproducing a new plant, and then figure the cost of attaching business a good deal as if the plant is in the course of construction a great many years, but this estimate is an estimate of the cost of establishing the business in like manner as the estimate of the cost of building the plant. It is not a fact that we make prompt telephone connections now, but on the contrary I think in the residence section, in general, some connections are not being made on account of the congested condition of the plant. I mean by congested condition that there is a lack of facilities. During the period of the war as you know, comparatively little construction work was done, but during that same period a considerable growth was experienced, and the spare plant which we

ordinarily have, that is, the extra facilities which permit us to take care of connection promptly, a great portion of those extra facilities were exhausted. I have no idea now how many applications for telephone installation we have on file, but I imagine we have a great number. I don't know whether many of them have been there for more than a year, I rather doubt that there are any that old, excepting possibly some in the outlying sections where it is a question of building a new pole line, or something of that kind.

"Q. The only conclusion to be drawn from that, that instead of having any cost of acquiring business, you have the cost of keeping away from business"?

"A. You are trying to connect up with this estimate of the cost of establishing business, the business as it exists, Mr. Howard."

"Q. I am speaking now of the particular item of attaching the business, not of the cost you have incurred in developing the business up to this point. Not the proposition that you may run into difficulties in bringing your present plant up to condition, but of the specific thing of attaching or acquiring your subscribers, getting the business."

"A. In connection with this present plant, or new plant?"

"Q. In connection with a plant that is all ready established and ready to go. That kind of plant would be swamped with business, wouldn't it? Assuming thay you had no plant, but 2701 just built your plant now, and it is all nice and brand new

and ready to go with the present intelligence of the people in regard to telephones, and the knowledge of the use of them, you would just simply practically have to close your office and hide out to keep from being over-run by subscribers?"

"A. No sir, what would happen is this-

"Q. (Interrupting.) Your manager now avoids all calls in order to keep away from the insistence of the people wanting telephones?"

"A. You are dealing with the present plant."

"Q. What would be the difference between the present plant and the plant—if this plant burned down or was wrecked in some way, and the telephone service in this town was put out of commission a year or two until a new plant could be built, your biggest trouble would be the pacifying of the clamor for telephones, wouldn't it?"

"A. What would happen is this: A very considerable amount of people, a considerable number of people would come to our telephone office and apply for telephone service. Those would be the business people who had the greatest need for the service. The first people who would come would probably be the people who had private branch exchanges. To handle those people in the office, it would be necessary to write up the contracts—

"Q. (Interrupting.) I am assuming now---

2702 Mr. D. A. Frank: Let him answer the question. I don't think it fair to break the witness off in his answer.

"A. It would be necessary to establish the accounts; it would be necessary to issue the contracts covering the providing of the service, the type of the service and so forth, and it would be necessary to have experienced men who know, who could determine what those people needed in the way of telephone facilities to render them the service which they required. In connection with private branch exchange installation there are many things that have to be determined. All of those things I have estimated would only cost \$4.00 per subscriber, including in addition to the things I have mentioned, advertising. A certain amount of advertising is always necessary."

"Q. Of course, but in the condition of a reproduced plant—assuming this plant had been destroyed and telephone service had been suspended, the only advertising necessary would be to let the people know the plant is open for business, then they would come swarming, not only the private exchanges, and business houses, but residences all over the city, there would be a general scamper to see who could get their telephone installed first, and the principal trouble would be to receive those applications in an orderly way, and give the service and install the telephones in such way as to keep the

people pacified.

2073 "A. To a considerable number of people telephone service is a necessary thing; to a considerable other number of people

it is more or less a luxury."

Possibly it is like automobiles, people clamoring for them whether they can afford them or not. There is no question that the attaching of that business costs money, and I have estimated a very nominal cost per subscriber of four dollars. In this method I have reproduced a new plant, physically, in a condition where it is ready to serve. In the same condition as our plant is now serving the public, excepting for the installation of telephones. It was estimated that at the end of the construction period we would have signed up contracts, established records and so forth the total number of subscribers, and then the two years following we would sign up and connect the other half, 75 per cent of that other half to be connected during the first of the two years, and 25 per cent during the second year. We would need the clerks to receive the applications and sign up the blank contracts and enter the names on the books

and would need these special men to determine the proper kind of telephone facilities to provide. I have set up on this particular item \$53,388, based on \$4.00 per station. That comes under heading "B" on page 7, expense during the construction period and includes building of the organization, attaching the business, maintenance

and reserve for replacements. That is just during the construction period, and the plant is not in use-not in operation at all. The only replacement that would be necessary would be just such as would come from a year or two's age and the maintenance as I have previously explained would be less than for a plant in operation, and it has been figured less. For the cost of getting up that organization to handle the business, and for attaching the business, although the people would be anxious and clamoring for the service, maintaining the property during that period while it is being completed, would amount to \$493,939.00. I consider that that is a very conservative estimate. Most engineers use a flat percentage figure of 20 per cent. I did not use that 20 per cent because this is a fairer way, a better way of working it out, in that we built

Q. The next item,—you have been so modest in that \$12,280 item that I will not ask you about that. I don't know what it is for, but will assume it is in there. Under "C" what do you mean by that? You build a new plant, you haven't any particular development period, you have a plant all built, and have it built upon the prices for reconstruction new. Are you assuming now that you

are going to lose business?"

it up in detail.

"A. The detail of the operating deficits during the two year development period is shown on page 22. That is the period following the three year construction period. I just told you that we have estimated that at the end of the construction period, at the time we

opened the exchange, we would start off with a half of our total number of subscribers, and then it would take 2705 us two years following that to get the full number of sub-

That is based on considerable experience in opening exchanges all over the country. Men who have had to do with that work estimate two to three to four years to get the normal number of subscribers. On page 22 is shown the way in which those opera-ting deficits build up. The first three months of that two year period the revenue is not sufficient to pay the expenses and pay a return on the investment, and therefore a deficit is created.'

"Q. Why do you assume that when you will have all the business that you can do? That is based largely upon the idea that the people have to undergo an initial period of construction and education and soliciting, --educating the people up to the point of the value of the service, isn't it?"

"A. No sir, it is based upon actual experience in the establishing

of a telephone plant."

"Q. That is already existing. We are reproducing a plant that is already to start off, and in a community where the people have been educated up to the value of telephones, to the point where they are clamoring for them, and abusing the telephone company because it don't give them service, and all that sort of thing. Why then will there be any falling off in returns, or a deficit in returns either when you have the business already attached?"

2706 "A. I talked to Mr. R. B. Still, the General Manager of the Gulf States Telephone Company, who has opened telephone exchanges in the last two, three and fours years. I also talked to Mr. Blomeyer, of the Texas Telephone Company at Waco—

Mr. D. A. Frank: What position does he occupy with reference to the Texas Telephone Company?

He is the President of that Telephone Company, and I have talked to other men who have had experience in recent years, recent time, in opening telephone exchanges, and that is their experience

even though people do know what telephone service means,

That is not where there was a competing line, but of course it was in a smaller town than Houston. It was not in small towns where people have never been accustomed to telephones. Their experience covers two different things. One, the establishing of a brand new exchange, telephone exchange, and second, the purchasing of existing telephone exchanges and developing those exchanges and that is their best judgment. Other men have given me the same information. Their experience was not in towns where telephone service had not been employed before. I just stated that their experience embraced two different things, one, the establishment of new exchanges, and two, the acquiring of exchanges and rebuilding them and then developing them. They bought the plant and rehabilitated it and developed it, so it

2707 covered both things, and they were very earnest in their statement that it requires in excess of two years, would be nearer three or four years, before they ever got their exchange on a paying basis. We have telephone exchanges all ever the country, to the farms and small towns. In some places the farmers through the better developed sections of the country stick up their own poles and string lines and get telephone service for about \$12.00 a year, and in some places for \$6.00 a year. The only difference I can see there and in the cities where the people have to communicate with each other so much is in the size and amount of business. The need for the service is still there. I cannot agree to the fact that the people haven't learned the value of it as they have in the city, I think they have learned the value of telephone service.

"Q. Mr. Hoag, in your set up of the cost of establishing business, is there any of these sub-heads you have here that will in any way apply to losses sustained by obsolescence or inadequacy? That would hardly apply in a new plant, would it, under the theory which you have reproduced this plant, you wouldn't have any losses

from obsolescence or inadequacy to speak off?"

"A. We would meet with the usual losses which are cared for by

our reserve for replacements."

Obsolescense and inadequacy does apply with as much force to telephone companies as it does to other utilities.

Our best judgment is that only 35 per cent of the plant of a telephone plant which is displaced, which is removed, is removed on account of its being worn out, and that 65 per cent is removed on account of inadequacy, obsolescence and public requirements, and that is a very conservative estimate. I mean to say that in building up this plant I would probably have to remove 65 per cent of the material and equipment at different times on account of its being worn out and 65 per cent of it removed on account of inadequacy, obsolescence and public requirements. I mean 65 per cent of what has been removed has been removed on account of obsolescence and inadequacy. When we once get our conduit lines placed we still have trouble about having to take them up, or change For instance: In connection with the construction of your Main street viaduct here over Buffalo Bayou, as I recall the figures, we were put to an expense of some thirty thousand dollars and had a charge against our reserve for replacement of something less than twenty-thousand dollars-the details will appear later-due to the fact that we have to abandon certain conduit runs and underground That is an example of public requirements. I would not say that our conduits that we have here now are not a permanent proposition, I wouldn't say that for the conduit system as a whole, but there are many parts of it in the city that will have to be

changed. We figure an annual rate of reserve on underground conduit lines of two per cent. That contemplates a fifty year life. We can figure out in advance where out main cables have to run and where our main lines have to run as a community grows, but necessarily that engineering cannot always be accurate, there are bound to be some mistakes in a growing community like Houston. A small example of what happened in connection with conduit lines: We built a lines out Fannin Street a good many years ago to McGowen Avenue, and at that time south of McGowen there was only a very limited amount of business, that portion of the city had not developed at that time. Since that time you know what the development has been. At the corner of Fannin and McGowen we built a small man-hole, and from that man-hole took out our small cables, ran them up the pole and extended them on out by means of aerial cable and open wires. We later had to come along and extend that conduit from McGowen and Fannin 'way out into the Montrose Addition, and into other portions of that third ward, and had to place heavy runs of underground cables out there. That made necessary the reconstruction of that man-hole at the corner of McGowen and Fannin. Our construction out to that point was adequate and sufficient to take care of any future development, the main line was, yes, sir, but this particular man-hole had to be all torn out and thrown away, and a large junction man-hole constructed to care for the heavy run of cable which had to be placed on account of this growth. That is an example of inadequacy in connection

2710 with conduit construction. The main line conduit is in Fannin Street and is being used and will be used for years, and we hope it will serve. We hope we will not have to move it.

We figured it would last fifty years in this rate of reserve we have established here, two per cent. We may have to add to it, but that would simply be additional conduit, but we don't figure it will wear out. So far as it goes it is adequate, it is so adequate that it may be built on to from time to time. I don't mean by "conduits" the trenches, but I mean the conduit itself, the man-holes, the vitrified clay ducts, and that portion of it, the things that permit the cables to run through. On the underground cables we figure the rate of reserve is three per cent, that is a thirty-three year They are not as permanent as the underground conduit on account of their being subject to damage. They are also subject to inadequacy. Underground cables are replaced on account of inadequacy very frequently. We have for example: The business section of Houston is constantly developing and enlarging. I have seen it enlarge from a comparatively few blocks to a very large area which now exists, and as the town continues to grow, that is going to continue to enlarge. From the main line cable on Main Street—when the business section did not extend west of Travis Street—we placed a 100-pair cable to serve that section west from Main Street to Travis Street. Then as the business

district grew, as it enlarged, we had to replace that 100pair cable with a 200 or maybe a 400-pair cable, and later we had to replace it with a 600 or 900-pair. That is a good example of inadequacy in the case of underground cables. We have put in cables now that are as large as susceptible of being put inwhere the amount of business justifies it. We of course cannot place a 900-pair cable, which is quite expensive, to serve forty or fifty subscribers, without we are very sure we are going to get such a growth in such a length of time as to justify the expenditure for the 900-pair cable. It never happens that in the growth of the community as a whole that we are required to change our conduit system as a whole, abandon one line because it didn't serve and construct a conduit in another portion that was built up, but we do have to abandon parts of the conduit lines. We do have to do that, and that means a considerable charge against our reserve for replacements. The example that I mentioned a while ago in connection with this viaduet work. I think of another one in connection with building construction when the conduit is laid close to the curb. When a large office building is constructed they invariably use the space under the sidewalk as a part of their basement space. Those things are occur-ing every day, every week, every month, and will of coursse, continue to occur as the town grows, making the conduits as located, subject to change,

2712 In other words, our foresight wasn't as good as it would have been if we had known just how the town would develop. If we knew positively what was going to happen as to the growth of the town, these conduit lines could be built much more permanently and there would be fewer changes. Not knowing that, the conduit lines are to some extent, at least, misplaced. And in connection with changes in street grades, we have to lower manholes.

The question of obsolescence of switch-boards is also dealt with in some detail here, and can be better shown if you care to wait until then. Inadequacy and obsolescence in switch-boards are two very different things. The switch-boards become obsolete when it is replaced, when a new invention, research work, develops a switch-board when renders more efficient service. That has occurred here in Houston of fairly late years. I might tell you what is happening in Dallas today. In the Dallas main exchange today we are displacing our manual equipment, manual common battery equipment, which is the same kind you have here in Houston, with automatic. That is in the Main Exchange and by the last part of the year we will also be doing the same thing in the Haskell Exchange district. In those two districts combined are some twenty-two or twenty-four thousand telephones in the city of Dallas. It is possible that we will have to replace our manual common battery equipment in this

Houston Preston Exchange. As a matter of fact we have it scheduled simply to protect ourselves in case we have to have the automatic equipment. There is such a demand for that that you have to schedule your needs considerably in advance. We do not contemplate changing it at this time, but we may have to replace it in three, five or seven years, or even less time. necessitates the displacing of this entire switch-board, and it means a charge against the reserve fund for replacements in excess of five hundred thousand dollars, and means expenditure for new plant in excess of a million and a quarter dollars to do that one thing. would tend to cut down the operating expense, but the initial cost of the automatic is considerably greater than the manual common battery system, and also the cost of maintenance is greater in that it is much more complicated that the common battery system. there would, of course, be a salvage value on this equipment which That salvage value might equal 20 or 25 per cent of the initial cost of that equipment, so that the loss would be 75 per cent approximately of the initial cost of that equipment. That would necessitate some reconstruction or remodeling of the building, because the building as now constructed is sufficient to care for the manual common battery. There is not, however, in the building sufficient space to care for the automatic equipment in addition to the equipment which is already there. Neither is the building

arranged, as it would have to be arranged to care for the automatic in that it was built some seven or eight years ago before the automatic had been given serious consideration. The automatic service is being given serious consideration. We are installing it in Dallas, and it is being in many other places. We would have to remodel this building which would mean a charge against the reserve for replacements, and we would have to add to it to install the automatic. It would not be just a minor change, but it would mean tearing out practically all of the west side of that building for several floors and adding to it, and remodeling the interior of the building, providing space for frames and things of that sort. That would effect the discribution system to this extent: That to connect the distribution system to the automatic new frames

would have to be installed in connection with the automatic equipment. New underground conduit construction would have to be placed, and a very expensive job would have to be done of underground cable work connecting these cables to the existing underground cables at the corner and carrying them on up to these frames which would be installed in connection with the automatic equipment. That in itself would probably cost \$50,000.00. It would not affect our aerial distribution system at all.

There are things which do affect the aerial distribution system. There are more things that affect the aerial portion of the distribu-

tion system than any other portion of the plant, with the possible exception of substation apparatus. Many things Inadequacy, that is, the growth of the city, cause that. public requirements. Inadequacy is the biggest thing. to the elements. Police regulations do not have anything to do with it, but the individual regulations to which we are subject by the residents have a great deal to do with that. Treating the fire limit as a police regulation: In 1907, I think it was when Mayor Rice was here in Houston, an ordinance was passed, possibly it was passed in connection with the franchise, requiring us to remove a very considerable amount of aerial construction in the down-town portion. In fact, it required us to remove all aerial construction within these established fire limits. You are wrong, that is not a thing of the past. As the town grows necessarily the fire limits extend and necessarily we will be called upon to remove our aerial construction in like manner as people who construct buildings in the fire limits will be called upon to set up fire proof buildings.

This matter I spoke of, having to change the building to install automatic equipment, would also apply to the lesser exchanges, like the Hadley and Taylor exchanges, but it wouldn't apply immediately. It would probably develop in like manner as we expect to develop the automatic service in Dallas. It would affect the switch-boards on those exchanges, in that extensive automatic 2716 equipment would have to be installed, and those switch-

boards would have to be remodeled to take care of the interconnecting between the manual common battery switch-board and the automatic switch-board.

Redirect examination.

Questions by Mr. Duls:

In making my estimate of what it would cost to establish the business I have attempted to arrive at the value of the plant, other than the physical plant. That is ordinarily called the Going Concern Value. I have made an estimate of what it would cost to establish the business in order to find that going concern value in like manner as I made an estimate of the cost of reproduction of the physical plant, physical property, in an effort to determine the value of that portion of the plant. The cost of establishing business includes a great many other items besides the cost of getting subscribers and

that is shown on this exhibit on the cost of establishing business. So that, when counsel questions me about the cost of establishing business in terms of the cost of getting subscribers, he left out of consideration a great many other items that enter into the cost of establishing the business, he leaves out the major portion of it.

Mr. Duls: Turn to page 11 and name some of the other items that enter into the cost of establishing business, or going con-

Mr. Howard: He testified to all that the other day.

Mr. Duls: He didn't mention them. He testified to some of them. I just want you to learn the other items besides the cost of getting the subscribers that enter into this thing.

Item 2 is building up organization, Item 3, developing records, routines and so forth. Item 4 is the first directory cost, Item 6 is plant maintenance. Item 7 is reserve for replacements. And on page 22 are the deficits during the two year development period, which constitutes the major portion of the cost. Those are some of the items other than the cost of getting subscribers, that enter into

his thing.

In estimating what it would cost to get subscribers I have made allowance for the fact that some subscribers would come in voluntarily, and have assumed that most of the business people would come to our office and apply for service, and a considerable number of people who desire service in their residences would do likewise. I made an allowance for that in arriving at my cost. It is a fact that today, with people clamoring for telephone service that we are doing advertising in Houston. If I were going to reproduce a new plant here I would have to do advertising. The cost I arrived

at of getting subscribers, the estimated cost, is based on actual cost records. That is, the records of the company show what it cost on an average to get subscribers and that is the cost I used. The records of the commercial department of the company show that cost and that is what has been used. Subscribers have been coming in voluntarily all the time, some subscribers, and still it costs money

to get subscribers.

In arriving at the deficits during the development period I did not use the existing rates. I instead used rates which at the end of the development period, that is, at the time when we had the full or normal number of subscribers, that would produce a revenue sufficient to care for all of the expenses and a return of eight per cent on the investment. If I had used the present rates for service,

the deficits would have been very considerably larger.

Page 4 of my appraisal shows the taxes during the construction period. When this matter was taken up a few days ago, the question came up as to whether or not I gad correctly figured that item out of taxes during the construction period. I have gone over that matter again, have checked that and find that my figures were correct, and that I did not make an error as at first thought I had. Therefore, the set up as shown on page 4 is correct. The usual

method of figuring taxes during construction is to figure the taxes on a mean time basis. That is, if the construction period is three years, then, after determining the amount of taxes to be paid, the total amount of taxes to be paid per year, that amount would be applied for one and one-half years on the assumption that the money expended would be expended for that average meantime of one and one-half years. I didn't consider that quite the fair way to work up the taxes during the construction period, and have therefore built it up on the basis of the expenditures as made during the quarterly periods for the three years. That resulted in the total taxes during the construction period of \$101,720. If those taxes had been figured on a mean time basis it would have resulted in the taxes totaling \$109,856, or \$8,136 more than the amount as used. The time at which the taxes are paid does not in any way affect the amount of money which should be capitalized in that these taxes are paid and form a part of the expenses of the construction of the plant. That is a part of the expenses which are incurred during the construction period. Even though the actual amount of taxes were paid one year or two years after the plant began operation, nevertheless there is an expense which was incurred during the construction period and is therefore a proper capital charge.

Cross-examination.

Questions by Mr. Howard:

2720 "Q. Mr. Hoag, let me see now: Did you figure that you paid any taxes on this 1, 2, 3 and 4 during that year?"

"A. The point I just made was that it doesn't make any difference when these taxes were paid, whether they are paid one year after this plant is constructed, or six months afterwards."

"Q. My question is whether you have to pay any taxes at all

for the first year, except on the real estate?"

"A. If I may explain that in detail I will say this: October 1st, 1919, was the date of the inventory and the appraisal, and therefore that was taken as the date of the beginning of this construction period. In the first quarter, which would be the period from October 1st to December 31st, 1919, as this shows, we would have purchased the real estate; therefore, we would have to pay the \$401 taxes, as shown on January 1st, 1920."

"Q. Did you advise yourself concerning the Texas law in regard

to taxes?"

Mr. Frank: He doesn't mean pay it; he means become liable to pay it.

"Q. If you purchase real estate in January, don't you know as a matter of fact you wouldn't have to pay taxes on it at all for the year 1919?"

"A. We would have purchased this real estate between October 1st and December 31st. That is, about the middle of the period, previous to January 1st."

"Q. And don't you know that you wouldn't have to pay any taxes at all for 1919?"

"A. The point I made a while ago is, it don't make any difference

when these taxes are paid."

"Q. It makes a difference whether you have to pay them at all?"
"A. We do have to pay them."

"Q. I am asking you if you familiarized yourself with the Texas

laws upon taxation?"

"A. It has been my experience in purchasing land for this company, and for myself, that when you purchase land as of October, or some other period in the year, that you assume the taxes for one-third of the year, or a half of the year, as the case may be."

"Q. I am asking you if you familiarized yourself with the Texas law upon the subject of taxation, and who is liable for taxes for

property."

Mr. D. A. Frank: It isn't a question of liability it is a question of practice, and what he states is the exact practice.

Mr. Howard: He hasn't purchased it in 1919; he is theorizing

about it.

Mr. D. A. Frank: What he has stated, that if you purchase land on the 1st of October, you have to assume a proportionate part of the taxes for the year. It is a question of agreement.

Mr. Howard: He is purchasing property and is supposed to get

a good title, and isn't assuming anything.

Mr. D. A. Frank: I passed personally on every contract from 1905 to 1914 on property in this town, and in one of those particular cases—right here at the Preston Exchange they assumed the taxes for the proportionate part of the year.

Mr. Howard: We are talking about the plant you are reproducing.

Mr. D. A. Frank: It is a matter of practice.

"Q. I am asking you if you familiarized yourself with the law and ascertained that the taxes for that year were assessed against the grantor, and not against the grantee? You didn't take that into consideration at all, as I understand you."

"A. I have not thoroughly familiarized myself with the law."

"Q. You have taken into consideration the fact that improvements placed upon the property after the first of January, are not assessed for taxation at all during that year?"

"A. I know positively that you pay taxes on property which

you own."

2723 Mr. Duls: On what date?

"Q. Did you ever build a house on a vacant lot?"

"A. Yes sir."

"Q. And did you discover when you came to pay your taxes at the end of that year, after they became due for that particular year, that you paid only upon the real estate, notwithstanding that you had put improvements on it after the first of January?"

"A. I don't recall just what I did."

"Q. If that is the law in this State, that you pay taxes only upon such improvements as are on the property on the first day of January of that year, your set-up would be an error to that extent, would it not? If you didn't have to pay the taxes at all?"

"A. I don't understand it would be an error, no sir."

"Q. Let's assume for illustration that you started to put up this plant in January, 1920, you are starting right now and putting up the first four quarters, during this year, beginning after the first of January of this year, don't you understand that you wou'dn't have to pay taxes at all upon those improvements for the year 1920."

A. No sir, I don't understand that." "Q. You don't understand that?"

"A. No sir."

"Q. If that is a fact, it would change your set-up of the 2724 taxes would it not?"

"A. No sir, not as I understand it, in that we have to pay

taxes on all of this property."

"Q. I am assuming you don't pay it for the improvements put on there during 1920. If that is the law, and you don't pay those taxes, that would make a difference in your set-up, because your set-up is based on the theory that you do pay taxes on those improvements for the year 1920."

"A. I have assumed that we do pay taxes on the expenditures as made in 1920, on the amount of property which has placed during

that period."

"Q. If, as a matter of fact, you don't, and the law doesn't require you to do it, your set-up would be in error as to the taxes, wouldn't it, your estimate as to the taxes?"

"A. I don't understand it that way."

"Q. It is a very simple thing. Take my assumption, whether right or wrong, suppose you put on those improvements, the \$235,000, \$170,000, \$376,000 and \$542,000, that you put that on the land after the first of January?"

"A. Yes sir."
"Q. You have made your set-up on the assumption that you have to pay those taxes?"

A. Some time."

"Q. Yes sir, sometime on that property."

"Q. If, as a matter of fact, you don't have to pay taxes on it at all for the year 1920, the year on which they are put on 2725 there, then your set-up would be erroneous to that extent.

I am not saying as you computed it that it is erroneous, but I am saying if you make that assumption, and you would not have to pay taxes on that equipment at all, then your statement would be bound to be erroneous."

"A. I would have to study that carefully before I could answer it."

"Q. It is very clear." "A. No sir, it isn't."

"Q. If you don't have to pay them, if you have included something that you think would have to be paid, and you find out you don't have to pay it, your estimate would be erroneous to that extent?"

"A. If these taxes don't have to be paid, this would be wrong."

Mr. Howard: That is all I want to ask you.

Redirect examination.

Questions by Mr. D. A. Frank:

In the course of three years in constructing a plant, began in 1920, we would certainly begin to pay taxes in 1921, and property erected during 1921 would bear taxes as of the date of January 1st 1922. So, that the only difference my set up, would be, instead of being divided up into quarters, it would be annual instead

2726 of quarterly, and what I have done here is to allocate it to quarters in an effort to build this up on a fairer basis than by taking the mean time, and is actually less than it would be if we were constructing the plant new. And in addition to that the whole plant that we have assumed here is the taxes paid on the present assessment, which is considerably less than the real value of the property. In other words I have merely applied the figure that is based on the present assessment and payment of taxes, instead of what it might be if I were constructing a brand new plant.

Cross-examination.

Questions by Mr. Howard:

I assume that I started to build this plant in October 1919, and there are no improvements on the land in the first quarter. The first expenditures for building is made in the third quarter which would be between March 1st and June 30th 1920. That \$235,519.00 represent the amount of money which was spent in the purchase of the land, and the next figure \$117,559.00 represents the average amount of money. In other words, to be strictly fair, we have not assumed this \$235,000 would be spent as of October 1st, but we have instead assumed that it would be spent about the middle of the period. We spent that money for the land, That is, we bought the land with the \$235,519.00. I have figured the taxes on the land of the period of the period

land from the very day we acquired it and it is \$401.00.

The next item \$170,377 is the average amount of physical plant in place.

On page 2 is the set-up that shows how I have added my improvements during this time, and also on page 3. The land is being shown as purchased in the first quarter, that is the first item. Then the building—although the building construction would start during the second quarter and probably even during the first quarter, still the first payment to the contractor would be made in the first quarter of \$104,138.

Redirect examination.

Questions by Mr. J. D. Frank:

Page 1 of my appraisal shows the total reproduction cost of the

physical property \$5,683,610.

The next thing appearing below that is expressed in this language: "Present or per cent condition of Physical Property, 92.91 per cent." I tried to determine the present condition of the physical property, because the estimated reproduction cost is based on reproducing the plant new, and to determine the present value it was necessary to determine the present condition of the property. That is to determine the accrued depreciation and to deduct that

accrued depreciation from the total reproduction cost of the property now. I found the property to be in 92.91 per cent condition. I determined the present condition of the property by a careful physical inspection of it. I made a general inspection of all of the distributing system. In the case of pole lines, I saw practically all of the poles in the exchange. Where the pole lines were obviously in the first class condition I made a detailed inspection of every twentieth or twenty-fifth or thirtieth pole; where the poles did not appear to be in such good condition I made a careful inspection of a large number by digging around the poles at the butts, determining the amount of decay, and whether or not the poles had a hollow heart. In the case faerial cables, and aerial cable accessories, such as suspension str. ds, bolts and so forth, I made a careful inspection of that portion. I inspected a considerable amount of sub-station equipment, and installations in the business district. I only inspected a limited amount, in fact, only a few of the telephones in the residence sections in that it was difficult to get into houses for that purpose. I covered the buildings by starting at the roof and going through to the basement, paying particular attention to the buildings as a whole, and also to the parts of the buildings that wear, like windows, doors, floors, elevators, heating plants, lavatories and so forth. I have been over a good many hundred telephone exchanges, large and small, and this property is in as good condition as any exchange I have ever been over,

and is better than 90 per cent of the telephone exchanges. With reference to some of the factors which tend to keep telephone property in high-class condition, the fundamental thing is the initial construction of such a property. The best materials procurable for telephone properties has been used, good engineering has been done, and first class workmanship has been used in the construction of this property. That means that a plant so constructed will remain in a perfect condition generally than a poorly constructed plant. The maintenance of the plant, that is, the day to day repairs and up-keep has a considerable bearing on the condition of a plant. This property is highly maintained. A well trained and efficient organization is constantly employed in keeping up this property and the parts of the plant have not been permitted to wear

and deteriorate, but instead have been repaired from day to day and have been kept in a first class working order. The replacements of the plant from time to time have a considerable effect upon its condition.

I haven't the replacements and enlargements separated, but the replacements and enlargements combined, that is, the net addition to the plant for the last nine years total over \$2,551,000. That is for the last nine years. For the last five years the net additions have been one willion two hundred seventy-seven thousand

have been one willon two hundred seventy-seven thousand dollars. That is the cost of these net additions, enlargements

and replacements.

The gross additions for the last nine years total \$4,252,736.00 for the nine year period. That much new construction has been put into this plant during the last nine years. Since 1914 it has been \$2,325,372.00. A considerable amount of replacements are replacements before the plant has lived its useful life, and that applies particularly to the aerial portion of the plant. Take poles, for instance only a very small percentage of the total are permitted to live their useful life.

All these matters mentioned by me tend to keep the per cent condition of the property high. There is one other matter which has not been mentioned, and that is the growth. In a growing plant, like Houston, the growth, of course requires large quantities of 100 per cent new material to be placed. And as long as the growth continues rapid, you will find as much new construction in a plant of this kind as you will old construction. This is shown more in detail in my appraisal on page 9. Also, certain details in connection with it are shown on page 8.

On page 8 is shown the reproduction cost of each class of plant, in the first column it shows the cost not including overhead expenses.

In the second column is the reproduction cost including over-2731 head expenses of each class of plant, and the third column is the per cent or total reproduction cost in each class of plant. For example the land represents 4.58 per cent of the total of the reproduction cost. The Central office equipment represents 24.64

per cent of the total reproduction cost.

On page 9 the first column shows the per cent of total reproduction cost in the class of plant as built up on page 8. The second column shows percent condition of each class of plant, and the third column shows weighted present condition. The first item of land which represents 4.58 per cent of the total reproduction cost of the property, is in 100 per cent condition, in that land does not deteriorate, and the weighted present condition of the land is 4.58 per cent. The land does not depreciate, but I have included it in this consideration of the present condition of the physical property because it is a part of the physical property, and what I am trying to do is to determine the present condition of the physical property as a whole.

Mr. Howard: What do you mean by "Weighted Present Con-

dition?"

Mr. Hoag: That means this: Take for example the pole plant,

which represent 7.86 per cent of the total reproduction cost of the property. The pole plant has depreciated 13 per cent in that it was found in 87 per cent condition. You can work that out by deducting from your 7.86 per cent 1021, which will give you

the Weighted Present condition.

Mr. D. A. Frank: You will get the same result by taking 87 per cent of 7.86.

Mr. Hoag: Yes sir. In other words, multiplying the first column

by the second column and you get the third column.

The stable and garage equipment, the last item on the sheet, was found in 75 per cent condition, it having depreciated 25 per cent.

There is an item of right of way there. That depreciates. That item depreciates 100 per cent at the time, at the moment the right of way is abandoned. When a right of way is obtained, it is charged on the books under the Right of Way account at whatever it costs and at any time the right of way is abandoned we have to charge it off the books, and the only way it could be charged off would be to clear it through reserve for replacements. For example: We have a right of way across the G. H. & S. A. Railway yards on Montgomery, which cost several hundred dollars. If we should re-route our construction and carry it along some other street, then at the time that right of way was abandoned we would have to charge

to reserve for replacements whatever that right of way cost us originally. As long as we have the right of way it is in 100 per cent condition, but the moment we lose the right of

way it deteriorates down to zero, goes from 100 per cent down to zero and becomes a loss altogether.

Cross-examination.

Questions by Mr. Howard:

We still have the right of way, and it is in 100 per cent condition, and it is so shown here. A physical inspection is the only possible way of determining the condition of the plant, It is not possible by inspection, to observe all the different parts of the plant, such as underground conduits between man-holes, that is, sub-surface construction and only the end of the conduit can be seen. You can make a fairly thorough examination of installed machinery, but there are parts you cannot see.

The average life of a plant, telephone plant, as a whole, is around fifteen years. That is the average life of this particular plant as a whole understand. That does not apply to any particular part of it. Some parts might have a life of two years and some twenty years. I could not answer the actual life of the plant as a whole, except as I have done, that we figure an average life is about fifteen years

for such a plant as a whole. I think my answer is about right, that the life of this particular plant as a whole is about fifteen years. I don't know that there is any money set aside for amortizing the plant. For reserve for replacements we have estimated 6.334, that is 6.33 per cent. The reserve for replacements—that fund is charged with such replacements as are made.

either for inadequacy, obsolescence, fires, storms, or other casualties. We keep our books according to the Interstate Commerce Commission requirements, and the Interstate Commerce Commission specifically provides for reserve for replacements in their accounting set up.

"Q. They may provide for reserve for replacements which means practically that fund is for the purpose of amortizing the plant and securing the investor the investment at the end of the period?"

"A. That fund is to protect the property"

"Q. To protect the property and to keep it at 100 per cent, so that at the end of the time the investor will have whatever is in the depreciation reserve added to the depreciated condition of the plant will mak it 100 per cent. That is the theory? ?

"A. No sir."

"Q. What is it?"

"A. The purpose of that fund is to care for replacements,

2735 due to these many causes I have mentioned."

"Q. Wouldn't that have that effect? The purpose of it is this depreciation reserve is set aside on the theory that the plant as a whole, aside from mere maintenance and replacements to keep it in operation, that it deteriorates. That is the theory upon which the depreciation fund is set aside upon?"

'A. Yes, sir, but that fund is being spent from day to day, and

week to week and month to month."

That is the reason it is set aside, to protect the property, to care for the replacements. That is replacements over and above the replacements under the Interstate Commerce Commission rules that we are charging to operating expense, those constituting minor repairs and up-keep from day to day. Certain character of replacements and renewals. In addition to that we set aside 6.33, not for the purpose of authorizing the deterioration of the plant, but for the purpose of caring for these replacements which are necessary. I do not think they are the same thing, not to my mind.

Mr. J. D. Frank: You are confusing maintenance and depreciation.

Mr. Howard: No sir, maintenance is paid out of the operating expense under the rules of the Interstate Commerce Commission. This in addition to that maintenance and replacements necessary to keep the plant operating and functioning to a reasonable degree there is another provision made for amortizing the investment.

Mr. J. D. Frank: Not amortizing.

Mr. Howard: For replacing it, that is amortizing it.

Mr. Hoag: To protect the property.

Mr. D. A. Frank: If amortized there would come a time when we wouldn't have any capital at all. Anything that is amortized is wiped off.

"Q. You are making provision to return to you your capital at the end of the time, at the end of the plant's life, and for that purpose,

over and above these maintenance expenses you set aside 6.33 per cent?"

"A. Yes sir."

"Q. Based on its average life, a little over 93 per cent?"

"A. On the basis that the plant has a life of from fifteen to sixteen years, I would set aside a sufficient sum during that fifteen or sixteen years to replace the plant. Now, whether it was replaced at the end of the period, or at various times through the period-

'Q. (Interrupting.) What do you mean by replacing it-such sum as added to its then per cent condition would

bring it up to 100 per cent?"

"A. A plant is not in 100 per cent condition, that is the physical

condition is not."

"Q. That is the theory of it, to bring it up so that the plant itself, as distinguished from the value, the rise and the fall of the value of the material and labor that has gone into it, this fund is for the purpose of creating-this sum you set aside 6.33 per cent is for the purpose of putting the plant back in 100 per cent condition?"

"A. Yes sir."

"Q. And providing for the difference between the plant in the condition it was originally installed, and the condition it is in at the It would be added to its junk value, that is what I mean. You say this plant was elegantly constructed in the beginning?"

"A. Well constructed."

A plant that is well constructed remains in better condition for its life than a poorly constructed plant. A poorly constructed plant might last as long. It might be used as long, but would not be in as good condition. This depreciation reserve is a sum determined by a realized depreciation which takes place from year to year. In our case it is determined from experiences in the State of Texas

for the Southwestern Telegraph & Telephone Company. 2738 don't know how depreciation in a telephone plant compares with depreciation in a street car system, I don't know enough about it to discuss it. I know that different utilities use different percentages, dependent upon what their experience has been as to the realized depreciations in like manner as we depend upon our ex-

perience.

Mr. J. D. Frank: We have got a whole lot on that, that we are going to put in.

My idea of the physical condition of this plant is based only upon such physical examination as I have given to it. I devoted about seven or eight days directly to inspecting the plant, but I did not dismantle any of it. I am very familiar with telephone plants, and can determine their conditions quickly and fairly accurately. I determined the physical condition of the plant but with that determination my inspection did not cease. In addition to the actual physical inspection of the plant which I made I also determined the number of troubles per hundred stations per month which we experience. For the year 1918, which is the last year in which we have complete statistics, of course, we experience about six

troubles per hundred stations per month. That is a very good indication of the condition of a telephone plant. The average telephone plant at this time runs eight to ten cases of trouble per month per hundred stations when figured on the same basis as we figure them.

am quite familiar with the Houston plant, in that I engineered a considerable amount of it and inspected a considerable amount of it at the time it was installed, and as the work progressed. That, in the case of underground conduit construction means this: that I know how a considerable amount of this underground conduit was constructed; I know that conduit was laid in an envelope of concrete; that that concrete was properly mixed, and that that furnished a good substantial structure and based on that I know in a general way what the condition of that property is which I could not see. My inspection included all of those things. I did not make a chemical analysis of it.

Redirect examination.

Questions by Mr. J. D. Frank:

The total reproduction cost of the physical property was \$5,683,610. I found the property in 92.91 per cent condition. My appraisal of the physical property with reference to its present condition is \$5,280,642. That representing the total reproduction cost of the physical property, less depreciation accrued depreciation. I do not figure any deterioration of the working capital, and cost of establishing business. It was considered with reference to the physical property itself.

2740 Item 10, the last item on the summary of my appraisal, is "Working capital, Including Supplies." I have included \$238,818 for that, and that includes the cash on hand necessary in the handling of a business of this size, the cash necessary to pay salaries and wages, to meet current bills, make ordinary purchases and similar things, and also includes as stated the value of the supplies. That is the amount of money we would have to keep on hand for the purpose of running this business. The accountants furnished me with that figure. The accountants will testify concerning that more in detail just as to how they got that figure.

Cross-examination.

Questions by Mr. Howard:

As to whether the company collected its revenues in advance, I don't know just what the practice is in Houston at this time. Bills receivable and bills payable enter into working capital, and the accountants can explain that in detail.

Redirect examination.

Questions by Mr. J. D. Frank:

I am not an accountant, but have just accepted the figures

2741 which have been furnished to me by the accountants.

I have found the cost of reproducing this property in its present condition, including cost of establishing business and working capital, including supplies, the total reproduction cost, less accrued depreciation, \$6,512,341. The cost of the Houston Exchange property as shown by the books of the company and as testified to by the accountant, Mr. Scott, shown in his exhibit No. 10, as of September 30th, 1919 was \$4,810,385.40.

The Master: What does that represent?

Mr. J. D. Frank: The cost of the physical property of the plant, as shown by the books of the company, as testified to by Mr. Scott.

I have considered the net and gross additions which have been added to this plant from time to time. The estimated population for Houston for the year 1918, based on the scholastic population on the ratio of 6 to 1, was placed at 160,000. The population must be considerably greater at this time. The growth of Houston has been very rapid—of the city. The future prospects for Houston are of course very bright, as indicated by all available data, such as bank

clearings, building permits, assessed valuations, bank deposits, and the growth in population. I have made a study of what the future of this telephone plant will be for, say the next ten

years. In 1929 we have estimated that Houston will have a population of between 245,000 and 250,000 people, and we have estimated that with that population in 1929, we will have a total of 50,749 telephones connected.

I have made an estimate as to how much money will have to be spent in the way of additions to this plant within the next ten years,

and I find that to be two and one-half million dollars.

I have testified to the present population of the city of Houston and have given an estimate of what the population will be within the next ten years. I have made a study of the history of this community with reference to whether or not its growth has been rapid or gradual. Its growth has been quite rapid in the last few years. From 1860 up to 1900, the growth might be considered as a normal gradual growth, but since 1900 the growth has been rapid. The population almost doubled between 1900 and 1910, and has more than doubled since that time. The prospects for the future are that the town should grow to 250,000 or 300,000 population. The geographical location alone is enough to make it a very large city. That is, that the population would go to that within the next ten years. I had a statement of the population by decades from 1860 to the present

ment of the population by decades from 1860 to the present time, which indicates the growth of the city. In 1860 the population was 4,800, in 1870 the population was 9,300; in 1880, 16,500; 1890, 27,500; 1900, 44,600; 1910, 78,800. Since 1910 the figures given are of course estimated in that a census has not been

taken since that date; in 1914 the population was estimated as 129, 500; in 1915, 147,100; in 1917, 154,600 and in 1918, 160,000. My estimate of what the population will be within the next ten years are based upon a telephonic study made of Houston. Our commercial engineers are constantly making studies of the various plants or communities throughout the State for the purpose of taking care of necessary additions from time to time, to aid in the financing and in the preparation of engineering plants, etc., to permit of caring for the

business. That work is done very carefully.

I have been connected with the construction of this plant down here in Houston in years gone by, and am fairly familiar with this plant, and also with this community with reference to its past history, and its prospects for future growth. Basing my opinion upon my knowledge of the local conditions down here, my knowledge of the plant, and the history of the community, I will say that this plant is capable of earning a fair return, it should earn a fair return. There is a need for such a plant as this in Houston. There will be a considerable increase in the demand for telephone capacity.

siderable increase in the demand for telephone service. From 2744 my knowledge of the plant itself I will say that this plant has been well constructed and it is favorably located and it

has been well engineered, and is well engineered.

I am familiar with the testimony that has been submitted in connection with the stocks and bonds that are outstanding. Basing my opinion on all of these things which I have stated that I have considered at arriving at the value of this property, such as the original cost, the cost of reproducing the property new, less depreciation, the potential earning capacity of the plant, the past history of the community, and the prospects for future growth of the city, the condition of the plant, its location and so forth, my opinion is that the value of the properties constituting the Houston Telephone plant is \$6,512,-That is of date October 1st, 1919. I take that date because that is the date as of which the appraisal was made. From my experience in the telephone business and from the careful study which I have made it is my opinion that was the fair value of the property on October 1st, 1919, that was the minimum value. That value is increased as of the present date, there would be some slight increase I have not added anything in my valuation of this plant for the item of patents. There are a great many patents which are used in the telephone business, and I have not included those in my appraisal because those patents are owned by the American

2745 Telephone & Telegraph Company, and under the 4½ per cent license contract, which the Southwestern Telephone Company has with the American Telephone & Telegraph Company.

the Southwestern Telephone gets the use of those patents.

Certainly the plant cannot be worth less than the reproduction cost less accrued depreciation. The plant has a considerable earning capacity, and as previously stated, it is well constructed, well engineered, favorably located, and is a first class plant. The business is of a kind which is necessary. I have given due consideration to the original cost of this property as shown by the books of the company, but I have taken the cost of reproduction, less accrued de-

preciation, as the value in preference to the original cost of the property as shown by the books for the reason that the books do not and cannot reflect the actual cost aside from value of the property. The book cost means little or nothing in determining the value of this property. The books do not show in any place the cost of establishing business, and that cost as given in the appraisal of reproduction costs of the property were added to the book costs then the book costs would show a total of \$5,833,266. In other words, the figures which I have put in here as the original cost as shown by the books, nothing is included therein for the cost of "Going Value."

If the estimated cost of establishing the business, or the going value were added to the book cost, then there would only be 2746 a difference of \$700,000.00 between the book cost and the estimated cost-reproduction cost of the property. In addition to that, if the books reflected the appreciation in the real estate owned by the Telephone Company in Houston, then that would add to the book cost, something in excess of \$100,000, which would in turn make the net difference between the book cost and the estimated reproduction cost approximately \$600,000.00. When I said "real estate" I mean the land and buildings located thereon. company like any other citizen of Houston, it appears to me, is entitled to any appreciation which may occur in its property. I have testified, if I added the cost of establishing the business, or "going value" to my original cost as shown by the books, the difference between the original cost and the estimated cost of reproduction would be something like \$700,000.00. I was speaking there of the estimated cost of reproduction new, less depreciation. In my opinion I think this property is worth at least \$6,512,341.00 as of the date of October 1st, 1919, and worth not a cent less than that at this date. That is my best judgment.

Cross-examination.

Questions by Mr. Howard:

I got the valuation of this property from Mr. Scott as shown by his exhibit No. 10, and that is \$4,810,385. That would be the book cost of the property. You cannot depreciate the cost, you can't take anything away from the cost. You could depreciate the property, but you can't take anything away from the property. A depreciation fund is set aside from year to year and that money is expended from year to year. My estimate of its present condition is that it is in 92 per cent condition. gardless of the cost of the property it is in a deteriorated condition. But you can't take anything away from the cost. The property does deteriorate and at any time a certain amount of the property is in a deteriorated condition. In getting the book value of the company's property you do not include your depreciation fund. That is spent in replacements. It is spent on the property in replacements entirely, to take care for all kinds of replacements. With reference as to whether or not it is a fact that renewals and extensions are often made, and are made by this company out of that fund, the money,

the money has, the money may be used and probably is used in the making of renewals and enlargements. If I had a plant that cost originally two million dollars and had set aside for several years a fund of six per cent on it, and get one hundred or two hundred thousand dollars in that fund you do not add that to the two million and have two million two hundred thousand. Two hundred thousand added to to two million makes two million two hundred thousand, but that fund is being spent from day to time and week to week.

"Q. I am not asking you about that. We are assuming now to set aside a reserve there of two hundred thousand, and then you take that two hundred thousand and make an extension to the plant with it, then your plant would cost two million, two hundred thousand dollars, wouldn't it, and you would have invested in the capital plant two million, two hundred thousand dollars, wouldn't you?"

"A. That two hundred thousand dollars could not be used for that

purpose."

If it were used that way then you would have two million two hundred thousand dollars in plant.

"Q. Then from that two million two hundred thousand dollars because the two hundred thousand dollars was set aside to take care of the replacements and to keep the plant up to a 100 per cent condition, you would have to deteriorate or depreciate the plant in the sum of its actual deterioration, wouldn't you, in order to get the right value on the cost basis?"

"A. No sir, that two million, two hundred thousand dollars is still invested in that plant regardless of where that money came from

or regardless of the physical condition of the property.'

It is invested there, however, out of the pocket of the original investor or owner of this property. He puts in originally the two million dollars in plant, then he goes on operating the plant, and

doesn't make any replacements, say, for five or six years, except the replacements that the Interstate Commerce Commission requires until his depreciation fund shows two hundred thousand dollars; I can get that idea.

"Q. (Interrupting.) Well, you have got that idea, you have got a plant now that is partly depreciated and you have got in your fund two hundred thousand dollars, haven't you, that was included to take care of that depreciation, you have got that, haven't you?" "A. Yes sir."

"Q. Now, you take that two hundred thousand dollars then and make an addition to your plant, then you have a cost there of two million two hundred thousand, haven't you?"

"A. Yes sir."

"Q. Now, will you say that that represents the true value of the property tested by the cost method?"

Mr. D. A. Frank: Certainly not.

"A. If I may be permitted to explain, Mr. Howard, I think I can make that clear to you."

"Q. That is clear to me, I am trying to make it clear to you.

That is the difference between us."

Mr. D. A. Frank: Let him answer the question Mr. Howard.

"Q. I wanted to test your theory. You are qualifying 2750 here as an expert valuation engineer in the way of setting up the value of these properties, and you showed us how you could reproduce the plant new and you told us how you could do it by the cost method and I am asking you if there are any additions made out of the depreciation fund. Now, by "additions", I don't mean replacements, I mean something that has gone to extend the plant and you have this two hundred thousand dollars and you make additions of it, then the cost of the plant aside from replacements is two million, two hundred thousand dollars, isn't it?" "A. Yes sir."

"Q. Now, do you tell me as a valuation engineer that that is the true test of the value of the property?"

Mr. D. A. Frank: Certainly not.

"Q. And that you test it on the cost method?"

"A. No sir, if you will permit me to explain, I am quite sure I can never answer your question, I cannot answer your questions any other way, I don't think."

The reserve for replacements is set aside from year to year; that reserve may be accumulated. This company has accomplished a reserve of some of some 20 per cent of the value of the property. Now, that money is used from time to time. from day to day as depreciation on the property is realized; in other words, as a pole wears out it as replaced out of that reserve fund for replacement.

"Q. Now, where a pole wears out, don't the Interstate Commerce rules under which you keep your books permit you to 2751 "A. That is a major replacement."

One pole is a major item of plant, minor items of plant that are handled as maintenance and repairs are such things as the cord, as the receiver cord, on the telephone, the cord on the switchboard; those are minor items and a pole is considered a major item.

Mr. D. A. Frank: Let him finish.

Mr. Howard: Well, he has given me two or three illustrations.

Mr. D. A. Frank: He has not finished about the pole yet.

Mr. Howard: But he has digressed now to give me some knowledge about what replacements are. This depreciation fund, that is the thing we are discussing. He has gotten up to the point where he is going to enlighten me-

Mr. D. A. Frank: You have not permitted him to answer the

question about this pole being a major item.

Mr. Howard: He told me it was a major item so I accepted his statement of it and ask him now to proceed with the depreciation fund and tell us what becomes of that. The reserve for replace-

ments is used, as I just stated in caring for replacements, for any costs, that is, it is used to protect the property. Now, that money accumulates and instead of having it lying idle,

the money is reinvested in the property.

"Q. Yes?"

"A. That is a decided advantage."

"Q. I am not talking about the advantage of it, you do that, don't you. I am not speaking about the advantage of it?"

"A. If you permit me to explain this, sir, I think I can make this

clear.

"Q. That is a decided advantage to the public, I am not talking about that. I am assuming that they do that, and they have got a perfect right to do it. I think we have agreed upon that, that they do

"A. In fact they save the interest charge on the money-

"Q. (Interrupting.) I understand that, I admitted that before you started. I didn't have to be told the advantages of borrowing from your depreciation fund, because I knew it. It is good business and economics and entirely proper, but now what I am asking you about is when you do borrow from it and make extensions out of it and that is added to capital, whether then in order to get the real value of the plant tested by this method, you depreciate it?"

"A. You can take nothing away from the cost, in that that is cost, that is what it cost. It appears as a physical fact and has nothing to do with the money. If the plant cost two million two hun-

dred thousand dollars, that is what it cost, and you can take 2753

nothing away from it."

"Q. Well, now, then, according to your theory, you want to take this depreciation reserve that the community allows you to set aside for the purpose of replacing your plant and divert it as I have admitted you have the right to do to the purpose of extensions and then when you have made those extensions out of your depreciation or replacement fund and added it to capital, instead of paying it back here to replace the first investment and keep it up to 100 per cent then you say that the original investment plus the amount that you have added in addition out of the depreciation reserve is the true value of the plant tested by the cost method, without depreciation?"

"A. No sir, I haven't said that."

"Q. Well, you said you couldn't take anything away, you couldn't depreciate it because it is what it cost, and you couldn't depreciate property so far as cost is concerned?"

You can depreciate property." A. You can't depreciate cost. "Q. I am not talking about cost, I am talking about property." Theoretically, take this illustration, we start with two million dollars that is invested in the plant. Now, that is the money that he has got in there, isn't it, two million dollars, that's true, isn't it, Mr. Hoag?"

"A. Yes sir."

"Q. Now, this other two hundred thousand, he didn't invest, he has taken that out of the earnings that the public pay, he takes that much of the money, besides the fair return that he has been permitted to earn, that is the theory, paying operating expenses and yielding a fair return, and they are permitted for the purpose of keeping the plant up to its 100 per cent condition, they are permitted to set aside this depreciation fund. Now then, they have done that, but instead of taking that depreciation fund and allowing it to lie idle, they made additions to capital, that is, they extended their plant. Then in order to get the true investment, you have to take the old original part of the plant that stands for the original investment and you add the new plant that you made out of the money that the people have allowed you for depreciation, then you get two million two hundred thousand dollars, but it will be assumed that this original property that stands for the original investment has been depreciated to the extent that the diversion is, to

the extent equal to the diversion, isn't that true?"
"A. No sir, there was scarcely any part of your statement true."

As to whether or not I may think that it is true, I beg your pardon, but I am just telling you the way it impresses me. The money that is set aside in the reserve for replacements is only used in the making of extension and additions to the plant, for the reason that it is not economical to leave that money lying idle. The

fact remains that you have diverted it, and that the investor in this plant has not a dollar of new money to the plant by reason of these extensions.

Depreciation is something that is unavoidable and that money has to be spent for depreciation eventually. You have the two million dollars, the original investment—that is what the man that started it has put into this community to serve the public, two million dollars, but everybody realizes that in the service of the public this plant is going to deteriorate as time goes on; that's true. They have to provide against. They say you can also earn out of our payments which we are contributing to you, a fund to be set aside to keep up your plant, your original plant up to 100 per cent condition to protect your property.

"Q. Now, he keeps that fund but instead of replacing his plant, we admit the reasons are proper, he diverts two hundred thousand dollars and makes additions, so that you wouldn't contend that the man who owns this plant has put into it by way of his own investment and out of his own pocket two hundred thousand dollars, would you?

"A. Yes sir, for this reason."

Up to the point where you say this fund is created, that is correct. Now, from that point on, that money is used temporarily for the purpose of making additions to the property rather than to borrow money and pay six per cent on it. Then there comes a time when the depreciation is realized, even in five years, ten years, or fifteen years; then that two hundred thousand dollars has to be spent to care for that realized depreciation and

this usage of that money in the interim simply means that the money is not lying idle, but instead it is earning a return and thereby reducing the reserve for replacements which it is necessary to set aside.

I have not had any experience in financing telephone companies. I have had considerable experience in the accounting as relating to all kinds of plant construction and maintenance and that sort of thing, and am, of course, familiar with the general accounting methods. Individually I have had experience in buying and selling telephone exchanges for the Company; I have bought a very

considerable number, have appraised and purchased.

In my opinion I say that you cannot value a plant upon the accounting method or cost method; in nearly all the properties which I have purchased the same method of valuation was used as has been used here by me, in that we would inventory the property and determine what its present or per cent condition was by a physical inspection. Then the final determination of value was arrived at after considering the possible earning capacity of the property, the appraised reproduction cost, and all of the other things in a general way, of course, as have been considered here, and that would finally determine the price.

Supposing that suddenly a radical change would take place 2757 in the currency of the country and prices would begin to tumble until they got down to prices at the pre-war levels, or below, bringing the value of these utilities to a price where they could be reproduced for much less than the actual money that went into them, and at the same time, if Mr. Frank is correct, in his idea about the Courts, they had undergone a change of opinion and said that you were entitled to get all that had been invested in the plant, I would know how to go about arriving at that value. It would be

a very difficult method to build it up in any more accurate form than these estimates of reproduction.

Assuming now where our reproduction values would be far below the money that was put into them, and we wanted to preserve our returns from being confiscated, and I was told to go and bring before the Commission or the Court, the amount that we had sunk in these properties, it could be done. As to whether or not in doing that I would catch everything that we had ever encountered in the way of trouble or loss or damage or injury, everything that can be conceived of in the building up of the telephone company, is what I was trying to explain. I understood your question, and I was trying to explain that, to get at that value in such a case as you stated, it would be necessary to estimate many things in like manner as this estimate was made up.

2758 "Q. In fact the books are correctly kept, the company that is handling this money has got a good sufficient corps of book-

keepers all the time?"

"A. It has been repeatedly suggested that the books have not been so kept in years gone by, that you could determine what the property actually cost. That is generally admitted."

O. Mr. Hoag, the only objection ever urged to any investment

here by any court, Commission or anybody else, the only objection that has ever been urged to the investment or original cost or accounting method of valuation, that is the only one thing, isn't it?"

"A. You are covering a good deal of ground there. I am not pre-

pared to say that that is the only objection?"

I know that it has been customary to arrive at values in this manner, by making an estimate of the cost - the reproduction cost of the new property, that is, for all the period that rate cases have been heard that has been customary.

"Q. Why there was quite a fight put up in the case of Smyth vs. Ames against the cost method, wasn't there? The utilities were all adopting the cost method and the people conceived the idea that they had probably been too expensive in the handling of the 2759 finances and they wanted to pay only upon what the properties were worth, what they cost to reproduce them?"

Mr. D. A. Frank: That is a matter for the court, it seems to me like.

"A. Well, I know about these things from an engineering and telephone standpoint, but not from a legal standpoint, Mr. Howard."

"Q. Well, that is what I am trying to get at, Mr. Hoag, that your knowledge of telephony is largely a knowledge of the physical construction and you have been employed very much in that line of endeavor as cincerns telephone companies and not in the manner of handling their accounts or taking their historical accountingd and figuring the method of valuing them and what they do with their depreciation reserve; that hasn't claimed your attention very much?"

A. All of those things have come under my attention to a considerable extent."

I have assumed that all valuation and equipment engineers keep pretty well in touch with the decisions of the courts and the Commissions, that is, professional witnesses. I mean by "professional witnesses" men who make a business of testifying in rate cases,

rather than men who make the telephone business their busi-2760 ness. I have valuated many properties, have purchased many

properties, have looked after the construction and engineering and maintenance and organization of the dorces incident to the doing of the work. I have done all of those things and most everything excepting actual financing. I am a professional telephone

Mr. D. A. Frank: I think his evidence in this case for the last two weeks speaks for itself.

Mr. Howard: I want to test his knowledge and the things that

affect his knowledge.

Mr. D. A. Frank: Well, but you are testing his modesty and not his knowledge.

These professional witnesses develop, I might say this in all modesty, in like manner as I have developed in that they work up through general engineering work, construction work, and that sort of thing before they can qualify as a witness.

Mr. Howard: I want you to understand, Mr. Hoag, right here, in asking these questions, I did not intend to be impertinent . In fact, I have a great admiration for your ability.

Mr. D. A. Frank: Thank you sir.

Mr. Howard: I say that very frankly and very chee-fully, but I was just making the point that in the matter of handling ac-2761 counts, and arriving at rates, he is not a professional valuation engineer, but that he is a very competent and thorough

construction engineer, and knows how to estimate a building.

Mr. Hoag: But, my point is Mr. Howard, if I may explain is simply this, that I know more about what really happens, insofar as telephone construction, operation and maintenance is concerned, and less about he decisions of Courts and Commissions than some men whom I would consider professional witnesses. When I use the term "professional witnesses," it may be my poor choice of words. Maybe my choice of words is rather unfortunate for I don't mean that in the sense of discrediting professional witnesses. I mean men who make a business of testifying in rate cases, and who are more familiar with the rate case decisions and the Commission decisions and so forth, Courts and Commissions, than they are with the actual construction, operation, maintenance, and so forth of properties.

Mr. Howard: Well, most of those men that you refer to as professional witnesses are high class men and qualified and keep abreast

of all matters pertaining to valuation.

Mr. D. A. Frank: I don't see how there can be any ques-

2762 tion on that.

Mr. Howard: Well, it is an issue. Mr. Hoag has advanced a good many ideas along the line of valuations that are not strictly what he has done, about which I don't think he is qualified.

Mr. D. A. Frank: Oh, if you expect to disqualify him. Mr. Howard: I do expect to disqualify him where it gets to the point beyond his actual experience. I am asking him that, and I believe he stated himself that he didn't profess to be a professional valuation engineer.

"Q. You have never made any detailed study of valuation, what the different commissions hold upon, and things of that kind and the manner in which they set up their accounting records and take care of the depreciation reserve, and the manner in which they depreciate the property under their methods?"

'A. All those things are covered fully, first in the I. C. C. hand book, the Interstate Commerce Commission, covering accounting.

That is the bible on that part of what you asked about."

"Q. Have you made any great study of traffic expense, and things of that kind?"

"A. I know what traffic expenses are."

"Q. Well, have you made any great study to know when 2763 they are economical and when they are not."

"A. Well, I know when traffic expenses are excessive and when

they are not in a general way, of course."

"Q. Well, now as I stated a while ago, if you would start out to value a plant that way, by getting its costs and the books are kept then this method includes and will catch or carry in the value of the property everything that has been spent including things that have been spent for equipment that soon become obsolescent, equipment that was inadequate and had to soon be discarded, it will catch everything like storms and damages of that kind won't it, Mr. Hoag, and reproduce it gradually?"

"A. In fifteen or twenty years from now. With our present method of bookkeeping, and the matters which may be—

"Q. (Interrupting.) I asked you, assuming that the books were correctly kept."

Mr. D. A. Frank: That is a false assumption.

Mr. Howard: I don't know what can be shown. I am confident that you can show your books were pretty accurately kept, if you wanted to.

Mr. D. A. Frank: We haven't said they were not accurate; 2764 we just said they did not have everything in them.

"Q. Well now, assuming that the books have been accurately kept, and all the money that has been paid out, there is a record of it, that method of valuing property, and finding out how much has been invested in it, will absolutely ascertain everything that has been invested in the property originally, everything that has been expended by reason of obsolescence and where you have to change your switch-board because it becomes obsolescent and because you find that some of your equipment is inadequate and have to take it out, the accounting method, always assuming the books were correctly kept, will show with accuracy what has been expended, won't it 9"

"A. If the books have been so kept, it would show that."

"Q. And in this cost of establishing business nothing is left to estimates and conjectures?

"A. If the books were so kept, yes sir."

"Q. If the books were accurately kept. If fact, Mr. Hoag, in the cost of developing business you have made estimates of that, For instance, take the item of attaching your subscribers, practically all of that is paid out of operating expenses?"

"A. You are speaking now of the plant which is in operation?" "Q. The plant which is operating, speaking of this par-

2765 ticular plant.

"A. The plant which is in operation?"

"Q. The plant which is in operation?"

"A. Those expenses are commercial operating expenses."

"Q. And that cost of establishing the business of this plant and attaching your subscribers has been paid out by the community from month to month and from year to year as time went on, out

of the amounts paid by them in the form of collections by this company?"

"A. I suppose they have."
"Q. Then, anything of that kind then you are familiar enough with, matters of valuation to know that it does make some difference where the money comes from, and those costs you weald not add to capital account then, would you?"

"A. My set-up is the estimate of the cost of reproducing the business and necessarily those costs, which would be incurred, the expenses which would be incurred, would be added to the capital account."

"Q. Your set-up, I believe, embraced just a short time for con-

struction, did it?"

"A. It embraced the construction period, also the following two

year development."

"Q. Well, now, getting off of an imaginary plant and getting down to this plant, you are seeking to raise the rates on the cost of developing your business, has almost entirely been paid out and has passed out in the way of operating charges, has it?"

"A. I don't know that, I couldn't answer that.

"Q. Well, that is one of the things that professional valuation engineers would understand?"

"A. The accountant would be the only person that could answer

that."

"Q. And you don't qualify as to things of that kind?"

"A. I don't undertake to answer that question."

Mr. Howard: Well, those are things that I wanted to show by somebody. I suppose you all, will put on somebody that knows something about those things, and with that understanding, I will discontinue this examination.

Redirect examination.

Questions by Mr. Duls:

I am not a professional witness and this is the first time that I have appeared in Court to testify. I have been testifying as an engineer, acquainted with telephone property and with construction of telephone property, and the purchase of telephone property, and I have tried to give the court my best judgment of what is the value of this property here in Houston. I have not testified as an I do not mean to say that this amount that I have testified to \$6,512,341.00 is the exact value of this property here in

Houston, but I stated that I considered that the minimum 2767That figure represents the total estimate of the repro-

duction cost of the property, less accrued depreciation. my judgment as an engineer and as a man acquainted with the telephone property, I think that figure represents the minimum amount that ought to be placed upon the value of this property in Houston. After taking into consideration all of the different

things that Mr. Frank has asked me about, the location of this plant, the size of the community here, the character of it, and the stocks and bonds, and all of those other things, my estimate of the value would be a different figure than \$6,512,341.00. My estimate of the value of the property would be around seven million dollars. not mean to tell the Court that the value of this plant can be determined to the extent of one dollar. In my judgment, as an engineer, and as a man acquainted with the value of telephone properties causes me to say after I have considered all these facts, this cost of reproduction figure is one fact, and the other fact asked me by Mr. Frank, that the value of this property is around seven million This \$6,512,341 represents the estimate of the reproduction cost of the property, less accrued depreciation. The potential earning of the property, that is the fact that it is a necessary business,

that it is well located, and in connection with all of the other things that we have mentioned, means that it is a very desirable telephone property. I can't conceive of a business of this kind, not being permitted to earn a fair return. My experience has been that people generally are fair and are willing to pay a proper charge for anything, and I believe these people are willing

to pay a proper charge for telephone service.

As an engineer, and as a man who knows how to value telephone properties, I do believe that the reproduction cost of the property is the minimum amount which ought to be placed upon the value of

a telephone property.

If a man were valuing this telephone property and wanted to buy it he would give a little bit more than it would cost to reproduce it in my judgment. I have paid more for properties than it would cost t to reproduce them many times in buying them for this com-That has happened right recently, since December, between December and August I purchased some eight or ten properties in Texas. I purchased the Eastland property, the Ranger property, the Gorham. Desdemonia and many others. These properties that I purchased were all independent properties and didn't have any-

thing to do with the Bell Telephone Company.

2769 I do not know as an engineer whether or not there were any deficits when this company first started operating here in Houston so therefore I don't know whether those deficits have ever been paid or not. But in this estimate here in which I say there would be deficits during the development period if I were going to reproduce this property, that is my judgment as to what would take place, but it is my judgment, as to what would actually take place if I were going to reproduce this property.

Cross-examination.

Questions by Mr. Howard:

I think this property is worth around seven million dollars. estimated cost of reproducing it is six and one-half million. includes all of the expenditures which would be in connection with

the reproduction of the property as best I could determine. I did not then add on a million dollars for good measure—that is one of the expenses which would be incurred in reproducing this property.

"Q. Mr. Hoag, you stated to me the other day that for the purpose of valuation, as I understood you, that it didn't make any difference whether things were paid out of operating expenses or not, it didn't make any difference where the

money came from. Is that your idea of getting at-

Mr. D. A. Frank: I don't see what difference it makes about Mr.

Hoag's opinion on that, Your Honor

Mr. Howard: Well, he has just asked him what his opinion was as a valuation engineer and I want to show that as a valuation engineer he states it don't make any difference as to the additions to final value whether certain things have been paid out of operating expenses or out of original investment, I want to ask him if he didn't make that statement.

"Q. You made that statement to me the other day, didn't you, Mr. Hoag, that it didn't make any difference where that money came from?"

"A. I made that statement to you in that you were wrong in the

statement that you did make."

Mr. Howard: No, I didn't make any statement, I didn't testify at all. I asked the question. We were talking about some of these construction items and I asked you about some things that were related there, if your item of construction wasn't paid out of

operating expenses and you told me that it didn't make a

particle of difference where the money came from.

Mr. D. A. Frank (interrupting): That is just exactly what the Court holds. We will furnish you authorities on that.

"Q. Mr. Hoag, where were those plants, did you enumerate them all. I heard the ones you enumerated, were those all you purchased?"

"A. No sir, I purchased Breckenridge."

"Q. Where is Breckenridge?"

"A. Not Breckenridge, but Burkburnett, up from Wichita Falls,

and purchased the Big Springs Company."

"Q. I don't care about your detailing them all. What was the maximum value, if you don't mind stating, without stating the name of the place?"

"A. One of them was over one hundred thousand dollars. The

others varied."

"Q. Some as low as ten?"

"A. Yes, I bought one for \$3,500."
"Q. Mr. Hoag, would you say that there is a man on the face of this broad Globe or Mars, or any of the other planets that would come in here and pay seven million dollars for this telephone company today?"

Now, let me have your honest belief on that, will you?"

"A. Any man who wanted to go into the telephone business in a big way, and had the money to go into the telephone business, and if that man knew the telephone business, he wouldn't hesitate a minute in paying seven million dollars for this Houston Company property."

"Q. It is a good business, isn't it?"

"A. It is a good business."
Q. And attractive?"

"A. It is a good property in a good location in a good town."

"Q. Now, Mr. Hoag, don't you know, or is this out of your line, also, that in the matter of investments that men never do invest in properties during abnormally high prices, they don't buy real estate when prices are probably due to specific abnormal prices unless it is property they have to buy?"

"A. That isn't true in Texas today, sir; there is some activity."

"Q. Is there more activity in the public utility line today in Texas than there ever has been?"

Mr. D. A. Frank: You asked him about land.

Mr. Howard: Well, he is talking about public utilities.

"A. So far as the public utility is concerned, the reason that the demand is not very great at this time is that the factories have 2773 not been able to supply them with the material required.

That is the only thing that is holding back the utility building today, and I say that after talking to other utility people, they

are all trying to get materials.'

"Q. Don't you know that when you make up an inventory and apply these prices, then when you are determining values that the elasticity of your market or the contraction of your market, or to put it in another way, the more persons that are disposed to buy, the better the value, that is, if the class to which you can sell your commodity is limited, that it tends to narrow and restrict that value of that commodity or business?"

"A. No sir. I don't know that."

"Q. Is there a concern in the United States today that would finance and buy a telephone company of this magnitude at the present price levels?"

"A. A property of this kind does not change hands very often."

"Q. Property of this kind won't change hands during these times of abnormal prices, will it? Now, isn't that your honest belief, to get right down to what you really think, do you think that a property of this kind would be purchased by any investor under these abnormally high prices, with the chance, at least, for prices to radically decline?"

"A. That is just a bit difficult to answer. I answered it previously in this way, saying that a man who wanted to go into the telephone business would buy this property in

preference to most any other of like size"

"Q. And the only way that your property has any value aside

from its earning capacity depends upon securing a purchaser, that is able and willing to buy it, don't it?"

"A. No sir."

"Q. Well, what other way now? I said aside from the purpose that it is serving and the use that you make of it?"

"A. Well, aside from that, the property, of course, has a junk

value."

"Q. Well, are you willing to accept a junk value?"

"A. No sir.'

"Q. Then you didn't intend to advance that as one test of its

value then, did you, Mr. Hoag?"

"A. No sir, but the earning value, or present earning value and the potential earning value of the property, the kind of property, the kind of business, the location and all, all those things have a bearing on the value.

Mr. D. A. Frank: The trouble about Counsel is, Your Honor, that he is confusing salability with the question of value, and they are not identical.

Mr. Howard: Salability always bears upon value.

Mr. D. A. Frank: Here's a building that we are in right now that the United States Government wouldn't sell for a 2775

dollar less than cost. Now, would you want such a building? Take the telephone building right across the street, now would you buy that except for a telephone exchange?

Mr. Howard: And yet you are trying to increase it just as much

as the materials have gone into it-

"Q. Mr. Hoag, you take for instance this building that he cited, the value of that when you come to measure its value by the cost of the material that has gone into it and the labor that has been employed and saying that it is worth much more now and that there is that much more inherent value in it, you say that would be correct, the correct way to get at the valuation of this building, although there would be no purchasers for it on the earth?"

"A. That is one of the things that justify the reproduction cost new theory. This building has no salability and one of the ways of arriving at the value of this building is to determine what the reproduction cost new of the building is. That is what we did with our telephone property. If telephone properties the size of Houston's were changing hands from day to day week to week, or even from year to year, then we would have another way of measuring the value of this property."

"Q. What I am trying to get at, have you any way on earth of realizing the value of this property in dollars and cents, all the labor and material that has gone into your plant, is there anybody on the face of the earth that would buy it from you at those increased values?"

"A. Well, our property probably has no salability; there is probably nobody wants to buy this telephone property.'

Redirect examination.

Questions by Mr. William H. Duls:

In my estimates that I have made here of the reproduction cost new of this property, that is, what it would cost to produce it new, in my opinion that estimate is conservative. I have not used abnormally high prices in making the estimate, that is, I have not even used present day prices in making the estimate, that is, prices today January 15th, 1920. I have previously testified that prices have increased since the date of this inventory.

"Q. Now, Mr. Howard asked you if telephone properties were being bought and sold at prices that were prevailing today; you have testified haven't you, that you have bought telephone prop-

erties-

Mr. Howard (interrupting): That's been gone over and he has

testified to it, what's the use of going over it again?

Mr. Duls: I want to bring out, that is redirect examination, in answer to Mr. Howard's cross-examination, I had already brought out that he had bought telephone properties,

and then Mr. Howard brought-

I arrived at the price to be paid for those properties in exactly the same way that I have gone about determining the value of the telephone properties here in Houston. I do that all the time whenever we purchase telephone properties; that it the way we always arrive at the cost of the property. I did not put any oil value on those out there, but we paid some oil prices. We had to buy those properties to render long distance service to the public in that the independent owners were unable to finance them. It was in part to feed our long distance service, and in part to take care of the local business.

Mr. Duls: We have one other item that we want to take up with Mr. Hoag, that is, it does not enter into the determination of the value of the property here, but it is an engineering matter and something that has been referred to already. It is the annual reserve for depreciation and with Your Honor's permission, I would like to take just a few minutes to explain just what the annual reserve for depreciation is, and just what it is intended to take care of, so that Your Honor will have clearly in mind when Mr. Hoag testifies the amount that is necessary to take care of that reserve and so that you

will understand his testimony.

Now, the telephone property of the company here in Houston is devoted to a public use and it is being used by the public. In addition, however, that property is being consumed in the public service. Now, it must be clear to Your Honor that the different physical parts that make up the whole of the property here have a very limited life; in other words, their useful life is limited. The poles, for example, rot and the switch-boards become obsolete, the property wears out or for one cause or another becomes inadequate, or it is wrecked by a storm say, from one cause or another, and usually from a combination of causes the property has to be re-

placed, so that unless the owner receives in addition to a fair return for the use of his property, an amount which will enable him to replace it when it comes to the end of its useful life, he will be in the position of one who has collected interest for a few years but who has lost his principal. Now, the amount in the reserve for depreciation is nothing more than the amount which the Telephone Company sets aside each year to enable it to replace its property as and when it comes to the end of its useful life. The Supreme Court of the United States as we attempted to show Your Honor in argument the other day had held that in these rate cases we must take the present value of the property and we have gone out and ascertained that present value as well as our best judgment unables us to do. Now, there have been, however, some suggestions in

2779 some Commission decisions and there are also some engineers who have theorized along the same line and Mr. Howard has advanced the same theory to the effect that there is a measure of direct relation between what you have in your reserve for replacements and the condition of the property at any particular time.

Now, the Supreme Court of the United—, as Your Honor will find when you come to read the decisions, has not passed on that matter and if any conclusion is to be drawn from the Supreme Court decisions, it must be a deduction. Now, we regard the matter about in this way. The present condition of the property is a fact. The present condition of a pole out on the street or of a piece of switchboard, is a fact. The present condition of this suit of clothes that I have on is a fact. The present condition of the house in which Your Honor lives is a fact, and it is wholly independent of whether you have set aside any reserve with which to replace that house or whether you have been keeping up insurance on it or of any other condition. Now, Mr. Hoag and the Telephone Company have tried to ascertain just that fact, namely, the present condition of this property here in Houston, and then we have sought to ascertain how that present condition affects its present value, and we have done that entirely independent of any amount that is in the reserve for There are some decisions which indicate rather definnitely that that is the way to consider it. In other words, when you are going to find put the value of property, what

when you are going to find put the value of property, what you deduct is not something that you have in the reserve but you deduct the amount which represents the actual loss in the newness of the property, in other words an amount which represent how much it has lessened in value. Now, that is what depreciation means, a lessening value, and that is what the Supreme Court of the United States means when it says and when it holds, as it did in the Denver Union Water Co. case that the cost of reproduction less the depreciation is a fair measure of value. Now, this position, as I say, has been taken in several cases. The Utah Service Commission in the case of Utah Light & Traction Company reported in Public Utility Reports, 1918 B at page 497, uses these words in regard to this matter which we are discussing:

"As regards depreciation, we believe this Commission may well hold along the same lines as the Idaho Supreme Court, which in

Murray v. Public Utilities Commission 27 Idaho, 619; 150 Pacific 47, said: 'So far as the question of depreciation is concerned, we think deductions should be made only for actual tangible depreciation, and not for theoretical depreciation, sometimes called accrued depreciation.'"

Interpreting that, as I remember, Your Honor, it means this: That when you find the value of a public utility property or a public utility plant, you do so by deducting the actual amount of the depreciation or the deterioration that has taken place in the property.

You don't go and deduct what you may have in the reserve

for replacements, you don't go to the books in any way, because the actual amount of the deterioration or the depreciation in the property is something entirely independent of the books. Now, not so many years ago, we had a fire in Paris, Texas. fire destroyed practically the entire exchange of this company in that city. The central office burned down and the poles were burned in two, and the wires were down in the streets. The company had in its reserve to meet that fire, reserve for replacements, \$1,200.00. The actual amount of the damage was over \$40,000.00. cording to the theories of some of these Commissions and some of the engineers, and according to Mr. Howard's Theory, you would determine the value of the property of the Southwestern Telegraph & Telephone Company in that city on the morning after the fire, by deducting from the reproduction cost new, if that was your method of ascertaining the value, or from the actual cost if that was the method you were going to use, the amount which is in the depreciation reserve or in the reserve for replacements. Now, in other words, that is to say, that in the case of the Paris fire, these engineers and Commissions and Mr. Howard would say that the value of the company's property on that morning after the fire is \$1,200.00 less what it would cost to reproduce that property new. Now, I ask Your Honor, if you would for one minute consider that the sum arrived at in that way represented the value of that property in its burned condition, when everybody knows that 2782 there is practically no telephone plant there at all, because

the whole thing has been practically destroyed. The measure of the present condition of the property has nothing to do with the amount in the depreciation reserve, in other words. If there was no reserve at all, the property would still be depreciated. If you had no reserve, the present per cent, physical condition of your property wouldn't be changed and wouldn't be affected in any way. reserve is merely a bookkeeping thing and it is entirely independent of the condition of the property. So, that, the first thing we would like to make clear to Your Honor is that this Reserve for Replacements has no relation and has nothing to do with the actual amount of the depreciation or deterioration which has taken place in the physical property. And, second, this amount in the reserve for replacements has nothing to do with the maintenance and repairs. Now, just to make that clear. Suppose that I have an automobile, a Ford say, it is not in very good condition, it is pretty old. repair that car every month and every two or three months I go around and pay the repair bill on it. That is maintenance, and yet I know, just as well as I know my own name, that that car isn't going to last over a year or two longer, and if I were doing business in the right way, I would be setting aside a reserve so that when this care left this life, I could replace it. Now that, Your Honor is exactly what the telephone company does. It has a repair account, which takes care of the maintenance and the repairs to

the property as the operation of the property goes along and then it has a reserve account out of which it replaces prop-2783 erty as it comes to the end of its useful life. The Telephone Company does not set aside an amount sufficient to build a new plant, that is an additional plant, it only sets aside such an amount as will enable it to replace property or parts of the property as they come to the end of their useful life. Any extensions or any additions to the property, we would make out of new capital. So that to sum up, what we would like to have Your Hon-r understand at this time is that this reserve for replacements hasn't anything to do with the actual amount of the depreciation in the plant, hasn't anything to do with repairs and maintenance and hasn't anything to do with extensions or enlargements to the physical property. Now, we are required, Your Honor, to set up this reserve for replacements, not only by the command of the Interstate Commerce Commission but by the command of the Courts as well. preme Court of the United States in the Knoxville Water Co. case. City of Knoxville, rather, vs. Knoxville Water Co., reported in 212 U. S., 1, uses these words:

"Before coming to the question of profit at all, the company is entitled to earn a sufficient sum annually to provide, not only for current repair, but for making good the depreciation and replacing the parts of the property when they come to the end of their life. The company is not bound to see its property gradually waste, without making provision out of earnings for its replacement. It is entitled to see that from earnings the value of the property

2784 invested is kept unimpaired, so that at the end of any given term of years the original investment remains as it was at the beginning. It is not only the right of the company to make such a provision, but it is its duty to its bond and stockholders, and, in the case of a public service corporation at least, its plain duty to the public. If a different course were pursued, the only method of providing for replacement of property which has ceased to be useful would be the investment of new capital and the issue of new bonds or stocks. This course would lead to a constantly increasing variance between present value and bond and stock capitalization—a tendency which would inevitably lead to disaster, either to the stockholders or the public or both."

And the Interstate Commerce Commission, in its System of Accounts prescribed for Telephone Companies, on page 67, paragraph 23, says, under the title "Depreciation of plant and Equipment,"—"Telephone Companies should include in operating expenses depreciation charges for the purpose of creating proper and adequate

reserves to cover the expense of depreciation currently accruing in

the tangible fixed capital."

And then follow provisions which define exactly what shall be included in this Reserve for Depreciation, which provisions will be referred to by by Mr. Hoag in his testimony and Mr. Hoag's testimony and Mr. Hoag's testimony and Mr. Hoag's testimony are the property of the province of t

mony will also show how we arrive at the amount which is set aside and the percentage. In this memorandum which

I have here in my hand, which has been handed to Your Honor and also to counsel on the other side are a great number of Commission decisions in which the percentages allowed for replacement are given, in which they vary all the way from five to ten per cent, indicating a general average of between six and seven per cent for telephone properties. There are two Supreme Court cases which have come to our attention in which a seven per cent has been allowed for this item. One of those cases is Cumberland Telephone & Telegraph Co. vs. City of Louisville, 187 Federal, 637, where the Court in discussing this matter said: "In our view, seven per cent of the value of the plant is the proper per cent to allow for depreciation." And in the case of Pioneer Telephone & Telegraph Co., vs. Westenhaver, 118 Pac. 354 the Supreme Court of Oklahoma said:

"In the foregoing case, the amount of annual depreciation in an electric light plant was involved, and held to be five per cent of the value of the property. In the opinion, it is said that the depreciation will vary from five to ten per cent, depending upon the circumstances of each case. We think under the evidence in this case, that seven per cent of the reproductive value of the physical property is fair and sufficient to allow for annual depreciation."

Now, Your Honor, to many minds depreciation involves only the idea of wear and tear and rot and rust. Now, those are only 2786 some of the reasons or causes that tend to make it necessary

to replace telephone property and they are only a small amount of the total causes. There are a great many other causes, for instance inadequacy and obsolescence and public requirements and extraordinary casualties, such as storms and fires and floods and all of these are referred to by the Interstate Commerce Commission in that account that I just read to Your Honor and defined by the Interstate Commerce Commission in requiring telephone companies to set up a reserve out of which to replace property, so that a more accurate term to use would be the annual reserve for replacements instead of the annual reserve for depreciation, and that is a term that the Courts and Commissions are now using and that is what we will use hereafter in referring to the item, the Annual Reserve for Replacements.

Mr. Howard: In regard to the remarks of Mr. Duls, Your Honor, we have nothing to suggest except that we are not at this time conceding 6.3 as a proper or a minimum amount that should be set aside for this purpose. We are not conceding that they are entitled to that earning or to set aside that much of the returns for the com-

pany for that purpose.

Mr. Duls: That is just exactly what we are going to show by Mr. Hoag, that that is a proper and correct amount to allow. What I say isn't testimony at all. It is only an effort to explain to Your Honor just what these different things are in rate-making.

Mr. George P. Player, called as a witness for the complainant and after being duly sworn, testified as follows:

Direct examination.

Questions by Mr. J. D. Frank:

Note.—The experience, qualification, etc. of the witness, George P. Player are set out herein at Pages 991-1002.

I am not an employee of the Bell Telephone Company; I have spent the most of my life fighting them. I mean by that that I was representing the Commissions, and on the opposite side of the fence from them; for the first ten years of my experience in the telephone business, I was with the Independent telephone companies that were in opposition to the Bell companies, and I would not say that I have been fighting them. The time I was with the Commissions I simply carried out the dictates of the Commissions as far as the rules and regulations are concerned and the law,—supervision.

I have made an appraisal of the property constituting the Houston Telephone plant of the Southwestern Telegraph & Telephone Company. With reference to the difference between an appraisal and value, an appraisal is just one method of measuring what there is in

the property,—an appraisal,—to appraise a piece of property
does not necessarily say, does not mean that it represents the
values of that property. In other words it is a measure of the
value; one of the things which we use in determining the value of

property.

I have figured out the economical construction period during which this property might be reconstructed. I went over this plant pretty thoroughly and am rather familiar with construction work of this kind and character. I estimated that it would take at least four years to rebuild this property. That would be the economical construction period of a property of that size. It would be physically impossible to do it in a year or two years or three years. so many things that go into a building of a property of this size or character in the way of preliminary organization and getting the thing started. It is engineering, the fundamental sites of where to put your lines and lines of conduit and everything of that sort, so that in order to do it in an economical way and to get the best results from the experience of the growth of the city in this, or that, or the other direction, and so forth, to take and make a plant spring up as a mushroom would not be economical. You have to take a reasonable length of time for the due consideration of all facts connected with the construction and use, the period of construction that would result in an efficient plant which would reflect economical principals. You would of course be anxious to get your plant into operation as soon as possible so you could begin to receiving returns; that is, that would be good business to do that, but you would not build your plant in a hap-hazard manner hardly, just in

order to secure revenue. You are putting in something that is going to remain in here, this property is a permanent fixture. You do not want it blown down by the first little wind that comes along or something of that sort, and you want to build something that is permanent and so you begin on the sound principle of putting in some-

thing that is worth while.

I have not made an inventory of the Houston Telephone property. I secured from the Engineer of the Company a copy of the inventory showing the quantities of various classes of materials placed in the construction of this property of this plant. The document you hand me is an inventory of the Southwestern Telegraph & Telephone Company, Houston Exchange, Plaintiff's Exhibit No. 13. That is the inventory made by Mr. Hoag and is the one I used. I had a true and correct copy of this inventory in making my appraisal. I made a check of that inventory for the purpose of determining whether or not it was accurate, that is, in order to satisfy myself that the inventory as taken by the company was accurate as inventories go. I selected, or rather just simply pulled out of the great mass of papers fifteen sections of the inventory field notes.

I had better explain that in this way; that when the inventory was taken the Company took a map of the City of Houston, and divided it into sections. Houston is so large that to have taken a single map and made an attempt to spot all the poles on the single map, the job would have been so bulky it could not have been

handled, so the Company elected to cut the map up into sec-

tions and take the field notes relative to the individual sections.

There were sections of underground cables of conduit sections, of aerial cable, pole line, wires and in connection with each of these sections were the sheets showing the size and class of pole, number of cross-arms, number of wires, and the sizes and number of cable guys and all parts of the plant equipment. I did not in any instance with any of these fifteen sections check an entire section. A representative of the City accompanied me during the entire time, together with a representative of the Telephone Company.

By the city there I mean that the City of Houston had a representative go with me in making this check; Mayor Amerman appointed a man to go with me and see that the inventory was practically correct. The name of the man was Mabry of the firm of Ernst & Ernst & Ernst are accountants. Of those fifteen sections each section was checked at least 25 per cent, some as much as 50 per cent of the section and as in other appraisals,—inventories of this character, I found no differences that would make any appreciable difference one way or the other, in favor of the City or in favor of the Company.

I found errors in the inventory. One was where there 2791 was a mistake made by those taking the inventory as on Section No. 2 of the Hadley District. They had shown on that 966 feet of 200-pair cable and it should have been 100-pair cable. I will say this, that the inventory sheets, I haven't one here, had the

different sizes of cables in the columns headed, 25, 50 etc., and they had made a mistake and gotten the number of feet into the 200-pair column instead of the 100-pair. That was a mistake against the City; the next discrepancy was on Section 15 of the Hadley District. I found it short one down guy. Now, in money, I guess that would amount to as much as \$6.00.

"Q. In money, how much would that difference in cable amount to where the mistake was made against the city; you had 966 feet of 200-pair cable which turned out to be one hundred pair; just make an estimate of that?"

Mr. Howard: Aren't you familiar with that enough to approximate it?

"A. Mr. Howard, there are thousands and thousands of figures in appraisals of this kind and I can't remember all. Yes, a difference of about \$425.00."

Mr. Howard: We don't want it exact.

"A. Well, it could have been-yes, about \$425.00."

Yes, I found other discrepancies in the inventory. That down guy that I spoke of, that might have been removed between the time the inventory was taken and the time we made the check.

On the underground cable in Section No. 7 the Company had omitted 966 feet of 200-pair cable, that is, the inventory was short that much. That would approximate,—I do not remember the prices of these different sizes, but it would be about \$500. There was also short 200 feet of four duct conduit. Those errors were against the company and are practically all the errors that I found in the inventory.

"Q. Well, now, did you make your check of this inventory in the same manner that you always make checks of other inventories when you were connected with the Commissions?"

"A. Well, I will say that, that exactly the same method was used in the St. Louis plant; we checked several sections and found them to be virtually correct."

I have seen several hundred inventories compiled and I have checked thirty or forty different ones and the discrepancy for or against the Company is so small that it would not amount to half of one per cent, and the Commissions have seen fit to accept the inventories as being correct. That does not eliminate omissions and contingencies, those things happen. I am speaking of the actual inventory, that is, the way it is made. I satisfied myself that the inventory was as nearly correct as I could get it.

After remaining here in Houston about two weeks going over all this property and making this check, examining the property as to what condition it was in, and so forth, talked to residents of the city, taking into consideration the character of the town, the probability of improvements, etc., taking into consideration

all those things I went back to St. Louis, took the inventory figures, showing the different amounts of different materials in the plant,

and made up my appraisal in the City of St. Louis.

When I was employed by the Southwestern Telephone & Telegraph Company to make this appraisal they did not instruct me as to how they wanted the appraisal made. I was called into the office of the Vice-President of the Company, and he told me that he understood I was free to do work of this character. That they had an appraisal of the plant in Houston; that they wanted an appraisal made up and asked me if I could do the work. I told him I could and he said, "all right, go ahead and see the people at Dallas and get what information you desire relative to it, and go to Houston and do whatever you care to do down there relative to the matter, and when you take your inventory or however you expect to do it, make up your report and submit it to us." I was not instructed to make up my appraisal in any particular way. Mr. Elias, the Vice-President of the company told me to use my own judgment as to how I should make this appraisal.

I will say this, Mr. Frank, that I have made this appraisal just exactly as I have made the appraisal for the Missouri and Oklahoma Commissions, and if I were appointed by the City of Houston to make this same appraisal, they would have gotten the same report, figure for figure, that you have gotten in this instance. It would not have made a bit of difference to me one way

or the other. I had had my appraisal printed.

Mr. J. D. Frank: We desire to offer this Exhibit reading: "A report on appraisal of property of the Southwestern Telegraph & Telephone Company, local telephone plant, Houston, Texas." And in the lower right hand corner: "Telephone and Electrical Service Bureau, St. Louis, Missouri." into evidence as Complainant's Exhibit No. 36.

Said Exhibit marked Exhibit No. 36, Geo. P. Player Witness" is transmitted herewith in Exhibit File."

In all of the appraisals that I have made in the last ten years, it has been my policy and plan, accepted by the two Commissions that I was with, and by the Courts, both the Oklahoma Supreme Court and the Supreme Court of Missouri, to use a five-year average price for materials in estimating property, and this report simply reflects an estimate as to certain classes of telephone property

2795 in place. It has been deemed wise, and some of the best Engineers in the country have adopted the average period of five years for materials; that is, they take five years preceding the hearing and use the average prices during that length of time; that is right. The five-year average prices which I have used here are between the years of 1914 to 1918, inclusive; that will give you the prices of five years for materials. There are several reasons for my using the five years average. During the last ten years I have had the prices of all prices of equipment used in the construction of telephone plants from various manufacturers, and I had all those prices, or nearly all of them, in my office. They seem to be the set of

prices and to use the average of five years, stretched over a period of time when you have high points and you have low points, both in labor and materials, so that in making an estimate of any property I

always considered it fair to use the five-year average prices.

I do not think that I could reproduce this plant at the present time at the figures used by me as the cost of producing this Exchange based on the five-year average price. In my opinion, it would cost to reproduce this Exchange, based on present-day prices, from thirty to forty per cent more, a million six hundred thousand dollars (\$1,600,000.00) more than figured on the five-year period. I would not undertake to reproduce this property here at the figure used by me based on the five-year average; it could not be done. This is just simply one measure to show what materials of this class and character in place might cost.

I have been familiar with the prices of materials for the last fifteen or twenty years, and am familiar with the present prices and cost of materials in a general way. I might qualify that answer by saying that I have talked to the owners of some of the largest

plants operating in the country, not only telephone plants, but, for instance, the Engineer of the United Railway Companies of St. Louis. At the present time the Engineers of the Missouri Public Service Commission are making an appraisal of that property, and have been at work on that for the last nineteen The United Railways Company operates all of the street railway systems in St. Louis and in St. Louis County, and is about a fifty million dollar concern. I do not know as yet what valuation the Engineers will find, but the Engineer for that company, the Engineer for the Union Electric Company, that supplies most of the light and power in St. Louis, the General Manager and Treasurer of the Stromberg Carlson Telephone Manufacturing Company of Rochester, New York, the Sales Manager of the Automatic Electric Company, Chicago, the Engineers of the Missouri Public Service Commission are the people I talked with. I have talked with these people in the past two weeks, and all are of the same opinion; that there will be no reduction in prices, nor will there be any reduction in labor, not only in the next year, but in the next ten years; they do not look for it. Yes, it is my opinion that we will not have any reduction in prices during the time that we have to reconstruct this property, and my opinion is based on the conversations with the other men, that I know are reputable men.

Some of these things, that, in my opinion, will prevent any reduction in prices of materials or reductions in the labor cost in the future cost, or say, during the four-year period of the ten years that

I spoke of are demand on the part of the public which is as good a measuring stick as could be used; the demand for increased facilities for larger office buildings, more modern office buildings, the demand for greater convenience in the mode of travel, has a tendency to keep up the prices. The working man laboring man is getting nearly twice as much today as he got three years ago for any service that he performs, he is riding to work now in a Ford or Dodge, some of them in Hudson cars; they are making

anywhere from ten to twenty dollars a day, and they can have the pleasured that they never had before. They live better in every way, live in better houses, and they are not going to be satisfied to go back to what they were living under, not enjoying, but simply existing three or four years ago. They have got to have more dollars in order to keep up. They are not going to be satisfied with less dollars. All of these things have a tendency to keep the price of materials up, because the manufacturer will have to pay the price that labor demands. Now, then, if labor keeps up, and most assuredly it is going to, then the products of labor are going to be just exactly in proportion.

Investigation in average cases of all prices of manufactured products shows that 55 and 60 per cent of the manufactured article is labor charges, and about 40 per cent raw material charge, that is, raw material prices, and as long as these high wage schedules continue we cannot expect any reduction in the prices of material. There is nothing at the present time which would indicate that there may be a reduction in the prices of labor; to the contrary, there is everything to indicate that there may be an advance. I base that statement on going back to the demand for this, that and the other

thing; the strikes occurring daily, men walking out, and they get back to work at a higher wage schedule than they were getting. There is more money in this country, more gold than there ever has been, and as long as there is an abundant supply of gold you are going to have a cheaper, or rather more expensive

line of production.

Getting back to the prices of material, and my statement that I have been familiar with the prices for the last fifteen or twenty years, or that I have been considering them for that length of time, I can qualify that by saying that, Mr. Frank, that during the construction of the long distance lines from St. Louis to Joplin and Pittsburg, Kansas, I handled every bit of the material that went into the construction of these lines, which was over half a million dollars' worth of materials, that is, I was acting largely in the capacity of assistant purchasing agent; I had to check all the materials, saw the prices and everything of that sort. Then I have acted in a similar capacity with the companies I have been connected with subsequent to that time, materials of all classes and character; then I have had the advantage of having the price lists on all classes of materials from the various manufacturers ever since I have been connected with the State Commissions, and so I may say that I am fairly familiar with the price of materials.

With reference to what has been the history say for the last fifteen years, with reference to the prices of materials, bought to approximately the middle of 1917, beginning at from 1901 to the middle of 1917, there was a gradual increase in the prices of all classes of

material. That is, a gradual upward increase. It is true
that at various times there have been fluctuations in material
prices and they would go down a little bit, but invariably, you
might say, there was a reaction in the market, especially in the min-

eral line, zinc, copper and lead, and when the reaction came after a decrease, these fluctuations, the price went up just a little bit higher than it was before the fluctuation, and the trend price on all classes of material since 1901 up to the middle of 1917 will show a gradual increase, besides the minor fluctuations right up to the middle of 1917, a gradual increase. On the whole that is comparatively even from 1901 to 1917, that is, it is comparatively upgrade. There was no great fluctuation in the price of any particular product that would cause it to jump and go way up; it would just simply be a gradual rise, right straight up to that point, that is, up to the middle of 1917. At the beginning of 1917 this country got into the world war,

At the beginning of 1917 this country got into the world war, and the demand for iron and metal products, especially was so great that it increased the prices of material rapidly, instead of having a gradual rise in price of material, you had a jump anywhere from nine to one hundred and fifty per cent on various classes of material, that is, after the middle of 1917. Then, of course, in the interim, between the middle of 1917 and the first of 1919, there were fluctuations, just the same as you will find during any period, but the prices have remained pretty high, there has been no decrease. In my opinion, the war is responsible for some of the increases in the prices since 1917 but not all of it. Demand has made the increased prices as much as anything else. I would not say that the war brought about this demand, I would not say altogether, because people

are beginning to live, and have been for the last two years, in, you might say a different attitude than they ever lived before; they are living better and want more, the higher wages paid, and everything of that sort, why, has just simply been one of the things to help bring those things about. I thought I indicated that the war prices hit the United States by saying the middle of 1917. The history of the prices of material show- that the sudden jump came along the middle of 1917, in this country, I noticed it especially in my lists from various companies that prices quoted, that there was no appreciable increase in any other than a general increase in any class of products until the middle of 1917, and then the manufacturers, the producers began writing letters, sending out letters please do not ask for quotations, the market is fluctuating so rapidly that we cannot give you anything that is consistent.

In using the five year average basis on 1914 to 1918 inclusive prices, why just take an actual division on the time that I have said, the jump coming in the middle of 1917, I would consider that I had three and one-half years of pre-war prices, perhaps, nine years,—nine months of prices that were gradual rises, and nine months of prices that were high. You could not exactly say, for instance, that they were anything like today, without being being the present

price for it.

In following out the methods that I used before the Commissions I have taken this five year average period because I wanted to be absolutely consistent with this work as compared with the work I

had done in other cases, the work that I have done in the 2801 last ten years, and in order to do that it was necessary for me to use the five years average prices as far as I could obtain them. I thought that it was the thing to do, and so, as I was given you might say, a free rein to go ahead and make an appraisal as I

saw fit, and that's why I saw fit to do it.

From my knowledge of the history of the prices of materials, the present condition of the markets and so on, I do not think that the pre-war level of prices will ever be reached again. As to why I make that statement I would really have to go over what I have already stated, the demand on the part of labor, on the part of the people

generally for modern equipment in every respect.

Neither Mr. Hoag or any other engineers have worked together with me in making this appraisal. As a matter of fact, I heard yesterday, sitting in here the figures that Mr. Topping makes. I do not know as yet what Mr. Hoag's testimony is, and I saw none of his work relative to his appraisal, in fact, we had no conference about any conditions in any way at all on that. I worked entirely separate and independent from the other engineers; my office is in St. Louis in the Wainwright Building, several blocks from the telephone company's offices, and I just simply worked this thing up myself. Topping lives in Kansas City, and Hoag in Dallas.

2802 Cross-examination.

Questions by Mr. Howard:

Appraisal and value are not the same thing. There are a few things there, Mr. Howard if I were going to make an appraisal of any piece of property, take this table for instance, I would appraise it and say it is worth \$60.00, but that doesn't say it is the value of that table. Now, then, as to whether Mr. Topping is right or wrong in placing his appraisal as the value of the plant, whether his theories are right or wrong, I would have a little hesitancy in not wanting to say.

I think that four years would be the economical construction period within which to build this plant. I have never built a plant like this. I have seen one built and built in four years; Oklahoma City was a comparable plant.

"Q. They built it in what time?"

"A. To an operating standpoint where they would attach the business and pay earnings-

"Q. (Interrupting.) Now Mr. Player-"

"A. (Interrupting.) Wait a minute, if you want me to answer

the question, I haven't finished."

"Q. I don't care for any lecture on the proposition. I asked you if you knew of one plant, and you stated one was built in Oklahoma City, now you have answered my question."

Mr. D. A. Frank: Now, if Your Honor please, I want to object to that procedure; throughout this entire proceeding Mr. Howard has refused to let a witness answer a question, he has continuously harrangued with these witnesses, and we want to most

2803 seriously object to any such procedure as that. If his answers are not responsive I think Mr. Howard has the right to make his objection, but I think the witnesses have a right to answer the

questions whenever he propounds them.

Mr. Howard: If the court please I asked him one question, and he has told me Oklahoma City, but I am now asking him when and where he saw a plant built up in a city that already had a growth of one hundred and sixty thousand people, with twenty-seven thousand subscribers attached, when did that occur, Mr. Player?"

"A. They haven't that many subscribers in Oklahoma City." I have never constructed, nor have I ever seen one like that constructed of this magnitude in four years under construction similar to the plant in Houston; never have. I never expect to see one, because the country—. I do not know of any in the history of this country of a telephone plant that has been built in a city of this size,—a plant of this magnitude nor have I ever heard of one being built.

I have not been in the telephone business practically all of my life; My operations have been confined to an area comprising two states, you might say of three states, Missouri, Illinois and Oklahoma, and there are a great many telephone plants in other cities outside of those three states. I have somewhat familiarized myself with things outside of Missouri and Oklahoma, but you know you have a pretty big extensive territory. I keep in mind something of what is going on over the country; we follow as thoroughly as possible

what is going on.

I am merely estimating and trying to conjecture what time it will take to build a plant when I am talking about building a plant that has never been built in a city of this size, and in all human probabilities never will be built but I want to qualify that by saying that it is sound engineering principles to make an estimate as to what length of time it is going to take to do any piece of work; as to how long your plant is going to be under the process of construction before it begins to earn any return, how much longer it is going to take to attach a certain number of subscribers; how much longer it will take to attach more subscribers, and then taking it up to the fourth year, the end of the fourth year period as to what it is going to do at that time. It is sound thinking and principles to make a set up of that kind. If you want to call it conjecture all right, but I am going to call it sound engineering principles.

"Q. That will be all right, we don't get very near together on that. Now, if a plant had been built under anything like similar conditions and reasonably managed and it took a certain amount of time to build it, you could make pretty fair conclusion from that to how long

it would take to do the job?

"A. If we were going to take any sized plant and try to build it today, we would know about when the plant would be completed, when it began operating and we were doing a pretty good business, as to just how long it would take to do that work, just how much it would cost, and how much it would cost for each class of the business attached to that plant.

2805 "Q. Mr. Player, it being estimated by two engineers that have had a good deal of experience in telephone work, they stated it could be built in a certain time, and you, another competent engineer, of a great deal of experience in telephone work, say it will take one third longer to do the work, that is evidence of the fact, that it is a good deal of conjecture and also a matter of a very great deal of latitude in which they may differ"?

(Objection made by counsel for Complainant, and afterwards withdrawn".)

"Q. Where other engineers assuming equal equipment state a time that it will take to build it, and you come along and state a time one-third longer, does that suggest anything to your mind

as to the accuracy of your conjecture on these matters?"

"A. No, it don't suggest a thing except this: that I am making one estimate, someone else is making another, and someone an-You say I am one-third longer than the other two, and it might look as though the other two were right, they bring two This is just simply a matter of estimate.

It is my best judgment.

I am not somewhat of a political economist; I am just an ordinary engineer. I haven't written any book or anything of that sort on the subject of economics.

(By Counsel for Complainant.)

I have not written any books on storage batteries.

(By Counsel for Defendants.)

I feel very thoroughly assured that these prices are not coming down.

"Q. You say that the engineers for public utilities over the country would advocate that fact in regulating these rates, basing their values on it, the property values"?

"A. You have used the wrong word, I didn't say advocating it,

I said it was their best judgment, their best opinion"

They might advocate a certain thing and express themselves about a certain thing, and it would be two different things, absolutely. I wouldn't want to express my opinion on it as to whether or not it is the same thing. The engineers are still in the employ of the Public Service Commission; the Commission doesn't control those employees that way.

I say that labor has advanced generally since 1914 fully 50%; some classes may have advanced as much as 100%, but I am speaking generally. When I stated that labor now would never go down because they have got accustomed to those luxuries of life, such as Dodges and Hudson automobiles and a few little things like that, I just mention that to show what the laboring man is enjoying now. He is enjoying better living facilities and everything owing to his increased wages than he ever did before. I did not make

the further statement that his wages now would be only about a third, that his dollar had shrunken down to where it only had a

third of the purchasing power; you misunderstood me. I said it would buy about 30% less, in other words it is worth about 30 cents now, where three years ago it was worth dollar. know things have gone pretty high, so that then insofar as the enjoyment of better times and things like that is concerned, the laboring man is not getting much more than he could in 1914. He is getting more dollars; he has got more dollars in proportion to the shrinkage. I have no more accurate data on that than the wages that we know are paid different classes of labor.

"Q. You don't know in effect what the general wage average increase is, do you"? You have never figured out and don't know"?
"A. Now, let me give you an example."

"Q. No, I am not asking for an example. I am asking you the general average wage increase. You can figure out plenty of examples. I can cite you to a whole lot where they have probably gone up over 100%. I am asking you if you have merely if you have ever brought your mind to bear upon this question, because you have undertaken to tell us about the underlying causes?"

"A. Yes, sir." I have never made a study of this proposition to the extent of determining the average general increase throughout the country in labor cost, more than examining the wages paid the different companies,-by different companies. I find in some places they may have raised them 50%, some places, maybe 70%, and some places 30, but I have never acquainted myself with the general average all over the country. Yes, sir, I have acquainted

myself with the general average of the necessaries of life 2808 of the things ordinarily purchased by labor, I know pretty

well what those things are.

Yes, sir, I have put in some particular time to determine what the general increase in foodstuffs and clothing and shoes and school books and things like that has been; I know just exactly what they have been.

"Q. Well, what is it? What is the general average"?

You mean, what has been the increase?"

"Q. Yes?"

"A. Well, shoes have increased-

"Q. (Interrupting.) No, I am not talking about shoes-"A. (Continuing:) All right, you asked me about shoes."

"Q. Yes, I asked you for the general average, and I asked you if you had ever-it won't do us any good now to pick out any isolated cases of shoes and things of that kind. I am asking you now as a man that is undertaking to enlighten us upon the effect of your observation upon the world's future, and the business world's future, and the business world, what study you have made and whether your study carried you to the extent that you have determined approximately the general average increase in the cost of living."

"A. You asked me the direct question if the cost of shoes, school-

books, etc. had increased."

"Q. Well, we all know that. Any school boy in the land knows that. What I am trying to get at, I am trying to test your information to see how far we should rely upon it in fixing this rate. Now, you are undertaking to tell us that laboring men enjoy so much better conditions than they used to, they have got in touch with high life, they are not going back

to the hard days"?

"A. Now let me answer the question, please sir."

"Q. All right".

-. I have lived in the communities for several years where I have been associated with the farmers, the merchants, the poorer classes of people, the laboring classes of people, and people in all walks of life. I know them personally. In the war work, and in other classes of work, it has come under my observation as to the way they live, what they produce, what their children wear, what their wives and themselves wear, that is the different kinds of people that you meet, what kind of houses they live in, whether they ride on street cars, or in automobiles, and I know from being with those people, the farmers for instance, they have increased the kinds of machinery they use, they have discarded the horse and the plow and are using tractors, the laboring man is wearing better clothes, and his children are wearing better clothes, he lives in a better house, and it is all due to the fact that he is getting more money. It is true that he is having to pay more money for the products of life, but he is getting more money with which to pay for those products.

My knowledge that I have given here is certainly based merely upon the scope of my personal observations, and in addition to that, I might say, that I have talked with other people that are familiar with the same thing, and they agree.

I have never heard of what they term "the vicious circle". You don't hear it talked. You can take up any newspaper or any maga-

zine and read it, it is all printed.

"Q. Well, it is the same thing, you get the idea, whether a man is speaking or writing, it is evident that it has been conveyed to you, the idea of this vicious circle, about the cost of living coming up to meet wages, and then wages going up to meet the cost of high living?"

"A. I wouldn't term it vicious, I think it is just the natural trend."
Yes, I think it is just the natural trend; the trends of wages, and

materials and all has been gradual for the last twenty years.

"Q. Now, all of this has been based merely upon what you observed, the same as any other man observes on the street car, or do you come here to give us a special knowledge concerning those things, Mr. Player"?

"A. Why, my general observation, my experience in the busi-

"Q. (Interrupting.) Just as any other man, Mr. Frank, or myself?"

"A. That had investigated those kind of things, that had really paid any attention to them, yes,"

"Q. So you don't base it upon any figures and you are not telling us now that you have made a study, so that you can give us the general average of the cost of living or the general average

of the cost of labor for the last 25 years?" 2811 "A. I have not reduced it to percentages."

"Q. You are talking in generalities?

"A. I am talking of general observation, yes."

No sir, I did not know that when the coal trouble was up over in England after a rise in wages, that there was an investigation made. and it was found that the cost in labor, that it was being contended that the cost of labor was the reason why the coal was laid down at the manufacturer at such an enormously increased price and that an investigation of that matter disclosed the fact that the added cost of labor was but a very insignificant part of the added profit that the manufacurers had to pay. I have never followed up those things to any great extent in England, nor have I made any specific investigation in the United States. Laboring people have to have coal generally.

"Q. Well, now, tell us any particular thing where you have given it any-have followed up any scientific or have familiarized yourself with any investigation along any particular line of prod-

ucts?"

"A. Why, with the investigation of all of the materials and equip-

ment that are contained in this report, I am."

"Q. Oh, you mean, you have gone through catalogs and found that the prices of these materials that are necessary to reproduce this plant, is that what I understand you?"
"A. You can call it catalog, price lists."

2812Yes, sir, I can tell you some of the underlying principles of what the coal miners are striking about, they want more money, and want better living conditions; I do not know of any

other thing.

"Q. Well, now, to be honest about it, to get right down to it, you are a valuation engineer that devotes most of your time to valuing these properties, and taking them out and making an inventory and going to the catalogs and applying the prices and you don't and haven't and wouldn't pretend to have any special knowledge concerning the effect of prices in the future"?

"A. Yes, sir, I have."

- "Q. Just as any ordinary man upon the streets that comes in contact with and talks with his fellow men has?"
- "A. No, sir, in valuing these properties and making his appraisal-

"Q. But, I mean-

"A. (Interrupting.) Wait a minute, let me answer your ques-

"Q. I am talking about your investigation that you have made in these collateral matters that control prices?"

"A. You want me to answer that question"?

"Q. Yes, sir, I would be glad if you would answer that particular question."

"A. I have made the investigation, I know this, that the demand for materials of all classes and character that go into telephone plants, electrical plants, water and gas plants, have gone up in price, are

what are called high prices at the present time, and that it is the general opinion of men well-versed in all lines of business

that the prices are going to even go higher."

"Q. It is."

"A. And naturally I am interested in knowing that subject because I may be making an appraisal of another plant a year from now, and I want to know what the prices are going to be there."

"Q. Did you happen to observe the statement made by the suc-

cessor of Mr. Hoover,-you know who Mr. Hoover is"?

"A. Yes, sir."

"Q. You know that he has recently retired and a successor has followed him?"

"Mr. D. A. Frank: Who is his successor?"

"Mr. Howard: I don't know, I have read his name, but I don't recall it, but you know that he has recently made the statement that prices, or the cost of living would in all probability reduce at least 25% by the first of June?"

"A. No, sir, I didn't know that. I don't know, that his opinion, his personal opinion on that proposition is worth any more than

mine".

"Q. Now, that is what we are getting at, all that you are volunteering now is just personal opinion, and these men who told you, you are basing it upon their opinions, aren't you? Why not take Mr. Hoover's opinion?"

"A. We may not agree upon the same principles."

Yes, sir, I say that there has been a natural rise in prices for fifteen years. I have been familiar with prices from 1901

up to the middle of '17.

What I call gradual is starting out with a dollar in 1901, in each month it raises one cent, one cent, one cent, right up to the present time, that is gradual. I am not telling you that the price trend from the year 1901 to the middle of 1917 was just that way until it got up to the middle of 1917; I did not say that. I said at times, there are fluctuations in prices of all due largely to the market. I have a diagram that I prepared myself some years ago on poles; I just happened to have it. I want to just show you this. It shows the trend. It shows the fluctuations down and up, and it shows the trend, a gradual increase. I wanted to just show it to Mr. Howard as an illustration.

"Q. Well, this is on poles, it is rather confusing here, this particular diagram to me. Let's take the 25-foot pole 6 inches at the

top."

"A. I would have to introduce this then if you want it."

(By Mr. D. A. Frank:)

"A. Yes, sir."

[&]quot;Q. You can make copies of it then, can't you?"

(By Mr. Howard:)

"Q. Well, just let it go. I won't ask any further about that, Mr. Player, but I would be glad if you have the data, not alone upon poles, but upon other things that go into this thing, I think you are probably mistaken in your proposition that there wasn't a very considerable rise, that the rise was not abrupt

then, I think you will find that a very marked rise began about 1916, and that during 1917, it may have reached about the high point, but I will be glad if you will get us that data

if you can, if you have got anything to show it."

"A. I can prepare that for you if you desire it."

"Q. I would like to know. Well, now, Mr. Player, as I understand your inventory, or your appraisal, you take the year 1914, and take five years back from 1915, and you get what you call "the average prices"?

"A. Well, sir, I used the years 1914, '15, '16, '17 and '18. That

is five years."

I took the average prices on the classes of material that went into this plant for that period of time, that is, the prices that prevailed during those four years, and divided them by five. I cannot tell you how much that would be in advance of the prices had I valued it upon the 1914 valuation or prices; I have never figured it any way accurately. Well, for instance, I can do this for you right now. I have the appraisal with me that I made of the St. Louis plant, and I can compare the pole of any size. I will give you enough items to give you a comparison. Now, this appraisal in St. Louis was dated December 31, 1913. That was right at the beginning of 1914. Now, if you will turn to page 20 of my appraisal, that is Northern White Cedar Poles, what are known as classification poles, and it seems to be one of the items of discussion.

Take this same pole, 25, 6 inches at the top, and it is designated as 25-foot Class C, that would be approximately

a 6 inch top. A 25-foot Class C Pole was put into the St. Louis case at \$5.18 as the unit cost, and this figure is \$8.21. The percentage

there is about 60%.

2816

Poles are one of the major items in a telephone plant of this kind. All right I will give you another major item, go on down that page to a 30-foot Class C Pole; the poles would carry the same relative price 30-foot all the way through. I will take some other character of equipment, turn to page 39; that is underground cable, and take the last item there of 400-pair cables; the unit cost of 400-pair cable in this appraisal today is \$1.7459 cents per foot. Now, I haven't a comparable figure with that, Mr. Howard, because that is pure lead sheath cable, and they didn't have any of it in St. Louis. If you will turn to the next page, please sir, page 40, and take the other item on that, 400-pair cable; the item there is \$1.1834 per foot; the price used in St. Louis was 92.49 cents, just about the same general increase. That would be about 30%.

about the same general increase. That would be about 30%.

As to the next large item that I consider important you can take the underground conduit, page 32. Let me find a comparable figure

with that. Run down the column there, Mr. Howard. This is on page 32, until you come to 11 ducts—four wide; the unit used in this instance is 2.1308 per duct foot,—per trench foot. In St. Louis, the comparable figure was \$1.9080.

The central office equipment is not comparable to Houston. This is prettly nearly what would be termed a "cable plant." St. 2817 Louis had a great deal of aerial wire at the time we made

this appraisal.

There is not a good deal of aerial work in this plant now; it is a very small item in this plant. This plant is an aerial and cable and

underground, very little open wire.

There are no other large items that I think of in the St. Louis plant that I could compare to this, that is, they have approximately the same class of buildings, and those kind of things, but not exactly the same size.

I have not said that the value I have adopted here and applied to my inventory is perhaps 30% less than the value to reproduce it now; I mean the estimate of reproducing certain property. What I testified to this morning that it would cost about 30% more at the

present day.

I could not tell you what the general increase of my prices are over the prices in 1914; I never figured that out no more than to make this comparison; I had no occasion to go back to that at all, you know, and it didn't have any bearing. I have used just identically the same principles as used by engineers, for instance, Sloan, Huddle, Fuestel & Freeman, Hagenah and Lamb.

In percentages the cost in this plant in the way I have reproduced it here, and would be above the same method in 1914. I can give you my best judgment on that, I would say about 40%,—maybe 30 to 40%. I estimated the price of reconstruction based on an average price over five years, and that is what this business

2818 is here. I say now that there was a general line of increase in material prices from 1901 to the middle of 1917, and that was fairly regular. That same per cent of increase applies practically to the cost of labor during those years. You will find this, Your Honor, that no matter what the material prices are, that the material prices will be just a little bit higher than the labor prices, no matter what time you select them. For instance it has been shown, time and again, that the percentage the labor cost bears to the material cost, the years '14, '15, '16, '17, '18 and '19, that the labor prices are just a little bit lower than the material prices, that is, the percentage they bear, the per cent of labor to material is practically constant.

"Q. Just a moment you make these pictures like our friend Topping and draw lines?"

"A. The curves, yes, sir."

[&]quot;Q. You see when you have simple minded people that are not mathematical folks, you have to draw pictures like you would for a child, to make things plain. Now, suppose you—you seem to be an obliging gentleman, you do this for me in a general way, you understand I don't want to lay any burden on you, you project the line of

cost on this proposition according to the general average established from 1901 to 1917, just project that line as if there had been no perpendicular rise in prices in 1917."

"Mr. D. A. Frank: That is known as the trend price."

"A. That is known as the "trend price," sir."

2819 "Q. Thank you, well, I didn't know what it was known as. I just figured that. Well, then, just to help me understand it in my simple way then, you indicate your reproduction price based on your five year item. Then indicate for me, as best you can in a general way the reproduction price as it is today, would be on prices as of today, and then the prices on the general trend of it, just do it in a general way, and make a picture of it so I can understand it?"

"A. Yes, sir."

I can fix that up for you.

(By Mr. D. A. Frank:)

"Q. I want to ask you one question: Mr. Howard asked you about whether or not the food prices were not coming down. I will ask you to read one sentence from the Associated Press from Wahington in the Galveston News published on the front page of the paper."

"Mr. Howard: You are offering the paper in evidence?"

"Mr. D. A. Frank: Now, I am asking him to read one sentence published in the Galveston News today."

"A. Washington, Jan. 22. Twenty-two articles of food reached record prices in December, according to a report issued today by the bureau of labor statistics."

Redirect examination.

Questions by Mr. J. D. Frank:

"Q. Mr. Player, making a comparison of the prices that you have used in this case, and the prices that you have used in the St. Louis case in December, 1913, you say that the poles, or rather the prices that you had used on poles in this case are approximately 60% higher than the prices that you used at that time, that underground cable is approximately 30% higher in this appraisal than in the one that was made in 1913. Can you explain why the poles are so much higher than the underground cable, and other classes of equipment?"

other classes of equipment?"

"A. Off-hand, Mr. Frank, I don't know whether I could do that, except in this way, there has been a general increase in the installation of all classes of plant, the demand for poles has been a great

deal greater than has been the demand for cable.'

I know something about the supply of poles; it is very limited. The fact of the matter is that today pole people are very much worried as to where they are going to get their supply of poles within the next few years.

As to whether or not it is a fact, that during the ten years that I was connected with the Public Service Commission, that the Commissions and the courts relied on my judgment with reference to material prices, and the values of the properties which I appraised, I do not like to talk about myself, but both the Oklahoma Commission and the Missouri Commission never questioned my judgment on these things because I did what was absolutely fair in all these

things. I didn't put it up any more for the Commission than

2821 I did for the people.

In the lower left hand corner of that page is a note, "C. N." denotes cost new; C. L. D. denotes cost less depreciation. I

mean by that reproduction.

The first column represents my estimate or appraisal of the different classes of property that I found in Houston, using a five year average price for materials and labor, and the second column "C. L. D." denotes the relative cost or appraisal of that property after the conditions per cent, or depreciation had been deducted. The first column shows the reproduction cost new based on my five year average prices, and the second column represents the reproduction cost new, less depreciation based on my five year average prices; that is correct.

As to how I determine the condition of this property, or per cent condition on the various items on property, in making my check of this property, while making the field check, I took particular pains to inspect all of the property that came under my observation, such as poles, wire cable, cable boxes, cross arms and any other equipment that was used in the construction of the plant. After I had finished the check of 15 sections of the plant, I took a machine and drove over practically the entire plant. I stopped in different places, and got out and examined the poles, cable and wire, and made notes as to the general condition.

With reference to the kind of examination of the pole plant for the purpose of retermining the present condition of that property, I will tell you just how I did. In examining a pole, we had a

2822 pick and shovel with us, and I scraped the dirt away from around the bottom of the pole, and took a long sharp knife that I have used for years for that purpose, and jammed it into the pole to see if there was rot or decay there, and in several instances climbed the pole, looked at the top to see if the top had rotted, if there was any chance for being watersoaked, the heart (as we say) rotted out of the pole and just a shell there. The same is true of cross-arms. I examined the cross-arms and I have inspected so much of this kind of property that I know pretty well just the shape that it is in by looking at it.

With reference as to whether or not that is the method usually employed by engineers in determining the per cent condition of the physical property of the telephone plant, that is the only way that the condition can be determined, that is, to go and see the

property.

You cannot take life tables and tell anything about the condition of the property; life tables do not mean anything. A life table is

drawn up showing presumably the length of time any particular plant will last, kind of plant. I have such a table on the back page of this report, but it does not reflect in any sense of the word the age of the property as it stands nor does it reflect anything relative to the value of the property. You cannot take a life table and from that life table find out the condition of it. A building will last fifty years, we will say, that has been built ten years. One-fifth of the

building is gone, if you had to use a life table where as a matter of fact if you make an inspection of that building, you will find that it is practically as good as new for all in-

tents and purposes.

The use of a life table is for the purpose of determining what amount of money or what per cent of money should be set aside in order to take care of the natural rust, rot, decay and depreciation and replacement of the plant during the estimated life, and obsolescence; so that when you examine it, the building might be in almost perfect condition, and still you might have a reserve to take care of it when it comes down,—that is true. In other words, in your reserve fund for depreciation you would have to take care of something more than mere rot, rust and decay; if you didn't have something more than what would actually take care of the business, of rust, rot and decay, why, you should be in a mighty bad fix.

I have never known of a rate case in any place where they determine the per cent condition of the property in any manner other than the manner in which I have determined it in this case. It is not only my opinion, but is the opinion of engineers in general, that this is the only manner in which you can determine the per

cent condition of the physical property.

I said that I testified in something like one hundred cases, and in every case I have been in there was an expert on the other side who had determined the per cent condition of the property that was in question and they all determined it in the manner in which

the books of any concern that had a piece of property and and had bought it in 1910, and they tell me that that property would last for twenty years, and from those books make a deduction of ten years or 50% of its value because the property was 50% or one-half of its age, approximate age, lapsed, gone, the property. I might put such a figure on it, 50%, and go out and look for that property, and they would absolutely have taken it down and destroyed it or burned it. I could not tell whether the property was there unless I would go and see it. I might go and look at it and find that instead of its life being half gone, that it was practically new and the book would be no indication that the life was half gone. That is especially true where they are replacing the property from time to time; it necessarily has to be. In a plant of this magnitude I know from my experience in the business that those replacements and changes are occuried daily.

Cross-examination.

Questions by Mr. W. J. Howard:

In by appraisal I carry forward the per cent condition to the different items and elements of the plant. I have no total prepared on the general average per cent condition on the whole plant; I just

depreciate each one separately, but for your information, I just made this claculation that the plant as a whole accord-

ing to my figures, is in about 88.7% condition. I first take the land and do not depreciate that any. Central Office equipment is on page 9, I take buildings and I applied to some 70%, and some 80 and one 85. I depreciated those as I went along. In other words that is the condition per cent that in my judgment those buildings were in.

Yes, sir, it is true that I think per cent condition relates only to the physical condition of the plant as compared to its new condition. For instance, you take the warehouse here, \$300.00, and I say its per cent condition is 70%, which would make it cost less the physical depreciation \$210.00. That is set aside for the purpose of taking care of things that bring about a depreciation of the physical condition; not that I know of. This is set aside to take care of the obsolescence, that all comes in, that is all under the term "Obsolescence and Inadequacy."

"Q. And that in order is added to physical deterioration when you go to try to determine what that reserve should be, or the annual annuity that makes up that reserve, you consider first, the deterioration in the physical plant, that is how to deteriorate from new down to a certain per cent condition on account of rust, wear and

decay, things like that?"

"A. Mr. Howard, don't confuse --- "

"Q. (Interrupting.) I am not confused at all about it."

"A. (Interrupting.) Wait."

"Q. (Continuing:) I am not confused at all about it. I am just trying to get your idea, I know exactly that you set up a definite and certain thing as per cent condition?"

"A. Yes sir."

It is true that there is wear and decay that will bring it down to a certain physical condition; I know that is going to happen.

I set aside a depreciation reserve to keep that property at 100 cents on the dollar, that is what I set it aside for. Obsolescence and inadequacy are the things that are going to combine or operate to prevent it remaining at 100 per cent on the dollar; rust, rot and decay.

"Q. Yes sir, then you combine the two things there, in setting up your depreciation reserve, you add one thing to the other, and

combine the two and aim to take care of those elements?"

"A. I aim to keep at at 100 per cent."
"Q. 100 per cent of the value then?"
"A. But I can't do it continually."

"Q. Oh, I understand you can't, you can't do it continually be-

cause you put a wire up here on these poles and it starts to wearing out and rusting out, you don't take that away, you don't repair it until necessary, you don't replace it until it becomes necessary, but if a string of wire out there becomes inadequate, you have to go into the ground with it, you don't absolutely make that change until it is necessary, but on the matter of percentages, as the years go on,

all that loss is accruing from all these causes, isn't it, and its past experience shows that it accrues and accumulates with 2827 something like regularity?"

"A. We are setting aside our depreciation reserve to take care

of it."

But then we must not confuse condition of the property at the present time with the amount of depreciation necessary to set aside, to take care of the property; we are not confusing that at all.

"Q. We are taking care of all these things, we are taking care of the things that reduce this warehouse for instance from \$300,00 to

\$210.00.

"A. That's the condition."

"Q. Yes, that is the condition."

"A. Now, let me explain that just a minute."
"Q. Yes."
"A. That is the condition that the warehouse is according to my judgment at the present time."

"Q. Yes."
"A. But I am going to have to set aside enough in my depreciation reserve fund to take care of that warehouse in the sume of **\$**300.00"

"Q. Surely, you are going to have to take care-set aside-

"A. (Interrupting.) The condition has nothing to do-the per cent condition has nothing to do with the amount that I am going to set aside."

"Q. It has this to do, though, it is regularly set aside to take care and provide for that thing that wears your plant out,

doesn't it, to keep your plant up to the 100% value?"

"A. Let me answer this that way, if I were going to do what you asked me to do, I wouldn't set it aside on the \$300, but I would set it aside to take care of the \$20."

"Q. But you don't change your annuity?"

"A. I am taking care of my property dollar for dollar."

"Q. That is, it could be done that way but assuming that your plant decreases 10% the first year, then the next year you don't apply your percentage to the 90% but you apply it to the 100%?" "A. I can give you an illustration that might help you".

"Q. I am not looking for help, I am looking to get the correct

view before this Master.

"A. As a concrete example, Mr. Howard, I testified in the Federal Court in the case of Western Union Telegraph Company vs. M. E. Trapp, the State Auditor of Oklahoma, as to the value of the Western Union Telegraph Company's property. That was in 1909, and that same question came up, of a line that was 10 miles long that would last ten years, that the first year it had depreciated 10%, should the rate for the message be reduced from ten cents to 9 cents.

"Q. Well, now, I am not contending that at all. That is where you don't get my idea. I am contending, you set up an annuity, that when it is set up from experience, and from the best knowledge you can get, you figure that you have to apply the annuity

each year to the original value in order to get the proper fund at the end of the time to take care of the plant, to take care of the investment. Now, the only thing that I am talking about, I am getting down to depreciation, when you come to apply your depreciation, when you go to value the property, of course you say this is cost, but what we are interested in finally is value, the cost, or how to get it, its value. Now, we'll take this warehouse for instance, it is simple and only a small thing, you have depreciated here?

"A, 70% condition."

"Q. Yes, 70% condition, valued at \$210.00."
"A. Yes sir."

"Q. Well, why not, if value is the thing we want and your warehouse that is in only 70% physical condition and thereby reduced to \$210.00 is reduced further in value by the fact that it is not worth half as much as it would be if it were more conveniently located, why don't you take that reduced value out of the plant before you go to apply the rate to it?"

"A. Mr. Howard, you are confusing that. I made a valuation of

this plant-"

"Q. Now, then, getting right back here's my view bout it, Mr. Player, and I want to see if it is not correct. I think you 2830 will get to looking at this thing through the old way and that is the way to do it."

"A. No, sir, we are using absolutely modern, sound engineering

principles.

"Q. Well, now let's see if they are sound. You know, a layman can get some grasp on these things. You have in trying to keep your property and your investment up to 100%, have set aside an annuity each year based upon the full investment cost, full investment price, investment value, you understand you are going to do that and going to disregard the depreciation principle each year. We are going to take the original investment all the way through and apply an annuity to it for the purpose of creating a certain thing, and you have already told us that the purpose you are trying to serve and the things that you are deterioration in physical condition plus obsolescence and inadequacy. Then you are setting aside a reserve for this very purpose. Then when you come to value this property to determine its value, why don't you deduct

both of these elements if they are both present in arriving at your net value?"

"A. I get your question. You want me to consider as to whether or not this warehouse is in a good location."

"Q. Yes, sir."

"A. And will serve its purpose."

"Q. Yes, sir."
"A. Three or four years from now just the same as it is doing now."

2831 "Q. No, I am assuming-"

"A. (Interrupting.) Now, wait a minute. In case it wouldn't, why I shouldn't include an element of inadequacy. That has not been taken into consideration and is not the correct method to apply in an appraisal of this character."

"Mr. D. A. Frank (interposing): It doen't exist."

"A. (continued). It doesn't exist. If the warehouse were not suitably located, the company would immediately locate its warehouse where it was suitable, where it would be most economical to

maintain it and bring the material to it."

"Q. And when they did that and built a new warehouse, then all these elements would disappear, wouldn't they, not only the obsolescence or the inadequacy, but also the physical conditions, the deteriorated physical per cent condition."

"A. Oh, no; no, sir."

"Q. All right now. I just wanted to draw your attention to this thing to give it some thought notwithstanding it might not strike your techincal mind as proper. When you go ahead to value this entire plant, take this telephone plant, for instance-

"Mr. Duls: You are talking about "value" now; not "cost".

"Mr. Howard: Well, "value" is the thing we are after; you say we are not after "cost".

2832 "Mr. Duls: That's right."

"Q. You reproduce this telephone plant now, and you reproduce it new, out of the best material, you reproduce it exactly as it stands here, serving the public now. Then in order to get one element, one of the indications of value, you call it "cost less depreciation." Then after you get this plant reconstructed and reproduced exactly along the same lines, a good construction engineer comes along and absolutely convinces you that the conduits are not running where they should run in order to best serve the public, and to be more economical and get the best service out of them, that the plant is a manually operated plant, it being demonstrated that the automatic will be the thing to be installed from a proper economical standpoint, and you have got an inadequate and obsolete and back number plant, instead of a modern one, would you depreciate that plant any on account of its obsolescence-

"Mr. D. A. Frank: Why, I object to the question because there is no foundation in this case for any such question. There is not any evidence here whatever of inadequacy or obsolescence. On the contrary, all the evidence shows that the plant is up to date, in fine condition, and is the same character of plant that is used in the best

cities of the United States today."

"Mr. Howard: There is evidence in this record already 2833 upon the question of obsolescence and there will be more." "Mr. D. A. Frank: There are some statements here by Counsel."

"Mr. Howard: No, sir."

"The Master: I will try to discriminate and not try to give any weight to improper testimony."

"Mr. Howard: Why, if it is improper, I guess Your Honor will

disregard it."

"Q. Now, then, your method of reasoning will lead you right to that conclusion, won't it, Mr. Player, that once you get a plant which is reproduced just along the very same lines that this plant is reproduced and we'll assume further that after it is constructed or is constructed out of material that wasn't entirely new, and that it lacks 100% of being in physical condition, then to get the value of that plant reproduced new, you take off you say the physical-

"A. (Interposing). Deterioration."
"Q. Deterioration. You take that off to get its value. am asking you why if the plant is not a modern plant but if built along proper engineering lines it would be more serviceable to the people, its conduits would be placed in proper shape, it would have

the most modern equipment in it, why, you won't also depre-2834 ciate it on account of that inadequacy and obsolescence that's in it?"

"Mr. D. A. Frank: I don't see how the witness can answer a question of that kind."

"Mr. Howard: Well, he started to answer it. He must have a better vision than you have.
"The Master: Well, do the best you can on it, Mr. Player."

"A. I beg your pardon."

"The Master: Go ahead and answer it if you can"

"A. I don't believe I can answer it."

"Mr. Howard: He would have answered it if Mr. Frank hadn't said that he couldn't."

"Mr. D. A. Frank: In explanation of it, I will say this. I think I can shorten this conversation a little bit. Counsel is assuming a condition that is impossible, that is, if a man builds a plant the size of this plant in Houston and as soon as he gets it completed he has got a plant that is made out of poor material, poorly engineered, inadequate, obsolescent, about ready to fall down, and not placed at the right position. Now, whether or not he would take that into consideration in looking at it, if it were such a plant as that a man would be an idiot that wouldn't say that the plant was no account, a plant of that kind. But that isn't the kind of plant they

2835 have got here. If his assumption had any basis of fact, no two reasonable minds would fail to agree on that proposition. Why didn't he ask him to assume something that is within the line

of reason. I don't see how he can expect the witness to answer such

a long question of that kind."

"Mr. Howard: Why, Mr. Player didn't ask for protestion at all until you told him he couldn't answer it. I assume that a fairly well educated man can grasp a fairly involved question."

"Mr. D. A. Frank: Well, a man would have to have a crazy-

quilt mind to grasp some of yours."

- "Q. What do you mean by this statement in your report on page 1, "Experience has shown that to duplicate an installation of this character, (that is, Central Office Equipment,) it would cost, irrespective of advanced prices, a great deal larger sum than was originally paid. This is caused by certain types of equipment used having become obsolete, which would require the factory constructing special machinery to reproduce the equipment, such as relays, coils, keys, etc." Now, you are assuming here, yourself, I believe, that there is a great deal of obsolete equipment in this plant. It is there, you can't laugh it out."
- "Mr. D. A. Frank: You just simply can't understand the statement, that is all."

"A. Mr. Howard, I mean just this by that, that you can inventory and large installation in the country any place. You 2836 will find that improvement has been made in certain

classes of equipment, that the manufacturer has changed his machinery to conform to the improvement. While the equipment in use is just as efficient for its particular purpose, used in a particular circuit, used for a proper thing, as the new equipment would be, at the same time, you would have to reconstruct new machinery in order to reproduce the same equipment, and therefore it would cost a great deal more money, it would cost this money, more money today by far to have the Western Electric Company reproduce some of its equipment here than it would be worth while paying."

"Q. That is just what I thought, that is just what I thought, and I think there is a lot in this plant. Now, then, they have got a lot

of this obsolete-"

"A. (Interrupting). No sir."

"Q. No sir, it is not obsolete in the sense that you have absolutely junked it, but an accruing obsolescence there, isn't there?"

"A. No sir, not in the sense that you mean it, not in the sense that you mean it. You mean in the way of becoming useless?"

There is nothing of that sort in this plant; not becoming less useful, not for the purpose for which it is being used.

As an engineer if I were going to reproduce that plant just from economical principles I would put in the newest equipment that the market would afford, and doing that you would vary from the model that we have here in this, that there's some types of equipment that are no longer made that give just as good service as those that are made, but it has been found more economical to improve them. It has not been found that you could put in better equipment for less money than some of the equipment that they

have got here now. I did not say better equipment; I did not say that. Here's the point, in this state of high prices where everybody is trying to conserve, make efficient materials and equipment as it is possible to do under prevailing prices, the manufacturers of all classes of equipment, not only of telephone, but of electrical, even down to the automobile, are making it as good as they can at the least expense possible, so that it will render the service for which it is intended, and that is where all this improvement comes in. I am trying to be honest.

No sir, I will not admit that there are certain parts of this plant that are not as modern as they should be, and if they were reconstructed now they could be eliminated and should be eliminated with regard to proper engineering,—I won't admit that. I absolutely contend that this plant is constructed and there is now in it no element of obsolescence or inadquacy as it stands here today; you are

correct about that. This is one of the most economically constructed, best constructed plants in the United States.

"Q. Mr. Player, you take in a city where the population seems to have a tendency out in one direction where the residence district and thickly populated district seems to be tending in a certain direction, and even the business portion seemed to be 15 years ago, seemed to have centered around a certain point, and it develops that very thickly populated growing additions have been laid out in just the opposite direction from what was then in mind, and it develops that the growth of the business district has changed quite radically from what was in mind would you say that that wouldn't affect the original engineering of the plant, I mean in regard to its adequacy, not in regard to the physical engineering at the time the plant was put in in regard to it having been located in the right place for the service today?"

"A. Mr. Howard, these things frequently occur that mistakes are made in fundamental plans in engineering, in all lines of business, as to getting a wrong building some place for a particular purpose.

Now, I want to cite you a concrete illustration of that."

2839 In the city of St. Louis when we made the appraisal of that plant there, we eliminated one of the finest buildings that the company had. I want to take this up in detail because it is just in line with what you are asking. The Euclid Exchange Building in St. Louis was built at the cost of-I wanted to get the exact location of it if I could. Well, anyhow this building at a cost of about \$45,000.00 to the company was placed in a location where it was thought that the town was going to grow and become thickly populated in a residence district. Before they could get all of the equipment installed in that building, the growth of the town proved conclusively that the building was in the wrong place and that building had to be abandoned absolutely. That illustrates what you said. not through any particular misjudgment or anything of that sort, but conditions just happened that way.

No, I am not assuming that everything that you are assuming is in a spirit of antagonism and of trying to combat my theory; I am

trying to give you, Mr. Howard, just a clear understandable version of this matter as possible.

"Q. That is what I say. I am admitting that the plant was perfect as originally laid out, that is just what I started out with, but owing to the conditions changing, that can render the services of a plant less valuable, less useful, can't it?"

"A. All right, I admit that that is true, but say that there

2840 is no such instance in Houston."

I absolutely say there is no such in Houston. I know where the Montrose Addition to Houston is, the most fashionable and desirable addition; I know about where it is. I have no idea how old that addition is. I think two or three years, something like that.

"Q. Well, it is very new. Did you know that the residence four or five or six years ago everybody thought the residence district was tending to eastward here from Main Street?"

"A. Tell me what is out in that direction,—Highland Park?"

"Q. No, Highland Park is way over there. Highland Park is rather-no, Highland Park is way over there, this way. Highland Park is in rather-

"A. (Interrupting.) I just wanted to get my bearings, that's all."

"Q. Now, the residence district, the labor or workingman's district of Houston lies off in this direction, to the north and to the northwest and around down towards the channel to the northeast, and the residence district is known as the south side."

"A. Are you speaking of this first as along Harrisburg Boulevard,

along there?"

"Q. The Harrisburg Boulevard, that is rather a workingman's section, pretty thickly grown up."

"A. I have been all through there."

"Q. Then that is comparatively newly grown up too, it is building down there rather considerably and the City is

branching out in a good many ways that wasn't anticipated five or six years ago. Now, do those things affect in any way the plant as originally laid out?"

"A. No sir." "Q. Why not?"

"A. Except in this, that the Company is going to have to build a new building out in the Harrisburg Addition. They are going to have to make some provision for extension possibly building out in the Montrose Addition some place, in order to take care of the increased patronage."

"Q. Well, I don't know enough about this from an engineering standpoint, but as I get it in a general way, where there is a very considerable traffic and where it can be done, you carry the traffic in

underground conduits, don't you?"

"A. Yes, sir."
"Q. Now, I suppose—Is there anything you might call a "trunk" conduit?"

"A. A what?"

"Q. A "trunk conduit," a large conduit that leads off into any particular section and carries a great many wires to a certain point before it begins to branch off?"

"A. Yes sir, the main conduits branch off."

"Q. The main conduits. Now, if the main conduit was laid with reference to the City building out here in the southeast part of town and it developed that it really built in the south-2842

western part of town, what effect would that have upon the

trunk conduit?'

"A. None at all."
"Q. Wouldn't that have any effect at all?"

"A. No sir, because those duties-Now, I am saying that in this instance, I have talked to a great many people in Houston. real estate men and others, and the growth of your city is constant, it is not limited to any one particular part. It is spreading all over. You have facilities here that no other city in the State of Texas has. You have got the best location. I am going to get into that later on.'

"Q. They have gone over it two or three times. We are satisfied about it."

- "A. But the engineering, the fundamental plans of this plant are just as perfect as any plant I ever saw. They are taking
- "Q. (Interrupting.) Well, now tested by inadequacy and obsolescence, is there any plant in 100 per cent condition?"

"A. I never saw one."

"Q. You never saw one. There is then some inadequacy and some obsolescence inherent in this plant here, is there not, there is some, at least?"

"A. Well, you can call it by any name you please, but I wouldn't say there is any obsolescence or any inadequacy that hadn't been taken care of by the company. I would say that there is a

2843 condition per cent, as to the property prevailing that would make the property as a whole in about 88.07 per cent present condition as an operating property, but as far as obsolescence or inadequacy is concerned, there is nothing there."

"Q. Well, we'll pass from that. Have you submitted this figure

here of five and a half mills-

"A. (Interrupting.) I haven't submitted anything yet."

"Q. You have just submitted an appraisal of these properties."
"A. Yes sir. I haven't talked about any figure."

"Q. You were asked to make an appraisal of the plant?"

"A. In the way that-

"Q. (Interrupting.) In that appraisal, you don't call the values off?"

"A. No sir."

"Q. What relation has it to value?"

"A. Just a measure of what might be considered, taken into consideration, measure up as to what the value might be."

Mr. D. A. Frank: He hasn't got through yet, Mr. Howard, with his testimony.

"Q. But in depreciating it, you have considered only the physical per cent condition and not obsolescence and inadequacy?"

"A. No sir, I have not taken into consideration any obsolescence

or inadequacy."

2844 Reirect examination,

Questions by Mr. J. D. Frank:

If my judgment can be relied upon, I have not included in my appraisal any telephone property in the City of Houston which is not used or useful in the telephone business; I just took what was

used or useful to the City of Houston.

In regard to — Counsel questioned me with reference to substitutions, if I were building a new plant here, if I did make substitutions, because of the change in the manufactured articles, a substituted plant with all of the latest manufactured articles, it is a fact that within a few months time that some of those articles would be off of the market so far as the actual manufacture of the articles is concerned. I might say this, that in the transmission of messages over our lines in France, the lines of the Army, we used equipment that had not been put into use in the United States simply because it had reached a state of improvement where it was necessary that we have the most modern improvement in the transmission circuits, and they shipped them right to France to us, so that we could use them there and they were not put in service here. The Bell Telephone Company did not ship them to us; they were shipped by the Western Electric Company.

With reference to the efficiency of those articles which are no longer manufactured, that does not have any effect on their efficiency because they are manufacturing them in a little different manner, nor does that make them obsolescent so far as the use of those articles are concerned; I testified to the same thing saying

they did not in answer to Mr. Howard's question.

I have ridden in the elevators over in the Preston building. I have not been riding in them every day since I have been down here; I have only been in them twice this week. When I was down here before I was in them every day. I have inspected them. If the Otis Elevator Company has made the statement that they could not give you a correct estimate of the reproduction cost new of those particular elevators, because that particular class of elevators is no longer manufactured, that does not affect the efficiency of those elevators in that building; they perform the services for which they were intended to all purposes now. That does not make them obsolescent, nor does that render their per cent condition any lower than it would be if they were still being manufactured. As a matter of fact, it does not have anything to do with the per cent condition.

If I started in to reproduce this plant here in the manner mentioned by Mr. Howard and made substitutions of various items of material, here, there and yonder, when I got through I would not have an estimated cost of reproducing the property which exists

in Houston today. I might just as well have somebody send me a map of the City of Houston and sit down in my office in St. Louis and draw out the conduit runs and the location of buildings, and then satisfy my own mind as to the kind of equipment I am going to put in them as to say yes to such a question as that. What I was trying to do was to estimate the cost of reproducing the property that was here; certainly, that is my idea.

The Annual Reserve for Replacements is to take care of storms,

fires, etc., among other things.

The telephone business is a hazardous business. You are 2846 liable to lose a part of it through conditions of the elements, fires, or anything of that sort at any time. I know that some of these buildings which I had in my appraisal are likely to burn down; those things do occur in connection with large plants all of the time. I do not take anything off of the per cent condition of the property on account of the fact that those things have occurred in large plants of this size and that certain items of this kind will occur in this plant; the proposition of condition per cent and what amount of money it is necessary to set aside to keep the dollar worth 100 cents, are two different things entirely. You are talking about two different things. You cannot mix oil and water and that is what you are trying to do in this, by asking a question of that sort.

Land is the first item of property in my final summary. I did not appraise the land. I secured from four real estate dealers their figure and their best judgment as to what the land was worth, then, in order to be consistent with my other methods of procedure I took the average figure of the four real estate men. Those real estate men were Mr. Hannah, Mr. Wilson, Mr. Mills, and the Sam Realty Company, all of Houston, Texas. I got from them an estimate of the market value of the various pieces of land and added together their four estimates and divided it by four and took that as the value of the land. I got \$178,500.00 for the land in that manner; the detail of that is shown on page 2 of the Appraisal. I have not seen any of Mr. Hoag's figures at all, Mr. Frank, and I do not know what his figures are. The details of that appear on page 2. I included as the valuation of the lots upon which the Preston building is located \$167,600.00; the lot on which the Hadley Exchange building is located, \$5,000.00; the lot on which the Taylor building is located, \$2,700.00; the property

2847 in Fullerton Place which has been purchased for a new exchange site, \$3,200.00, the lot is for the proposed Harris-

burg Exchange, a total of \$178,500.00.

Taking up the item of Buildings, I have included in the appraisal as the cost of reproducing these buildings, \$463,131.00. That is the reproduction cost new. The reproduction cost new less depreciation is \$395,814.00; the detail of that will be found on pages 3, 4, and 5.

On the Preston building I placed a valuation of \$346,092.00 new; \$311,483.00 cost less depreciation. I found that building to be in 90% condition. The Hadley Exchange will cost new \$83,142.00; cost less depreciation, \$74,828.00. The Taylor Building \$31,547.00,

cost new less depreciation, \$28,327.00. The warehouse located at 3213 Texas Avenue, cost new \$300.00; cost less depreciation \$210.00. The garage located on the Preston lot, which is used for housing vehicles and tools, etc. \$1,400.00 cost new, cost less depreciation \$1,120.00. A little storehouse located on the rear of the Taylor Exchange lot, cost new \$650.00; cost less depreciation, \$552.00, giving me a total cost new of \$463,131.00, and the cost less depreciation of \$395,814.00.

In ascertaining the cost of these buildings I did this, I have estimated the cost of the buildings owned by this company, that is, the Southwestern System in many places in Oklahoma and Missouri. The buildings are built under general standard specifications and do not vary to any degree one from the other. The same class of steel, concrete reinforcement and other materials are used in all of the buildings. They are built expressly for telephone purposes, the

floors are thicker and heavier, as are the foundations and side 2848 walls than an average building of the same size would be.

This is due largely to the engineering basic principles for building a building or any part of a telephone plant. The buildings are put up to have additional stories added to them, that is, the foundations are built heavier than they naturally would be for a two or three story building, they are built to take four, five or six stories, like this Preston Exchange building; the building is constructed for five additional stories, I think it is, that is, this building has been constructed in such a manner, that whenever it is necessary to do so they can add four stories on to the building, with no need to reinforce the foundation or the lower side walls or anything of that sort. It is already there for the purpose. In my experience in estimating the cost of these buildings. I have followed the same principle in Houston as I did in St. Louis, Oklahoma, Springfield, Mo., Fulton, Marshall, and other places, of estimating the cost per cubic foot, the cubical contents of the building. I have the price per cubic foot and that varies; on the Preston Exchange building I use a price of 551/2 cents per cubic foot. That is on page 3, and I show that in connection with each building, the price per cubic foot. The Hadley Exchange, the Hadley building, 44½ cents, the Taylor building, 43 cents. That procedure or method of estimating does not vary or differ from the methods used by other engineers in the same class of work.

The figures used by me included architect fees, they included the cost of the building erected as it is. I would not undertake to get those buildings built on the prices I have used at the present

time; I don't think so.

The figure of the central office equipment I have here is \$975,668, cost new; \$882,283,00 cost less depreciation. Unfortunately, 2849 I have to admit an incorrect wording in this item; Roman numeral I, right after the letter of transmittal, under the heading of "Central Office Equipment." That is the last paragraph under Roman numeral I. I say here, "the figures used by the Company in its appraisal have been used by us." That is not correct. I did all of this work and in writing this letter, I was a

little hurried and I should have said that the figures used by us were supplied by the company. Now, the same is true on page 6; it should be that the figures used were supplied by the company.

In the statement down there at the bottom in the last sentence in that paragraph under Roman numeral I, I say: "The company used an average price of five years in this instance, and we in making our check find the prices used to be conservative;" the estimate which I used was based on the five year average prices. I asked the Engineering Department of the Southwestern System for the average five year cost of the Central Office Equipment. I did that for several reason. This is a big plant and the Central Office Equipment is a good big part of it. Of course, I have checked the records—well, I did check the record of all the equipment installed in the St. Louis Plant, that is the voucher cost. I did the same thing relative to Springfield, Missouri, where the cost of that Central Office Equipment was \$86,000.00, and in other smaller plants owned and operated by this company, and I have never found yet any discrepancy as to

the cost of the Central Office equipment for the simple reason that they simply go to the bills rendered by the Western Electric Company for the cost of the installation. I felt reasonably sure that they would have no object or idea of giving me any inflated cost or the wrong cost in this instance; I had no hesi-

tancy in asking for it.

When I got those prices I made a check of them. I did this; I checked them in comparison with other appraisals that I had made of the same class of equipment, and found them to be conservative and correct and so I adopted them. This same procedure has been accepted by both the Oklahoma and Missouri Commissions and by the courts after that, in cases of those commissions. The next item is No. 4, Subscribers' Equipment; the cost new is estimated at \$357,087.00; the cost less depreciation at \$308,732.00. I show the details as to that on pages 10 and 11 of my appraisal. Under this account, I might say that, so as there will not be any confusion or confused ideas, that I have used under these various captions, Account No. 18-C, for instance; this is all in accordance with the Classification of accounts set up by the Interstate Commerce Commission, prescribing how the company shall keep their books under various account numbers like under subscribers' equipment, station apparatus, would be 18-C, their account number for aerial cable is 2-C, their account number for aerial wire is 14-C and so on, and I have just just for comparison purpose, have used account numbers conforming to the classification of accounts, construction accounts.

I am familiar with the rules of the Interstate Commerce Commission with reference to the system of accounting for the telephone companies. I will say this, that when the Interstate Commerce Commission issued their classification of accounts in January, 1913, I was the engineer for the Oklahoma Commission, and recommended to that Commission that that classification be adopted, be used by all telephone companies in the State, where it could apply, and that Commission immediately issued an order prescribing that classification of accounts for Telephone Com-

panies. The Missouri Public Service Commission have done the same thing and have that also. It is compulsory on telephone companies throughout the United States. There is a penalty attached provided for in the classification of accounts in the law that unless the books of the Company are kept in accordance with that classification that the company will be penalized. They have to keep all of their accounts in their local exchanges in accordance with that system of

accounting.

On this station equipment or subscribers' equipment, as I designate it, it so happened that that differs greatly from central office equipment in that the units are compact and small and prices are readily obtained on this class of equipment; I had the prices and could use the prices for this class of equipment that I had. Those were the prices of the Western Electric Company; these are Western Electric instruments and I could not apply the prices of the Kellogg instrument, or a Stromberg-Carlson, or a Dean instrument to the Western Electric instrument. Those are the same kind of instruments that are used in Oklahoma and Missouri; this type of instrument is used by the Bell Telephone system throughout the United States. It is not obsolescent, that is, for common battery equipment. In rural districts, where they have rural lines and

small magneto exchanges, something of that sort, you will frequently find Kellogg instruments in many places. Dean instruments with Kellogg switchboard in many places, and Stromberg-Carlson instruments on a Kellogg switch-board. words, for many years past, a great many of the companies have not been limited to buying Western electric equipment. No, you do not find that in some of the larger equipments, as we say, in the telephone business, there is no Duke's mixture in the exchanges. It is all a standard type of equipment and it is found economical to have a standard type of equipment. I might explain that this way: you have your trouble men, taking it from the operating room, you have your operators, then in the Plant department, you have your installers, your trouble men, your wire chiefs, and each and every one of those men know that class of equipment, know just exactly how to handle it, if it gets into trouble, what to do for it, and if you had two or three different kinds of instruments scattered around, then it would necessitate having two or three different kinds of supplies on hand to repair those particular instruments, and a man might know just exactly where to look for the trouble of a certain kind on a Western electric instrument, or owing to the change of a spring or something of that sort in a Dean or a Stromberg instrument, he would be puzzled, take him longer to do it. In other words, standardization throughout is the most economical procedure, or basis for the company to work on, and that is what they do in these larger plants.

If a man goes from one exchange, say, a repairman or a lineman goes from one exchange to another, by reason of the fact that 2853 the equipment is standard he can work as well in one town as he can in another and not only that, but in repairing instruments, or lines, or things of that sort, he carries one standard

class of equipment with him, repair parts, etc. He can do anything

connected with that.

In connection with the various rate cases that go before these Commissions, I have had and the Commissions in some of the cases in which I participated had occasion to investigate the prices of the Western Electric Company with reference to whether or not they were high or low, or how they compared with the other companies: we have done that, in fact, I personally have gone through the Western Electric plant at Hawthorne, Ill. I have also gone through the Automatic Electric Company in Chicago, and the Stromberg-Carlson manufacturing plant there and I can say frankly that the prices of the Western Electric Company are no greater than they are of these other companies for the same class and character of equipment. As a matter of fact, the prices are a little bit lower, due to economical reasons more than anything else. Their facilities are so great of supplying the demand, they can turn the apparatus out more readily, thereby causing the Company that wishes to buy it to be served long before they can secure a similar type of equipment from some of the other companies or manufacturers. Not that the prices are any lower. but in the interim that they would have to wait for this equipment they are receiving revenue from apparatus installed where they would still be waiting for it from the smaller manufacturers.

The Western Electric Company is the largest manufacturer 2854 in the United States, that is, of telephone equipment and has the largest facilities. I would not say that it is the best. I would say that it is as good as can be had. Frankly, Mr. Frank, I believe that there is some classes of equipment made that are just about as good, in fact, the Stromberg and Kellogg and Western Electric are just about on a par, but not on everything; some things they are better on, other things they are not quite as good. I believe it is generally conceded that on a magneto telephone, the Kellogg Company makes a better telephone than the Western Electric, that is, throughout the independent field.—conceded by

the independents.

I have had occasion, I guess, to examine vouchers and bills sold by the Western Electric to the Bell, aggregating Ten Millions of Dollars worth of material. I have investigated the prices of some of the materials which the Western Electric Company has sold to some

of these independent companies.

In making those investigations I never found an instance in which the Western Electric Company had charged the Bell Telephone Company more than it had charged an independent company for the same class of equipment, on the other hand, I have not found where they charged the independent company any more than they charged the Bell. I found the prices the same, I can cite you to instances of that, the installation of the No. 1 switchboard, the same as you have, practically the same as you have here, in Columbia, Mo., the installation of the No. 1 switchboard in Joplin, Mo., which

is as large as any individual board you have here, the price

2855 is just exactly the same.

On this subscriber's equipment, I took the five year average price on that and applied it to the quantity of material that I found

in this plant just in the same manner that I have always done. The cost new of that particular item of property is \$357,087.00, and the reproduction cost new less depreciation is \$308,732.00. Now, under this heading comes several minor accounts, such as the station installation, the private branch exchanges, the booths and special fittings. I thought I had a summary of that, but I have not, but the aggregate is that figure of \$357,087.00. Subscribers' stations alone, that is the desk telephones and the wall telephones used by the company including pay stations, are \$147,668.00, the cost new; \$125,188.00 cost less depreciation. That is on page 10.

On page 11 I have Station Installations, which is installing the subscribers' telephone in place, and I have figured out the reproduction cost new and then the reproduction cost new less depreciation.

Page 12 is a part of it, that is the "Exchange Interior Block Wires," that is under account 48-C, that is \$1,772.00 cost new, and \$1,506.00 cost less depreciation.

A block wire is the wire that is run along the buildings and in the block, within the block from one terminal head to the subscribers' stations.

2856 I do not continue that on page 13, that comes into a different account, that is "Aerial Wire drops." That comes under the heading of the "Distributing System."

Cross-examination.

Questions by Mr. Howard:

There is no concern or manufacturer of this telephone equipment that compares in magnitude to the Western Electric. firm that I said is a large firm is the Kellogg Switchboard and Supply Company of Chicago. They manufacture mostly equipment for small exchanges. Well, they make large installations also. They build common battery switch-boards of large type. I don't know personally of a large installation, I can't recall it right now, that is, that is in service at this date. The first switchboard that the Kinloch Telephone Co. had in St. Louis was a Kellogg installation. That was a great deal larger than all of the combined switch-boards in Houston; it was a big type of board. That is out of date now and has been destroyed years ago. I do not know of any large board that they have installed now, that is, the Kellogg. Another one is the Stromberg-Carlson Manufacturing Co. It is not larger than the Kellogg in magnitude, I think it is about the same sized concern. They manufacture switchboards and instruments. Exchange of the Kinloch Telephone Company is operating Stromberg-Carlson equipment. It is the largest one unit switch-

2857 board in the world today, and that was installed, let me think, about 10 or 11 years ago. The Kinloch Telephone Co. uses that. The Kinloch Co. has about 40,000 subscribers in the City of St. Louis and operates elsewhere. I was just going to say, now that I recall it, the Delmar Exchange and the St. Clair exchanges of the Kinloch Telephone Co. which are large exchanges, larger than either Taylor or Hadley, are Kellogg equipment. I believe the East St.

Louis Exchange is also Kellogg equipment. That is an independent

company, that is all the Kinloch that I am naming now.

In St. Louis they have two telephone companies; the Kinloch and the Southwestern Bell Telegraph & Telephone Co. The Kinloch is about the largest independent company that I know of. The Keystone in Philadelphia may be about the same size, but I don't believe it is quite as large as the Kinloch. They are about, I think they are capitalized at Ten Millions.

I do not know who manufactures the equipment for the Keystone, but I would hazard a guess that it is Kellogg equipment because I know the Sales Manager that used to be with Kellogg very well,

and I think that he is interested in that company.

I would not call these other manufacturing companies very small as compared with the Western Electric. I will tell you another installation that the Kellogg people made and one very large installation was Los Angeles, California, and they installed a modern, common battery switch-board there, operated just as successfully as any other type of board, any other make, but it was replaced with automatic. There are numerous ones all over the country,

2858 I can't just recall them to memory. It has been a long time since I had that question put. Neither the Kinloch nor the others that I know of of those concerns are engaged now in the manufacture of any large equipment.

Redirect examination.

Questions by Mr. J. D. Frank:

I have not included in my Subscribers' Equipment in connection with the instruments any receivers, transmitters, or induction coils; never have done that. I did not include them because I know from the investigation of the records of the Bell Company for the last 11 years, that the Southwestern Telegraph & Telephone Company, the Bell Company don't own the transmitters and receivers and inductions coils. They rent those from or secure the use of those from the American Telephone & Telegraph Co., that is the common practice throughout the system. In connection with my Central Office equipment, page No. 9, I have a heading: "Other Equipment." The Central Office, "Other Equipment," is the equipment that consists of furniture and fixtures used in the operating room of operator's rest room, and dishes and cooking utensils used in the kitchens of the various exchanges. That is in connection with the rest rooms, cafeterias, and cloak rooms.

I have been familiar with a good many large telephone exchanges and know that it is customary to have those cafes and rest rooms,

and so on in large exchanges; all of them have them. It is as much a part of the essential equipment of a modern exchange to have facilities for the operators that will make their surroundings pleasant, and give them as near home-like conditions as it is possible as it is to have the switchboard and wires.

I am familiar with the Home Company at Kansas City, the Home Company at Joplin, Missouri, the Kinloch Telephone of St. Louis,

and other large companies, and they have these facilities, and that particular item of property has been included in the appraisements of the various companies and it is perfectly proper. It is generally recognized by the Commissions that the Company's property includes that particular equipment; the items have never been ques-

tioned at all, it has been taken for granted that it is.

On page No. 1 of my summary the next item of material there is the distribution system, aerial. That covers pole lines, pole accessories, the aerial wire and aerial cable. Of course, in connection with the poles, we have only the poles in place. With the item of accessories we have the cross arms, and anchors and guys, pole sets and other equipment that goes to make up the pole line equipment. In the wire we have the copper and iron—bare-wire, whatever covered wire there is, the drop-wires; and on the cable we have the different sized cable, together with the terminals and other parts of the cable equipment that go to make up the cable parts.

2860 On that property I found the cost new, \$1,021,043.00,

cost new less depreciation \$886,587.00.

With reference to the details of that particular part of the equipment, on page 20 is the beginning of the poles, and we will find the summary of the poles on page 23; pole accessories begin on page 24 and end on page 25. I might give the figures that go to make up this total amount as we go through. Going back to the poles, we have a cost, new, of \$302,085.00, cost less depreciation, \$225,425.00. Account 21-C Exchange Pole Line Accessories, cost new \$70,300.00, cost less depreciation \$59,338.00. Aerial wire—that is on page No. 25.

In aerial wire, we have cost new \$59,110.00, page 26; and cost less depreciation, \$49,261.00. Aerial cable, aerial exchange cable, Account 2-C, beginning on page 27, and the summary will be found on page No. 31, cost new \$589,548.00, cost less depreciation, \$522,563.00; gives us a total which is shown on the summary, see Final Summary page 1, of cost new \$1,021,043.00, cost less depreciation,

\$826,587.00.

My next item on Final Summary on Page No. 1 is Distribution System-Underground. The distribution underground of the underground cable consists of the underground cable, both main and subsidiary house and block cable, and subsidiary cable. There are five different accounts under this item which are 14-C, 15-C, 24-C, 25-C, and 35-C. That is the classification set up by the Interstate Commerce Commission. That is the beginning of the underground system on page 39. Now, turn to page 41, that gives you the summary of

the \$576,250.00, cost new; cost less depreciation, \$497,458.00.

2861 The next page 42, account 25-C, exchange underground cable, subsidiary and block, the summary on that will be found on page 26. It is a summary in itself. That cost new \$86,740.00, cost less depreciation \$74,078.00. The next item is 35-C, the summary of which will be found on page 48. This is house cable, total of \$8,589.00, cost new, \$7.646 cost less depreciation. Now, then, we will have to turn back to page 32, beginning with Account 14-C of Exchange underground conduit main. The sum-

mary of that will be found on page 35. I do not find the cost new of that particular piece of property, \$62,930.00; there is an error here some place; oh, the summary will be found on page 36, I made a mistake. I find that the cost new of that property \$459,686.00, and the cost less depreciation \$429,847.00 in Account 24-C, which is the exchange underground conduit subsidiary starting on page 37 and ending on page 38, the total of that account is \$48,557.00, cost new, \$42,285.00, cost less depreciation. That covers all the underground system making a total of \$1,179,822.00 cost new, and \$1,051,314.00 cost less depreciation. That gives me for my distribution system, aerial distribution system, underground, etc., the sum of \$4,175,-251.00 cost new, \$3,703,230.00, cost less depreciation.

I have on page 1, Item 8, overhead expenses 17%; that 17% is 17% of the physical plant as shown in the total, line 7, page 1. That represents the overhead expenses involved in the construction of this property, which are to be added to the cost of the material and the labor of placing them up there, although they were expenses that were incurred in connection with the construction of the property; those are expenses that could be allocated in the

2862 same percentage to each individual class of the plant, but it is the general practice to put them in as a lump sum in this manner. The detail of this 17% will be found on page 2, Roman numeral.

With reference to the item of my overhead expense, organization expense 2%, the matter of building a plant of any size at all, it does not necessarily apply to Houston or St. Louis or any other property, there has been the general supervision over the entire period, and this is carried on by the general offices of the company, and we have found through experience that 2% will be a reasonable allowance for that supervision. That is also sometime spoken of as "General Expense." Valuation engineers always include an item of that kind

in their cost of starting the property; it is always included.

The next item is Omissions and Contingencies in the sum of 3%. There are so many items that can come in under the heading of omissions and contingencies, leaving out parts of the plant that you overlooked in taking your inventories and unforseen expenses of various characters, various kinds. Omissions here is not designed to take care of omissions only; there are contingencies. Going into detail a little more and giving you an illustration of contingencies, showing why it is necessary to make an allowance of that kind, one item that could be illustrated in a way is the location of a plant, that afterwards develops is not exactly located suitably, or something of that sort. I do not know of any plant in Houston, through the inventory that we checked, that would come under that specific

2863 item, possibly, if we had taken and checked the whole inventory we would have found considerable of the plant that might have come under one item and if anyone else had checked it they would have likely found some more. Now, for instance, we have always found items of contingencies and omissions. Up at Springfield, Missouri, the company had left out of its inventory an

item of \$2,500.00 for a sewer that had been constructed which was found properly charged to omissions and contingencies. The reason I haven't such matters as sag in cable and wastage in materials in connection with my omissions, I suppose, I should have gone into all I thought it had been gone over, why all those things came that. The cable ends that are not accounted for, there are two or three feet, sometimes as much as four feet in every cable spliced; there is a loss on wire in splicing; it may seem a small item, but in soldering joints, soldering expense, there is a good deal of time of the men doing the work that goes into the charge of the work, but you cannot very readily pick it up, and the fixing of mains and fixing cables and all of those kinds of things. I heard Mr. Topping's testimony in reference to example for omissions a few days ago. Those are the things that usually go to make up these omissions and contingencies, and those are the things which make it necessary to include an item of this kind to be correct.

If you are constructing any kind of conduit out here, and have to change the route on account of some unforseen obstruction and so on, that, of course, does not appear when you are inventorying the property; you are liable to run into a sewer or gas main

2864 and break it and have to fix it up or detour around it, or something of that sort; all those things come into this item.

The usual allowance on this made by engineers runs from 3% to 5%; I have taken 3 in order to be consistent with other appraisals I have made and to be conservative. In other words, in representing the Commission, I always practically took the lowest that I could and I have followed that same practice in this case, that is just exactly what I have done.

My next item on Overhead Expenses is liability and fire insurance; I have allowed 1% for that. That covers the liability of employees' insurance, fire insurance during the period of construction, which the contractor or builder would have to carry,—would be forced to carry. It is rather a conservative figure; I have seen it as

high as 3% for this item.

My next item here is interest during construction, 6%. I include an item of that kind because interest during construction is allowed during the construction of any plant, and especially is it necessary t ocarry this item on account of the hazard connected with the telephone business. The telephone business is not like an ordinary business, there are many things that come up in connection with it that you do not find any place else, they are not even in the construction of electrica lproperties. I am not talking about liability insurance; I am talking about interest during construction. It is true that interest during construction would merely cover the interest you would be out for the money you have used during that period of construction, but there are other things in connection with it.

The reason that interest during construction is charged is that you have got your money in there but are not getting any money for the use of it and you charge interest for the period of time during which you have got your investment and are receiving no return. I think the figure I have used here is lower

than you could get money at the present time. You should figure on a basis of about 3% upon it for a year and a half average time, that is, I have taken the average time of two years and counted 3%. I do not know any place where you can get 3% money, that is, at the present time you could not; I got this on a five year period and I am just staying consistent with the thing the whole way through, that is, trying to; I adopted the very lowest figure, I think, at which rate of interest I could get the money. During my twelve or fifteen years' experience I never heard of a telephone company that got any money at 3% in anything like small quantities. In large quantities it might have been borrowed at that rate several years ago, but not at the present time.

The next item is Engineering expense 5%. This is the usual and customary charge allowed in all appraisals for the item of Engineering; it covers the laying out of the plant, fundamental studies, all things that go in connection with the laying out, building and supervision during the building, etc., all engineering. I

have got a total of 17% for all of my overhead expenses.

I have not attempted to work out the percentage after each item, that is for instance, on omissions and contingencies, I have stated that I would have omissions and contingencies, but have not

2866 said that I would have omissions and contingencies amounting to nothing on land and ½ of 1% on buildings and 6 to 8% on Distributing Systems. I have taken it on the property as a whole and that is the way I have applied all of my overhead expenses obsolutely. It would not make any difference in the final result if I worked out this overhead expense with reference to the percentage which should be allowed to each particular item of property in the plant; it would not affect the total result at all, it is just simply separated from the entire property here as a matter of convenience and for nothing else.

Cross-examination.

Questions by Mr. W. J. Howard:

"Q. Mr. Player, on the whole question of overheads you engineers have started things in telling me about the percentage customar-y allowed, in figuring these things out, why not take the direct method and apply the overhead, determining upon the items that carry overheads? Now, for instance, land, the overhead that that carries is negligible. Now, why not limit it to buildings and architect's fees, why not eliminate those items and apply your overhead to things that really require the carrying on of overhead expenses, instead of bringing in the items that do not?"

"A. As I said before, Mr. Howard, that could be done, but it

would have no effect on the final results."

They all carry it right straight through as a lump sum on the whole property; it can be segregated and really charged as to each class of plant, but as I stated before, it is just simply a matter of convenience to apply it this way and it is the usual and customary way of doing it.

"Q. Some of the items here, I think are very conservative, Mr. Player. But now, your final 17%, is that not a little in excess of what has been the customary lump percentage to give on overheads, hasn't 15% been a very usual figure and customary figure?"

"A. Well, Mr. Howard, I will say this, that up to three or four years ago there was only one charge in one item that would affect

15% at all."

That was not injuries and damages, but is interest during construction. In the Springfield case and in the St. Louis case, I used 15% overhead and only used 4% during construction. In the Marshall case I used 6%, the same as this, money prices had gone up

and the interest rates had gone up.

With reference to my item of organization expenses 2%, which would be in excess of \$80,000; I haven't the chart of the organization of this company and it would be pretty hard to explain that to you without a chart showing the organization. That would not take the time of eight \$10,000.00 men for a period of over a year; there is the whole organization that would have some part in the building of this plant, you understand, there are the general officers, President, Vice-President, the Secretary, all of the employees, the

Legal Department, the Plant Department, all come into or 2868 under the General Expenses, and really the per cent of it

figuring 2% is conservative.

"Q. Yes, I understand that is conservative, Mr. Powell just called my attention to the fact that it runs all through the plan. Still at the same time, it is an easy thing to run up money on paper, an easy thing to draw on paper,—and we have \$80,000.00,—that is a good deal of money.

"Mr. D. A. Frank: As compared with four or five million dollars,

it is not very much, Mr. Howard."

"Mr. Howard: Yes, but now we are going to build a plant for four million dollars, and this \$80,000.00, as I understand it, is charged in here as expenses to just get ready to spend that \$4,000,000.00—to invest the \$4,000,000.00."

"A. No,—a part of the \$4,175,000.00 is being spent under the supervision of the general offices, all from the time they buy the land and start the construction, start the laying out of the plant—

the plant starts with the general offices."

This organization expense that I am speaking of does not mean getting the organization, getting the company organized, and getting your organization men together that are going to look after this investment; not in your overhead charges you don't at all. These overhead charges I could have called "General Expenses," and it would have been applicable to have called it general expenses. I am not prepared to detail it in any way except in the general way I am accustomed to.

Now, in these omissions and contingencies, when I start out in the manner in which I have done here to figure on reproducing the plant I estimate the materials necessary, I estimate the labor necessary, the number of men, and how long they are

going to work and all that sort of thing. In doing that I do not just adopt the theory that I am not going to be exactly accurate and that I have got it down to just within two or three days of the man labor I am going to employ, or within five or six of the man hours I am going to employ; I do not try to work it out that way at all. I told you this, Mr. Howard, the other day, that in estimating the reproduction cost new, I had the material and added to that the amount of labor necessary and I did not figure out that it was going to take a man thirty minutes to do this class of work or twenty minutes to do that class of work and sum up the whole thing; I do not go into all that detail. I did not arrive at how much material it was going to take of all the difference kinds; I had the inventory as to the amount of material, and then I built the labor price necessary to put that material into place. You can call that an estimate. but as I explained Friday, you will find the labor to bear a certain percentage to the material cost, and I get at it by that method. That might not lead you to employ too much labor or take care of some of these contingencies that might arise. If you had \$100.00 worth of material and applied 60% of that to labor, that is just that material and labor charged.

2870 "Q. But in figuring that labor to a man .- from experience you know that plants like this are never built without running into some difficulties,-and in figuring the labor and applying the per cent of labor charged to materials used, those contingencies

are included largely in the amount of labor, aren't they?"

"A. No. Sir."

For instance, we go along the street and we see a cable splicedwe will say it is a 200-wire cable; we know that in making that splice about 400 feet of cable was lost, some solder lost, there was some paraffin lost, other little materials that go to make up the splice, understand, little paper sleeves, muslin, and things of that kind that you cannot see. There are practically no contingencies in labor.

"Q. Well, there are contingencies where you take more time-for instance, if a trench fell in-for instance, you have to throw out the dirt and brace the trench-those things are included, and you anticipate things like that when you apply this 6% for material

and labor?"

"A. No, sir, not when I apply the labor. I am taking in anything

of that sort in this 3% which I have allowed."

If we disregard this inventory entirely and are trying to find out what these people invested in this business here I don't know that we would go to the books to find out. To go about finding out what was invested in this plant here I would have to take an inventory of it. Let me say this, that I don't know when this plant was started in its construction; if it was started prior to January 1, 1913, I doubt very much if there are any records. I am not relying on any book figures as to the cost of this plant here.

2871 "Q. Well, if you spend money and keep books, it will show up in the books-all those expenditures would show?" "A. If subsequent to December 31, 1913, I would say yes-because then the books were kept absolutely according to the rules laid down by the Interstate Commerce Commission."

"Q. Well, assume that—we will assume they have kept books, and they are experienced business men, they would keep books on it?"

"A. I wouldn't like to testify as to an assumption, Mr. Howard." If they kept books of their expenditures, I don't know whether or not those omissions and contingencies that have been inherent in this plant would appear upon the books or not as expenditures. In valuing these properties, when I valued them for different commissions that I have represented I did not give any regard whatever to the books of the utilities. There are two separate divisions, there is the Auditing Department of this state Commission, as of every commission. What I mean to say is I am merely a specialist in inventorying and valuing property; that is right for this case.

"Q. You, in referring to these omissions and contingencies a while ago, you stated that during construction you would find that parts of the plant had not been located suitably. What did you mean by that, Mr. Player—as an illustration of a contingency, I

think it was?"

"A. Well, sir-"

"Q. You just said that, I want to know what you mean by that?"
"A. I never—in all plants—I thought that had all been gone over."

2872 "Q. No-you just mentioned it a while ago?"

"A. In all plants there are some omissions that you are

liable to find-discover."

"Q. You stated a while ago, Mr. Player, in discussing the matter of contingencies, that you frequently found that parts of a plant had not been suitably located. What do you mean by that expression?"

"A. There may be a building in the wrong location."

"Q. Or a pole, as Mr. Frank suggested?"

"A. There may be some manholes in the wrong location, underground conduit, and cables in connection with it."

"Q. Yes? Then what do you do in that case?"

"A. What do we do in that case?"

"Q. Yes, what do you do in that case, what do you do when you discover that, if you are constructing the plant—and you are constructing it now?"

"A. Why, I would make some notations of it, if we discovered it

in taking the inventory—

"Q. But we are not talking about taking inventories now, we are building a plant, understand—we are out building a plant, and it is in the course of construction, and you, as supervising engineer, have discovered that a part of the plant has not been suitably located. And having made that discovery, what would you do?"

"A. Well, Mr. Howard, you will admit that those overhead

charges are in this inventory?"

"Q. Well, I am not speaking about that,---

"A. Well, I am. We are making this allowance of 17%.

"Q. Well, I am not talking about the 17%. You are analyzing your statement-awhile ago you made it, and I am 2873 just simply asking you what you meant by it, and you have told me that,—and now I am asking you as a supervising engineer, who has come here to tell us about building this plant, what you would do it you would find this plant not suitably located; if you can tell us, do so if you are so disposed, and are not disposed to keep anything back?"

'A. No, sir, I am not."

"Q. Then just answer the question in a few words and do not try to vary the question or try to evade it."

"A. No, sir."
"Q. Then, what would you do if you found parts of the plant not suitably located?"

"A. That would not have occurred if I had laid out the plant."
"Q. Well,——

"A. But I am taking the inventory of this property-I am taking

"Q. Well, we will let it go."

Mr. J. D. Frank: Let him answer it.

Mr. Howard: No, he is talking about an inventory—about taking inventory, and I didn't ask him anything about taking an inventory, and he has declined to answer the question, but has gone off discussing the inventory.

Mr. J. D. Frank: No, sir, he is not trying to evade the question. I did not understand your question just now, and I don't think the witness did. But be understands your question now, and I would

like to have him answer.

2874 The Master: Go on and answer the question as asked, Mr. Player. Suppose you found a pole in an improper place?"

"A. Well, I cannot answer Mr. Howard in any other way than this, your Honor,—that I am building up a plant here on inventory, and I don't know what the actual changes are."

The Master: If you found a pole in the wrong place, and put it in the right place, what would you do as supervising engineer?

"A. Why, I would put it in the right place, of course-if there

was anything of that sort.

"Q. Why, if you had told me that we would have been - of the question long ago. The next thing is liability and Fire Insurance. Now, of late, Mr. Player, that item is one that has taken the place of one that used to be formerly known as "Injuries and Damages," isn't it?"

"A. Yes, sir,—liability.

"Q. Have you ever figured out how it compares with the experience as shown resulting from injuries and damages, whether 1% is less than Injuries and Damages, ordinarly incurred in building these plants in the days before there was any Employers' Libility Insurance?"

"A. No. But in the various cases we have been over and deter-

mined, why, that has always been considered a conservative allowance."

"Q. One per cent?"

"A. Yes, sir."

The Master: Do you know what these insurance companies charge for the insurance against injuries under our Employers' Liability law?"

Mr. J. D. Frank: I think it runs something—taking the Telephone property as a whole—something like \$3.60 on a \$100.00 pay roll.

Mr. Howard: That appears to me reasonable.

Mr. J. D. Frank: Just a minute. I think Mr. Hoag is familiar with that.

Mr. Hoag: It is \$3.20 for line men, repair men, and that class of employees—that is, for \$100.00 pay roll. It is 17 cents for \$100.00 pay roll for telephone operators; it is 10 cents for \$100.00 pay roll for clerical people, stenographers and such people.

Mr. Howard: Now, Mr. Hoag, I would like to ask whether that is a lesser amount or a greater amount than was formely carried

for Injuries and Damages?

Mr. Hoag: I have heard it stated that that rate of insurance means a less cost to the utilities than did the old way of handling it. Whether that is so or not I don't know.

The Master: It must be true, because the larger concerns in the

State use it.

Mr. Howard: Yes, sir. I have no doubt it is true. It is a pretty

big saving, I think.

"Q. Now, Mr. Player, so far as you know, no other engineer has ever revised this overhead charge on account of change in it occurring in the matter of injuries and damages, do you? Do you know whether there is any savings in overhead or any change—

"A. I don't know whether there has been any late revision or

not, no sir.

I figure 5% for engineers' expense, and I know that in do-2876 ing it, it has been the customary thing to take 5%. I have no idea as to how many engineers it will take to supervise the construction and have not attempted to analyze that.

Redirect examination.

Questions by Mr. J. D. Frank:

Under the discussion of "Omissions and Contingencies," or in connection with that, in working out the cost of material and labor I have proceeded on the theory that the construction of this plant would be done under ordinary circumstances. In building up my unit of costs for the material and for the labor, so far as those unit costs are concerned. I have not made any allowance for the fact that at times we would encounter certain obstructions and difficulties, which would run up those costs; that is why I have allowed this 3%, to cover those things. I know that those things always happen in

connection with the construction of any property of any magnitude. Speaking of my duties in connection with the commission, when counsel asked me about the handling of books, and so on, and my statement that I disregarded the books there I meant in reference to making an audit of the books, revenue, expenses, etc. I am not an accountant, couldn't check the books to find out what the plant cost at all. Those commissions have accountants to look into those matters. You see in those commissions we have an

Auditing Department and an Engineering Department, and very frequently the engineers make appraisals that check very closely with what the auditors find on the books, other times there is a wide difference between them. We have never paid any attention to what

the auditors were doing, nor they to us.

Counsel has questioned me about this overhead expense of 1% for Liability and Fire Insurance; that also takes care of considerable expense in connection with the fire insurance, as well as our liability insurance; a contractor would naturally have to carry the insurance, both fire and liability, in order to protect himself. This amount is rather conservative. It is not limited to expenses resulting from accidents

In connection with my statement of disregarding the books there, I meant just this: that where I take an inventory of a plant for the purpose of making an appraisal of it, of the difference parts of the plant, that I don't go to the books and make a comparison as to what the aerial distribution system cost, as shown by the books, and then adjust my figures to comply with that: I make an appraisal, I don't take anything from the books as to the cost of the property as it stands, that is, in an appraisal, If I were going to make an auditing, that would be a different thing

In making up the final estimate of the value of the prop-2878 erty, that is, after I have completed my appraisal and am trying to determine the value of the plant, I do not consider the original cost and all of the other facts in connection with that; I am not determining any value at all in this appraisal; I am taking the inventory of the property and applying the unit cost as to that property in place, as to what it would cost to reproduce it in a certain period of time. In other words, I just took my inventory and applied my unit cost to it and got my physical figures that way in this appraisement, just the same way as I have been doing for all of these

commissions for the last ten years.

On page 1 of my Summary, Item No. 10 "Right-of-way," for that item I have included \$26,743.00. That will appear on page 49 of This item is estimated; no check was made of the cost the report. of the right-of-way. The estimate is made on the basis of the number of stations installed at the rate of \$1.00 per station. usual method of procedure without finding out through some source as to what was actually paid. From my experience it is rather low as compared with the actual cost of obtaining right-of-way. in years past done considerable right-of-way work, and I know very well that the charges for right-of-way in some instances are great and in others not so great; and I believe that this figure that I have used

here, and I have used it in other cases, is very conservative for an exchange plant. I know that it does cost money to secure this right-of-way.

Cross-examination.

Questions by Mr. W. J. Howard:

No. I did not get any of the items set up in the inventory direct from the books of the Company: I got those from Mr. Hoag, the engineer. I asked the Engineering Department for this cost, of course, simply because we had no way of estimating. I presume they have in charge the Right of Way. I did not ask the company for any cost of the right of way. I do not know what they paid or anything else for any right of way in this city, but I know that they do have right of way expenses. With reference as to whether I would or would not claim that it is an inventory for the right of way I would say this, I will answer your question and say No, with this explanation: That in my experience in the business that I believe that \$1.00 per station. I have used the same charge many times before, is a very conservative figure. I have seen set ups by the companies, while other charges for right of way would be two, three and four dollars a station actual cost. I do not know that this station here would be susceptible to determine accurately whether they have any right of way costs at all and don't know that I could ask the Engineer and that he would tell me nothing at all. I could have done that, but don't know whether he would have told me nothing. up the figures on what is considered sound principles

Redirect examination.

2880 Questions by Mr. J. D. Frank:

That is the way the commissions have always handled that proposition.

"Mr. Howard: Mr. Player, I ask why you are claiming this item of \$26,000.00 for right of way, we want to know—you are asking for return on value here, and we want to know."

"Mr. D. A. Frank: The judgment of this witness as to what it

would cost ——"
"Mr. J. D. Frank: A considerable part of that goes to the city of Houston in the nature of permits, about twenty-five cents for every pole set out here, fifty cents for every one hundred feet of trench that we dig."

"Mr. Howard: That is not right of way,"

"Mr. D. A. Frank: Certainly it is right of way"
"Mr. J. D. Frank: It is changed to operating expenses."

The Interstate Commerce Commission makes provision with reference to the item of right of way. They treat that as a capital charge, that is why I have included it in this; you will find the account, number of account 9-C set up on page 49 here of my report, I have treated

this whole appraisal right in accordance with the Interstate Commerce Commission's classificaton of accounts, as set up. It is a capital charge.

2881 "Mr. Duls: You do not know the number of the account of the Interstate Commerce Commission's system, do you?" "Mr. Player: Well, this is 9-C under the classification-

"Mr. Duls: Well, here is a copy of it, right here on page 27 (indicating)."

"Mr. Player: This under the Interstate Commerce Commission's classification, account No. 207."

"Q. This is in connection with a heading entitled—just explanatory of fixed capital accounts, isn't it?"

"A. Yes, sir."
"Q. Now, will you read that section 207?"

"A. It is headed, "Right of way. This account should include the cost of all land and interests in land acquired for the location of telephone wires, cables, pole lines and conduits, salaries and expenses of right of way agents, expense of appraisals and of juries, commissions or arbitrators, real estate brokers, commissions, costs of plats, abstracts, notarial fees, examinations of titles, recording deeds, etc. This account should also include the first cost of acquiring the leaseholds of land for right of way, the terms of which are for more than one year each, whether acquired through direct lease, assignment or otherwise,-

"Mr. Howard: Your honor, we don't think this all should go in."

2882 "Q. Will you finish reading that, Mr. Player?"

"A. In parenthesis "(but not including the rents paid periodically in consideration of rights obtained under such lease) if any such leasehold is acquired by assignment, the charge to this account must not exceed the amount actually paid therefor by the accounting company to the assignor."

2883 On page one of my final summary my next item after right of way is furniture and fixtures, local-that belongs to the local exchange; and furniture and fixtures, general office. They will all be found on page 50 of the report. These two figures are taken from the, were supplied me by the company, by the engineer of the company, Mr. Hoag. The local office cost new \$9,767.00. found on inspection the condition account as eighty per cent, making the cost less depreciation \$7,814.00. The proportion of general office, furniture and fixtures, cost new \$7,412.00. I applied the same present condition, I looked at the furniture and fixtures in the general office at Dallas and found that that item was in the same condition as here in Houston. I found the cost less depreciation \$5,930.00. Those are the figures which I have carried into my final summary on page one.

Cross-examination.

Questions by Mr. Howard:

By fixtures as applied here I mean Window shades and electrical fixtures and brackets of different kinds, and coat hangers and all those kinds of things. The central office here would not be the only office; it would also include clerical offices. I had a look at that furniture up in Dallas also; they have a lot of it. I am undertaking to have the figure of \$7,412.00 represent the entire cost of it.

The company figured the entire cost of the central office 2884 equipment, of the office furniture and fixtures in their general offices and assigned this proportion to the Houston exchange. That was all estimated for the benefit of San Antonio, Dallas, Ft. Worth, Austin and Beaumont,—the system here in

Texas: Galveston and Richmond and towns in Texas.

"The share of Houston was \$7,000.00. That would make it, just considering these large towns, would put it up in the neighborhood of forty thousand dollars, wouldn't it, to say nothing about the little towns?"

"A. I have the company's figures on that, the detail of it."

It is all in the inventory.

"Q. Now, that allocation—that is, allocation of expenses, and to have some supervision of this plant that was necessary, this plant stood by itself and ought to have its affairs administered here; it is figured that it cost seven thousand dollars extra to put in furniture to do that?"

"A. Well, you couldn't carry on the business of this particular plant by itself without having a general organization to supervise it, and I think that the cost would run up a great deal more than the company will show, irrespective of what they are, if they have to

have an extra organization to run this big plant."

They have got a general manager here now and have a local manager of the plant. I guess the company will put on witnesses to explain this allocating process.

2885 Redirect examination.

Questions by Mr. J. D. Frank:

That is the property that is used by the employes who are working in connection with the Houston plant, as well as other plants of the company throughout the system and used in connection with the

Houston plant.

The next item in my final summary is item No. 13, Tools and Teams. That will be found on page 51 cf the report. Tools and Teams is a heading that I use in making my set up to designate a certain class of property. There were no teams used in connection with this exchange; it is all motor vehicles here, but that is the general designation as to this particular class of equipment, is tools and teams; under that is charged, well, the detail of that on page 51 is the explanation of it. Page 52 will show the detail of the vehicles.

I did not show the detail of tools, because the explanation on page 51 speaks for itself on that. 14.08 per cent of the tools of the state are assigned to Houston, in the sum of \$11,638.00, condition present

75%, cost less depreciation \$8,728.00.

The stable and garage equipment I obtained from Mr. Hoag the figures as shown under column C. N. on page 52, cost new, and checked each of those items, looked them over and found that the general condition is 80%, all except the last item on the page, which is a new engine, Ford engine, which is in perfect condition, one hun-

dred per cent. Total of vehicles is \$9,870.89, and the cost

2886 less depreciation \$7,911.00.

Up to this time I have been estimating the cost of reproducing the physical parts of the plant; on line 14, on page 1, is the total, \$4,950,475.00 cost new; and cost less depreciation \$4,389,-My next item down there is Stores and Supplies and will be found on page 51. I have treated that in connection with working capital, have just separated them there and made the computation for the two of them. In other words, it is customary to, or rather some engineers treat those items as one, that is, make working capital include stores and supplies, and some of them separate them. I separated these, as I have always done in my appraisals, for the purpose of showing or allocating to that specific item about the amount of stores and supplies that would be necessary to carry on the business of a plant of this kind; that would include what poles were necessary, and wire of various kinds, cross arms, in fact, all equipment other than the station or central office equipment, except small parts of central office equipment such as cords, lamps, batteries, -what are termed short lived parts of the plant. I included there as working capital the item 16, which would be \$137,814.00.

Working capital represents the amount of cash and supplies that should be included necessarily to carry this business on for a month or six weeks; the company has to meet monthly or semi-monthly wages of all descriptions, and run small accounts and unforseen items of expense that would arise through a storm breaking down part of

the plant and they would have to put in extra forces in order 2887 to get into shape, etc. It has been the usual practice of engineers in a great many cases to secure from the accountants the amount of revenues accruing for a period of one year, dividing that for the working capital. We have found, or I have found in going over a great many cases that one month's revenue is not sufficient to carry it, but that at least six weeks should be allocated to the working capital, and that is what I have done in this instance, I have taken approximately six weeks' revenue accruing from all sources of the local plant and allowed them as the working cash that the company should have on hand to take care of its expenses exclusive of supplies; if we were to include supplies, the amount would be \$162,-814.00; separately it is \$137,814.00. That is for the purpose of taking care of the salaries of the six or seven hundred operators they have here and various employes that they have for running this plant here; it includes no part of the general expenses at all, it is purely local.

Cross-examination.

Questions by Mr. W. J. Howard:

"Q. Mr. Player, in figuring this matter up, working capital—and you say it has been a practice—have you engineers, in determining what is the proper amount to set up ever taken into consideration that there are different characters of utilities, such as—take the lighting, gas—the gas companies, water companies, they collect their bills at the end of the month—the street car company,

their bills at the end of the month—the street car company, for instance, collects its cash every day, sometimes in advance—and the telephone company, such companies as those col-

lect a great part of their revenues in advance."

"Mr. D. A. Frank: They don't collect any of it in advance."

"A. Well, Mr. Howard, that is always considered in those things, but you will find this: That while the company may bill its subscriber at the beginning of the month, that a great per cent of those subscribers—and I have found in numerous cases where these bills were rendered this way—that is, at the beginning of the month—that from seventy-five to ninety per cent of the subscribers will not pay their bills until the end of the month or until the beginning of the succeeding month and only a small per cent of, about fifteen, we will say—will pay their bills before the tenth of the current month,—while the company must have some money to meet its requirements—it wouldn't make any difference whether the bills were paid in advance or not, they would have to have the cash to carry on their business, they would have to have their supplies on hand."

Supplies is not different from capital; the Interstate Commerce Commission sets it up; there are some corrections in the Interstate Commerce Commission's classification, you can carry it any way you

please.

2889 If the company gets all of its revenues in advance, or any part of them in advance, it does not require a great deal less money as capital than one that does not collect until the end of the month; they know what their fixed expenses are approximately, and they must have what they estimate, as a reasonable man would, to take care of unforseen expenses, and they kind of make a bet with themselves, so to speak, that they are going to collect all this money; they might lose, and they might have to secure money from other sources to pay their employes when their wages were due.

Redirect examination.

Questions by Mr. J. D. Frank:

Up to this time I have given you the statement of what it would cost to reproduce the physical part of the plant, and have also testified as to the working capital. The next item that I have is cost of establishing the business.

In connection with my appraisal of the physical property I have not included any increment of the cost of the property constituting the physical part of the plant, situated and assembled and established plant, doing business and earning money; I have just included the physical property. That is why I set up this item No. 17 here as a separate item; cost of establishing the business. I have treated here my estimate of the cost of reproducing the business, in addi-

2890 tion to the cost of reproducing the business, in addition to the cost of reproducing the physical parts of the plant itself. What I have discussed heretofore with reference to the cost of reproducing were simply the bare bones of the plant.

As to what this cost of establishing the business is, what is included therein and how much I have allowed for it, and why I have allowed for it; in the building up of any business there are costs relative to the building up that can in no way be avoided, they are just as much a necessary part of the business and go into the cost of the property as any of the physical parts of the plant. In starting a business of the character of the Houston telephone exchange, we would have the preliminary costs, we would have to have the necessary expert advice to ascertain the amount of capital necessary, the approximate number of telephone stations that could be secured, the approximate or the rates to be charged for services rendered, then the approximate revenues to be received from whatever rates were charged; traveling expenses, railroad fares and hotel bills, stenographic work, printing and postage, all necessary to the preliminary work. Then, we would take the second step and have the legal expenses, the procuring of the charter and the capitalization expenses, charter fees, the filing and recording, the attorneys' organization and promotion fees, corporation records, secretary's books, and other records, procuring of a city franchise, with the attorneys' fees, the expense of the special election, and the incidentals, stationery, postage, printing, and stenographic work in connection with that special business. We would have the

2891 cost of selling service as as the third step.

If I were reproducing this plant here and the people were educated with respect to the need or desirability of telephone service, as to whether you would still have some expense in connection with selling service; I have not yet seen a telephone plant in any city or town, where there was competition, or whether there was not competition, but what the telephone company was put to great expense in selling its service; the matter of advertising—a company advertises continually, in towns where there is no competition they advertise—they advertise that the directory is going to close at a certain time, they advertise that they are ready to take care of certain parts of the city, or something of that sort, and there are a great many other things that enter into the cost of the selling of the service; you have your contract agents which necessitate expense, and your clerks, and all your postage and printing and stationery, incident to that subject.

Even though a certain number of subscribers would voluntarily come to you and apply for the service, you would still have expense in connection with the securing of that new business. I have seen instances where people living in towns where we had telephone service for years, didn't have telephones, the neighbors would ask

them, "well why don't you get a telephone?" "Well, we haven't thought about it," and you would go so far as to call up the telephone company and say, "Smith hasn't got a telephone, send one of your men out to see him;" and he makes two or three trips to see Smith, because he hasn't quite decided and he wants to talk

it over with his wife about incurring an expense of \$1.50, 2892 or whatever the price is, for a telephone for a month. All

those things go to make up the cost.

Now, we come into a fourth step, in the training of the forces, the operators, the commercial department, the management for the local property and the employes under him; the engineering department, plant department, with its general employes, its general foreman, a sub-foreman, cable foremen, cable splicers, switchboard men, inspectors, all of those employes; under the plant department, the linemen, the ground men, the installers and inspectors; then again we have a printing and postage and stationery connected with the expense of this department.

Whenever you need additional employes to do that particular kind of work, such as linemen, cable splicers, operators and so on you cannot go out and pick up employes of that kind from

the street most any day.

There is another place where advertisements are used, the papers practically carry a continual advertisement from the telephone company, that they want operators, they want employes of different kinds; a green person would come to the office, especially operators, and men wanting to become familiar with the business; they have to be trained, and, of course, the company has to pay those men while they are learning. The operators get, I believe—I don't know what the price in here in Houston, but I think in St. Louis they pay the operators a dollar a day while they are learning, and

then after they have learned the business, why, they put them on regular salary. It usually takes six or seven weeks

before they put those operators on the board to serve the public; and it has been found that it cost, or did cost, up to a year ago, I am not familiar with the present day cost—about \$43.00 per operator to train them so that they can sit at the switchboard and answer subscribers. That is in St. Louis; that is in these larger plants—in fact, most of the plants of the Bell system.

The fifth step we come to is the first issue of the directors, with all of the necessary costs incurred in that department. As much attention is paid to the directory as there is to any other part of the business; without the directory, why, the telephone subscriber of the company would be absolutely helpless, he has to have it, and it has to be prepared in a way that it is intelligently gotten up so that the subscriber can readily find the information he desires pertaining to the telephone.

Then we come to the next step which is the Operating Deficits. For the period of the first year during the construction of any big plant,—in a small plant it doesn't amount a year, but in a plant of this size it would, where you would have the general expenses, the general records, the taxes, financing, brokerage fees, the dis-

count, the printing of stock certificates, printing of bonds, the loss of revenues during development, the maintenance expense that is incurred in a plant being erected, it has to be maintained just the same as though it were actually in service, and until put in service,

whatever operating expenses are incurred, removals and changes, traffic, commercial, collecting, uncollectible items, rents, replacements. There are other incidental items that would go into this part of it, as postage, printing and stationery, and maybe other items that I have not named and cannot recall right now. Those are items of expense which would arise during

your construction and development period.

As to whether it is customary or not to work up the cost of establishing the business in dollars and cents as to the expenses which would be incurred for each particular item of expense, it has been my experience with the cases—in all of the cases that I have been connected with, we have set up the cost of establishing the business and allocated so much in dollars and cents to each particular step of the business; I have never in any case prepared it in that way, to the present day and hearing, but it is the customary way of doing it.

The sum of \$990,095.00 as the cost of establishing the business, which I have included in my set up, or in my appraisal, was arrived at in this way, that is twenty per cent of the total cost of the physical property, shown on line 14 of the final summary, page 1, or in other words, twenty per cent of \$4,950,475.00. I took the twenty per cent, flat figure, for the reason that the Courts, commissions have allowed it in just that way. In many decisions the courts have stated that this per cent is reasonable, say to include in the cost of the property this amount of money as a part of the capital charge, and that is the way a good many of the engineers put it in these cases. They do that because it is a convenient way of handling it without the assistance of the entire audit-

ing department to examine the books for years back to find out just exactly what costs were allocated to this particular step of the business; and an engineer would have a pretty hard time by

himself going into the records to ascertain that.

Say that the plant had began operation way back about 1888 and had been brought down to the present time, an auditor could not get the information definitely as to what it had cost to build up the business in a plant of this magnitude. I don't think he could, for the simple reason that, as I stated, this morning relative to the books, that prior to January 1st, 1913, no system, that is, classification of accounts or prescribed classification of accounts was followed by any of the companies. I do not believe that an auditor could do it, and I know an engineer could not. The allowance that is usually made by engineers for the item of cost of establishing the business is twenty per cent. There is a case that has been referred to that I might refer to, and that is the Westenhaven case. The Commission did not make any allowance for the cost of establishing the business when that case was before the Commission, and I

talked to the Commission relative to it and they did not think that it should be included, and the case went up to the Supreme Court and the Supreme Court immediately added twenty per cent to the cost of establishing the business as a reasonable charge. That was the Supreme Court of Oklahoma.

We have a good illustration of the cost of establishing any business right here in the City of Houston. In going over the plant, my route took me to the basin down here, this port

the City of Houston has established; the cost of establishing that business—while I could not get any figures relative to it, the mere knowing, that business principles had shown me that that was a very large item of expense to the City of Houston; to get that business started down there it has been necessary to dredge that channel, and at a great expense; it is one of the things that is going to, of course, make this one of the best towns in Texas, if not the best, because it has those facilities; but the cost of establishing that business is a good illustration, I believe, for the City.

Cross-examination.

Questions by Mr. Howard:

I do not mean to say that the Telephone Company spent a lot of money dredging that channel. I stated that as an illustration, it was a cost to the city to establish that business down there. I am just making an illustration as to the necessity of adding the cost of establishing business to any project.

"Q. Why, that is a cost of construction, you get an engineer if you dredge it out—and while it is a matter of administration, you are not administering the earth, you are constructing the 2897 channel, aren't you—and that is carried into the actual con-

struction part?"

"A. Oh, well, you have all these expenses in it just the same, Mr.

Howard."

I say that there are many decisions that state that 20% was the thing that was set up in reproduction in getting the value of the plant. I don't know how many decisions I have in mind; there is case after case of it, Mr. Howard; I have the Pioneer Telegraph Company vs. Westenhaven case, that was ten years ago. As to the others, I would have to get you up a list of them; I cannot recall any other case. I will tell you this, I will get you a list of twenty.

"Q. You have come here to testify and have stated there are many court decisions that said 20% was the proper amount to add, and now I have asked you for one, and you cited the Pioneer Telegraph Company versus somebody, that was one you were interested

in and you recall that?"

"A. Yes sir."

"Q. That was in the Supreme Court of Oklahoma. Now, did you ever hear of any other case besides that one? I will tell you one where they allowed a considerable value, and that was in the Waterworks case. Do you remember whether they allowed 20% in that or not?"

"A. No sir, I don't recall."

"Q. You do not recall? Now let's take this one, Westenhaver. what is that?"

"Mr. D. H. Frank: That is the Pioneer Telephone & Telegraph Company against Westenhaver—or Westenhaver against the Telephoen & Telegraph Company." 2898

"Q. Now, Low large a plant was that?"

"A. Probably \$100.000.00." And this is \$5,000.000.00?"

"Q. \$100.000.00?

"A. The same principle applies."
"Q. That same principle applies? Well, now, let's see if it does, that is one of the things we want to find out. You said a lot of these things, said in advertising it don't cost them any more to put in advertising for a \$5,000,000.00 plant than it does for a \$600,-000.00 plant, does it.

"A. No, the newspapers would charge just the same. You adver-

tise more frequently in the large ones.

"Q. You might advertise more frequently in the large one?" "A. And I guess the rates in the larger towns are larger than in

the small towns, too; it will cost more, yes."

"Q. You think it will cost more, you think that will run all the way through 20% because they said 20% on \$100,000.00, because they permitted an item of \$2,000.00 to go in as the cost of establishing the business, getting up a little organization and having some investigation made as to whether it would be a good idea to put a telephone up in that town, and pay some of the hotel bills and incidentals, and allowed \$2,000.00, and because they allowed \$2,000.00 in that case, you think that was a precedent to add a million in this case?"

"A. I would add the same amount."

I would add the same percentage. I think it would cost just as much to stop at a hotel if you were overlooking a little plant as if you were overlooking a \$500,000.00 plant. Of course, there are variances and I have heard of them as high as 35%; I say I have heard of them just in reading the different decisions.

"Q. It didn't make much impression on you. Well, now, the first thing we are going to do is to start out and get somebody to make an advance survey of this thing to determine whether-

"Mr. D. A. Frank: Fundamental plan."

"Q Fundamental plan? Al- right. You have got other set-ups in here, the Engineering plan, haven't you-have to send for an engineer, and are getting up plans for it.'

"A. That is the physical part."

"Q. That is the physical part? Now, over here under another item, you have got 2% for organization. Now, that is an expense, as I understand, that comes about preliminary to going to work."
"A. Well, that organization—I explained that this morning,—

was general supervision, general expenses."

"Q. They wouldn't spend any time in going to Fort Worth or San Antonio and seeing whether a telephone plant in one of those towns would pay or not, or anything of that kind. What would they do with this fellow we are going to employ now?"

"A. Which fellow?"

"Q. The one that is going to make this fundamental plan?"

Why, it takes an organization, Mr. Howard,—we have got a

big organization-this Southwestern."

2900 "Q. Oh, yes. But we want to see what is the necessity of carrying along this big organization, of putting in this telephone exchange, we want to see how big a crowd we are going to get together here, about how many men you will get to do that work.

"A. I don't know."

"Q. You haven't any idea?"
"A. It all depends entirely upon the laying out, and how big the city is, etc. I have never made any particular study-"

"Q. Made no study?"

"A. I told you this morning as to the number of men it would

take to do a certain piece of work."

"Q. You do not know how much you are going to need for them, you don't know how much you are going to pay the lawyers now to get the franchise?"

A. I have made a rough calculation, Mr. Howard."

In my first step, the preliminary step on the fundamental plans and expert advice and so forth, I have allowed for this plant, \$4,950.00; that is one-eight- of one per cent.

On the legal expenses I have allowed \$44,550.00; that is nine-

tenths of one per cent.

The third step is the cost of selling the service, of course, this embraces all those little items of detail that go into these steps; that is \$123,762.00, or two and five-tenths per cent.

The next is the training of the forces, \$32,178.00, or 65/100 of 1%; the next is the first issue of the Directory,

with the instructions, etc., \$7,426.00, 15/100 of 1%; the next is the operating deficits or \$777,225.00, or 15-7/10%, making the total costs of establishing the business \$990,095,00, or 20%. Now, that is my best estimate and judgment as to what it would cost to do that in Houston.

As to what this fundamental business man is going to do to get \$4,950.00, I will read you what I have estimated that the department to which that is charged will do. They will find the amount of capital that is necessary,-I have gone over all this,-the approximate number of telephones that can be secured,—they are going to find that out,-they are going to make inquiry and find out the approximate number of telephones. That is in the study; would have to do it, or we would have to do it if we were going to invest five or ten millions dollars in a property, to see whether or not it was going to pay us to put in that much money. Now then, they have got to make an approximate estimate of the revenues to be received and what rates are to be charged. They are going to go out and will have a map of the City of Houston, and they are going to locate their cable runs, their office buildings, their underground system, and all of the work incident to getting that business going. I guess possibly that department would have as many as twenty people in it and they are going to work four years,—all during the construction period of this plant and I am going to pay them \$4.950.00; I am going to use my big organization for this.

"Q. Well, you allow \$4,950.00 for this work. Whom are you going to pay it to, and how much are you going to pay them, and for how long a period? You have set up this figure now, \$4,950.00 and you have got the \$50.00 on, which indicates that it is worked out with some accuracy. Now let us know how many men there are in your organization, what type of men they are, what degree of skill, how long they are going to work, and what is going to be the rate of pay, because you must have done that, or you wouldn't have had down \$950.00—you must have done one of two things, worked it out accurately or guessed at it."

"A. Mr. Howard, I have seen those, or approximately those figures worked out in a good many cases, I have just made an approximate

estimate of what it would be."

"Q. You have guessed at it?"
"A. No, I haven't guessed at all."

Q. Well, you haven't been able to tell me how many men would be employed or their financial rating or how long they were going to work? Now, take the next item, \$44,554.00, that is worked out with a great deal of accuracy because you have left off the odd dollar and worked that out accurately."

"A. It gives us nine-tenths of one per cent."

I get this nine-tenths of one per cent, because those are figures I have adopted and used for the purpose. I just adopted it, that is it exactly. I know these figures have been allowed in other cases, and are usual. I worked these figures out for the Missouri Commission

in the Springfield case, a plant of over a million dollars, and worked it out for them in the Home Telephone Company

case at Joplin. I cannot refer you to the report where they have adopted this nine-tenths of one per cent for lawyer's fees. With reference to what service they are going to perform specifically, at the start of my testimony in this step, the reporter took down all the different items that came under the legal expenses of this property. That was under the second step of this proposition and is all under the heading of "Legal Expense". It is already in the record. We were not a going concern.

"Q. Al-right. You say here they are going to get a franchise. Now are you going to pay the lawyers \$44,554.00 for getting a franchise? Can you tell me one simple thing or substance that the lawyers are going to perform for which you are going to pay them

substantially \$44,000.00?"

"A. I read it all into the records, sir."

I will tell you what they are going to do; he is going to procure the charter. I don't know what he is going to procure the charter for. I put in \$44,554.00, because I say it is the same figure I have

used in other cases, and is as applicable in this case as in any other case; and that is not the only service he is going to perform, if you are going to limit it to the individual. He is also going to attend to the raising of capital of the company; he is going to finance the company; we are going to have him draw the papers. As to what papers he is going to draw and what is going to be a reasonable

charge for drawing the papers is already in the record. sir, I think that I will undertake to reproduce the record.

If you will let me answer a question now before you begin another, I will get it in. He is going to attend to procuring the charter, he is going to assist in the capitalization, he is going to attend to the paying of the charter fees, and that part that comes in there—the filing and recording of the charter, the organization-

You are interrupting me, sir. I cannot be interrupted every few

minutes and testify.

"Q. Now, tell us—you are telling, now, about the lawyer's fees, you understand, and you have told me he is going to prepare the charter and is going to draw up some papers in connection with the capitalization, and then you said he was going to draw the charter. Of course, the lawver don't do that."

"Mr. D. A. Frank: What he means is, file it."

"A. He is going to file it."

"Q. All right, he is going to send the charter up to Austin and have it filed."

"A. And then there is expense in connection with incorporation, and there is a corporation record to be secured, the Secretary's books and other records.

"Q. Is the lawyer going to secure those?"

"A. And secure a city franchise."

"Q. How is that?"

"A. And secure a city franchise."

"Q. Well, what is the lawyer going to get for securing city franchises, that is what I would like to know, how much you allow him for that?"

"A. The expense of securing a city franchise."

"Q. How much is that?"

"A. Expense of collection, postage, stationery and stenographic help in connection with this department."

"Q. In connection with the legal department?"

"A. Yes, sir. These items that I have read to you are what is usual, considered as part of the legal expenses that enter into the cost of establishing a business of this character."

"Q. All right. You cannot tell me one specific charge."

"Mr. D. A. Frank: Heat, light and water."

"A. Yes, sir."

With reference to whether or not I can tell one specific charge, I haven't the items, I am just putting it down as a flat percentage and just dividing it up so you could see what it would be.

Taking this item of \$123,762.00, that is your selling service. As

to what I mean by that, that I said, was the third step of expense relative to this item, and it includes the advertising. various classes of advertising that come into the establishing of any kind of business; you advertise that you are going to do a general telephone business.

"Q. Now, Mr. Player, just there you have told us that-that you advertise you are going to do a general telephone busi-

What is the necessity of advertising that you are going 2906 to do a general telephone business in a town of 160,000 people, where a telephone plant is going to be constructed,—what are you going to tell them?"

"A. In the first place you wouldn't have a town of 160,000 people when you begin this business, you would have-the town grows as

the business grows."

"Q. Well, I understand you are talking about the way this plant is built up, the existing plant you are getting for the city?"

"A. No, sir."

"Q. You are to reproduce this plant, you are to put it up now?"
"A. That is true, but your costs go right on ahead with your in-

creasing business."

Well, I will advertise that there are certain classes of service and certain rates, so that the people will be familiar generally with the charges that I make for different classes of service; I will advertise that the local subscriber can talk to any other place in the United States over my lines, I will give them that information.

"Q. Now, is that during the initial period, or doesn't that run

on a while after the plant gets into operation?"

"A. Oh, we begin to advertise, to let them know what our busi-

ness is going to be. "Q. All right. Now you are going to put in some advertising. Now, about what is that going to cost you?"

"A. \$123,762.00."

"Q. What,—just advertising alone?"
"A. No, sir."
"Q. Well, I was asking about the advertising?" 2907

"A. I don't know."

The next thing I am going to put in is I am going to have solicitors go out and solicit business: I am going to have enough solicitors to take care of a town of this size. I haven't made any estimate of the number of solicitors I would have; I would have to give that further

study.

The next thing besides the advertising and solicitors, I would have the cost of all the stations that were disconnected and changes of the records in that respect, etc. during the period; I haven't made any estimate about hoy many of them there would be and how much it would cost to make those changes. This is the cost of selling the service; I have not made any attempt to itemize the cost of any one of the different sub-divisions.

This item of \$32,178 is for the training of the forces; I am going to train enough employes to operate this plant and that will be something is the neighborhood of seven hundred employes, and to get how much it is going to cost to train each one of them, I would divide \$32,178 by seven hundred. I am going to set up a school for training; each employee has to be trained along a certain line of work that they are engaged in in order to become proficient.

2908 No, sir, it is not a fact that in the practical operation of these telephone companies that they go into colleges and high schools and find boys who are about to graduate out there and that they pay them wages of some kind for about two weeks, give about two weeks' training, and then those ordinarily bright boys go out to installing telephones after two weeks.

"Q. You are going to say that the bright boys all over this country who never knew anything about the telephone business before couldn't reach that degree of efficiency in four weeks, that he can go

and install a telephone?"

"A. I would like for you to show me some of them; I have never

seen one.

For the original directory I have \$7,426.00. The original directory and all directories don't more than pay for themselves in advertising; I don't know that they do. Yes, sir, I know that they don't. I have printed directories many times that I couldn't secure enough advertising to pay for them. I haven't looked up a directory here and don't know how much advertising there is in it. do not know how much it costs to print a directory. It is a fact that a great deal is covered by the advertising returns; but you have got a department that takes care of the compilation of the directory.

This brings us to the item of \$77,225; that expense is going to come in in this way; that there is no revenue whatever accruing during the first year and in addition to that while the plant is under

construction and we have the heavy expense of organization, etc., and no revenue coming in we have a deficit naturally, and that deficit does not begin to be made up for several years to come. Interest during construction has nothing to do

with it,—with the cost of establishing business.
"Q. You haven't been operating, and interest during construction salaries during construction have been taken care of, what def-

icit are you speaking of?"
"A. Yes, taken care of in this account, cost of establishing business."

"Q. Salaries during construction go into the deficit account?"

"A. You are confusing-

"Q. (Interrupting.) No, I am not confusing anything, but I am asking you a question. You have told me that you were starting in with a deficit at the beginning, because you haven't been operating for a year, and now you are telling me about salaries and about employees; where do their salaries get into deficit?

"A. There are no revenues coming into a plant of this kind until

after the operating period begins."

Up to that time I have not taken care of these expenses by supervision, engineering and overhead and interest during construction. All this overhead and charges to general expense was taken care of in the physical property itself.

"Q. And the interest during construction during that time has been paid for, so, now, when you get the plant built, what else have you?"

"A. In the first year of the period-

"Q. (Interrupting.) I am not talking about the first year, but when you actually get the plant built. Have you any subscribers—have you any salaries,—if you are considerate a little bit, we might get this up to the point of the completed plant, and both start as we want to, so let's understand whether you claim you have any losses in deficit that have got to be taken care of in that time?"

"A. I will say not."

"Mr. J. D. Frank: What are you speaking of, deficits during the development period?"

"A. Yes sir."

With reference to what the deficits are and how they occur, during the first year of the operating we began installing our telephone-, and the telephone- installed will not pay enough revenues to pay all of the expenses incident to the cost of running this business. After you start up operating, you have completed your plant and start operation and are going to begin putting in your telephones.

"Q. But you are going to get in so few telephones,—you have got twenty-seven thousand of them, your plant has been reproduced all

right, and is all built right up to the subscribers?"

A. New, there are other items,---"

"Q. (Interrupting.) Yes sir. Now, why did it take a year to begin to getting in earnings on this company's investment?"

"A. They wouldn't get any in a year.
"Q. Why not?"

"A. There wouldn't be enough installations made to make any

earnings."

"Q. Now, let's analyze there a little. You are in a city now where the people are wanting service, and you are all ready except the the installing of the office equipment, that is the subscribers' equipment. Now, you have twenty-seven thousand subscribers in the equipment you are going to install, and, you say you are going to get only a part of these in during the first year?"

"A. Yes sir."

"Q. How much of them are you going to get in?"

"A. I will probably get a third of them in." "Q. What is going to be the limitation of your getting more in, the physical impossibility, or the limitation of not having the business?"

"A. Both. During that first year, advertising and selling this

service."

"Q. What are you advertising for, when, as you understand, you are reproducing this plant under similar conditions exactly that prevail here in a town of one hundred sixty thousand population, trained into use of the telephone, clamoring for the service and can't get it-"

"A. (Interrupting.) You asked me in the previous question why I couldn't get more than a third in."

"Q. Why, couldn't you?"

"A. Because both on account of lack of plant facilities, and lack on the part of the subscribers taking the service as we expect, and you have got to advertise and go out and sell it."

"Q. What are the lack of plant facilities, what are your limitations

in that respect?"

"A. All right. The plant is built in a four year period; it isn't all completed at the end of the first year."

2912 "Q. Well, you are taking four years?"

"A. Surely, this is spread out over the period of time of

the construction."

"Q. You are taking four years to construct it, and it is then completed and the people are ready for the service, now, just tell me what on earth have you got to do,—during this period of construction you have had your contracts printed, you wouldn't wait until your plant was all constructed and then start to printing your subscribers' contracts, or getting your office ready. You will have your plant, and will have your contract forms all printed, you will have your necessary books that you are going to set up business when it comes in, and you are assuming too that there will be some contracts signed up prior to the time the plant is completed?"

"A. No sir, I am not assuming anything."

"Q. Well, you told me you were going to get the first year onethird of your subscribers. Aren't you going to start at all to getting subscribers attached until the plant is completed?"

"A. I told you I would only be able to get about a third of the

subscribers installed by the end of the first year."

"Q. Now, I want you to say why that's so?"

"A. Because I can't work my forces any faster than that, and can't get the equipment any faster than that."

"Q. You have had four years to get this equipment all here?"

"A. No, sir, I have only had a year."

"Q. Only had a year?"

"A. Yes, sir."

"Q. You knew when you started the plant you were going to have about twenty-seven thousand subscribers, didn't you, and you don't mean to say now that you are going to go ahead and complete your plant and then begin getting your subscribers' equipment?"

"A. I am not making all of this charge for the entire four years;

for a third of the subscribers,-

"Q. (Interrupting.) Not doing what?"

"A. I am spreading this over the entire four years, and am not making any specific charge for any one year. I told you when I started to give the detail of this that my best judgment from past experience was that was about what it would cost to establish this business; but I haven't worked out in dollars and cents the exact details, and now you are asking me as to what it would cost in dollars and cents in detail."

I have given the flat percentage that in my judgment would be charged for from this. I would undertake to say that it could be worked out as a problem from my figures; I believe it could be worked out very nicely, but I have not done it. I do not know from working it out and trying to get down and determine how long it would take to get the subscribers under these conditions, or how long it would be before my earnings would be up practically to full capacity; I have not determined that in detail. So then this \$777,000 finally comes back to this same thing even after I have undertaken to give the set up of the different items and applying the prices to them, it just comes back to the point that I think 20% is right, because it is what has usually been allowed.

As this plant has been building up and they have been taking on new subscribers, I do not know it to be a fact that whatever cost of advertising came about in trying to attach and acquire that business, and also the cost of installing the subscribers' phones and things like that and the cost of printing the directory

have all been paid out of operating expenses.

(By Mr. Howard:)

"Q. I don't understand you to say that you don't know that on account of the fact that you haven't concerned yourself with the books?"

"A. I don't know the detail of it."

2915 Direct examination.

Questions by Mr. J. D. Frank:

"Q. Just one or two questions I want to ask on that in connection with the matter of the issuance of the first directory. You are getting out the very first directory in connection with the opening of the plant here. Would you expect to get as much advertising in that as you would in a directory where the plant has been in operation for a good many years?"

"A. In the first directory you would very likely have mighty

little advertising."

It is also a fact that the cost of the first directory would be a

great deal more than the subsequent directories.

With reference to counsel questioning me with reference to the installation of telephones, as to whether or not it is a fact that it is a physical impossibility to install twenty-seven thousand telephones in any one year, I will say I never heard of it being done. I will say this, that one man and his helper can install on an average of about three telephones a day if they worked just as fast as possible for him to do so, you can figure out how many men it will take to do that installation work and it would be a useless expense even if it could be done and you installed twenty-seven thousand telephones ready for action.

If you installed twenty-seven thousand telephones and had them

installed on the day you opened up your plant for operation I would not expect that all of these places where I had in-

stalled telephones would actually take the service.

As to whether or not it is also a fact that just in the normal course of the telephone business people very often order telephones and then when you go to install them they change their minds, I have had that happen myself. I have signed a contract, and taken the telephone ready to make the installation and they had changed their mind about it. If you went out to install twenty-seven thousand telephones over a period of two years, before you are ready to begin operation, you would probably have at least several thousand of those who wouldn't want the service by the time you were ready to give The fact that you would not begin installing these telephones until about the time you were ready to begin operation is the general way of doing business. As to whether or not you probably would make no charge at all for the service until you had ten or fifteen thousand of the telephones installed, you see advertising by the companies, and especially where there is competition, that there will be no charge for any service rendered for a year or until we get fifteen thousand subscribers or ten thousand subscribers, that is frequently done even where there is no competition, why, the company agrees to make no charge for service until such and such a number of telephones are connected. In other words, if you installed ten telephones in business houses in a plant of this size and charged them whatever rate you charge for your service, the service would be absolutely worthless to those ten houses. The extent of the service is what makes the service valuable; the

more stations you can talk to the more readily will the prospective subscribers take the service, and if you have just a few subscribers connected with the plant, no matter what size, the service would have mighty little value, and by virtue of that fact, why, the company agrees that until we have such and such a number of stations installed, until we can give you service that will be of some value to you, we will not begin to charge you anything for this service, and it might be that it would be six months or a year, maybe eighteen months before you began charging for service. I would

just depend on conditions.

I did not intend to work this out in dollars and cents as to each item of expense that would be incurred in building up this business. If I had worked it out in dollars and cents it probably would have been more than 20%; I am sure that it would. At any rate this represents my best judgment based on my experience in the telephone business and my experience as a valuation engineer in connection with these Public Service Commissions that I have represented for years and it is a conservative estimate of what it would cost to reproduce this business.

Cross-examination.

Questions by Mr. Howard:

"Q. Mr. Player, on this last item I have no doubt there is some deficit, or some loss in this initial period of starting business,

even would be in a town of this size, if you were to build the plant up and start new, it is bound to be some cost and will take a little while to get in full swing. Now, it occurs to me that can be worked out to some little approximation, and I would like to You have already stated to Mr. see where we would come out. Frank, that one man can, with his helper, could install three telephones a day?"

"A. About that, yes."

The only limitation upon the number of men that could be conveniently employed in that kind of work in a plant constructed for these installations would be whether or not it would be economical or good business. As to whether or not a force of one hundred men would not be a terrible large force where there are a great number of people ready to take the service and ready for the service, you understand, that as you increase your force of that sort all of your other expenses increase in proportion. Yes, it would be a terrible job to get an organization of one hundred men to install telephones; that would be a pretty big job right now. One hundred men could conveniently work on the plant and would not be in each other's One hundred men would not install three hundred phones a wav. I did not state that one man could install three; I said one day. man with his helper,—you have got two hundred.

"Q. I understand that you have only got one man installing telephones but I am talking about the telephones installed. One hundred pairs then would install three hundred phones in a day, or

nine thousand a month by working on Sunday?" "A. Yes, if it would be possible to get that many." 2919

"Q. Well, then you would put in twenty-seven thousand in three months?"

"A. Twenty-seven thousand, you are assuming that, but that

wouldn't happen."

"Q. I have taken your figures and have got no fault to find with them, now, let's hear it?"

"A. Well, we haven't sold that much service."

"Q. Well, the people here are all clamoring for the service and are up there lining up for the girls to let them sign the contracts and place their names on the books; they would be there and the trouble you would have, would be that you would have to have policemen to keep them from coming into your building?"

"A. All right, let's concede they do that. Well, I agree with you

if your assumption is correct."

"Q. So there would be about three months where they would be a probable loss of returns?"

A. No. I am only agreeing-

"Q. (Interrupting.) Or one and one-half per cent on the investment?"

"A. No, I am only agreeing with you from the assumption that we are going to have all these men here at one time and all of the instruments.

"Q. Well, that is going to be a fact."

Mr. D. A. Frank: Why not assume that you will have fifteen thousand at work and put them all in in two days. 2920

Mr. Howard: Well, they could do it in three months. Well,

we can figure the loss in earnings then.

Direct examination.

Questions by Mr. J. D. Frank:

If I were to start out today to get one hundred men to install telephones I have no idea in the world where I would get them; I do not believe it could be done at all, an absolute impossibility. I know that that kind of labor is scarce and that all companies have a hard time in carrying on the business that they have. know this that if this company could get the men to do the work that the applications that are in this office now for service would be put in immediately instead of having to wait, they just can't get the help and that is all, and they are losing revenue, as a matter of fact, the installation of the telephone is only one very small step in connection with the preparation of the physical property for furnishing service; that is true. You would have to have other mechanics working in your central office, on your cables and things of that kind in order to actually furnish this service after the telephones were installed, not only that, but your operating force and clerical force and everything that goes to make up the giving of the service. As to whether or not one hundred men would get in each other's way on the switchboard, I will say I never saw more than fifteen men on the largest installations at one time.

I have not figured out in this case how much taxes would have to be paid during the construction period; I do not consider that I have covered that in any phase or any part of my appraisal, haven't made any allowance for that at all, except in the cost of establishing business under this item No. 6. I mentioned

taxes.

Mr. Howard: We are willing to allow that.

Instead of figuring out what the taxes would be during the construction period I figure that is included in the 20% allowance for the cost of establishing business; it has always been considered part of it where I have had anything to do with it. I may be right, or may be wrong, I do not know.

With reference to the final figures that I get on the cost of reproducing this property in Houston, the figures shown on page 1, line 18, as the grand total under the column "C". "N" means the cost new is six million one hundred and three thousand,

three hundred and eighty-four dollars; under the second column headed "C". "L". "D"., meaning cost less depreciation, five million five hundred forty-two thousand, eight hundred fourteen dollars. That is based on the five year average prices from 1914 to 1918 inclusive.

I am familiar with what the original cost of this property was as shown by the books of the company, and am also familiar with the gross additions which have been put into the plant during the last nine or ten years; I have seen those figures — I am also familiar with the net additions which have been put into the plant during

the last nine years; I have seen those too.

With reference to the proposition of how much will probably have to be spent in the matter of extensions and so on in the next eight or ten years, in going over the plant generally, in talking with different business men as to the future prospects of Houston, considering the increase in population, the number of factories that are going to be put up, and will be put up, the general extensive business that will be indulged in and enjoyed in this town, in my judgment, I think you will have to spend in the neighborhood of three millions of dollars within the next ten years in order to supply the service desired.

I am familiar in a general way with the financial history of the plant and how the property has been built up since along about 1901 as shown by Mr. Scott's exhibit as to the property account.

From the study which I have made of this community and the conditions in this community I would say that there is a need for a larger plant; there is great need for a larger plant than the one that you have here now. From the studies that I have made I would say that there will be an increase in the demand for telephone service in this locality, owing to what appears to be the reasonable increase in population, building and so forth there will be. Basing my opinion on the studies which I have made with reference to this community and the plant and its location and so on, it is my opinion that this plant is capable of earning money under normal conditions and circumstances; a telephone property in a town the size of Houston should under normal circumstances earn money. In my opinion it has at least a potential

earning capacity.

I have made such a study of the plant as to familiarize myself with the plant itself; I have been all over the plant. In my earlier testimony I stated that it was one of the best constructed plants in the country, it has been maintained, was well engineered, that there was nothing connected with this plant that wasn't what would be considered first class in every respect. I would say that the plant is favorably located. I think that the plant has been well engineered and is taken care of in an efficient manner at the

I have given some study to the history of this community; I have talked with people as to the prospective growth, and the growth in the last few years. The history of this city with reference to growth is that it has been rather a fast growth. Approximately the population at the present time is about 160,000. From the study which I have made, the prospects for this city with reference to future growth are very great; there are more industries coming into the city, more factories being built. This municipal port that they have opened up will have a tendency to increase business which, of course, in turn, increases the population, people have to come here to take care of this increased business, and I believe the town, the city will increase very rapidly. It is not at a stand-still by any means.

In arriving at my estimate of the value of the property constituting the Houston Telephone plant I have given due considera-

tion to all of those facts.

"Q. Basing your opinion on all of these facts, such as the original cost of the property as shown by the books, the cost of reproducing the property in its present condition, taking into consideration the size of the plant, the character of the plant, its location, the past history of this community, the future prospects for the city and the prospects of this plant for earning money under normal circumstances, what, in your opinion, in dollars and cents at the present time is the value of the property, constituting the Houston plant of the Southwestern Telegraph & Telephone Company."

"A. Irrespective of this appraisal that I have made on a five year average, I would say that the value of the plant today would be no less than seven million seven hundred thousand dollars in round figures; that would be the present condition of the property."

Cross-examination.

Questions by Mr. Howard:

I made this appraisal as a measure of what it might cost to reproduce this property on the basis of using five year average prices. As to why I took those five year average prices, going back to the first two pages of the record of my testimony, you will see that this com-

pany when they asked me to make an appraisal of the property, that I had no instructions as to how to do it, or anything in connection with it except that when I finished any

thing in connection with it, except that when I finished my report I should submit the report, and I have been familiar with material prices and labor and have been doing this class of work for the last ten years on a five year average price basis and so adopted that procedure in this case. I thought that was about right as to the reproduction on a five year basis. I thought that was about the way to get at a proper appraisal of the plant.

"Q. All right. Then you got an appraisal of something like four million dollars, and you added to that something for overheads, I believe, then you added on something for working capital, you added on something for stores and supplies, and you got something

like four and a half million, didn't you?"

"A. No sir, adding the matter in of what you had stated there, I got about five millions."

"Q. Got about five millions. Then you depreciated the plant and considered about eighty-five per cent condition and that runs through all your figures?"

"A. No sir, I gave my estimate of that, 88.7% condition."

"Q. You never figured it out to see?"

Mr. D. A. Frank: 87.8.

"Q. Have you figured it out to see what it is?"

"A. It was 88.7."

Mr. D. A. Frank: Well, I was wrong.

I consider that the depreciable part of the plant should be depreciated to the extent of eleven and a fraction per cent; I found what the condition per cent of the property was. I got the 2926value of the physical properties, then depreciation, after making this return, of this appraisal in the way I thought was fair I got four million, seven hundred twenty-one thousand four hundred and fifty-nine dollars for depreciable assets new. I have the depreciated value appraisal of cost less depreciation of the whole

property but do not show the other subdivision. "Q. But, anyhow 11% would be something over four hundred thousand dollars and would bring it down to approximately how

much?"

"A. Well, I can figure it for you."
"Q. Well, take 10% off, you can do that quicker, probably do that

in your head?" A. Well, four million three hundred and fifty thousand dollars."

"Q. Four million three hundred and fifty thousand dollars, physical property value. Then you add the other things, and get it up, including in round numbers a million dollars for going concern value and you get a final figure of about five and a half million."

"A. Get a final figure of five million, five hundred forty-two

thousand, eight hundred and fourteen dollars."

"Q. That included physical plant present conditions, working capital, included all the contingencies, including overhead, everything that you thought of under contingencies, and included the working capital, included this million dollars going concern, that we haven't been able to figure out. Now, what do you omit in getting the final figure of five million five hundred thous-

2927sand dollars?" "A. I have omitted using any present day prices on ma-

terials and labor."

"Q. But you have already told us that wouldn't be the fair thing to do for appraising this property for the purposes of this case. You have told us that the fair way in your judgment would be to take the five year period and strike an average?"

"A. I said that was my opinion; that I was doing this as I had

done it in the past."

I think it represents the reproduction cost, less depreciation on that basis that I had worked it out. I thought that the fair way

because when I was told to make an appraisal and bring it in here for the purpose of enlightening the court I took that method; I

think that was fair on the basis that I worked it.

I have not given any study to what the value of the plant should be for rate making, but think the present value of the property as of today would be seven million seven hundred thousand. That would include the advanced or the present day prices and every-

thing.

"Q. Do I understand that you mean to tell the court that to reproduce the property in the same way you have it here would probably cost seven million seven hundred thousand dollars now, and in your report, in the way you thought fair you say it would be five million and a half; the cost item seems to have been

ignored?"

2928

"A. I wouldn't say just that for this reason, when I started making this appraisal the year of 1919 was not ended, and I used the prices for material that I had and was familiar with, which was the average price for five years, 1914 to 1918, inclusive, leaving out the 1919 prices. If I were at work on it today on another year, I possibly would include the 1919 prices."

I very probably would include them. I did not include them in the first appraisal; the five years I used were 1914 to 1918 inclusive. If I made it today I very probably would take 1915 to 1919 inclusive, and if I was going to reproduce its cost value today I would

use 1919 prices.

"Q. But for the purpose of rate making you considered the average the fair way to get at it because that was the method you originally adopted?"

"A. If you want my opinion as to what the figure should be for

rate making purposes-"

"Q. (Interrupting). No, I don't want that so much, Mr. Player, as I did your opinion at the time you made this appraisal, that you made it for this five year average period, because you considered that fair, is that true?"

"A. I considered it the fair measure of what the value of this

property might be."

"Q. That was for the purposes of rate making, you understood that, at the time?"

"A. For the purpose that was desired."

2929 "Q. Now, Mr. Frank enumerated in the things yesterday the information that you followed with reference to the original cost and that considering prices and asked your opinion of what that was. There was nothing in the original cost figures that induced you to raise the value above five and a half million, was there?"

"A. Oh, no."

The fact of the matter is that is considerably under that figure. In this inventory that I went over and checked up the per cent for the purpose of this plant I did not determine any percentage of the properties that were being used for long distance tolls.

I did not eliminate any items from the physical properties that

I found in the inventory. I took Mr. Hoag's set up in that regard just as I found them, because all of the property is in the exchange that is used and is useful in the operation of local service, as I understand it, is included. I checked the inventory over and found no property that should not be included. Practically none of the items I have included in my appraisal are used for long distance business exclusively. The whole plant is used for long distance service and at times becomes part of the local telephone exchange, but the exchange is renumerated for any expense it is put to for that purpose. There is an item of payment to the local exchange for any expense that it is put to relative to running the long dis-

tance service. I did not audit those accounts but know from past experience that has been done. What has been done in this particular instance I do not know because I have never

investigated it.

"Q. Just one more question. On page 41, Mr. Player, you will notice down there under this account, 15-C, the last item 15 No. 546 coils, what are those used for?"

"A. Those coils are used in the transmi-tion of messages, that is, that is called a loading coil guys equipped with 15 No. 546 coils on

a trunk cable."

All of the trunk cables between offices have loading pots, what are called loading pots. These, as I understand it, are used for local purposes. That is a great big iron,—what is called a pot, a loading pot and those records and those charges are gotten from the records of what those pots cost.

Direct examination.

Questions by Mr. J. D. Frank

I have the final figure here on page 1 of my summary as reproduction cost new less depreciation, as five million five hundred forty-two thousand eight hundred fourteen dollars; I did not mean to say by that that was the value of the property, I explained that by saying that that was the cost less depreciation on the property figured on appraisal of five year average prices, that it would not repre-

sent the value of the property in any sense of the word, for 2931 the simple reason that the prices have increased anywhere from thirty to forty per cent over the five year average, and if you are going to reproduce that property today to get the value of the property, not an appraisal, but the value, it would show a

figure, in my judgment of not less than seven million seven hundred thousand dollars. In my opinion it would be worth at least what it would take to reproduce it taking into consideration the present condition of the property.

"Q. Now, Counsel has questioned you with reference to certain

parts of the property used for long distance purposes as well as local purposes and you stated that was taken care of by certain allowances to the local exchange. Do you know how much is usual to allow the local exchange on account of long distance arrangement?"

"A. That matter has been gone over to my certain knowledge in over one hundred cases in which I have participated in, and an

allowance of 25% is the standard allowance."

That is the allowance made by the Oklahoma Public Service Commission, and the Missouri Public Service Commission. I know from my connection with the Commissions that they have made an allowance of that kind in nearly one hundred cases,-in over one hundred cases that I have been connected with. The contention was not made in any of those cases that the 25% was too low, or that more should be allowed than the 25%; it has always been the fixed amount, and the Commissions recognize that as a fair allowance

and allowed it in various cases. At one time, several years ago, as low as 15% was being paid, and the Commissions raised it to 25%. I know whether or not that is the allow-2932 ance made by those Commissions at the present time; I know that

they allow that.

Cross-examination.

Questions by Mr. W. J. Howard:

"Q. You, as an engineer, Mr. Player, have never tried in all your long experience on Commissions, have never tried to work that out to see whether that was an arbitrary allowance, or whether it would bear some relation to the service rendered by the respective companies, the long distance and the local exchange, never went into that, Mr. Player?"

"A. I can say that with every telephone company in Oklahoma that I made a specific set up as to the cost of handling the long distance business by the exchange and as to what commission should be paid, and it ran higher than 30%. In some cases they asked for an allowance of as much as 50% for handling the long distance business, but the Commission found that 25% was an equitable

"Q. But they did raise it from what they had been allowing, 15%?"

"A. To 25%".

"Q. My question is, Mr. Player, whether that Commission, or whether you as their engineer at any time ever got the idea by working it out, something upon a partnership basis, where they are

joint enterprises in handling the messages as to what portion should be set aside to each. Whether you ever tried to work

it out that way instead of taking the local exchange and just paying it enough to pay for the expense it was put to in handling this long distance business. Have you ever tried to work it out with a view of letting them participate in the profits of the transaction?"

"A. No sir; I have only had experience with it as I told you."

Just compensated them for the expense of doing it.

Direct examination.

Questions by Mr. J. D. Frank:

The most of the property used in long distance calls is property outside of the city; you have got thousands of miles of poles, wires, and things of that sort used in connection with each long distance call; the equipment within the exchange is a very minor part of it.

2934 The qualifications, experience, etc., of the Witness, C. A. Gates, are set out herein at pages 237-244.

C. A. Gates, a witness for complainant, being duly sworn, testified as follows:

Direct examination.

Questions by Mr. J. D. Frank:

I have not made an inventory of the property constituting the Houston telephone plant. I have made an appraisal of the property constituting the Houston telephone plant of the Southwestern Telegraph & Telephone Company based on an inventory that was made by the company through Mr. Hoag. The book you hand me is the inventory. That is a copy of the inventory that was given me as representing the inventory made by Mr. Hoag, representing the property in the city of Houston. Plaintiff's Exhibit # 13, Inventory of Southwestern Telegraph & Telephone Company's Exchange at Houston. I had a true and correct copy of Plaintiff's Exhibit # 13, which I took as the quantity of the property. I accepted that as being the quantity. I am familiar to a great extent with the property in the city, having built the larger part of it, either directly or indirectly, and, of course, know it cannot be very far off.

2935 In making the appraisal of the property constituting the Houston telephone plant I first built up a set of unit costs and determined what each part of the distributing system would cost to build. I have here a set of unit costs which I have prepared.

In getting my material prices and my labor costs I took the records of the company showing the prices that had been paid for material for the first nine months of 1919 as a basis for most of my prices. Where those prices had changed materially, where they were not fairly representative of the prices that I thought would obtain while this plant would be built, I secured prices where we did not have the prices,—I secured prices. In other words, for my material prices I have taken the average prices for the first nine months of 1919, just as far as those prices were obtainable or were representative.

With reference to labor, I took the prices that were being paid in the city of Houston for that labor during the last half of October,

1919.

I said something about the time during which this Exchange would be reproduced and was referring there to what is known as the economic construction period. As to how long I figure it would take to reproduce this Exchange, I would say that it would take three

years to get your Exchange in operation with half of your subscribers. As to why I am taking three years as the time necessary to reconstruct the property, having built this property, I am

rather familiar with the time required to actually install what is here today, and I have also considered the conditions as they exist today as varying from the conditions under which I built and installed the present exchange. I have also talked with contractors as to the probable time required to build the building. I have studied the situation as a whole, and taking all things into consideration, I think that three years would be the most economical To start with, one would have to determine where they would want to build this exchange new, and then some study by an expert as to whether or not the exchange would pay—whether it would,-whether the town would be a desirable town in which to invest money. After these facts were determined a study would have to be made somewhat on the line of what we call a fundamental study, fundamental plans, you would have to determine where the subscribers could be secured, how many subscribers could be secured, where would be the economical point to build the building, build your exchanges, how many buildings would be needed. That would all take some time, and that, in my opinion, would be about two months; the proper force could determine about where you wanted to buy your lots, buy your land. It is very common practise with us to lay out your switchboards, your apparatus floors, and build your buildings around them. The Preston building was built in Our building laid out and engineered before the that manner. plans went to the architect. Our switchboard was ordered and I estimated that that could be done in this way, that in order to do the job in three years it would be necessary to order your switchboard about the time you started your plans in the hands of your architect, and that during the period they required to build the

2937 buildings, which in the case of the Preston building, under existing conditions would probably be about thirteen or fourteen months, the manufacturer could build the switchboard, and when your building was finished your switchboard could be put in, and probably one year would be required to install it. During the time your outside plans could be engineered and the work started, and by the time your switchboard was installed your outside plant would be very well along, and probably at the end of the three-year period, in fact, perhaps two or three weeks in advance of that time, according to the schedule that I have drawn up, you would have your plant ready to operate with one-half of the number of subscribers that you have here today. I think that would be probably

the most economical period in which to build the plant.

What I would want to do is to construct the plant without having to go to extra expense on account of rush work, would not want to rush it; would not want to build it in pieces. You would want to build it as a continuous job in order to get the most economical

construction.

In arriving at my unit costs and considering the prices which you would have to pay, I have not proceeded on the theory that you would construct this plant in piece-meal fashion, do it on a whole-sale basis. The prices are all on a wholesale basis, the idea being to start the work and carry it along just as nearly as possible as a continuous job, and not have a lot of idle time, and a lot of men standing around, or a lot of plant lying idle eating its head off with interest.

2938 I have taken the average price of the first nine months of 1919 as the prices of material because I think they will come nearer being the prices that you would have to pay for the material that would go into the exchange constructed in the manner that I have outlined. What I was trying to do was to determine what we would have to pay for materials during the construction period. Now, the chances are that the prices would go higher for the first nine months, because some of the materials have gone up since that The prices that I have used are just a little bit lower than the present-day prices, and I would say this, that in order to build this exchange within the six-month period, or within the three-year period, it would be necessary to either buy or contract for the great bulk of the material that goes into this property within the first six I have used present-day labor costs because they are certainly the lowest costs that I can expect to build this exchange with, and they are probably not what they would be. Every bit of labor in the country is going up in price, and it does not appear that with the demand that we would have to create for labor here in order to build this exchange that we could get labor for even present-day prices, certainly not any less than that. In my opinion, it is the very lowest figure that would be safe to consider.

In a general way I have made a study of the past history of prices of materials that enter into a telephone plant of this size. I am familiar in a general way with the prices of materials, how they have fluctuated in the past and what increases there have been. I am familiar in the same way with the present-day prices of these materials; that is, the tendency. With reference to the his-

tory of the prices of materials that enter into the construction of a telephone plant of this magnitude, during the last ten or fifteen or twenty years has been a general upward trend, throughout the entire period that you mentioned. I think that statement is true with reference to the time prior to the beginning of the European war in 1914. I think there has been a general upward tendency, but it has been more marked the last few years. I do not think that the increases in prices in the last few years have been due entirely to the world war which we have gone through. I think there has been a general upward trend. I think without the war prices would have gone up. I think the war has had its effect. I don't think there is any question about that, but the war closed with the Armistice practically and yet prices have continued to go up.

From the study and investigation which I have made with reference to prices I would not expect any appreciable reduction in prices of materials during my construction period. As I have pointed out, practically every dollar's worth of material that goes into this plant

would have to be bought within six or eight months from the date that you decided to build the plant in order to get the material to build the plant within the three year period. Disregarding the fact that you would have to purchase the material within the next six months. I don't see any indication that there will be any appreciable reduction in prices of materials in the next four or five years, in fact, I see indications to the contrary. Everything you pick up, every daily newspaper, is filled with demands for increased wages.

2940 I noticed an article in the Associated Press vesterday morning where the trainmen were asking for an increase of 44% and and 30%. I think the average is probably around 38%. There is not a newspaper you pick up that people are not asking for more money. I believe some of the city employees here are asking for increases; the school teachers are asking for increases, and the labor situation is such that they are in better situation to get these increases than ever I have not overlooked the policemen in Houston; the policemen are very much interested. Just follow the daily newspapers, some of the articles on labor; here is the Houston Post of January 26th, "Hearing between trainmen and Hines postponed. train men now getting \$4.00 a day are asking for \$5.77; a 44% increase: through train men now getting \$4.08, asking for \$5.88, 44% increase; local freight trainmen now getting \$4.48 are asking for \$6.28, a 40% increase; yard foremen now getting \$5.33 asking for \$7.20 or a 35% increase; yard helper now getting \$5.00, asking for \$6.90, a 30% increase, a switch tender now getting \$4.00 asking for \$5.90, a 471/2% increase.

As to the effect that high labor schedules have on the prices of materials, I should figure, that probably out of material that goes into the telephone plant somewheres around 60% is represented by labor manufacturers and 40% is represented by raw material, and as long as we have a high wage schedule I expect no reduction in prices of Take for instance, switchboard cable, which is copper cable, and a change in the price of copper makes a very small change in the cost because the value of the silk or cotton in the insulation is

the largest factor and with cotton 39 to 40 cents a pound, as it has been this fall, is the biggest factor, and on top of that comes the labor.

Cross-examination.

Questions by Mr. W. J. Howard:

I stated that \$3,800,000.00 in gross additions to this plant was spent during a certain period of time; that period covered 1910 to 1917, inclusive, and it might be interesting to say that in that period \$950,000.00 was spent for Central Office Equipment.

In the set-up I did not include the full purchase price for the Home Telephone Company, this represents just the material, -just the

physical property.

In assuming here that I am going to construct a plant in a threeyear period, which is quite a long time, and a big plant with several exchanges and 27,000 subscribers, I do not contend that we have to get that plant fully completed before we could render any service at all, but you would have to get enough of your plant completed to give a service that would be of some use to your subscribers, so as to give a comprehensive service to your subscribers, in other words, there would be no use to connect up ten, one hundred or a thousand stations, as a matter of fact, the economical plan would be to go ahead,

if you were going to rebuild this plant and built it as soon as 2942 soon as you could conveniently and that period seems to be,

from studies I have made, about three years, and you would have everything in there then, except your subscriber's stations. During the time that you were installing your switchboard you would

also be building your outside plant.

"Q. Then when you get your switchboard in, and had your building built, and your switchboards in, you would have considerable cable laid out, and a good deal of wires and construction done for quite a distance out, and there would be no objection to your connecting up a good many subscribers as soon as your switchboard was installed?"

"A. Well, you would not have your entire plant probably in shape to connect up very many subscribers, and to do your work you would

have to educate all your operators and people.'

It could not be handled contemporaneously with your building in some places; you do not have to get your switchboards to educate them up; you can put your school in so that you could do it. You might put in a school board. It is to measure this thing about like this: I have divided the period up into quarters, and during the first quarter there would be nothing to operate; on the amount purchased during the second quarter 10% of the full plant would be built; 14% of the underground conduit would be built; during the second quarter 10% of the Preston building would be built; during the third quarter 25% of the pole line, making 35% would be finished, and we have in our exhibit a complete set up showing just how that thing would go along. Up in the third quarter we

would get 25% of our pole line and 39% of the conduit; we would also get 10% of the Preston building. That will all

appear in the appraisal as it goes along.

Direct examination.

Questions by Mr. J. D. Frank:

I have prepared an exhibit showing unit costs and material prices that I have used in connection with my appraisal.

Mr. J. D. Frank: We offer that in evidence as plaintiff's exhibit

The exhibit offered was thereupon received in evidence, plaintiff's exhibit #37, witness C A. Gates, and is transmitted herewith in the Exhibit File.

With reference to just how I built up my unit costs and material prices, let's take a pole for instance on page 2, the first item is a 35

foot, class B pole. The pole only is \$11.89. That is the price at Escanaba, Michigan. That is where we get the poles from. The next item is the freight on that pole from Escanaba to Houston which is at the rate of 53 cents per hundred weight plus 3% war tax. I got that rate from the Railroad Administration; that is based on a weight of 650 pounds and amounts to \$3.55, making a total of \$15.44, and to that we have added supply expense, amounting to 7%, \$1.08, making the total cost F. O. B. Houston, \$16.52.

Supply expense covers the cost of handling the poles as a supply item until it is turned over to be used; covers the cost of all employees engaged in handling it in the pole yards, less shrinkage while in stock as a supply item. Including the supply expense

I get \$16.52 as the cost of the pole in Houston.

As to what one of these poles cost in place, on page 7, is the labor cost based on the average cost of setting a pole in the city of Houston, using the labor costs as they were in the latter part of October, 1919; also incidentals, including teaming, distributing and other miscellaneous expense items, not covered in materials and labor being 75 cents, and being a total of \$5.85. That figure there, \$5.85, plus the total material cost of \$16.52 represents the cost of one of these poles in place, but does not include the taxes or interest during construction and other items of that kind. That is without the overhead, doesn't include the cost of engineering either. In building up the unit prices, I have not applied any overhead, but have simply included the supervision up to the actual job.

I have prepared an appraisal of this property.

Mr. J. D. Frank: We offer this in evidence as Plaintiff's exhibit

#38.

The appraisal was thereupon received in evidence, marked: "Plaintiff's Exhibit 38, witness C. A. Gates," and is transmitted herewith in the Exhibit File.

applied them to the quantities shown in the inventory. On the first page of my appraisal is the summary of the appraisal. The first item is the reproduction of the land, \$210,850.00; that is shown in detail on pages 6 to 9, inclusive, and 46 to 49 inclusive,—the blue prints are on pages 46 and 49 inclusive. On pages 6 to 9 I set out the values and on pages 46 to 49 are the blue prints of the various lots of land. In appraising this land I secured the estimates of two Houston real estate men, and those estimates I have included.

On page 6 is a summary of these estimates, and my estimate after considering the estimates of the two real estate men, and making inquiries about property values in the neighborhood. In fact, the values used represent my judgment after getting all available infor-

mation I could about the price.

On lot No. 8, Block No. 3, Fannin Street between McGowan and Dennis, W. L. Dennis appraised this lot at \$3,500.00; W. G. Burchfield appraised it at \$4,000.00; I used \$4,000.00.

Lot No. 12, Block No. 3, on south side Dennis Avenue, 100 feet

east of Fannin used for Hadley Central Office, Mr. Dennis appraised that at \$5,000.00; Mr. Burchfield at \$3,000.00; I used \$3,000.00.

Lots Nos. 11 and 12, Block No. 247, northwest corner of Harvard and 8th, Houston Heights, used for Taylor Central 2946 Office, Mr. Dennis appraised at \$3,200.00; Mr. Burchfield at

\$4,000.00; I used \$4,000.00.

Lots No. 11 and 12, Block No. 23, northeast corner Harrisburg and Yoakum, to be used for Harrisburg Central Office, Mr. Dennis appraised at \$4,000.00; Mr. Burchfield appraised at \$4,500.00; I used \$4,000.00.

Lots 1 and 2, and half of lot 12, Block 650, southeast corner Texas Avenue and Roberts Street, used for storage purposes, Mr. Dennis

used \$3,350.00; Mr. Burchfield, \$3,000.00; I used \$3,350.00. Lots 1 and 2, half of lot 3, half of lot 11, Block 70, southwest corner Capitol Avenue and San Jacinto Street, used for Preston Central Office, Mr. Dennis' appraisal of \$185,000.00, Mr. Burchfield, \$200,000.00; I used \$192,500.00. That figure of \$192,500.00 is the

mean between the two estimates.

My next item of material is buildings, \$535,081.00. On page 10 is a summary made up as follows: page 10 shows the Preston building, \$394,212.00; the Hadley building, \$75,857.00; the Taylor building at \$39,551.00, a total of \$509,620.00 to which has been added 5% for Architect's fees making a total \$535,081.00. the details on that. On page 11 is a letter from A. W. Allen, General Superintendent of Fred A. Jones, transmitting the estimates. That is, I had the Fred A. Jones Company make an estimate of what it would cost to reproduce those buildings. I selected the Fred

2947 A. Jones Company, because the Fred A. Jones Company built the Preston building and built the Taylor building, and I found that they had in their files the original quantities that went into those buildings, and I thought they would be better able to make

a fair estimate than anybody else.

Mr. Duls: If the Court please, Mr. Allen here is our next witness; Capt. Allen is head superintendent of the Fred A. Jones Building Company of Dallas. We have asked Mr. Allen to come down to Houston for three reasons: First, when Mr. Hoag was on the stand, counsel for the City,-I think it was Mr. Howard-intimated that he had used the figures of the American Construction Company on the Preston Building as the highest reproduction figures that he could obtain, and that he did not ask the people who actually constructed the building for their estimate and use that. Now, the Fred A. Jones people built the Preston building, and we have asked them to give us their best judgment as to what it would cost to build or reconstruct that building today, and Mr. Allen will tell us about Now, the second reason we have asked him to come down to Houston is so that Your Honor may have the opinion of the people who actually constructed the two buildings which the company uses here in Houston-the Preston building and the Taylor buildingas to what they think it would cost to reproduce the building, if they were going to construct it today; and then also offer their estimate as to the third building which the company owns here, but 2948 which they did not construct, based on the plans and specifications which were used in the actual building of that building. And the third reason, of course, is because Mr. Gates has used the estimate which the company with which Mr. Allen is associated has made in his appraisal, and we wanted to give your Honor and counsel for the City an opportunity to ask him any questions in reference to these estimates that you might have.

The Master: Mr. Allen, you may be sworn.

ARTHUR W. ALLEN, a witness for the complainant, after being duly sworn, testified as follows:

Direct examination.

Questions by Mr. William H. Duls:

My name is Arthur W. Allen; at the present time I live in Dallas, but I travel a good deal, so I have no fixed place that I claim as a residence. My business is that of Superintendent of construction and estimating and I am connected with the Fred A. Jones Company who have their headquarters in Dallas. They do all kinds of commercial buildings, industrial buildings, and occasionally some dwell-

ing houses of high grades. Their operations are confined to Texas. The position I occupy is that of General Superin-

tendent and Estimator.

With reference to my duties as Estimator for the Fred A. Jones people, when plans and specifications are secured we make the survey of all quantities and tabulate them and then add the current prices for labor and material to them, making up the complete estimate. Our purpose in making these estimates is to arrive at a very close cost on the work contemplated. We make them for the purpose of bidding on the work and securing new contracts.

"Q. I wish you would tell the court what training and experience you have had that enables you to qualify in making these esti-

mates?"

"A. I started out and learned the carpenter's trade-

Mr. Howard: There is no use going into all that detail and encumbering this record. We will just admit that Mr. Allen has had experience enough to understand his profession.

Mr. Duls: You admit that he is qualified then to testify as to

what it would cost to reproduce these buildings?

Mr. Howard: Yes—we don't admit it, we assume he is a man that is qualified, his position would indicate that.

Mr. Duls: All right then.

I am somewhat familiar with the telephone buildings, which the Southwestern Telegraph and Telephone Company owns here in Houston; I am very familiar with the Preston Building; the 2950 others in a general way only. Our company constructed

the Preston building and also the Taylor building.

I have made an estimate of what it would cost to construct the

Preston building today.

The figure which I finally arrived at for the Preston building, the cost of constructing it was \$329,023.00. That figure does not include the heating and plumbing and wiring and the other matters; it includes only what we do as general contract,—general work of construction.

I have made a similar estimate as to the Taylor building and the

figure I arrived at for that building was \$34,622.00.

I have also made an estimate of reproducing the Hadley building

and the figure I arrived at for that was \$67,488.00.

These figures do not include any architect's fees, and in making these estimates I went about it in exactly the same way that I would if I were going to bid on a job. I could say that it took me at least four days to make the estimate on the Preston building; on that particular building we were fortunate in having all of our revised quantities that we used at the time the building was built to refer to. We had the same thing on the Taylor, but on the Hadley they were made from plans and specifications only. We have those figures in our office in Dallas and they could be checked by the City at any time.

2951 The estimate of the Preston building was made about November 15th, and that of the Hadley and Taylor about

December 1st, 1919.

If we were bidding on this job to-day we would not accept the contract on the figures I have made without checking them through very materially, because there has been a very material rise in material prices since they were made, on all material,—in fact, labor and material. I absolutely do not see any prospect of the price of material going down. There is no reason to expect that the price of labor will go down.

As a contractor engaged in the contracting business I have only in one case known wages to take a general decline; the panic in California,—when the 1907 panic hit there, why, labor practically ceased, and then the labor unions would work for whatever they could get for the time being; that is the only case. I mean that it takes a panic or an absolute cessation of demand for mechanics.

"Q. Yes? Well, now, in making them up, what did you finally

use as a check on the figures which you have arrived at?"

"A. We—from our past experience, we are always armed with what we call cubic foot prices, by referring back to some building we have on record cubic foot prices we have used, and we accordingly check the building in hand at the time by some previous prices."

To-day the first class buildings are running from 60 to 65 cents

a cubic foot.

2952 I have made an estimate of what it would cost to reproduce these three central office buildings here on a cubic foot basis. The figure I arrived at on the completed Preston building, which takes into consideration, the heating, wiring, plumbing, and everything that would make it a completed building is, \$394,212.00; that on the cubic foot basis is 62.7 cents. The same figure on the

Hadley building is \$75,857.00; the cubic foot basis on that is 54.2 cents; the Taylor building is \$39,551.00 and that is 56½ cents a cubic foot.

As to whether or not telephone buildings require a certain amount of better constructions than ordinary buildings, I will say the Prestor building is built with the intention, or with the floor loads calculated on the basis of 75 pounds to the square foot for the first floor and 150 for all the floors above, just double the average floor load,—in other words, these floors are designed to carry double the load ordinary office buildings. They are built from the standpoint that the construction has to be a great deal better built than an ordinary business building, much heavier in construction—steel, and in the footings.

Mr. Duls: Your Honor, I might just state, to clear up that firs point, that Mr. Hoag's estimate was \$394,560.00 as the record shows and Mr. Allen testifies that the figure at which they would reproduc the building is \$329,023.00. That is all.

Cross-examination.

Questions by Mr. W. J. Howard:

2953 When contractors are figuring on buildings where the have in view the construction of a building on a building of this size, they often vary very considerably; there is a variation.

It is the custom for constructions companies to enter into a writte contract to construct a building, a contract of some sort, and ofter if they are not very responsible, they are required to give bond.

"Q. I do not know whether that is your custom or not. Now, you were to build a building like the Preston building and yo applied to your company and got this figure, at \$329,023.00, an another reputable and responsible building company agreed to buil it for less figures, agreed to build it for \$35,000.00 less, which bi would accept?"

"A. If I was the telephone company, do you mean?"

"Q. No, sir, if you were the owner?"

"A. If I was the owner?"

"Q. Yes, sir, if you were the owner?"

"A. I would weigh that low bid very carefully at the presentime."

If we are building it by a reputable construction company the will give bond for the building of it, if the man that was low has the commercial rating and backing and standing in the building world, and was building it on the lump sum basis, I should sure use the low bid.

Our company built this building and I can tell you approximatel the cost of that building, what we built it for, I can tell you 2954 the bid, I believe; it was \$149,900.00 and something. The

is comparable to \$329,023.00 that I suggested just now.

Questions by the Master:

The inside timber in this building was all quartered oak. I think that the lumber market will continue to rise. I do not think the lumber market is out of proportion with other things, not in the least.

Redirect examination.

Questions by Mr. Wm. H. Duls:

I think prices will continue to rise because there is a big domestic demand all over the country and lumber—there has been no steady improvement of it for the last year—for instance, we get a price to-day, but if we figure a job two weeks from today and use those same prices, we are several dollars out of the way, sometimes several dollars a thousand even; just as a sample, I will state that the big door manufacturers today are the Payne Lumber Company, the Brown, the American and those people,—will not accept orders for doors—those are panel doors, similar to what they are in the telephone building, and guarantee any delivery, neither will they make a price upon them, and if you place an order you may get those doors, say in seven or eight months, nothing under that, and at prices current at the day of delivery. That is the condition of the building business today.

I absolutely would not take a job constructing a building like the Preston building on a lump sum basis. The basis I would take it on would be a fixed fee, or on a commission basis, that is, a cost-plus basis; we might use that cost-plus on a sliding

scale, but it absolutely would not be on a lump sum basis.

A "sliding scale" basis means that we state prices in the first place based on estimate, and for every dollar we saved we would draw a certain per cent on that, which would be added to the fee; for every dollar over that we would lose a certain per cent of it down to the limit; in other words, we should have a fixed fee we would get, and then the sliding scale would increase that fee or diminish it down to that as the building was built, more or less, than the estimate.

Recross-examination.

Questions by Mr. W. J. Howard:

I say that I would not take contracts now, not on a lump sum. The fact is that this is a period that is so abnormal in building experience that you do not know what to do, and do not know how to contract yourself, or how to act and the only safe thing is to get cost plus a certain per cent. As to whether prices are going up or coming down, of course, that is a thing that absolutely rests entirely

in doubt. A panic, or disorganization in the banking world would tend to disturb these things very much; might cause

a great drop in all things.

"Q. Did you read, Mr. Allen, here a few days ago, when the report

of-I don't know just what, you may recollect it better than I dohow some commission was sent over by the government to Europe, and came back with some report, and predicted a very dreary outlook for our financial-or radical changes in our manner of financiering within a short time?'

I noted that there was such a report, yes, sir."

A thing like that that would upset things to a great extent might affect a rise or decline of material. At the present time, though, as we experienced in Dallas and many other cities in the North around the manufacturing centers, there is a great shortage of houses. It is possible that that is due to some extent to the known cause that for two years practically all building and construction in that regard or of that nature was suspended, but there was a shortage of houses before that; there was some shortage of houses but it has been very marked since then. It is possible that that shortage could be caught up with by overbuilding if you could get material and labor to do it. There is another thing is our vision of the future and that is it is a possibility that to a great extent immigration wil! be restricted and the probability is now that it will be very much less in the In our northern cities, though, we have been up against the housing problem for at least five years, and school house work, and absolutely required public educational buildings we have been short on. Other materials, such as brick and cement are not coming in as yet so as to decrease the cost of building. For instance,

at one time before the war we were commencing to use sheet metal for forms and that was replacing lumber; but at the present time sheet metal has increased so much in the way of prices, with the high price of lumber prevailing there is very little differ-Another thing I have noticed is in oil circles, there is a very great feeling of uncertainty as to what is going to happen as to the

shipping of oil and gasoline.

Q. It has even been predicted that gasoline is likely to go up to fifty cents a gallon. Now, anything like that would have a direct effect on the building of automobiles and would stop this building of garages over the country,-that is another thing that would affect the demand?"

"A. Possibly, but the big business people in the country, the big men that claim to be authority, are looking for a period of industrial building five years ahead, laying their plans for that."

That is, unless something unusual happens to intervene, to un-

settle it.

Redirect examination.

Questions by Mr. Wm. H. Duls:

Outside of panics and those other things that Mr. Howard suggested, I do not see any reason for a decline in prices; the supply of material and labor is now way under the demand. I mean to tell the Court and Mr. Howard that this rise will last five years longer, and it will surely last beyond the construction of the 2958 building.

Recross-examination.

Questions by Mr. W. J. Howard:

Well, of course, we get no lumber except a very high grade of wood, like mahogany and teak wood and some others outside of this country, but what is grown upon our own soil. We export some lumber. I understand there is quite a bit of lumber in Russia, but they are way behind in their methods of lumbering, and in their present condition they are not doing any lumbering to speak of. But those are things, as the demand grows, we seek out, and there is a possibility that we might draw on Russia in the dim future.

We are only a year out of the war, and when the people in Europe get settled and comparative order is restored, production, I suppose, would then be restored in the European countries. That would release the supply to a great extent, this demand, there is just that pressure upon it, and it is seeking an outlet in labor saving devices, but in Dallas this year we have been building two or three buildings and there never has been a time when one of our jobs has been properly manned on account of the scarcity of labor.

•

Redirect examination.

Questions by Mr. Wm. H. Duls:

2959 Building permits in Texas are on the increase; I could not tell you just what per cent, but they are increasing. That same fact is true of the whole United States as a whole, but it might not be in some section where there is not normal growth,—some small section.

Recross-examination.

Questions by Mr. W. J. Howard:

As to whether or not that comparison is based on the years 1917 and 1918, or on the years prior to the war, I thought we could be safe to say that you could base it on the most prosperous year and there would be more building in value. During the war for a period of two years the building permits in the United States went down way low. I would say that for the State of Texas that increase will bring them up to or above the normal issue of permits prior to the war,—building permits have increased exceedingly but never even compared with what you are having at the present time. I do not know about Houston, but I do know that Dallas and Ft. Worth are way ahead of any record. The demand for office buildings rose from 60 cents square measure to \$2.50 in Dallas. The conditions in Wichita and Burkburnett are liable to drop down, I should imagine.

Questions by the Master:

I think the increase in building permits usually go- on values,—that is, cost of building. I should say that in Dallas they are doing more actual physical building now than they did during the prosperous years before the war. I am familiar with that, right now it is ahead of anything that she has ever had in her record for buildings that are actually under permit. I say that is the general condition over Texas so far as I know and I can say that of Ft. Worth.

Recross-examination (continued).

Questions by Mr. W. J. Howard:

That is somewhat directly affected by the oil, but still there is a great deal of what you call natural prosperity; industrial increase

in buildings, regular legitimate industrial work.

Besides this domestic demand that I speak of there is a demand also in foreign countries for lumber and building materials. The war destroyed a great many forests in Europe, and the people have got to rebuild their homes and houses in Europe and that creates more demand for these building materials. My company buys quite a great deal of steel. I don't think the steel corporation would accept orders on two years' basis; I think the only way they would accept them, they would take the order, that is, if some of them could not be billed directly, they would take the order subject to such deliveries as they could make, the prices to be current 2961 at the date of delivery.

Mr. C. A. Gates, a witness for complainant, resumed the stand and testified as follows:

Direct examination.

Questions by Mr. J. D. Frank:

I have heard the testimony of Mr. Allen and have adopted the estimate made by the Fred A. Jones Company as to the cost of reproducing these buildings. The figure which I get for the cost of reproducing the buildings in Houston is \$531,081.00.

Cross-examination.

Questions by Mr. W. J. Howard:

I regard the American Construction Company as a reputable and responsible construction company, as far as I know; I do not know very much about them. I do not know who the management is today, haven't had occasion to investigate the matter. If I could get a reputable company to put it up for \$35,000.00, \$45,000.00 or \$40,000.00 less than those figures I would con-

sider all the circumstances surrounding it. Assuming they are a reputable company, absolutely responsible and would give a bond to put it up, I certainly would adopt the lowest bid, everything considered.

Redirect examination.

Questions by Mr. J. D. Frank:

The next item on page 1 of my summary is Distributing System. I have included as the cost of reproducing the distributing system, \$2,577,511.00. The detail of that is shown on pages 52 to 79 inclusive. The summary of the distributing system appears on page

51.

The first item in my summary of the distributing system on page 51 is poles, amounting to \$321,331.69. That is shown on pages 52 to 55 inclusive. There are seventeen thousand, two hundred and fifty-eight poles in the plant. I have in there an item of labor and incidentals amounting to \$5.88 a pole, which applied to the total number of poles, makes \$100,959.30.

Just below that I have a heading "Miscellaneous Street Costs" which is, first, poles set in private property, \$2.00 a pole, there were 897 poles. It very frequently occurs, especially in Houston where there are very few alleys, if any, in the residence section, at least, it is necessary to set a distributing pole on private property. It

always costs more money to put that pole in there, because 2963 of lifting it over the fences, moving shrubbery, replacing lawns, difficulties in raising the pole because of the fact that it has to be set along side of buildings. Our experience over a period of two years, with the advanced price of labor, is that the cost would

be at least \$2.00, probably more.

The next item is poles set in cement walks. There are 69 in the plant. I have estimated that we can replace that walk for twenty cents a square foot, I have estimated that we have to replace nine square feet of walk for each pole, or \$1.80, making a total of \$124.20.

Poles cribbed with concrete 2 at \$12.79,-\$25.58.

There are 7354 poles that are painted at a cost of \$1.99 each, or \$14,634.46. There are 15,505 poles that have the butts treated at a cost of 94 cents each, making a total cost for the treament of \$14,574.70. This brings the total cost of the exchange pole line, poles only in place, of \$321,333.59, which I have carried into the summary on page 51.

The next item is Exchange Pole Line Accessories; the detail appears on pages 56 and 57. The total of these items is \$86,111.71.

which is carried into the summary on page 51.

Some of those Exchange Pole Line Accessories are cross arms on page 56, and an item of 12 pin fir cross arms of which there are 151, at the unit price of \$6.44, making a total of \$972.44. There are anchor guys at the bottom of the same page, 6,000 pound strand guys, 867 at \$3.57 each,—\$3,095.19. I carried all of my pole line accessories over to page 51, \$86,111.71.

The next item is Exchange Aerial Cable, the detail on 2964 pages 58 to 61 inclusive. At the bottom of page 58 there are 22 guage cable, type AA lead tin sheet, ten pair, 4,443 feet at

10.27 cents per foot, \$456.30.

Under the head of Exchange Aerial Cable I have some other itemof material other than the cable itself. On page 59 there are pipe and underground dips, galvanized iron. One or two of the other items are, the labor of placing the cable on messenger, \$55,264 feet, at 12.8 cents per foot, amount to \$122,273,79. It is on page 59, Labor and Incidentals. Labor and Incidentals on cable and dips of which there is 35,230 feet at 22.5 cents per foot,—\$7,926.75. All of the several items that I have enumerated in connection with the construction of the Exchange Aerial Cable. Total on bottom of page 61 is \$648,518.05, carried in the summary on page 51.

My next item of the distributing system is Exchange Aerial Wire; the detail is shown on page 62. That is open wire work. The first item is No. 14 iron wire, 31,580 spans of wire, amounting to 681.84 miles, at a cost in place of \$34.52, or a total cost in place of \$23,-537.12. I get as the total cost of Exchange Aerial Wire Lines, \$93,480.38, and that appears at the bottom of page 62, is carried into

the summary on page 51.

The next iem of the distributing system is Exchange Aerial Wire Drops; the detail appears on page 63. The total figure is \$52,503.74, and that is carried into the summary on page 2965 51.

The next item is Exchange Underground Conduit Main; the detail is on pages 64 to 67 inclusive. On page 64, the fifth item which is duct vitrified and clay malleable tile in complete concrete encasement; of that particular type of conduit there is 25,482 trench feet, at a cost in place of \$2.28 per trench foot, or a total of \$58,098.96 for all of that in place. I show the amount of Exchange Underground Conduit Main on page 67, \$593,051.57; it is carried in the summary on page 51.

I have an item of "Cutting and Restoring Paving." I have not included anything for cutting and restoring paving where that paving did not exist at the time we built the underground work.

My next item is Exchange Underground Conduit Subsidiary. I show that in detail on pages 68 and 69. As the final figure for the total Exchange Underground Conduit Subsidiary I get \$78,-227.53. I have figured out the cost of the various kinds of paving that we would have to replace in restoring that property. The final figure of my Exchange Underground Conduit Subsidiary is shown on page 51.

The next-item in my distributing plant is Exchange Underground Cable Main, detail on pages 70 to 72 inclusive. I first set out the various kinds of cable and then have Miscellaneous Material that goes along with that cable; that is all included in the unit

cost-that is miscellaneous material. The final figure on that appears on page 72, is \$555,610.72 and is carried into my 2966 summary on page 51.

The next item is Exchange Underground Cable Subsidiary, pages

73 to 76 inclusive on which pages the details of that are shown, and as the final figure on that I get \$107,588.39, which I carried into my summary on page 51.

My next item is Exchange Underground Cable, House Cable, of which the detail is on pages 77 to 78. I get a total of \$14,219.44,

which is carried into the summary on page 51.

The last item that I have in my distributing system is Exchange Right of Way; the detail is on page 79. That item of expense in connection with the distributing system covers permit fees, labor, and all other expenses involved in securing right of way,—first, locating 16,361 poles and 1830 anchors on public streets and alleys; second, for opening streets to place 233,958 trench feet of conduit, and 22,080 trench feet of underground dip pipes; third, for placing 897 poles and 235 anchors on private property; fourth, for placing 13,286 trench feet of conduit and 4,479 trench feet of underground pipes on private property; fifth, for placing 26,915 feet of block cable and 98,910 feet of block wase on privately owned buildings; sixth, for placing 15,126 feet of house cable in privately owned buildings,—a total of \$26,867.28, which I have carried into the summary on page 51. I have made an estimate of what these various items would cost for doing that particular work. The ex-

pense in connection with right of way matters is not charged to operating expenses. It is a capital expenditure and I know from my experience in the telephone business that it

does cost money to secure this right of way.

With reference to the majority of items of materials that are used in connection with the telephone business, the Southwestern Telegraph and Telephone Company does not buy them in any other manner than on the wholesale basis; carload lots are considered wholesale quantities. If you would buy, for example, ten car load lots of poles, you would not get your material any cheaper than you would if you would just purchase one car load lot. The best prices you can get is in car load lots. The prices which I have studied here were on wholesale quantities and those are the prices which I applied in making my appraisal of this property.

Recross-examination.

Questions by Mr. W. J. Howard:

I do not know whether or not the American Telegraph and Telephone Company has any control over the company that furnishes the poles. I do not know that I have ever heard anything about that, but if I did, it would be purely hearsay; I do not know anything about it.

Direct examination.

Questions by Mr. J. D Frank:

2968 The total figure on page 51 under my summary of Distributing System is the figure that I carried into my summary appraisal on page 51.

The next item of material on page 1 under summary of appraisal is Central Office Equipment. I have included there as the cost of reproducing that part of the property, \$1,242,514.00. In appraising that particular part of the property I asked the Western Electric Company, who manufactured that apparatus, to make me a price on reproducing that property; an inventory was sent them and they made their estimate on that statement. I did not ask any other manufacturing company to make an estimate on what it would cost to reproduce that part of the plant, because there is no other company that I know of that manufactures the same class or character of equipment, or that could replace that equipment

Cross-examination.

Questions by Mr. W J. Howard:

I say I got these figures from the Western Electric Company; on page 81 is a copy of their proposition. They are the only people who manufacture that particular equipment.

I have analyzed the labor cost of the Central Office Equipment, but not recently. I do not know what part or what proportion the labor of that manufacture bears to the selling part, that is,

the labor cost of the manufacture bears to the selling cost
2969 of the product, but it perhaps runs from 60 to 70. I am using
these figures I have in mind in days gone by, that that is
not positive, absolutely certain. They have increased considerably
in later years, that is, the prices of equipment,—they have increased
considerably in later years.

Direct examination.

Questions by Mr. J. D. Frank:

Prices of all other equipments have increased considerably in the last few years.

The next item of material is Station Equipment and that is shown in my appraisal on pages 101 to 124 inclusive I have a summary of the station equipment on page 101 and the first item under station equipment is station apparatus, details on page 102.

That station apparatus consist of subscribers' sets, protectors, pay stations, and miscellaneous equipment that goes with them, amounting to \$195,140.15. It appears in the summary on page 101.

The next item is Station Installations and the details are shown on page 103. Station installations include the wiring, the labor, the incidentals, in placing subscribers' stations. I have figured out the cost of the material and labor of making each one of

those installations and have then applied that to the whole installations; that was the average cost which appears in the unit cost. The total of that is \$108,334.33, which is carried into the summary on page 101.

The next item of station equipment is Interior block wires, details

on page 104. Block wires are not wires that are run into the houses; these are the wires that are run at the back of the business blocks, or the rears of the buildings, and are used to connect between the cable terminals and the subscribers' station. I have included under this heading the miscellaneous material that goes along with that, and labor and incidentals.

I get as the total figure for plumbing, \$95,026.10, which is car-

ried into the summary on page 101.

The next item in my station equipment is Private Branch Exchanges. The summary of private branch exchanges is on page 105 and the detail follows on pages 106 to 123, inclusive. Those are the various private branch exchanges that we have located in the big business houses in Houston, and where there are larger ones they are shown in detail. My total figure for private branch exchanges is \$62,252.52, and I carry that into my summary on page 101.

The last item of station equipment is Booths and special fittings; details are shown on page 124, and I get as the total cost in the placing of that equipment, \$3,668.25, and have included that on

page 101.

On page 101 I get as the total figure for my station equipment \$378,921.15, and that, in turn, is carried into the sum-

mary on page one.

I have not included in my appraisal any transmitters, receivers, or induction coils; those are the property of the American Telegraph and Telephone Company.

Cross-examination.

Questions by Mr. W. J. Howard:

I also got those prices from the Western Electric Company, the prices on the apparatus; they are the prices that we paid for apparatus and for material the first nine months of 1919.

Direct examination.

Questions by Mr. J. D. Frank:

The part of the property that I have been considering up to this time is the physical property only. I have not included all of the physical property in that. I have given you an estimate of the cost of reproducing the physical properties, other than the furniture and fixtures, tools and store equipment, stable and garage equipment, not including any taxes or interest during the construction. The total figure for my land, buildings, distributing system, central office equipment, and station equipment is \$4,944,877.00.

The next item I have here is Contingencies and Omissions of three per cent; that is, three per cent of the total cost of

the physical property enumerated above.

"Q. And you worked out that three per cent with reference to the amount of contingencies and omissions, which would appear in the various items going into the plant?"

"A. I don't understand that question."

"Q. Well, have you used a weighted average or have you worked out the amount of contingencies and omissions that you have on distributing system, say, for instance, and the amount that you have on central office equipment?"

"A. I would use the weighted average."

You would have contingencies and omissions with land. As an illustration, in the case of the land that we bought on Fannin Street on which our Hadley building is erected, we had an item which does not appear to-day when we go to value that land; at the time that land was purchased the title was examined, was approved by our attorneys and the land bought. I think that was approved by Mr. D. A. Frank, but, at any rate, after we bought the land, the Bremond heirs came in and brought suit, and much against my wishes, on the recommendation of my attorneys, I paid the Bremond heirs about \$250.00, which is about eight per cent, I guess, on that land, as I remember it, that is, over and above the cost of the land; I had that to pay.

2973 That was on account of defect in title at did not appear on the record as shown by the abstract and my attorney

gave me an opinion on the abstract and wrote better.

With reference to other contingencies in consection with land, I have two in mind today that occurred in the last two or three years in this state where I did lose land. In one instance, I contracted for the land, was told there were no restrictions, and while I had the contract so drawn that I would be relieved if there were any restrictions that prohibited the building of a telephone exchange, I did not have to buy the land, I did lose a considerable amount of money because it was just at a time when it was necessary to build an exchange quickly and I had my plans started as soon as I got the contract signed; then when the second attorney got through with it, I found that there were restrictions that could not be removed and I couldn't build the building on that lot, and I had to go through the whole thing again and get a second lot. At that particular location, there were but very few lots that could be used for business purposes, and I dare say that if we knew exactly what he change meant to us, that it would represent thirty per cent of amount that we paid for the lot in trying to locate a lot free

om restrictions. There is another instance where I purchased a ot, was about to build a building on it and the State of Texas desired the land for a park, and I had to give it up and buy another lot. I still have the land, the State of Texas has not bought it. We did not dare build on it and I cannot sell it to anybody else

because we do not know when they will come along and condemn it, anytime, we don't know what day. That is in Aus-

tin, the capitol of the State.

With reference to other contingencies in connection with land besides the illustrations I have made, in the prices I have used in Houston I have not considered commissions of real estate men. We have never bought a piece of land yet that we did not pay directly

or indirectly, a real estate commission, and I think that probably three to five per cent,—I do not know just what your real estate men exactly would charge you, I believe I have got something on that right here. (Referring to paper), your real estate men would charge you five per cent,—I guess I haven't got it either; they would charge you five per cent on small sales at least, and on large sales, I do not know; they used to charge five per cent for the first eight thousand dollars and two and a half per cent above in Dallas. They charge you five per cent straight now and nothing has been considered on that. I have nothing else to say in reference to omissions, in connection with land.

With reference to our Preston lot over here I have not included everything that is on that lot; we have not included the driveways, curbs, sidewalks or the cement washing stands by the side of the Preston building where we wash automobiles, nor do I include this garage over here on the Preston building. That has not been included, and neither were the warehouse buildings on the lot at the corner of Texas Avenue and Roberts Street; neither is the stable on

the Taylor lot.

Those are illustrations of contingencies and omissions which you do have in connection with land and buildings.

Now, we have another very apt illustration of things that are liable to be overlooked in estimating the reproduction costs in buildings. In San Antonio I made a contract in 1910 for the erection of a three story building on Travis Street, which was to cost about \$50,000.00. The contract was taken in a lump sum. footings for the foundation were distinctly specified, they were based on test bearings that we had made by men who were considered competent engineers and architects, but when we got down to the footings, we found there a condition that had not been forseen by those men, and it was necessary to put in 340 pieces of piling. When we got to driving the piling, we found we were on the edge of an old creek or shelving of limestone formation, the piling would slip and drive off, and the added expense to the telephone company, independent of the \$50,000.00 contract, was a little over \$12,000.00, or in the neighborhood of twenty-five per cent of the cost of the Now, that is something that would undoubtedly be omitted by any engineer who went there to investigate and value that building, unless we could get into it and find out what the history of the thing was. In many cases we have had buildings where the contractors have defaulted and we have had to take over the buildings and finish them. You are usually protected by a bond under those circumstances, but there are many cases where the bond does not cover it, and many cases where the bond per-

haps only covers a part of it.

2976 My contingencies and omissions in this case in dollars and cents amount to \$148,345.00. I have added that to the cost of the physical property enumerated above, and as the total cost of that physical property, including contingencies and omissions I get \$5,093,223.00.

Cross-examination.

Questions by Mr. W. J. Howard:

With reference as to whether or not I am trying to justify the contingency of three per cent on land and buildings,—three per cent is the weighted average on the whole property. As to whether or not I am trying to justify three per cent on the land, I think that there is,—I think you will probably have, taking the thing as a whole, you will find that would not make it if you went out and looked at it. You do not have any compensating elements that might tend to wipe out that three per cent. The telephone company, as far as I know, has never bought any land in Houston for less than it is worth. We are not claiming a pretty nice profit on the land we bought in Houston; we cannot take the property.

Here in Houston we paid for the Preston lot \$110,000.00 in about

1910. I have it set up here now for practically \$192,000.00. "Q. \$192,000.00, a profit of \$87,000.00 in ten years."

2977 Mr. D. A. Frank: \$82,000.00.

"Q. \$82,000 in ten years."

Mr. Duls: That is not profit, Mr. Howard.

Mr. Howard: Well, it is increase. Mr. Duls: Increase, but not a profit.

We cannot take the increase, we have got to use it, we cannot get away from it. Intrinsically it is worth \$192,000.00. I have just told you that we have no profit because we cannot take it and haven't any increase because we cannot take it. As to whether or not the probabilities are that we had a pretty good bargain in it when we bought it, I think you will find other property that has gone up much faster than that that right here in the City of Houston.

Direct examination.

Questions by Mr. J. D. Frank:

What I did was to estimate the cost of reproducing the various parts of this plant, and then I applied my contingencies and omissions to the cost of reproducing the plant. My weighted three per cent would apply to the reproduction cost of the property as a whole.

2978 The next item I have in the summary in my appraising is Engineering, four per cent, amounting to \$203,728.00, and I have taken the weighted percentage and applied that to the property as a whole. That applies to the land, buildings and all of the property going to make up the plant as a whole. It would be greater than four per cent on some parts of it and less than four per cent on others. I used four per cent because I think that is the very minimum that it could be done for; four to six per cent is the usual cost,—somewhere in between four and six. Five per cent is the figure that is generally allowed by engineers for that. Mr. Lyndon

allowed six per cent for engineering and that was in some work that

he did for the City of Houston.

The next item here is General Expenses, two per cent, which in dollars and cents amount to \$105,939.00; that is expense that you would have in connection with the construction of this property if you were reproducing the plant, and is expense that the Southwestern Telegraph and Telephone Company has all the time in connection with the construction of its properties from time to time. I know that it is customary for other engineers to handle an item of that kind in arriving at the cost of construction. I take two per cent because I thought that was a minimum figure that it could be reproduced for.

Cross-examination.

Questions by Mr. W. J. Howard:

As to how we would spend the money, the first item of \$105,000.00, we would have to have general supervision throughout the entire period of construction; everything that we have covered so far has been simply the actual cost of doing the work. We have a supervising engineer during the entire period of construction; only one supervising engineer.

"Q. Well, what is the four per cent engineer for, what is he going

to do?"

"A. The engineer is going to build the plant?"

You need somebody to supervise these engineers that are going to build the plant, that is, a general supervisor; he would not necessarily be an engineer. He would not be an engineer, he would be an executive. The executive work he would have to do would be to supervise and direct the whole property. The engineer would not do that; the engineer is not supposed to buy the material, the engineer is the man who designs the plans. I mean you would have to have somebody who would be the executive, hire the engineer and tell him what to do; have him simply hire someone to simply superintend construction and see that he did it. We could not get the services of the Western Electric Company or the services of the American Telegraph and Telephone Company because it is not their business. They would give us any engineering advice that we might ask for, they maintain an engineering department that is continually egaged in research work and answering the questions we might want, and continually assisting us in financing the busi-

ness; we couldn't finance this business at the rate we get.

2980 We could not get six per cent money. I think it is a great favor to get six per cent money under excisting circumstances.

With reference as to whether or not he is going to need a building engineer, that would be only one of the duties he would have. The general expense would cover the general executive force; he would direct the construction of the plant and the business generally and it would not be "him," it would be several "hims".

"Q. How many men are you going to have of "him"—you have

got the engineers now to supervise everything and see that your foreman and everybody that knows the material that you want, and you have got a great big body of men here, engineers, as you have built it up. Now what are these overlords going to do?"

"A. You seem to have a confused idea of the duty of an engineer." The engineer is not an executive, is not a man that tells people or goes out here and runs the business; he is going to run the plant. I assume we are going to have some money. You will have a complete organization, beginning with the manager and president of the company; the president would give his time probably for the time being to help out, merely as a good fellow, and he would have to have a general manager and the general manager would have to have his staff; would have to have his office work, would have to pass on various and sundry things; you would have to have your accounting, you haven't accounted for your accounting. It is very

true that we have our incidentals here, but look at it this 2981 way; suppose a man comes down and puts six million dollars in this plant, who is going to take care of it.

"Q. Well, we have a bank here. You know, as well as I know, you have to have somebody in there to handle this money, and kind of be supervising head. But now, when you come to talk about a corps, a big organization to build one telephone plant, and you are going to take three or four years to build it, now how many men is it going to take in addition to those engineers on the field who know right where to build the plant, and when it comes down to a close approximation, how much material you are going to have, how much labor and where you are going to put the plant,—then you have got a sort of directing head. I just want to know in the spending of five or six million dollars, what great big force you are going to require besides one executive head and two or three bookkeepers."

"A. One executive head and two or three bookkeepers?"

"Q. Yes. Take that—we will allow that now. Why couldn't they handle it?"

"A. Why, Mr. Howard-"

"Q. I understand you could build up as big an organization as you want to, employ a whole lot of men, spend a whole lot of money, but tell us now just what he is going to do—you have told us he is ging to buy the material?"

"A. There is not any business in this country that will go out and spend six million dollars and give it general supervision for two per

cent."

That is less than it cost the Southwestern Company to super-2982 vise the State of Texas this last year and supervise its construction work, that is, its general expenses is a less figure. These incidentals you are speaking of are incidentals we have found from experience, and that two per cent is less than that cost the Southwestern Company for the last several years. Direct examination.

Questions by Mr. D. A. Frank:

In Dallas when they organized the Southwestern Telegraph and Telephone Company the plant was not as large as here in Houston. They had an organization and had a considerable force. It had a president, vice-president and general manager. The president and general manager devoted their entire time to it, and they had an organization. I did have the details of the number of people, I should judge off hand, they had something more than thirty employes in the general office, and their general expense, as I remember it, was something like sixty thousand dollars a year, and the only place they operated was the Dallas Automatic Telephone Company; the operation of that company would be for a three year basis, something like an expenditure of \$180,000.00 alone and in this estimate here I have only \$105,000.00. It is a fact that is recognized by all first class engineers that "general expense" is a legitimate item and the two per cent is very conservative.

2983 As to the character of the work done by an engineer in a plant of this kind, an engineer's business is to study the situation and the conditions, and to design the property and to recommend to the executive heads the types of property, the operating methods, that should be used, in his judgment. The ordinary engineer is incapable of even managing a telephone plant without special training. A man has to have long years of experience in order to do telephone engineering; an engineer is a specialist.

The location of this building over here on the corner of Capitol Avenue and San Jacinto Street was not accidental. We did not just put it there because we happened to have a vacant lot; that was the result of a very careful study of this city and the various buildings in it, and the telephones we had then, and the telephones that we might put in in time, even in buildings that then existed and in buildings that might be built, probably would be built in the future. We could not just as well have located that building up close to this large station that is back over here as to locate it where we did; it would have cost a great deal of money. It would have cost a great deal of money to carry your lines to it, put your conduits to it; the economical location is the one that will give you the shortest wire run, the shortest average wire run between your central office and your subscriber, and that location is usually sought. That is usually the result of long study which is known as part of the funda-

2984 mental plan.

The engineers who do that class of work are known as commercial engineers, and are frequently men who are versed in the construction of telephone plants to the extent that they know material, or would be capable of designing a switchboard, or laving out a central office, in other words, a man might have eminent ability as a commercial engineer and might know very little about plant engineering, and the same might be true the other way; in other words,

you would not take an ordinary plant engineer and start him out to

do a commercial engineering job.

In making these fundamental plans, even with an organization such as the Southwestern Company has we do not rely entirely on our own engineers to do that kind of work; we have a commercial engineer, but we get help very frequently from the American Telephone and Telegraph Company. With reference to the kind of an organization they have with respect to doing this fundamental plan work, they have a commercial engineer, with a staff, that is working out all over the country; they have the experience of the entire tele-They work it out all over the United States. phone system.

The last study that was made to make a fundamental study of the Houston exchange was made here in 1915; we had a great deal of data on which to base our study; the cost at that time was something If you were to come in here today; if you had around \$5,500.00. no telephone department and started to make a study of the

company, the commercial department of the Southwestern 2985 Telephone Company has estimated that it would cost about \$27,000.00 to make such a study in Houston today on the assumption that there were no telephones here. After you got through with that sort of study you would not have anything done except to determine where your subscribers are going to be and where your central office location might be located and where you might get a lot, in other words, to merely locate the lots and know where the

business was going to be would cost us \$27,000.00. When it comes to plant engineering there is nothing accidental about the location of this underground work and these poles and the laying out even of your floors and your buildings, every bit of it has to be studied. As I pointed out this morning, before the architects go to work on the building plans themselves, it is a very usual thing for us to have the engineering done on the central office apparatus, to lay out the floors, lay out the location of the apparatus and then tell the architect to build the building around. In the work that is done for the Southwestern Company in the making of these fundamental plans by these experts working for the American Telephone and Telegraph Company that work is part of the four and a half per cent, in other words, the license contract covers that.

As to whether or not your plant engineer determines the size of your poles, the size of your conduit and the size of your cross-arms and things like that; the size of the conduit is based on study made by the commercial engineer, as to where the post is

going to be and how large the post is going to be and the location; the location of the conduit is determined by the plant engineer after he has located all the obstructions in the streets, or attempted to do so; it is not always possible to get the location of the pipes, water pipes, gas pipes, sewers, in the streets of a city.

The commercial engineer would tell you how much business you would have in a certain locality, or how much you could expect. rely on our plant engineer to build a plant to carry that business. The plant engineer might go out here and lay out a plant and find

he would have to change it after he got in the streets.

Supposing we had our plant built and our commercial engineer had advised us where the business would be and we had found the business where he said it would be and had our plant completed, and had our switchboard in, it would then require the services of another engineer to tell us how to operate. We have a traffic engineer.

The system of operating a big exchange like this one over here is not a mere accident; it is the result of years of study, the result of contant study, because conditions under which it is operated are constantly changing. In other words, the methods even to the manner of handling the girls and janitors and set up of the board,

2987 and everything like that, is constantly changing and is constantly being studied by this traffic engineer. When I have a set up for engineering expense, the expenses that I have included covers the salaries of these engineers who are doing these various kinds of work. Those engineers engaged in that character of work do not have time to do any supervising of other employes; they cannot do anything outside of their own departments, and if they did, in the majority of cases, their own training is such that they would be unfit for supervision. We have an executive department that controls all departments, in other words, if you had a plant in the city of Houston you would have a general organization which would control the situation relative to the engineers, as well as to the accountants, as well as to operation and repairs and other things of that kind. I think that a man who had six or seven million dollars to invest would feel that his money was being thrown away if he did not have an organization to take care of it, in other words, I do not think that a six or seven million dollar plant could run itself like the soviet form of government in Russia. No man would invest much money in a thing of that kind unless he had some common knowledge of who was going to handle it and how they were going to handle it; he would certainly want an organization that was capable and effi-The amount I have allowed here is really less than it could cient. be done for by a capable organization; I think it is less than anything I know of. It is about \$30,000.00 a year for three years construction period, and there is not any company that handles the expenses on as low as a basis as that where they build a plant of this size or approaching it. I would not think of getting an engi-

2988 neering expert and tell him to go and build a plant and operate it and expect that he would get results. I would practically have a plant superintendent and he would have charge of the plant and be over the engineers. It is true that the fact that this man is an engineer would not mean that he was doing engineering work, but he would have to understand engineering in order to direct the engineers. To set up an organization of this kind I would probably follow the lines, if I were going to built it, of our usual organization; general manager, general superintendent of the plant, general commercial superintendent, and general traffic superintendent.

"Q. Now, Mr. Howard suggested that in order to operate a plant like this in the City of Houston, that all you would need would be a general manager and two or three bookkeepers. Could you operate

it that way, Mr. Gates?"

"A. No, sir. You would want an auditor and a treasurer."

You would have to have a regular accounting set up, and for 27,000 subscribers it would take quite a little organization. I do not know how many people they have here in the accounting department. have had to move them out of the building over here because it wasn't big enough to take care of all the employes. The building is 55 x 125 feet on the first floor and we had to move some of the employes out because we did not have any room for them. It would not require that much space for a general manager and three bookkeepers. you had your general organization here in addition to the local organization, you would have to have still more room.

seventh floor of the building here is now used for the division 2989 We have two exchanges there, Capitol and Preston. Those are operated mostly by young ladies and they have supervision; the traffic department supervises them; all of this comes back to the question of the requirements for general organization, and that general organization would be required even from the very beginning, from the construction of the walls of the building. There is no question about it in my mind.

Cross-examination.

Questions by Mr. W. J. Howard:

The organization I am talking about that we had to move out of the second floor is the accounting organization for the Houston exchange during the operation. Not during the construction period, but they would have their accounting besides, plant accounting during construction and that would require more people.

Q. You have to look out for the traffic, have all this traffic expense, you have got of course men out starting the plant, handling the pay roll, and buying some material, you are going to keep a bigger lot of

employes than in operating, all the time?"

A. Not necessarily all the time, but what would happen is this: your organization would be greater on the plant side during con-struction, but it would be greater on the traffic side after you

got in operation, less than on the plant." 2990

The Commercial Engineer doesn't overhaul the plant; he studies the location of the buildings, your residences and the character of houses you have, and whether or not your people are supplied with telephone service, what telephone service you are going to have, so that when new citizens come here they will have telephones In the last five or six years we have made very considerable changes here. With reference to changes in service I do to take care of them. I did not tell you that not know what service you are talking about. the engineer was making changes. The last time to do this work we had an engineer down here two times in six months. Had one man here from the American Telephone and Telegraph Company, here for two weeks, and had two people at the general offices in Dallas one fourth of the time, two people for three months, tabulating the reports of those engineers and two people one-third of the time,-two people all the time for three months and one-third of the time with

three other people.

"Q. Now, you say your engineers brought right up with this business, been right here with it, watching its growth, that they cannot tell you about those things as weel as these two A. T. T. men they brought down here?"

"A. No, I don't say our men couldn't tell us about the business."
When we are going out to spend money, Mr. Howard, we try to
get the best advice we can, just like a man when sick, he gets the best

doctor.

2991 "Q. I was wondering where you get all of those expressions. Now, this A. T. T. gets a nice compensation from this all over the United States, pulls down about \$40,000.00 from this plant, and then they get that same little pull down all over this territory where the Bell system operates. Now, they have got to send out some engineers once in a while to take a look at these plants, haven't they,—otherwise that would be paid out of gratitude, that \$40.000.00?"

"A. No gratitude about it, Mr. Howard." They give more than the value received.

Direct examination.

Questions by Mr. J. D. Frank:

The last thing that we considered yesterday was general expense,

\$105,939.00.

The next item of material which I have on page 1 of my summary is other equipment for central office, furniture and fixtures, details of that are shown on pages 82 to 100 inclusive and on page 82 is a summary of that by units. This property that I speak of as Other Equipment for Central Office consists of the furniture and fixtures in the operators' quarters, the cafés, retiring rooms, and schools. Pages 126 to 132, inclusive, show just what that property is

2992 and what the price is of each item of the property; the price is what the books show we paid for it. We have the original cost of all this furniture. I did not attempt to estimate the cost of

reproducing that property.

The next item is taxes during construction; I have shown the details of that on page 221.

Mr. Howard: Hasn't he worked that out about like Mr. Hoag has?"

Mr. J. D. Frank: I think so. If you do not want to go into detailed explanation of it, why, I will just ask him to state how much it is.

Mr. Howard: Yes.

It is \$75,262.00. I have made due allowance for the fact that under the laws of this state you pay taxes only on such property as you owned on January 1st of any particular year, and in figuring

out the amount of taxes I get \$75,260.00, figuring the taxes of 1919 as a basis.

My next item is Interest during construction and that is shown in detail on page 222 of my appraisement. The interest rate is six per cent, it is figured by quarters, on the average plant I believe, it is for each quarter. In order to determine how much interest you would have during construction I had to make an estimate of how this money would be spent. If you will turn to page- two and three you will find a statement showing the amount spent for different purposes by quarter. As to just how that money would be

spent, the first item on this statement is "land." Under figure 1, representing the first quarter, is an item of \$200,000.00; it is estimated that during the first quarter that payment would be made for land purchased. At the bottom of the page, on the line reading "Total additions to the construction of the physical plant by quarters," the total of all expenditures made during each quarter is shown. In the second quarter an additional payment of \$30,380.00 would be made on land, \$44,518.00 spent for pole lines, \$102,684.00 for conduits; \$4,404.00 for right of way; \$2,000.00 for furniture and fixtures; \$5,819.00 for tools and store equipment; \$7,958.00; making a total spent during the first two quarters of \$396,958.00. That same plan is continued throughout the entire statement, so that the second line from the bottom gives you the total spent in any quarter, and the bottom line gives you the total spent up to that and including the quarter under which it appears.

On page 4 I have "Expenditures for Plant Construction during development, two years." The two years development period begins after the ending of our construction period. I have not included any taxes during the construction period in connection with this matter about which I am testifying at the present time; I have not included any taxes during the construction period. The other computation there is made in connection with the testimony which I will give concerning the cost of establishing the business. I worked out this interest during construction on page 222. The

2994 first column shows the quarters. The next total additions to construction by quarters, the next average plant I placed during that quarter, and the next column the interest for that quarter at the rate of six per cent per annum. I have taken six per cent as the rate of interest because I think that is the minimum rate that I would have to pay for money. I get as the total amount for interest during construction \$405,750.00, and I have carried that into the summary of my Appraisal on page 1.

I get \$5,995,031.00 as a total reproduction cost of the physical property, including these overhead charges and taxes and interest during progress.

As to the part of the property I have been considering up to this time, I will say I have been considering the physical property only in other words, the bare bones of the plant and I have estimated the cost of reproducing that physical part of the plant.

The next item is cost of establishing the business, going value

and I have included for that \$987,996.00 and show that in detail in some part of my appraisal.

Cross-examination.

Questions by Mr. W. J. Howard:

I have got a very comprehensive set up on the cost of establishing business. That is not a standard set up of the American Tel. & Tel. Company on the question of going concern that I know of; I never saw one that they made.

I have been directing my attention to the reproduction of the telephone property here in this city, that is, what I have been talk-

ing to you about.

"Q. But the real thing you have been trying to do is to find out what the proper rate is in a telephone plant that has been in operation here a good long time, and so, of course all these things in regard to the length of time it is going to take to construct this plant, the number of subscribers you are going to get, that all necessarily is a thing that you have been drawing upon your general knowledge, you have nothing upon which to base it?"

"A. No, I do not think that is quite true."

"Q. All right, well-"

Mr. D. A. Frank (interrupting): Let him answer your question.

(By Mr. Howard:)

"Q. Was there ever anywhere at any time a telephone company completed and reproduced entirely in a city of 160,000 educated and trained to the use of the telephone service?"

"A. I did not get the first part of your question."

"Q. Has there ever — at any time that you know of a telephone company reproduced in a city of 160,000 people where there is no other telephone office within a period of three or four years or one continuous period, without any operation of any part of the plant?"

"A. No sir, I don't know of any place under those conditions. I do know of exchanges that have been built in cities—"

"Q. (Interrupting.) But not under such conditions?"

"A. Where they have been rebuilt after the exchanges have been

wiped out."

"Q. Now, Mr. Gates, I notice in this set up, you have put in nine hundred eighty-seven thousand, some dollars and some cents. Now, for the purpose of brevity, let's call it a million and save a good deal of time. I am not going over all of these figures, and now let us look at it from this angle, that it is not our purpose to go out and spend as much as we can of it, but it is our purpose to save all we can of it, and so let's see this first item; "Preliminary expert's advice on following subjects." Page 226. Now, understand, we are living in an enlightened age, where the people are trained in the use of the telephone service it has bene long tried out,

and we are going to reproduce the plant here, and want to save a million dollars, and now you say the first thing you are going to do is to pay a man and ask him can a telephone plant be made to pay, and you are going to employ an expert to do that?"

"A. You are going to have to employ an expert to answer the

general questions. That isn't the only time-

"Q. (Interrupting). You are going to employ an expert to tell you if a telephone plant can be made to pay and how many subscribers can be expected in a city that has been accustomed to

telephone service, where it has been demonstrated and they have attached 27,000 subscribers, and they like the service, and who are rather partial to the use of the use of the telephone, so you are going to pay an expert to tell you about how many subscribers can be secured in that territory. That is the next thing that is up to him to tell you. Is that true?"

"A. Yes, that is one of the questions he would have to answer." No, I do not think a man of ordinary intelligence would be able

to tell you unless he had devoted some study to the matter. In the telephone business today no man would spend his money, expend

six million dollars without some sort of advice.

"Q. I did not ask you to give me any lecture upon the telephone business, but I simply asked you to answer me a few of these questions with reference to this set up Now, you say that you would pay \$3,500.00 for certain services?"

Yes, sir.'

"Q. Now, you are going to pay him for asking him if a telephone plant can be made to pay and how many subscribers can be expected in a place where it has been tried out and you are going to ask him what kind of a plant shall be constructed. do you mean by that?"

"A. What I say."

I mean to get some advice on what class of plant, whether automatic or manual, whether underground, or overhead, or what class of buildings should be erected. We have had our general expense and our surveys, but this is preliminary.

had no preliminary expenses whatever. Then you would want to know about how much capital would be required. As to whether or not anybody could tell you right down to one hundred thousand dollars, or within a margin of one hundred thousand dollars, I will say, if he gets it within one hundred thousand dollars on six million dollars capital it would be pretty close. I do not think that I could go to most anybody in the business and that they could give me an approximation of what a plant like this would cost.

"Q. The revenue and the operating cost. Couldn't you go to any telephone plant in the country and they would give you their experience about the cost of operating telephones, and the general You could not get but an approximation any how?"

"A. You are asking me a question and then making a statement." "Q. I am asking you if you could not go to any telephone plant, the management anywhere in the United States and if they could not give you an approximate statement of its operating expenses and

revenue?"

"A. Just what is the question you are asking me, Mr. Howard?" Just read the question. (The reporter read the question to the witness as follows: "Q. I am asking you if you could not go to any telephone plant, the management, anywhere in the United States, and if they could not give you an approximate statement of its operating expense and revenue)?"

"A. I doubt if I could, and if I could I would doubt its

value."

2999 "Q. Now, on page 227, Attorney's Fee, you have the following charge: "Attorney fees for drawing charter and filing same and for legal advice during organization of six million dollar company, \$10,000.00." Now, you understand we are trying to save this money, not to spend it, and don't you know that under the laws of Texas that in order to prepare a charter it is practically as easy as writing a general warranty deed?"

"A. I am not a lawyer."

I am setting this up and stating that I will pay him \$10,000.00 and I think that a good lawyer, capable of giving you legal advice for three years, and drawing your charter, and so forth, that you would be getting him cheap at \$10,000.00. If I could get a good lawyer for that I would consider that I was getting him cheap. I would not want a lawyer to draw a charter unless he was a good

lawyer

"Q. Don't you know that all that is necessary is to furnish him a list of your subscribers and the amount that they subscribe, and then the State tells him what to do; that is, you furnish an affidavit as to the names and residences and the amount of stock subscribed, and then an affidavit as to the value, and then establish that they have paid up that much money, and then the charter is sent to Austin to the Secretary of State who then sees that you have happened to make a mistake, that he hasn't just followed the requirements prescribed and it is mailed back to him suggesting how to change it and then you get the price the fees for certains

change it, and then you get the price, the fees, for getting the charter; and you say you would pay \$10,000.00 for that,

would you?"

"A. No, sir. This expense, if you will read the item, is for legal advice during the organization of a six million dollar company, and is the only legal expense in the entire set up for the entire three years."

"Q. \$10,000.00 means a lot of money to any man-I know that

it means a lot of money to a lawyer -- but it may not-

Mr. Duls (interrupting): We do not draw our charters in that way, and the way you state it would be a mighty simple matter, if that's all you had to do.

Mr, Howard: The State tells you everything you have to do and

even has a form prescribed for it.

(By Mr. Howard:)

"Q. Now, we are trying to save this money, as I have stated, and not to spend it, as it is not a very complicated matter to draw a charter."

"A. But we are not paying the \$10,000 simply for drawing the

charter.

Well, a lawyer would have to investigate the laws of the State first, and then of some other States, to see what State we wanted to incorporate under, and then he would advise me as to the best form of organization and the best place to organize; then he is going to draw my charter; then he is going to advise me as to the contract

with my trustees, or my bonds, for instance, if we issue bonds, or make a sale of stock to a trust company, he is going to 3001 pass on my contract with them; he is going to have to pass

upon the franchise that I am going to get, and he may have to draw up that franchise; he is going to have to draw or pass upon the contracts for the purchase of materials. Then he will pass upon the contracts for the plant erection, the buildings, the purchase of the land,-why, Mr. Howard, in the purchase of this land alone a poor It is very true that I might could lawyer could cost me \$10,000.00. get one who I thought was the best and he might lose me the whole thing, but I would pay the money and try to get a good lawyer.

In the legal expenses I do not have any idea that it would be a complicated affair, but I would want a lawyer and would want to pick the man I wanted. Now, the lawyers I would have can go ahead and draw the contracts that I am going to make with perhaps fifty thousand people for service. I haven't gotten through answering this question, if you please. He is going to draw my contracts for right of way; he is going to handle any damage claims that I may have; he is going to assist in the assessment of property; he is going to represent this corporation before the city, and any city boards that they may be called before; he is going to examine and protect the title of real estate, and in that point alone might lose me more than I am going to pay him and he is going into the record of the contract with the employes regarding the compensation law of this state, and with reference to the condemnation of right of way; we may have to condemn right of way for your lines and buildings, and there are innumerable things that come

up on the compensation law of this State that will have to 3002 be looked after, and a great deal of legal advice that will be necessary, and if I could secure a real good lawyer for this sum I would, as I say, consider that I was getting him very very cheap; that is, if I could get a good man who would give his services for \$3,300.00 a year for three years and give you the service you wanted.

As to when I would get the charter, I am not talking about the charter of the Southwestern Company; I am talking about the charter of this company I am setting up in business. I am not representing to you or to the Court here that I am giving you these matters with reference to this Company here, but I am setting up the reproduction costI did not get out the charter for the Southwestern Telegraph and Telephone Company. I wasn't talking about the Southwestern Company; I don't know the exact date of the charter of the Southwestern Company.

My estimate doesn't refer to the cost of establishing business of the

Southwestern Company.

"Q. Then as the plant was added to from year to year and there came up the necessity of legal expenses, and of all these commercial expenses that you spoke about, they, to a great extent, were also paid out of operating expenses, were they not?"

3003 "A. I do not know whether they were or not; I am not familiar with the books and accounts and cannot tell you

any more than I know.'

It is very true that I am the Vice-President and General Manager, but then I would have to refer to the books. I do not know anything about whether or not it is a fact that during all of this time that expenses of that character were charged to operating expense.

It is not a fact that only a part of the legal expense for getting this charter and this organization would be allocated to this plant; it does not cover a great many exchanges. I want to say to you again, Mr. Howard, that the charter that I have assumed in this reproduction appraisal applies to the company to be organized and to be operated in the city of Houston,—only the Houston exchange. I am talking entirely about this particular reproduction appraisal.

"Q. I have no objection to talking about the other, and, of course, that is also a fact that a charter was gotten and that the legal ex-

penses for all of these different exchanges-"

"A. (Interrupting.) No, it is not a fact. The legal expenses in this appraisal refer entirely to the company to be organized to con-

struct an exchange in the City of Houston.'

"Q. I thought we had gotten by that. Now, then, the one that you are trying to fix the rate on is this plant here, the one doing business here now, is operating or existing under a certain 3004 charter, isn't it, and that charter serves the provisions not

only of this particular exchange, but numerous other exchanges throughout Texas?"

"A. That's very true."

I am talking about the cost of establishing business in the City of Houston if you were to build a new exchange here. This is under the set-up as I have supposed right along, just exactly the same proposition as for legal expenses in getting a charter and conducting the legal affairs of the company that we were to set up and not the Southwestern.

I say that in 1915, 1916, 1917 and 1918 we incurred such costs for selling service; that cost was charged to an account known as "Advertising and Canvassing,"—charged to operating expenses. That cost of establishing business which is set up here is soliciting and things like that, advertising, \$4.37 per station, that has already been paid for by the public in the way of operating expenses; you are again confusing the reproduction theory of the existing plant. "Q. Now, Mr. Gates, I want to find out something about that very

point from you as a practical telephone man. You are telling me that when you make certain earnings here from the public and pay your operating expenses out of them, including the cost of getting your subscribers, and you have been paid for it once out of the earnings of the Company, and you are goint to set up the amount again under the head of "Going Concern",-"cost of estab-

lishing business", and draw a return on that?"

3005 "A. Mr. Howard, you are confusing the proposition, confusing the two different things. Let me explain this thing now as I see it and then I will answer your question in this way. This appraisal is based on the theory that we are going to reproduce the Exchange—this appraisal is based upon the theory that we are going to reproduce this Exchange—that there is no Exchange here. I am not referring to the subscribers that we have here, but we are starting a new Exchange. There are no subscribers, and we are starting here with the cost of establishing this business, the cost of one-half of the subscribers; that is, the subscribers that we will get during the construction period, during the period that we are not operating. During the period that we are not operating we have no operating revenue against which we can charge this as an operating expense and we must necessarily capitalize this expense at that time. do not capitalize it after we get in operation but treat it just the same as we do today. Now, we set up this reproduction cost as a measure to measure what it would cost to get another exchange like this one today, and for no other purpose.

"Q. All right." "A. The cost of the subscribers has not been paid for by the public nor anything of the kind. I am not referring to the subscribers

we have here."

3006 Direct examination.

Questions by Mr. J. D. Frank:

With reference to the questions asked me by Counsel yesterday with reference to if it was not a fact that the cost of securing the charter had acaually been charged to operating revenues. We did not have any operating revenues when we secured the charter, and would not have for several years after starting and operating the ex-What I have done is to simply estimate the cost of reproducing the telephone business in Houston just as I estimated the cost of reproducing the physical part of the property.

Ommissions and contingencies apply to the physical part of the As to whether or not the physical property itself has anything to do with the cost of establishing the business, I may have left out some item that we will find out afterwards in the cost of establishing the business, but I have not used the percentage for omissions and contingencies except in connection with the cost of the physical property and that has nothing to do with the cost of

establishing the business. With reference to the expense of maintenance during construction, it is a fact that you would have a large part of that property constructed prior to the time you began operation; on the average it would be constructed for more than nine-tenths of a year

3007 in advance of operation.

I stated it would take about a year and fourteen months to construct our buildings, and that then it would take about a year after that, or a year longer, to install the switchboards. The expenses we would have in connection with the upkeep of that building while your switchboards were being installed would be the heating, lighting, water and janitor service; you would also have to have night watchmen for various parts of this property, and in fact, you would have practically all your expense that you would have after the plant was completed so far as people are concerned, and some additional, due to the fact that you would have a large number of men working on the building.

With reference to the length of time required to install those boards, some of the complicated works you have in connection with the installation of those boards are that there would be in installing the multiple alone, something upward of a million solder connections to be made; there would be a great many feet of jumper wire to be run on the inanimate frame, and those connections to be soldered. Whenever you make any physical additions to those parts, it takes several months to install the units; that is, a multiple means a multiple spliced, which means, splicing the cable run to the entire multiple; in this case there is a multiple of more than ten thousand lines, which would mean the splicing of cables containing more than thirty thousand wires.

On page 1 of my summary the next item I have under Cost of Establishing the Business is Working Capital and Building Supplies, to the amount of \$238,818.00. Working capital includes supplies that are necessary to be carried in stock and to have on hand to maintain the property, includes money required for expenses in addition to collections, payments of salaries of employes, the payments of taxes, various and sundry other expenses that enter into the operation; the cost of operation of the business, before collections are made for services rendered to the subscriber. The figure of \$238,818.00 is the figure that is required at the present time and I have taken it from the books of the company. I secured that from the accountants.

Cross-examination.

Questions by Mr. W. J. Howard:

My set up of \$238,818.00 includes supplies. We get a portion of our money in advance, but a comparatively small portion. I do not know what proportion.

Direct examination.

Questions by Mr. J. D. Frank:

I get as the total reproduction cost of the physical property, \$5,995,031.00.

3009 I have determined the per cent condition of the physical property constituting the Houston Telephone plant. I did it from a personal inspection of the property, from my knowledge of the property extending over a period of years; I made a personal inspection of a very large part of the property. I do not know any other manner in which I could determine the per cent condition of the property without inspecting it. I could not rely on the life tables.

The facts with reference to the condition of this physical property, I think this exchange is probably in better shape than any exchange that the Southwestern Company owns, and I think it is probably in as good shape as any exchange of like size anywhere in the country. I have examined telephone exchanges all over the United States, in the eastern sections of the country, and in the western sections, from the Canadian border to California, and I must say that I was surprised at the condition of this exchange when I inspected it in the last couple of months, notwithstanding the fact that I thought I knew something about it before, but I find it in a very much better condition than I really expected to find it. per cent condition of the property as found by me is 92.98 per cent. In determining the per cent condition of the property the things that I took into consideration were rust and decay. The question of obsoles-ence does not enter into that. The question of obsoles-ence does not enter into the per cent condition of the property, or the condition of the property, because the property is not obsolete; it is here being used, and what I am seeking to determine is

is here being used, and what I am seeking to determine is 3010 the condition of the property that is here and that is being used. If it were obsolete, it would be out of service.

I have not included any property in my appraisal other than the property that is used and is useful in the operation of this plant. I have excluded some as not in operation and not used or useful; I have excluded property that was not used, such as the old Taylor building out in Houston Heights. Not the old Taylor building in Houston Heights but the old Taylor building on the corner of Center and Taylor and the Houston automatic building in Houston

Heights.

Page 223 contains the details of that per cent condition. On that page, on the left hand side of the page is a list of the various kinds of property; the first column shows the obsolete class of property, the present total reproduction cost for each class of the plant; the next column shows the per cent division in which I found the property; and the third and last column shows the weighted per cent condition at the time I expected it. For example, I found the land in 100 per cent condition and the buildings in 95 per cent condition. I do not think that is a rather high per cent condition for the buildings of that type considering the length of time they have been in service; I think these buildings, if anything, I think that my per cent condition is too low on the building. I could take less than \$5,000.00 and put the Preston building in as good condition

as it was the day that I turned it over to the operating de-3011 partment to operate after I built it. I worked it out as to each part of the property and I get as the total per cent con-

dition for all the property 92.88 per cent.

On page 1 of my Summary the figure I get as the reproduction cost new less depreciation on the property is \$5,568,185,00, and when I add to that the cost of establishing the business and working capital, the figure I get is \$6,794,999.00, which is the total reproduction cost less depreciation.

Cross-examination.

Questions by Mr. W. J. Howard:

I determined just the physical condition of the plan regardless of any inadequacy or obsoles-ence then existing. When I set up my depreciation reserve. I set up a reserve or unit that is intended to take care of more than the deterioration tested only by the depreciating per cent condition; I set up enough to take care of obsoles-ence and inadequacy. I estimate that some parts of the plant will become obsolete, but when they do become obsolete, they become obsolete all at once. It has not been figured though upon the basis as if they had not accrued by percentage through the year. It is figured on the basis that we know that some of these things do

become obsolete, but when they do become obsolete they go all at once; like right of way, for instance, if we abandon 3012 a piece of right of way it is absolutely obsolete, we have lost

it, we have lost what it cost us.

"Q. Yes, but every year that advances from the time that the plant is constructed, it is approaching by a percentage the time when it will become inadequate or obsolete?"

"A. But it has not become obsolete."

There is coming a time when it will become obsolete, but when that obsoles-ence occurs, it occurs all at one time,-we take the part out.

"Q. Oh, I understand you do not absolutely abandon it until a certain period,-but there has been accruing through all this time and you have been setting aside for that very purpose, or supposed to set aside, a fund to care for that obsoles-ence and inadequacy when you remove the articles?"

"A. We have set aside a fund; but obsoles-ence has not occurred,

the obsoles-ence occurs at one time.'

The plant goes along, this plant today is in good operating condition, but it is not obsolete; but some part of it may become obsolete two years from now. My opinion is that when you come to estimate the present condition of this property and its value, you take it as it was constructed as I have done here treating it as new. Then I come and say; well, we are now going to depreciate the prop-

erty, and my idea of getting a fair value of it is to depreciate 3013 it by only the per cent condition and ignore the items of their obsoles-ence and inadequacy, although we have made provision and have been permitted to earn a certain sum to provide for this inadequacy and obsoles-ence. My reason for that is this: the plant is here, it is in operation, it is performing the functions that is was intended to; it is not obsolete, it is not inadequate and there is no deterioration; there is nothing except natural deterioration and I have taken into consideration that only.

"Q. Now, that being the case, Mr. Gates, and there is no obsoles-ence and inadequacy, and you have all these years taken from the community sums of money to provide for obsoles-ence and inadequacy, and it turns out there is none in existence, then you have taken from the people and for that fund, something that was

wrongly estimated and should not be collected?

"A. No, I think your premise is wrong to start with. We have not taken from the people enough money to take care of depreciation, and to pay us a reasonable return and for our expenses, we have not had the reserve to start with; in the second place, we know that sooner or later some of this property will become obsolete."

But it has not become obsolete at this time; but we must have the money so that when the property becomes obsolete, we must have

the money to take care of it.

"Q. Now, Mr. Gates, take for instance, we can take this table (indicating attorneys' table in the court room) say it was bought ten or twelve years ago and you look this table over and test it by every means that you can see, and the table is in prac-

tically 100% condition, it needs a little paint, and that estimate reduces it down to say, 95%, the table is designed to accom-

modate the purposes of this Court room—
"A Yes, sir."

"Q. —and it did for several years, and when it was put in it was supposed to accommodate it for several years; but we have come now to the point where within another year the table will be of no value whatever for this purpose here, but we need a much larger and differently constructed table-it would be economical and more convenient to have a circular table instead of one like this; now, it has not been taken out yet, but the conveniences and fixtures desired may require that it be taken out within the next year. you say that when you come to estimate the value of this table-we will say we will get the cost of it, or get the cost of what it will take to get a table like this new and depreciate it only five per cent that it will take to paint it and put it in good physical condition, that means that this table, while it is in good physical condition, the five per cent of its value will put it up to 100%; yet, because it is no longer useful, or will be useful for only another year, we must also deduct this accrued obsoles-ence and inadequacy that has been coming on during the years since it was first installed. Won't

you have to consider that fact in trying to fix a value upon 3015

"A. Not so long as you are using the table; as long as you are using the table it is not obsolete and inadequate, or you would not use it.

"Q. It is not obsolete, but the question of the value of the table,

you wouldn't say that table, although you know it is in perfect physical condition, but that you know in a year is to be displaced, has the same value as one that will serve the purpose for twenty years, would you?"

"A. As long as you are using it and it is serving the purpose it is

worth what the value would be to put it in shape."

"Q. Not when we know that within a year we will discard it and

buy a new table, because it won't serve its purpose?"

"A. I think the time is off when you do discard it, somebody might come in during the year and decide they want an oblique

table instead of a circular one."

"Q. But the fact is and all the physical facts absolutely demonstrate, that it is a circular table and a larger table that is necessary to fulfill the requirements and be up to date and give the best service. Now, isn't it a fact, isn't it almost demonstrated that you have to take into consideration the fact that the able was not what was desired for the purpose for which it was being used?"

"A. I think that as long as you are using that table for that purpose and it is serving the purpose, that there is no obsoles-

ence."

3016 "Q. There is no obsoles-ence and you would not depreciate the value of that table?"

"A. There is no obsoles-ence and I would not depreciate the value

of that table except by physical deterioration.'

"Q. Except by physical deterioriation? Now, turn from the table to your plant. And are you familiar with the fact that we are coming to the age of automatic telephones, that they are taking the country and they are going to be installed—that economy and good service and up to date equipment require their installation? Now, you have got a plant standing here today, manually equipped and this plant has been installed for something over twenty years. Now, the first year you were nineteen years removed from this age, the next year eighteen years removed, and now we have gotten up to the point where it will be demonstrated—can be demonstrated that it will be replaced by automatic equipment. Now, you say that this plant, to get a test of its value would be only—would be 92 per cent, or in other words, its full reproduction value, less the deductions for the actual deterioration of the physical?"

"A. I do not think obsoles-ence should be taken into consideration in considering this appraising until the property becomes obsolete This appraisal is based on this theory: That we are seeking to determine the value of the property that is here, that is being

used."

"Q. Yes.

"A. Now, we are not substituting some other property for it, but we are taking the property that is here and estimating what 3017 is its present value—and my estimate is as I have said—

"Q. Yes? And now in determining its per cent value, you will have to take into consideration the other, if anything, for the reason that within a year you are going to have to make radical changes in the plant in order to make it modern?"

Mr. D. A. Frank: What is the evidence of that?

"A. There is no evidence to my mind that we are going to have to do that. If we wanted to change this thing within a year we couldn't do it, Mr. Howard."

"Q. Well, within two years, or whatever time?"

"A. We couldn't do it within two years or within three years, or

even five."

"Q. Well, assuming now that an automatically equipped plant is a more modern and better plant, would you regard it as good economy to go ahead and reproduce a plant new with the manual equip-

ment, instead of starting it with the automatic equipment?"

"A. But what I am seeking to give you is value, the reproduction value of this particular property, I am not seeking to originate the plant or to replace this plant with another type or class of property, what I am seeking to give you is the value of the property that is here and the service."

"Q. Yes, right now?"

"A. Yes, sir."

"Q. And you absolutely shut your eyes to the fact that it is liable to be replaced within a comparatively short period of time by more modern equipment?" 3018

"A. I don't know that it is going to be replaced; I know

this, Mr. Howard-"Q. No, but if it is proven that in all probability automatic equip-

ment is the modern equipment?"

"A. Mr. Howard, if it was desired to replace this plant with automatic equipment, we couldn't do it in five years, you couldn't supply the equipment."

"Q. Well, even within five years is a comparatively short time?"

"A. In five years automatic app-ratus may be discarded."

"Q. It may be?"

"A. Things of that kind change. Just to give you an illustra-tion, the New York Telephone Co. had about thirty years ago installed the multiple switchboard, the first multiple switchboard ever put in of any consequence, in Courtland street exchange; that switchboard was installed, but was never operated; it was the greatest improvement we had in the art when it was put in there, and it changed over night. Now the automatic apparatus today, in the present state of the labor market, may be, may prove it, but the entire output of the manufacturers as I understand it, as I have been informed, is contracted for at least five years in advance, we couldn't get automatic apparatus unless there was some change in the manufacture or the schedule of that apparatus within that five year period; within that five year period something else may take the place of the automatic."

"Q. I understand, perhaps, your reason or position on that point. But my question is, if the issue is resolved to determine in

favor of the automatic equipment as being a much more desirable equipment, then would you still contend that there 3019 was no obsoles-ence in your plant on that account?"

"A. There is no obsoles-ence, for the reason that I cannot conceive,

I cannot see where you could replace this property if you started to do it within any time that you could say, that you now fix that this thing was going to become obsolete. But it is not going to become obsolete, it is not obsolete. What we are talking about is the property that is here, and not some other kind of property.

"Q. It is a fact, isn't it, that there was an automatic plant established in this very city, that was working very satisfactorily, and you came in here and they lived for a year and a half in competition with your company, and then your company later bought it out and

paid \$1,300,000.00 for it to eliminate competition?"

"A. I don't know about \$1,300,000.00 just to eliminate competition; we got considerable property, Mr. Howard. Automatic telephone plants have been in existence for a considerable period, and in some places, and in many cases, they meet the need of the public; some people don't like them, and I think it is largely a question of time to determine just how the automatic is going to be taken by the public."

I have such a map showing where the conduit lines of the Home Telephone Company ran; I don't know whether I have it 3020 here or not. In some instances they are parallel. I have

an inventory of that equipment in my inventory. If there were cases after we purchased the Home Telephone Company that a great many of our conduit lines and pole lines paralleled and ran along the same territory they were not included in the inventory; only the property that was used or useful was included.

"Q. But did not the paralleling of those lines make your equipment very excessive—that is, that it was no where near loaded to its capacity and no prospect of its being loaded to its capacity for

years?"

"A. On the contrary, the purchase of the automatic property saved us the tearing up of streets, the construction of additional conduits in many cases,—the City of Houston had grown so——"

"Q. (Interrupting.) Did it in all cases, were there any cases in

"Q. (Interrupting.) Did it in all cases, were there any cases in which you were using it to some extent, but not anywhere near its capacity?"

'A. As I said before, we have not included any property that is

not used or useful."

Direct examination.

Questions by Mr. J. D. Frank

"Q. Mr. Gates, I just want to ask you a little bit more about that automatic. As I understood your testimony before noon, the automatic, while physically it may be operated, is more expensive than the system which you have in now and is not en-

tirely out of the experimental stage as far as universal use is concerned; was that your testimony?"

"A. I don't think that I said it was more expensive. I s didn't think there was much difference in the total expense."

It is more expensive to install, more expensive to maintain, and more expensive from an interest standpoint, but less expensive from

The main advantage of the automatic an operating standpoint. system would be that you would get rid of your difficulties in getting and training employes; you would get rid of a large amount of your

difficulties that you have there.

Assuming that wages are going to come down and prices are going to come down, as Mr. Howard seems to think, there would be no special reason to have the automatic system at all, if that is true, that is, if wages come down, but they will come down only because there would be a lack of demand for labor. That will make it easier to get good operators; you can keep them long enough to train them and I think the coming of the automatic would be deferred; possibly it might never come. But even if the price of wages should rise and labor difficulties should get more and more acute, it is my understanding that practically all of the output of the Automatic Electric Company is scheduled for five years or more in advance

I do not know exactly how many stations there are in the United States of every kind of telephone; The American Telephone Company has something like Ten Million. The American

3022 Telephone Company and all associated companies, the Bell companies, in the United States have approximately Eleven Million stations, and there are other telephones in the United States besides the Bell Telephones. I do not know how many there are of those. I saw a statement the other day that would indicate that there were probably two million outside of theirs. From what I have before me and what I have read I should judge there are about thirteen millions or more stations in the United States. I do not know what the output of the Automatic Telephone Company's plant is.

"Q. A statement was made in evidence the other day it was about 85,000 a year. At the rate of 85,000 a year, just to replace the ones that are in use now in the United States and not take care of any

increase, it would take more than 100 years, wouldn't it?"

"A. Yes, sir." It is a fact that they could increase the capacity of the factory There would be no posprobably if there was sufficient demand. sibility of getting those within a reasonable time from the present time if it was desired, as I said before, I think it would be a physical impossibility to change this plant over in less than five years, unless there was some decided change in conditions. From all I can see today, in my best judgment as a telephone man, I do not think there is any likelihood or even possibility of this plant being made automatic in less than five years.

(By Mr. J. D. Frank:) 3023

"Q. In one of the questions Mr. Howard asked you this morning, he made a statement something like this: Assuming that this plant had been here 20 years; -would you say that this present plant had been here 20 years, or that property constituting the plant at the present time?"

"A. No, sir, I don't think it has been here anything like 20

years."

In fact, most of it is largely new. I have some figures that I would like to find here. Since 1910, there has been more than four and a quarter millions of dollars spent in the City of Houston on the plant. All the buildings have been built in that period, all the switch-boards that are in those buildings have been installed during that period and a very large part of the cable and outside plant have been built within that time.

Cross-examination.

Questions by Mr. Howard:

If we were changing to the automatic system here we would not have to replace our entire plant, that is, substitute other kinds of property for the entire plant. It would be mostly in the telephone instruments and the central office equipment; it would not require any change in the outside cable and pole lines and underground conduits and such as that. I do not know what the composite age of the plant is, that is, the average age.

3024 Direct examination.

Questions by Mr. J. D. Frank:

I know what the original cost of this plant was as is shown by the books of the Company. I am familiar with the amount of the gross additions that have been made in this plant during the last nine or ten years. I have made an estimate or an approximation of the amount of money which would be required for necessary extensions in the next ten years; I should judge that at least $3\frac{1}{2}$ millions of dollars would be required. I am thoroughly familiar with the plant itself.

As to whether or not the plant is economically justified, or that there is need for such a plant as this in the City of Houston, I would say beyond question, the City of Houston needs a telephone plant. The City of Houston is a growing prosperous community, many lines of business here; it could not go on without telephone service. In the present condition of the business and the conditions of various businesses and interests in Houston there is something which will indicate that there will be an increased demand for telephone service in this city; the demand is increasing and will probably continue to increase if the prospects are any criterion whatever.

I believe that this plant has been well constructed and well maintained. I doubt if there are many plants of like size in the 3025 country that are in as good shape and have been as econom-

ically constructed as this one has.

Taking the location of the plant as a whole, I think it is favorably located. I think the City of Houston is a prosperous and growing community. I think it is a good city for a business to locate in. In fact, I doubt if there are many cities more favorably located.

I would say that this plant has a potential earning capacity and

every reason why it should earn money. It is furnishing a necessary service to people who can afford to pay for the service that they need. Under normal circumstances the plant would be capable of earning

money.

As to whether or not this plant has been well engineered in the past, I think it has been well engineered. A great deal of attention has been paid to the engineering work, and a great deal of care has been used before the actual plant expenditures have been made. I know that to be a fact, because I have been directly interested in most of the expenditures that have been made here in the plant as it exists today.

I think the plant is being well engineered at the present time. I don't believe there is any waste money in this plant or that there has been any construction put in here that was done in a wasteful

I have made a study of this community, that is, of the City 3026 of Houston; I have studied the growth of Houston from all sources and and all angles and I have gone over the records of the city, or had them gone over and I have secured information from all sources that I could, the Clearing House Association, the Federal Reserve Bank, and numerous other sources as to the business.

I would like to introduce this Exhibit, as the City Book of Houston, published in 1917, which I believe is put out by the City of Houston. I did not prepare the book but I have studied the book very carefully and I found a great deal of very interesting information. Then I followed out the sources of information and from that and from information that I have secured, leading out from that book, I have prepared an exhibit which I want to introduce in evidence.

Mr. J. D. Frank: We desire to offer as Exhibit No. 39, Mr. Gates' exhibit, and in connection with this Exhibit No. 39, I would like to offer in evidence this Illustrated City Book of Houston, 1917, as Exhibit No. 40.

The documents referred to were thereupon received in evidence, marked "Plaintiff's Exhibit No. 39," and "Plaintiff's Exhibit No. 40," and are transmitted herewith in the Exhibit File.

On the first page of this exhibit, I have shown the growth of the city, its population, beginning with 1860. In that year the city had 4,845 people. In 1900, it had increased to 44,663. In 1910, it had increased to 78,800. I have estimated the increase between 1900 and 1910 at the same ratio as shown by the census from 1900 to 1910. In 1914, the population is estimated by the publisher, the

figure estimated by the publishers of the City Directory, and the estimate of 1918 is based on the scholastic population and that shows a population of 160,000 people. The population has doubled several times in the last forty or fifty years. My study shown that there has been a steady increase in the population of this city. On the page following is a diagram which illustrates this. That is, on page 2 of the Exhibit. That is a curve which I have prepared showing the increase in the population, beginning at 1860, a little less than 5,000 people and going up to 160,000 people in 1918. On page 3 I have shown there the assessed value of the property

in the City of Houston as shown by the City. There has been a steady increase in the assessed value per capita. In 1901, the total assessed value of the City was a little over 27 millions, which amounted to \$582.46 per capita. In 1910, this had increased to \$808.96 per capita, and in 1919, it had increased to \$936.64 per capita. The total increase in assessment from 1901 to 1909 expressed in percentage has been 444.3 per cent, and the increase in the assessment per capita for the same time has been 60.8 per cent. The next page shows a curve which shows the assessed value per capita for each year from 1901 to 1919, and shows clearly how it increased per capita. The curve shows a very marked upward tendency from the beginning, and the reductions are due to some changes in the method of assessment.

The next page of my exhibit shows the bonded debt of the City of Houston; between 1900 and 1901, this was \$3,085,000.00, 3028 or \$65.26 per capita. In 1918, this had increased to \$15,474,-

750.00, or \$96.72 per capita, an increase of 401.6%, the total, or 48.2% per capita. The next page is a curve which shows that; it shows that the debt goes along fairly level until 1912, and then shows a marked increase per capita, showing that the credit of the City must have been good or it couldn't have sold the bonds, indicating to my mind that other people thought this was a prosperous

3029

The next page shows the cost of the municipal improvements in the City of Houston; in 1901, this cost amounted to \$3,667,225.00, or \$77.58 per capita. In 1918, this had gone to \$23,108,802.00, or \$144.40 per capita, an increase in total cost of 532.7%, an increase per capita of 86%. The curve on the page following shows the increase per capita,-shows a very decided upward trend, indicating that the City has accumulated a very considerable amount of prop-The next page shows the revenue of the City of Houston from all sources, except bond issues. In 1903, this revenue amounted to \$787,586.00, which was \$14.87 per capita. In 1918, this had increased to \$3,686,501.00, which was \$23.04 per capita. The increase in total revenue of the City between 1903 and 1918, was The increase per capita in the same period was 54.9%, a very considerable increase. That indicates that the City is in a fairly prosperous condition or that it has been going forward, and it also indicates that the people of the City have accumulated considerable property, or they couldn't afford to pay an increase of nearly 55% in their taxes. The increase per capita is shown by a

curve on the page following.

The next page deals with the expenditures of the City of Houston. In 1903, these amounted to \$695,748.00, which was \$13.14 In 1918, the expenditures were \$3,486,500.00, which was \$21.79 per capita, an increase in total of 401.2%, an increase per capita in the same period, of 65.8%. This would indicate that the increased cost of government is more than 65% per capita, since 1903, and I understand that this year will see a still further increase, judging from the budget. On the page following is a curve showing the fluctuations in the expenditures per capita. It shows a gen-

eral upward trend, in fact, a very marked upward trend.

The next page of my Exhibit shows the building permits issued by the City of Houston in the year 1902 to 1918, with 1919 estimated after having the actual data for about 10½ months, so there is about 11½ months estimated in the last year. Building permits in 1902 were \$958,000.00. In 1913, they were \$5,432,265.00. There was then a decrease during the War, but in 1919, it was estimated that they would be \$5,500,000.00. During the period from 1902 to 1919, inclusive, building permits aggregating \$54,818,600.00 were issued by the City of Houston, indicating to my mind that the City is prosperous and growing and that it is a community that is full of business, that has made for telephone service, in fact, for all public services.

On the page following, is a diagram showing the building permits issued by the City of Houston in 1902 and 1919, inclusive. This diagram shows the figures in a cumulative manner. That is, the figures grow as the buildings grow in the City. If we had no buildings in the City of Houston in 1902, we would have during that year \$958,000.00 built, and we have added each year as we go along until now we have something over \$54,000,000.00 worth of buildings in the City of Houston that have been built since 1902. Those figures over at the left-hand side are millions. That "0, 4, 8, 12, 16, 20," etc.,—dollars, beside that, millions of dollars.

The next sheet shows the bank deposits from 1910 to 1919, in-I think that shows beyond the question of a doubt that the individual people of the City of Houston have been prospering finan-Bank deposits are shown as near December 31st, as possible. The call was made on different dates in different years. The 1919 figure was the November 17th figure, but since that time there has been a call as of December 31st, and there is a slight difference, I think, of about Two Million Dollars less. In 1910, the bank deposits were \$28,910,930.00, which was \$366.88 per capita. there were \$98,087,994.00, which was \$613.05 per capita. This was an increase in the per capita of 67.1% during this period, a total increase in the bank deposits of over 239%. I think that clearly indicates that the wealth of the City is increasing and that the people are The next page shows a curve showing how the prosperous people. bank deposits per capita have fluctuated between 1910 and

bank deposits per capita have included between 1970 and 1919. There was a decrease in 1914 and 1915, due to the first flurries of the War. From that time, the trend has been almost steadily upward. I don't know of any better indication of the wealth of the community than its money.

On the next page are the bank clearings. These are shown from 1914 to 1918, inclusive. I might say that prior to this date, the Houston Clearing House Association was not a member of the National Clearing House Association, and its figures contained some items that made them different from other cities, and made it impossible to compare them. So I have taken the figures since 1914. The clearings in 1914 were more than \$422,000,000.00. The total increase was over 87%. The increase per capita was from \$3,265.00 in 1914, to \$4,945.00 in 1918, an increase of 51.4 per cent per capita. On the page following is a curve showing the bank clearings per

capita between 1914 and 1918. It will be noted that there was a slump in 1915, but since that time the increase has been very marked. Everything that I have been able to get, all the statistics that I have been able to gather, everything that I have been able to learn, indicates that Houston is a very prosperous community, that it has increased in wealth, and apparently it has a future that is very bright and it is going to continue to increase. We have found that in our business we have had no serious complaints from subscribers that I know of regarding the higher rates that were in effect through Feb. 1, 1919, to July 31st. In fact, during that period, the number of ap-

plications for service increased more than 40% over the same 3032 period of the year previous at the lower rates. The daily newspapers indicate that the people generally are in favor of

paying a higher wage to some of the City employees. In fact, there does not seem to be much objection on the part of the people or much complaint about expenditures.

(By Mr. Howard:)

"Q. How would you like to submit the matter to a referendum?"

"A. What did you say?"

"Q. How would you like to submit the matter to a referendum vote?"

"A. I don't think that is the way to do anything of this kind.

don't think you could ever get the general public.

The general trend of people who get out and talk about this thing is that they are willing to pay a reasonable price, what we find in talking with our subscribers, they say we are willing to pay you a reasonable price for the service. The referendum doesn't get the people who are interested. Lots of people vote who really have no interest in the matter.

Mr. D. A. Frank: You had a referendum about the first of March, after the rates were raised and the people kept the service after the raise.

"A. (continued). They not only kept the service but as I said there was an increased demand of about 40%. The trouble with a referendum is the point I tried to bring out, there's lots of people vote besides just telephone users."

(By Mr. J. D. Frank:)

"Q. Mr. Gates, I believe they had a referendum in which they voted down the increase in street car fares after the City had passed an ordinance allowing increased rates?"

"A. That's my understanding."

Mr. Howard: They would vote it down very promptly if they were given a chance to do that.

Mr. Duls: They would vote down paying taxes too, very promptly,

if they were given a chance to do that.

I have determined what in my opinion constitutes the value of the property of the Southwestern Telegraph & Telephone Company in the City of Houston, and basing my opinion on all of these things, as the original cost as shown by the books, my estimate of the cost of reproducing the property in its present condition, the condition of the plant itself, the necessity for such a plant as that in Houston, the amount of its outstanding stocks and bonds, if that has anything to do with it, the past history of the community, and its present prospects for the future, and on my opinion as to whether or not this plant is capable of earning money under normal circumstances, not less than seven millions of dollars in my opinion, is the value at the present time of telephone property of the Southwestern Telegraph and Telephone Company which is being used in the City of Houston at this time for the purpose of furnishing the public with service.

Cross-examination.

Questions by Mr. W. J Howard: 3034

It is more than the books show we paid for it, but I don't think

the cost is the measure entirely.

Mr. D. A. Frank: The books only show the physical cost, too. After Mr. Burleson put up this increased rate there was an increase of something over 40% in the demand for phones. We did not advertise or send out any soliciting agents during that period, nothing more than we did in the previous year.

"Q. That shows what a clamor there is for telephone service, and

big demand for it?"

"A. I think the City is growing and the people want telephone

"A. You have to keep your applicants pacified and give them

excuses-"A. (Interrupting.) We have difficulty in placing telephones,

"Q. You have a trouble man to stand between you and the de-

mand for telephones?"

"A. We will probably have more difficulty if we are unable to pay for material to build this plant and extend it, that is without getting a rate sufficient to expand this capital."

"Q. At any rate, you have subscribers clamoring for service?" "A. Oh, we have subscribers coming to us. It is a fact that we

are unable to take care of the business at this time.'

"Q. You have more demand than you can supply?"
"A. It is a fact that we have more demand than we can 3035 supply, for various reasons.

(By Mr. J. D. Frank:)

"Q. You are unable to get various types of equipment, on account of shortage of material?" "A. Yes, sir."

(By Mr. J. D. Frank:)

"Q. You don't know that that same condition would exist if the people of Houston were today without service for three or four years, would it?"

"A. Well, if a city as large as Houston went without this service for three or four years, they would get out of the habit of using telephones to a certain extent and they would have to be reeducated."

"Q. That is the reason you say it would cost money to attach the

business in case the business was destroyed?"

"A. Yes, one of the reasons. If a man came to the office and put in his order, it would cost us some money to attach that business."

"Q. It is costing you money all the time to attach that business even though they do come to your office?"

"A. Yes."

3036 James E. Allison, a witness for complainant, being duly sworn, testified as follows:

Direct examination,

Questions by Mr. J. D. Frank:

My name is James E. Allison; I live in St. Louis, Mo.; my occupation is that of a valuation engineer of the firm of James E. Allison & Company. That is the firm that is doing business in St. Louis, Mo. I am a valuation engineer connected with that firm, I am the head of the firm. We make valuations of Public Utilities, confine ourselves almost entire- to that, for rate cases, for reports to bankers, for examinations, trust funds, etc.

With reference to just what experience I have had which qualifies me as a valuation engineer, after graduating from College, Harvard University, I became a student engineer in the Cordage at Xenia, Ohio, and in the Star Cotton Mills belonging to the same firm at Danesville, Ohio, specializing on power plants and making designs.

After that I was a student engineer in the Xenia Gas Light & Coke Company where we had construction work 3037 and operation of the Gas Company. Afterwards became Manager of the Company. I then removed to Nashville, Tenn., and became Manager and Chief Engineer of the Southern Manufacturing Company, which manufactured street railway equipment, and was also at times the Consulting Engineer for the United Railways at Nashville. I volunteered in the Spanish war and became Captain of Cavalry and Adjutant of the Regiment. After that I came to St. Louis and opened an office as Consulting Mechanical and Electrical Engineer. That was in Ninety Eight. One of my works there was the construction and design of the combined telephone and signal system for the street railroads. I worked about 2 years on that. In 1904 I was made Consulting Engineer for one of the Departments of The World's Fair, and had charge of the design and erection of combined telephone and signal apparatus for the Gates of the Fair, to take care of the people coming in and to have what was called a secret place where all the people were registered just as they came in by electricity. After that, just about 1906, I was made Chief of the Bureau of the Department for Inspection of Boilers and Elevators of the City and Chairman of the Board of Examining Engineers, examining the power plants. In the early part of 1909, I was appointed Commissioner and Chief Engineer of the St. Louis Public Service Commission. That was a Commission created to make detailed valuations and recommend rates and regulations for all public utilities for St. Louis, that was in the early 1909. There were three commissioners. I was appointed Commissioner and Chief Engineer. It was my duty to organize the engineering force, to lay out the methods

3038 of valuation which was then pioneer work, and receive detailed valuation of all the equipment in St. Louis. The amount of work we did there amounted to about \$107,000,000,00 in

four years: Public Utility Property.

As Chief Engineer those valuations were made under my very close supervision; you might say by me. Of course, we had quite a large force of men. They were under my personal supervision and you might say direct and minute supervision. In 1914, there was a State Commission created and the City Commission practically lost its power. I resigned and entered the practice, general practice, of valuation and consultation on public utilities. Since then we have valued, well, I think with what we did on the Commission (By-theway, I took the engineering organization of the Commission with me, and many of them are with me now, with the consent of the Commission), we made detailed valuations of about \$250,000,000.00 of property. We have been in consultation with Public Utilities, in consultation capacity with valuations that amounts to, I think, two hundred and thirty or some additional millions, making altogether about \$580,000,000.00 that we have been responsible for more or The value of the property which we appraised ourselves in detail, about \$350,000,000.00 and about \$230,000,000.00 that we have been in consultation capacity in, and I think, let's see, well you might run the figures way up by saying that we acted in a consulting capacity to the President of the Conference Committee on the

Valuation of the railroads of the United States.

The President Conference Committee is a committee of Presidents of railroads who had direct charge of the valuations of the railroads as they are presented to the Interstate Commerce Commission. They supervise what is done by their attorneys and engineers. The connection I had with this conference was only

in a consulting capacity. I made the report to them on some of the

methods and theories of valuation.

During the time that I was connected with this St. Louis Public Service Commission I had occasion to appraise telephone property; we appraised in detail the Bell Telephone System there and the Kinlock System. Since then we have appraised telephone properties amounting altogether to about \$45,000,000.00. I say since then, I mean including what we did there. Our appraisals of telephone

properties in detail, detailed appraisals, not reports, has been about

\$45,000,000.00 of telephone properties.

My work as a valuation engineer is not confined mostly to the State of Missouri; we do work all over the World, Pennsylvania, Illinois, Missouri, Arkansas, Texas, Kansas; in fact, wherever we are sent for to do it.

Up until the time I made an appraisal in this case I had done valuation work in the State of Texas, one report made for the City of San Antonio on the telephone property there. There was a law suit there and we were called in to make a valuation of the property and advise the City as to whether they should go on with the suit or not, that is, there was rate litigation between the City of San

Antonio and this same Company, Southwestern Telegraph 3040 and Telephone Company. We were employed by the City to make a report on the valuations of the Southwestern Telegraph and Telephone Company in that city; it was either last year or the year before; I think it was 1918. It was while the Camp was I have heard that the city accepted our report on the valuation of the property there. Yes, I understand they accepted our report and the litigation was dropped. I do not recollect our valuation of that telephone property there compared with the valuation

which has been placed on it by the Telephone Company.

In this valuation work that we have been doing, we have got a principle of telling our clients that the results are going to be the same whichever side we are on, and I have lost some business that way and I expect the bulk of our business, you see, we have made valuations for the City of St. Louis since I have been off the commission, a very large part of it has been for the cities. We acted in a consulting capacity for the City of New Orleans on their street railway properties, and a large amount for the City of St. Louis. We made a valuation in 1918 for the City of St. Louis in their case before The State Public Service Commission in connection with the street railroads. We were retained by the City. We desire to have work from both sides. We make valuations for either one side or the other, and our results are not influenced in any way or deter-, mined by whichever side employs us, that is understood before-It ought to be understood in every engineering report, and I think it is part of the ethics of the profession. I never had but one time in my history where anyone offered or asked me to bring

in any report for any purpose. That was only once. I did 3041 not take the case.

We have done other valuation work in this State; we made the valuation of the Lighting Property in Houston in 1914 in the rate case against the City, for the Electric Light Company; we made

that for the Light Company.

I am a member of the Lawrence Scientific School of Harvard; I am a member of the American Society of Civil Engineers; member of the American Society of Mechanical Engineers; American Economics Society and other organizations. It is not an economic society, but it is an engineering organization. I forgot to mention

that I am a Lecturer for Washington University. Washington

University is at St. Louis.

I was employed by the Southwestern Telegraph & Telephone Company to make an appraisal of its property in Houston. not instructed, nor was any request made to use any certain method in valuing this property or appraising it. Our report, however, is based on an effort to get a measure of present value, and the report

is its reproduction cost.

I have made an appraisal of the property of the Southwestern Telegraph & Telephone Company in Houston. In making that appraisal we have used, as closely as we could, present day prices. We use present day prices because we wish to get a measure, as close a measure as we could get, of the present fair value of the property, and to do that we considered that we had to use present prices. to whether or not prices of material and prices of labor are

pretty high at the present time, I will say prices are comparative, if you compare prices with what they have been they 3042

would be considered high, but perhaps in a few years we won't consider them high, but comparing them with past prices, they are

In my valuation work I have occasion to be familiar with the prices for a number of years back. I am familiar with the prices which in a general way existed prior to the beginning of this World War which we have just gone through; we have eleven years' records in our office of prices and we have practically a complete record of vouchers and bills of all these companies, and they are all indexed, and copies of their contracts, and it forms a rule for records, and they have there all the prices practically of the material that enters

into the make-up of public utilities since 1909.

With reference to the history of the prices of material since 1909, they were comparatively stable until the influence of the European War reached this Country, when we went into the war. There was not a general increase in prices of material between 1909 and the The prices were quite beginning of 1914 when this War started. In fact, in making valuations before the war, the original cost and reproduction cost, so far as physical property went, would come out very closely together. There was a long period of comparatively level prices and I think we may look for another period of comparatively level prices.

I would say that prices between 1909 and 1914 were pretty If there were any changes at all it would be due to the gradual advance of labor coming from the greater accrued

power of the labor unions. The general tendency would be upward, but it would be very general. There was an upward general tendency.

I would say that in the early part of 1917 this country began to feel the effects as far as the high prices were concerned of this European War; 1 do not recall the curve, but I have it here with me, anyhow it was along about that period.

From my study and from the information of these various prices in the past and at the present time, there is nothing which would indicate that we may expect cheaper prices and cheaper labor prices in the near future, in my judgment, I don't think you will.

There is a great deal of shortage in the market of construction material, I mean by that, for instance, that all the cities are underbuilt, most of them, the prosperous cities' building has been neglected naturally during the war. We had to catch up with that. space can hardly be found in most of the cities. The railroads have been neglected to the point where it is estimated it will take \$3,000,-000,000.00 to put them back in good shape. That all represents work and material. Of course, the basis here, as I think, of it all is labor, and labor seems to be advancing instead of going down. There is no indication that we are going to have any reduction in the prices of labor in the future; I think there can be no reduction for some time. It would be a very dangerous thing if there were

any causes creating a reduction in the cost of labor, and I

3044 don't think it is going to be brought about.

As to whether or not there is anything else besides this shortage of production which I speak about, which, in my opinion, would tend to keep up the high prices which I am speaking of, if you take lead, the cost of lead seems to be advancing. Copper went down a little while ago due to their accumulating a great store of copper while, I think, the war was going on. Copper, however, is a pretty well controlled article. It is lower now than it was during Timber, we can look for a steady advance in timber. the war. Leather is going to be not much lower because there is really a shortage of cattle, and you can look over the whole field that way, if any one gets at it soberly, they will hardly hope for any lowering of prices in construction or manufacturing unless we have some very great improvements in the efficiency of manufacturing. can't foretell that. There may be and there may not. generally happened for a long time, and there has been high cost after these wars and prices have stayed up until there was a greater efficiency obtained, due to the invention generally of machinery. After the Civil War, labor, for instance, has never returned—the labor index cost as gotten out by the Government or calculated from the Government reports, labor has never returned below what it was in 1865. It has gone up comparatively steadily.

The Armistice has been signed for something over a year now and there has been no appreciable reduction in either the prices of material or the prices of labor; the prices of material, for instance, in

telephone work have been advanced in the last month con-3045 tinually. Of course, nobody knows how high it is going up, but we can't see any indications of its getting any lower for a long period of time if it ever does. Money itself, throughout the history of the war, has always become cheaper and cheaper, which makes prices always advance.

I have prepared a report as to what it would cost to reproduce this property of the Southwestern Telegraph & Telephone Company. The report was thereupon offered and received in evidence marked "Plaintiff's Exhibit No. 60, witness Allison," and is transmitted

herewith in the Exhibit File.

On page 3 I have a summary of the reproduction cost of the physical property. The first item I have there is Land. As to the cost of reproducing the land which is \$215,187.50, the details with reference to that are shown on page 12. In appraising that land we took the judgment of a local real estate expert, Mr. George Wilson, and they are the same figures that were obtained by Mr. Hoag. The price of each particular piece of land is shown on page 12.

With reference to buildings, which is the next item on page 3, we found the reproduction value of the buildings was \$476,300.00; we got at that practically in the same way. We took the bids of contractors in Houston, and on page 12 each building is shown added up making a total of \$476,300.00. The contractors that I am speaking of are the contractors on the Preston building, the American Construction Company for the building, the Warren Company for heating and plumbing, the Barden Electric

Company for electric wiring and the Otis Elevator Company for elevators. On the Hadley building, Mr. Baring for the building, Warren Company for heating and plumbing, and the Those were the same Barden Electric Company for the wiring. gentlemen who made estimates for Mr. Hoag; we took the local bids estimate in preference to making a detailed estimate. we got those figures we did not include anything for Architects' fees. It is customary to include the Architects' Fees in estimating the cost of reproducing a building; that is a matter that you would have to pay if you were reproducing the building. With reference to the customary fee, the American Institute of Architects, I believe, specify 6% on business buildings, they used to charge 5%; on residences it runs anywhere from 71/2% up, and on alterations it would run higher. I do know too, a conservative allowance on that for Architect fees would be 5%, but we haven't included it in there, in fact, that might be called an omission and contingency but we did not include it in there; it would perhaps be justifiable.

My next item of the property on page 3 is the Distribution System for which I have \$2,599,485.66; the details shown with reference to that particular part of the property begin on page 13; there are further details in my table on page 13. That is an intermediate

table, however.

For the purpose of illustrating how I have appraised the property, taking on page 13, for instance, a 25-foot Class "C" Pole, we obtained actual prices from the dealers in poles. We took those prices and applied our estimate of the cost of installation,

3047 freight, etc. Now those estimates I did not carry in my head, but I have them here if you care about them. I have got as the cost in place of a pole, \$9.42, that carries installation with it, that is, the cost of the pole in place. Regarding the details of this item, in that 25-foot, Class "C" pole, the cost of the pole is \$5.35; freight, which has to be applied after getting the freight rate from the Government, the Railroad Administration, is \$1.66, that is, total F. O. B. Houston, \$7.01; we have applied an installation cost there of \$2.41, making a total of \$9.42. As to where we got the prices with reference to the price of these poles, we have quotations coming into our office from the pole men. We got these prices that were used here from the Western Electric Company. As to why we went to the Western Electric Company to get prices, we would have gone to several, as a rule, but we had gotten prices from them before and we went to them because they were the easiest practical, and we

could get them quickly. We had to get them very quickly.

I have been in this business for a good while and have investigated the prices of material a good many times, and I have had occasion to draw comparison between the prices of the Western Electric Company and the prices of other suppliers on telephone materials; we have made valuations of Independent Companies considerably, and we once had a study made in our office to see, as a matter of curiosity and information to ourselves, we didn't know we were going to use it, we found that the Bell Telephone

Company buy a little cheaper on the whole than the Independent Companies, that is, for the comparative items. That was made some years ago and I remember the results very clearly. That is, that the Bell Telephone Company receives better prices on the materials which they used than the Independent Companies get. By-the-way, in getting these quotations from the Western Electric Company on poles we got a quotation on a large lot of poles; we asked for prices on a lot of 17,000 poles, told them the quantity of poles that we wanted, but did not tell them what we wanted them for, in fact, where they were to go to, we wanted to keep out of that if we could. In getting our other prices from them we didn't even tell how many stations there were in the plant that we had in mind, but gave them a margin figure. So far as I know they may have known what we desired. We put it that way. We didn't care

In the building up of our unit costs in this case, I have proceeded on the theory that we would construct this plant on a wholesale quantity and our prices are built on that basis. We asked for a price on 17,000 poles, and that is true with reference to the large quantity of the other parts of the property. In our Central office equipment, getting the present prices, we asked them for a quotation on a plant with between twenty-five and thirty thousand sub-

about them knowing it. We don't know what they know.

scribers.

On page 16 with reference to Aerial Cable, we have a price there of 90 cents a foot installed, 200-pair cable. We have labor and miscellaneous material, 7.8 cents; labor and miscellaneous material

on porch supplies and terminals, 3.4 cents; cable itself, 68.7 3049 cents; freight on cable, storeroom expense, drayage and return freight on reels, 10.31 cents, making a total of 90.21 cents.

With reference to the rest of my distributing system, I have worked all that out in detail that way; it is worked out in detail. have figured out the price of the material, then the price of labor and everything that goes with it, and have estimated the cost of the particular quantity of property in place, in other words, I treated all my Distributing System just as I treated this pole and these cables and that illustrates my method of appraising that prop-

On page 3 of my report, at the next item there, Subscribers Station and P. B. X., which is Private Branch Exchange, the figure we get for that is \$373,457.01; the details with reference to that are shown on pages 32 to 34. That is the telephones sets, installations

and private branch exchanges and so on.

In appraising that property we got the prices of the equipment from the Western Electric Company, and checked those with vouchers-we didn't get all of them,-checked those with vouchers and records in our office using, wherever we could, present prices from the Western Electric Company. That is under installation on page 33; installation is figured separately.

Wherever we have that "Unit Cost," that does not mean the cost place in the station equipment. The station installation is carin place in the station equipment. ried on another table at the bottom of page 33, and that is the cost of installation, added to the cost in the table above

3050 which would make the cost in place.

"Q. I notice in one place, Mr. Allison, you have on page 33 under station installation, Subscribers Station installation, Subscribers own quantity, \$2,263.00, unit cost 50 cents. Now why is there any cost

"A. That is the cost of connecting it, what we think the cost of the company would be, a round figure. We have all the details worked out with reference to that and can give it if Counsel for the City desires. Of course, to give details back to the ground, we would have to bring a car-load of records here. To give details back to the very foundation of everything that we consulted in making these unit costs, we would have to bring all of our records, practically all of our records on telephone property, but I could tell

them what part was marerial and such as that. My next item on page 3 of my report is "Central Office Equipment"; we get for that item \$1,174,257.00. The details with reference to that are shown on page 34 to page 99; on page 34 is a summary of it, at the bottom of page 34. In appraising that particular part of the property we appraised that as original cost, for the reason that we could not get from the Western Electric Company any detailed prices on it within the time we had to make this report. So we took the inventory as furnished by the Company and priced it up at original cost. In doing that we had vouchers of the Company on nearly all of this material or a great part of it, and we had our own records as to cost, original cost, that is cost, say as of 1914.

Now we took that original record and we added 55% to it. We did that because we found that that was as near as we could get information as to the advance in this character of material

since 1914.

Mr. Howard: What is that material, Mr. Frank? Mr. J. D. Frank: That is the Central Office Equipment at the

bottom of page 34. Added 55% over the 1914 cost, that is, 55% over what it originnally cost, and then we arrived at this figure of \$1,174,000.00. After we had gotten it, we got a statement from the Western Electric Company which gave us their estimate on these different exchanges. Those are not the figures that we have down here, we used our own figures but their estimate. If we add our 5% of omissions and contingencies, which is necessary in an estimate, we come to the figure of \$1,232,970.00. Their figure as given as bids on this thing was \$1,242,514.00. In other words, our estimate when we put in our percentage for Omissions and Contingencies was within \$10,000.00 of what we received an estimate on.

We undertook to make an estimate of what it would cost to reproduce this central office equipment; we used 1914 prices, then added 55% to that as the increase, and then added 5% for Omissions and Contingencies, and then later we received a bid, as I call it, from the Western Electric Company and their figures was something like \$10,000.00 greater than the figure which we had, of course, that

coming so close there was somewhat of a coincident. They do not always come that close. It is a peculiar coincident, but it showed to our mind the necessity of omissions and contingencies. Our estimate without the omissions and contingencies would have been considerably lower than that. The details of all that Central Office Equipment are shown on the following pages, our P. B. X., I would say, by-the-way, the details on that which we did the same way were omitted by the printer; we can furnish it if necessary. I have got a summary of it.

"Q. Did you consider the prices for Houston only on that Cen-

tral Office Equipment, those vouchers that you used there?"

"A. We used those vouchers. They are the same prices. They

get the same prices at other places."

Item 6 on page 3 is the bare cost of labor and material of an estimate on an Inventory without omissions and contingencies. Omissions and contingencies, of course, are intended to provide for the physical property, and it is cost omitted from an inventory for con-

tingencies in construction that cannot be foreseen.

In our item of Omissions and Contingencies we have taken 5% there which is an orthodox figure and is the result of engineering experience all over the world in making estimates and valuations. Whether it is high enough, I don't know. You can't tell. It is to take care of the things that you don't know about. If a man had a bill of material or some specifications for a building contract and was going to make a bid on it, before he arrives at his price he puts in as percentage for things that he didn't know about, for

3053 things that he had omitted or contingencies that might arise in the building of it that he couldn't foresee. Every estimator adds something to his bare figures of expending quantities of material to the price. If he didn't he would come to grief.

We did not apply omissions and contingencies to buildings because we had a bid figure on that; we considered it as a bid figure. Now, we considered that that was a bid. We used it as a bid, that that would be all the Company would have to put out, that would, however, imply that the Company gave complete specifications of what they wanted. In erecting buildings it is always found out that

there is something else wanted that is not in the specifications, in fact, one of the most prominent builders in the United States told me that they made their money on the changes in specifications. He was commenting at that time on building a building for John D. Rockefeller, and he said he couldn't get him to change a door knob

and he didn't make any money.

Even after you have got your building constructed and it is generally on a bid, if you have certain omissions and contingencies in connection with that building the contractor would stand it unless the specifications were changed. As a rule, this builder told me, the specifications are changed, and that is where they make some We assume, taking the most conservative view of it in this case, that you had complete specifications, that the builder put good profit. up just what you wanted, and you didn't want anything changed Now, if the facts as put to these bidders who furnished these figures were different from that, we didn't understand, in fact, we Omissions and contingencies didn't know the details of it. under ordinary buildings ought to go on there.

figures ought to go on ordinary buildings also, that is an

oversight.

(By Mr. Howard:)

"Q. You are an engineer, mechanical and construction engineer, and you start out to reproduce a building, and the first thing you overlook was an engineer's fee?"

"A. It wasn't an engineer's fee. We didn't overlook that." "Q. You never heard of a lawyer forgetting the cost of a law-suit."

"A. I have heard of them taking 50% and not getting anything." "Q. Would you honestly say that that is an omission. that is so apparent to even a layman, that he wouldn't even start to building a building without figuring on architects' fees, that you come along and figure reproducing a building, an engineer now, spent a life-time at this kind of work, and the question of architect's or engineer's fees would never occur to your mind, and that you admit that, and you state that to be illustrative of the items of errors and omissions?"

Mr. J. D. Frank: He has not applied any Omissions and Contingencies to Buildings at all.

Mr. Howard: He is going to apply them good enough when he

gets to other things.

"A. Well, Mr. Howard, I would like to tell you that all of these figures are honestly done. I don't care about that part coming in.

These figures are honestly done. This thing shows on its face just This thing shows on its face just exactly what I did. It shows exactly on its face what I did. There Now do you think I did is no architect figures in there.

that for theatrical purposes? I didn't notice it." 3055 I will tell you why I did it, because I forgot it.

As to whether or not getting an architect is one of the very obvious and outstanding things that meets the mind of an engineer right in the beginning when he is confronted with a building, I am not making excuses for my overlooking that, but I did overlook it, and I omitted it because I forgot it. It is an illustration of omissions, a very good illustration too, no matter having spent years on these things, I could overlook that architect's fees ought to go there and I did overlook it. Oh no, I might not as well omit a roof. have not included anything in here on account of having omitted that architect's fee; this was all made up before I noticed my mistake. I did not apply omissions and contingencies because I took that as a bid. What I did forget was that it was a bid by the contractor and that the Company would have had to submit to the architect plans before they got the bid, that slipped my mind.

(By Mr. Howard:)

"Q. You would have to have somebody watch the building while they were putting it up, that is part of the architect's fees, supervision, not only submit plans to him, but a prudent man would have somebody supervising the building that understood the buisness while the building was in progress. wouldn't he?"
"A. Well, the architect very often does it."

With reference to the item of engineering we have included 5% on items 2 to 7. That is the usual engineering allowance made in valuations by the Engineers making the valuation. I would include something for Engineering because there must be Engineering plans for the plant. This is a reproduction, an estimate of reproduction, the originators of the enterprise would naturally call on engineers to make the plans and supervise the erection of the plant. They could not do it themselves. The promoter could not do it. It would have to be done by engineers, and is always done by them. That is an expense that is incurred in the construction of any property of any size, that is, property of No investors, unless they were very badly advised, would start anything like this unless they had very good engineering

advice even at the beginning.

Item 9 is Construction Administration. During the reproduction, or during the building of a plant like this as a whole there would be a considerable amount of administrative work to be done, the paying out of money, the dealing with the engineers, arrangement for payment for material; all of those things would require the time of people of considerable ability, and we put in there the round figures of 1%. That is the per cent that is usually allowed in a case of this kind, unless they have raised the engineering figure. Sometimes they include that in the engineering figure. engineering figure of 5% is very, very conservative. Your lighting plant here, we found that there were payments of 10% for engineering that had gone over quite a number of years. I imagine that a firm of engineers reproducing a large property like this, it might take 5.%, it depends a good deal on their reputation. Investors will

put their money into enterprises that are under the super-3057 vision of engineers of reputation, and it makes it easier to get the money. Engineers of reputation naturally charge just 3058

as lawyers, for that reputation. It balances itself, easy to get the money just as you take a bond issue of a County, and it is generally put on a circular that it has been passed upon by such and such They are known to be Those lawyers charge for that. good lawyers, and is one of the costs of putting out the bonds, just as this is the same way with reputations of engineers.

Taxes and Insurance are supposed to The next item is No. 10. be the taxes and insurance on uncompleted property as it is being We assume a construction period here of two years to reproduce the property. That is a period that would not be exceeded only if everything was favorable, and it would have to be quite

favorable to get this plant built within two years.

If other engineers in this case had testified, some of them, that it would take three years to reproduce this property, and some of them four, I would not say that their judgment is faulty. I would say that is the least possible time that it could be constructed in.

From my knowledge of this plant and the size of it and everything, I do not think that I could reproduce this property economically within a two year period. I- might be done, and that is the reason we took it, but I wouldn't like to take the contract, or be responsible for urging a contract which limited anyone putting it up

to two years. It would cost a great deal, rush work would. "Q. I heard you use the word "conservative" a few moments ago. Mr. Howard has in a way objected to that word

at times. I went over this report with you, did I not, in places, asked you if any of those figures were conservative? Do you remember my asking it?"

"A. No, I don't recollect it at all."

"Q. I did not prompt you to use the word "conservative"?"

"A. Well, it is a word that has to be used in getting things whether you put out a conservative estimate or a liberal estimate

It is a thing that expresses the issue."

Item 11 is the Interest. We took a construction period of two years, and we have calculated interest during construction for the minimum, that is, for one year. That is the interest on the money as it goes into the plant of which the investors are deprived. They are deprived of that interest and it is a part of the investment. That

is a conceded item in all valuations.

The rate of interest we used was 8%; we considered 8% as probably the lowest figure for reasonable return, and as soon as money goes into this enterprise, put into anything, it partakes of all the risks of the enterprise, and is entitled to the same rate of interest as it would be entitled as a reasonable return. A man would only have to put himself in the place of an investor to see that, that he takes a certain risk, and expects a certain return, or he would not go As to what I consider is a fair interest rate, I would say to use the same word, very conservative. I understand you

get 8% on mortgages in Texas. Item 12 is the complete construction cost of the plant outside of Tools, Automobiles, Office Furniture and Fixtures, etc., out-

side of these items below it.

Item No. 13 is Tool Account. We took the book account of the Company for that, or rather they furnished us with the book account for tools. In making up an inventory the tools, furniture and fixtures, and those things, if they were done in detail, would require probably more work than all the rest of the plant. So it is customary, to save expense, to take book figures on those things unless you get at some other short method of estimating it. The list is so long of comparatively unimportant items, we took the figures furnished by the company here, and they are supposed to be book figures.

We did the same thing with reference to Automobiles and Horses, Wagons, Motorcycles, etc., item 14 on page 3 of the Exhibit, and

also with item 15 on Office Furniture and Fixtures.

Item 16 is the total of all of the physical properties outside of

Working Capital and Supplies.

Item 17 is an item of Working Capital. The supplies go into that. We took the figure furnished us by the Company. Then we placed what was, in our judgment, the proper amount of cash for a company of this size to have in its operation, cash in bank, or cash in accounts of subscribers, but there is always a permanent bal-

3060 ance of good accounts, not necessarily the same accounts, which are owing to a company of this sort; that amount belongs to the Company, but it is in these permanently. They cannot get it out. \$125,000.00 would carry that. In fact, the general way of figuring these things when you haven't these detailed books before you—by the commissions, is to take six weeks' operating expenses, six weeks' operating expenses here would be very close to \$100,000.00, I think Ninety-nine thousand and some dollars. We take that orthodox figure and add \$25,000.00 to it for this item of permanent balance, and also for the item of immediate cash for extensions. There is always something for that. The smaller extensions, you will have to have money to put them in before you can get actual capital from financing or from your sources of capital as a whole. The \$125,000.00 is merely an estimate on our judgment from examining some \$350,000,000.00 of this kind of property.

The total Physical Property is \$6,092,058.20.

Yesterday I mentioned a bid of the Western Electric Company on central office equipment for the Houston exchange, and I gave that figure as \$1,242,000.00, which is something like \$10,000.00 more than we have estimated when we include our allowance for omissions and contingencies. The price given to us by the Western Electric Company was the price to one of the associated companies.

The part of the property I have been considering up to this time is the physical property. In my appraisal of the physical property I had not included any increment because the property constituted an assembled and established plant, doing

business and earning money.

In item 18 we have cost of establishing business \$1,794,124.00. That is our estimate of the cost to establish the business as it stands today,—to get the capital. There are really three elements there.

the cost to initiate the enterprise and carry it through the initial stages. That is taken up by the promoter as a reward for the promoter and a reward for legal and organization effort and the cost of getting money. That is like the cost of getting bricks, or anything else. People not used to thinking clearly on these subjects are apt to neglect it, but it is an absolute cost. And then comes the other elements, or the cost to establish the business after the plant is built. I have made an estimate of what it would cost to reproduce this business the same as I have made an estimate of what it would cost to reproduce the physical part of the plant itself; the business is a necessary part of the plant.

"Q. You know that you would have a cost of that kind if you started in to reconstruct an exchange or build an exchange of this

kind?"

"A. To create a property of this kind, the business is a part of the property. Without that part of the property, the property is valueless, except for scrap. I show this in detail on pages 6 to 10 of my report; I show in detail our reasoning in arriving at our pages of the cost of establishing business and getting the

3062 estimate of the cost of establishing business and getting the money."

In any large enterprise,—and we are setting up here a reproduction of this enterprise as it stands today, a \$7,000,000.00 enterprise, there must be someone to start it; there must be someone to initiate and get going the forces which will finally result in the plant and in the business. Those services are always performed in a large enterprise, generally performed by men called promoters. The name has gained some bad odor on account of practices of promoters in getting part of their reward sometimes by deceiving the investing public as to the value of the security created. However, whatever the reputation of promoters may be, the office of the promoter is a neces-It has come now so that respectable firms sometimes sary thing. take up promotion and the old reputation is dying away. ters usually get their reward in a speculative way; sometimes they get a very large reward and sometimes they don't get any. In making our estimate here, we have tried to set up the hypothesis that we would reward the promoter with a speculative reward, and we have put here the sum of \$50,000.00 as the amount that would be required to get a competent promoter to take up this enterprise and start it. Promoters, as a rule, have to be men of ability,-men generally used to dealing in large figures and with a pretty good idea of what profits they want. We had some measure of what the promoter would charge in the knowledge of one case where there was a \$50,000,000.00 company promoted, and in that case the

a \$50,000,000.00 company promoted, and in that case the promoters were a firm of bankers. They charged a \$1,000,000.00 fee and got it. That is 2%. I don't know that they based it on percentage, but that was their fee. That is a case that I actually know of. That was the reorganization of the United Railways of St. Louis. Besides that, these same bankers got a considerable profit in the securities end of it; but that was their fee,—\$1,000,000.00, or 2%. Two per cent of our \$7,700,000.00 would make approximately \$150,000.00 or more. However, in making

this estimate of the cost of reproducing, we put it in at \$50,000.00, as a minimum. No one can tell exactly what the promoters would charge for it, but I hardly think we would be able to get men who could do it and do it well under \$50,000.00. That is a percentage of about two-thirds of 1% of the capital involved. The promoter would have to decide where the money was to come from, what was the best way to get it, and those things would differ very greatly in proportion to his ability. Fifty-five thousand dollars is a low estimate on the ability required for that kind of service,—the importance of the service. That is all the expense that is included in starting out a business of this kind and it cannot be avoided.

The second item, organization and legal cost, we have included \$25,000.00 for that. After the promoters have really started the thing, or during that time, there comes into being an organization called a company to take charge of this. It has to have efficient men to manage it during the construction period. One cost is the

heavy legal expense. In creating a property between \$7,000,-3064 000.00 and \$8,000,000.00, you would have to employ lawyers of high reputation and those lawyers would require good, round fees. I believe your best lawyers here in town, if they were asked to undertake the organization of a \$7,000,000.00 to \$8,000,-000.00 concern, would charge at least a \$25,000.00 fee. The importance of their work is very great, and the importance of their reputation is very great. Some people might say we could get a law clerk to do this and do that, but when you are putting out an enterprise before the investor, he has got to know and feel sure that the legal part of it has been passed on by competent authority. That is a benefit a lawyer gets for establishing a good reputation. They generally make their money along at the end of their lives, after establishing a reputation. The value they get is not entirely for legal service, but the value of the client in knowing it is right.

In addition to that you would have a considerable expense in organizing your forces and we have included for all this organization and legal expense, \$25,000.00; we think that is a low estimate.

Our third item here is Capitalization or initial risk. We have included in it fifteen per cent of item 18. That is the total physical property in Table No. 1, and items 2 and 6 in table No. 2. We endeavored to get 15% of those items which require actual cash in the

creation of an enterprise.

Capitalization of initial risk is the cost to induce an investor to take his money out of a tried enterprise and put it into an untried enterprise. If I should go as a promoter to an investor, or underwriter, the investor would say: "I want to put \$10,000.00 in this new telephone company." And then he would say: "What is it going to pay me?" And I would say, you are going to be allowed to earn a reasonable return,—it is a regulated utility. And he would say: "What is a reasonable return? Is it above what I can get in the other enterprise?" And I would say, no, sir; and he would say: "What is going to induce me to take my money out of something that I know has earned money, and I can assume that it will earn money, and put it in this new thing, unless I can

put it into something that will get the money." and then I say, you put in \$100.00 and you can earn on \$115.00; or in using the language of the financial world, I would say, we will discount this security; you get it for \$87.00, we will let you buy it at \$87.00, and you can expect it to pay dividends on par. Any man who has ever invested money and is a faith investor, knows he would not put his money into a new enterprise unless there was some inducement. It follows that you can not get money without an inducement, unless you deceive the man who puts his money into it. The sound advisor to investors today in utilities would say to them: "Don't go in unless you can get the consent of the regulating authority that this inducement to make you go in is to be capitalized." The facts that there is a small chance of that under the present methods

of regulation is, perhaps more than anything else, what is preventing new utility enterprises. I believe Texas is suffering from lack of railroads, and if it would be well looked into, it would be seen that they are not being built because there is no inducement for people to put their money into them. There is no way that they could make a profit over what they would make by lending their money out on farm mortgages. In other words, the investors are not willing to take money which they can put in safe and sound investments, where they know that they are going to earn on it, and put it into anything new that they know nothing The risk to an investor is the risk as he sees it. The apparent risk.—not as it actually turn- out. He is going to withhold or put in his money as he sees the risk, and any new enterprise that hasn't a record of earning behind it is subject to a discount; its securities are, unless you can fool somebody; especially a utility, where the future earning- are being held to a certain basis, are not going to be allowed to compensate him for his risk. The public themselves don't realize this fact. Very few people have thought it out, and yet, as I said, it don't take an expert to see it. It only takes a man who has some money and knows how he would act if he were approached on an entirely new enterprise. This matter is handled in this way in the beginning of new utilities and investments. Most utilities were started when regulation was rare. money was gotten then on the idea that they were going to make a great deal of money; that they would be untrammeled, and

our mail full of circulars of securities for sale at less than par. Nearly every time a new enterprise is started they come frankly and say, we will sell you this security at such and such discount and will give you some other kind of security: a bonus is very often used. Of course, I don't contend to measure the cost of initial risk by what any wild person might print on a stock certificate. This is not the measure, but it is what the conservative investor, in going into your enterprise, would be apt to estimate. I use the figure of 15%. Another man's judgment might be as good or better, but the idea is to put it in here to call attention to the fact that there is some cost there. There must be some inducement offered. The

measure of it is according to the opinion of different people. We

have put, I think, a conservative measure on it.

Item 4 on page 6 is the initial deficit. If this plant was built, and you had already gotten your money and you began to build up your business, it would take some time before the business could be built to a point where it would give a reasonable return. No matter how fortunate the circumstances, the least time of getting the subscribers connected, getting them fixed up, you would take, we have estimated here, three years. During that time you might be making some profit, but the history of most of them is that they do not; but if you were going to put the money in with your capitalization of risks at 8% and you knew for three years you were only going to get 5%,

you would say: "I am going to be deprived of 3% a year for 3068 three years on the return that I would be willing to take for my money. I want that capitalized or I will not put my money into the service of the public." That 3% for three years would make 9%. Otherwise, you would lose that 9%. item that is allowed sometimes—that item is allowed by Commis-This item is what is sometimes spoken of as deficit during the development period; that item is allowed frequently by Commissions, and sometimes it has even been called the measure of going concerns' value. I think the New York Court calls that early deficit, -supposed to be a part of the cost of establishing business. Some Commissions have even gone so far as to carry that on for years and years and years. We don't do that here; we give them a reasonable period, and if they don't make good, that is a part of the risk that they take, but for a certain few years at the beginning of the enterprise, the investor knows he is going to make his full return and knows he is going to be deprived of part of it and that it is capitalized. He is going to demand that.

Our next item is the cost of assembling capital. The reward for initial risk is something that goes to the investor. The man who puts up the money, takes it out of something else and puts it in. The money for a large enterprise like this is not all gotten from one place. It is assembled, may be, from all over the United States, assembled by means of investment bankers, salesmen, stock broker's salesmen going to different people and selling them a thousand dollars' worth here and a thousand and ten thousand dollars' worth there.

and a thousand and ten thousand dollars' worth there. It is done all over the country. It costs money to do it. These salesmen have to be paid and the investment bankers have to get their profit in order to stay in business. That money is gotten from all these sources and assembled, and in this case it would be assembled here in Houston to build this plant. The cost to do that, and it can not be done without cost, is just the same as freight or poles or anything else. The money has to be gathered from these different sources and brought together. That, we have estimated at 3%, which is quite low.

There is no duplication between that item of cost of assembling capital and your cost of promotion. The promoter's services are simply to start things. When he goes to get the money he has to go to the investment banker. It is the cheapest way, and legitimate

enterprises do go there because the investment banker, if he has a reputation, will not go behind something that has not been investigated. He investigates it himself. That is a part of his cost, and then he goes to his clients who have faith in him and says: "Here is something that I think is very good at the price," and sells it to him, and in that way gets the money which is remitted to be put in that plant. There is no duplication in that. No duplication in that and initial risk.

The cost of attaching business is the cash expenditures that the company has to make to get the subscribers connected up and ready to pay revenue and get them properly on the records. The

stablished. It is just like the records of a title guaranty company,—it costs money to make them. To imagine this telephone plant in Houston wiped out and another one being reproduced, we can take two views of it. One is that this is an entirely new thing, as it was when the telephone company started,—that the people have to be educated, and all that. That would create a very high cost and it is somewhat hard to grasp. However, unless you take that view of it, you are conceding to the reproducing parties a part of the value that has been created by the old company. However, we took it that way, and we have put in here a cost of two dollars per station to attach the business. That means the cost of getting the people on the books, aside from the physical connection. The usual cost, the actual cost that it does cost the company would be about four dollars, along in there.

I heard Mr. Kelsey testify yesterday it would be about five dollars per station; we have usually allowed about four dollars per station,

but whether he is right or we are right, I don't know.

We have made due allowance for the fact that the people of Houston are accustomed to telephone service, and have not gone about valuating that part of it from the standpoint that the people would not know about this telephone service. We have put in two dollars there under the assumption that the people would rush in knowing about telephone service, and take it. Two dollars is less

than it costs to get a proper record of the subscriber. We investigated the records in a case in Arkansas in which it cost two dollars and thirty-three cents merely to get the consumer properly on the books and properly connected. It takes time with the clerks and there are a great many different entries and cross entries and papers to be signed and records to be made. There is one inspection, perhaps, to see the property, where the telephone has to be There is an investigation, perhaps, of the people, not in located. every case but in a good many cases. We took this, of course, from the company's records, had to take it from the books, and all of those charges amounted to two dollars and thirty-three cents. two dollars here in Houston. That did not include the cost of making the physical connections. It is a cost of getting any record started. In our office we have very elaborate records and it cost us a great deal of money, not only to get them, but to keep them.

We do not throw off the thirty-three cents in order to be conservative; I don't know that I did it for that. In making a valuation of this kind we generally make some concessions to keep from wrangling when it don't make any difference with the result. I do not think I could actually go out here and attach this business for two dollars per station; I think it would cost more. I did not know that the records of this company show that for the State, as a whole, it amounts to about five dollars per station to attach this business; I know that the records in San Antonio show what it cost there, but I

didn't know what it cost in this State.

The total amount that I get on page 6, is \$1,794,124.00, and on page 3 I get as the total reproduction cost of this prop-

erty \$7,886,182.00.

I have not taken anything from this property on account of depreciation. I don't believe in it. There is a great deal of argument, theorizing on different methods of deducting depreciation. A number of years ago the general rule was to make a calculation by what is known as straight line depreciation, theoretical depreciation. That was a very savage method, created deductions of twenty-five or thirty per cent, even forty per cent. It was fallacious. It has been abandoned by most of the people who have studied this problem, and most of them have come to the point—

Mr. Howard: Has it been abandoned by the Supreme Court of the

United States?
"A. What?"

Mr. Howard: Allowing for depreciation.

I am not talking about depreciation. I do not deny there may be depreciation in the plant, but it is the method of measuring it. I don't think that that straight line method was ever adopted by the Supreme Court. However, if you will let me get on: There are still others who take the stand that 100% of the property is not necesstill others.

sarily a new property. The investors' money in most cases, never buys a new property. Most properties never are new;

they are built piecemeal. The investors' money can only buy permanently a property maintained at a certain high level of efficiency and replaced as the parts go out. There is a level which large properties sustain that is permanent, and it goes on as far as we can see into the future, so there will be no percentage of the property gone as long as it is allowed to replace itself. It is like a tribe of people, not like one man or one automobile or one building. People differ in these depreciation theories, like they do on religion. I think most people believe in their own salvation.

I made an investigation of the property here in this town; I inspected the property and, in my opinion, the property is above what we would call the normal state of operation. It is in better state

than, perhaps, it can be permanently kept.

(By Mr. Frank:)

"Q. Now, Mr. Allison, several engineers have testified in this case with reference to the condition of this property. Some say in 89% and some in 92% condition. Regardless of your belief about this matter, if this property is in 92% con-

dition what would be the reproduction cost new, less depreciation, as-

suming that the property is in 92% condition?"

"A. I want to say in the record that I do not believe that is the right way to get the value; but if you did take 8% off of this property -

That would be 8% off of item 18?" "Q. (Interrupting.) "A. If you take 8% off the depreciable property-No, sir, 3074 it would be 8% off of item 2, 3, 4, 5, 8, 13, 14 and 15. Eight per cent of that is \$389,808.91. If you deduct that from \$7,886,-182.20 you get a result of \$7,496,373.29. I make the deduction, but I am merely making a mathe-I do not think it ought to be made.

matical calculation in the record."

I am familiar with the original cost of this property; we did a great deal of work on the original cost of the property in our office; I am not familiar with the additions which have been made to this plant in the last nine years. I have seen a statement as to the additions to the plant in regard to subscribers, the growth of the plant, and I may have seen a table showing the growth of the plant in I have not got a statement of what money, but I do not think I did. the additions have been to this plant in the last nine years, but I know the plant has grown very largely. That did not enter into my work, except as a general judge of whether the city was prosperous and whether business was increasing or not. We had a complete inventory of the property, a detailed inventory of the property. Here it is, I recollect it now.

I am familiar with the history of this community with reference to its growth; I have gone over the tables of population and I was here for five months in 1914, and I have been here for a number of days now and have taken a great deal of interest in the general aspect of things, and know, as anyone knows. This city is one of the best instances of prosperity that I have seen; any town in the United

States

Mr. Howard: We admit that. We cannot take issue upon 3075 Are you familiar with this plant? You have made a thorough study of the plant itself?

"A. Yes, sir."

This plant is in excellent condition, a very good plant. I heard Anyone that would go over it could say that. Mr. Kelsev sav so.

From my knowledge of the facts in this case, the history of this community and the condition of the plant, I would say that this plant has been very well engineered; I would say that the plant has been well constructed, it is a beautiful plant.

From my knowledge of local conditions I would say that there will probably be an increase in the demand for telephone service in this

city, from the growth of the city, all facts would show that.

The plant is capable of earning a fair return; it has the potential

earning capacity.

I have considered all of these matters, the history of the community, the original cost and cost of reproducing the plant, etc., in arriving at what, in my opinion, would constitute the value of this property; I have a very definite idea of the present fair value of the property.

"Q. Taking into consideration the original cost and what it 3076 would cost to reproduce this property, the history of this community and prospects of the future, and the condition of the plant and all of the relevant facts, what, in your opinion in dollars and cents, is the fair present value of the plant of the Southwestern Telegraph & Telephone Company constituting the Houston exchange?"

"A. Under the hypothesis that there is to be a reasonable return?"

"Q. Yes, sir."

"A. The fair present value of the property, under the hypothesis of reasonable return, would be approximately seven and three-quarter million dollars."

A statement of value like that must be in round figures; seven million, seven hundred and fifty thousand dollars. If you take off the depreciation that I mentioned a few minutes ago off of my seven and three-quarter million dollars you would get approximately seven million, four hundred thousand dollars as the value of the property. I think that the property, the fair present value of the property is fully seven million, seven hundred and fifty thousand dollars. I don't believe that ought to be taken off, but if you do, it is that much less. Just assuming that I do deduct that, if that is properly subject to that depreciation and assuming I make that deduction, in my opinion the value of the property would be three hundred eighty-nine thousand eight hundred and eight dollars less than seven million, seven hundred and fifty thousand dollars. I will make that deduction if you wish me too; seven million, seven hundred and fifty thousand dollars less the amount assumed here for depreciation would give seven million, three sixty thousand, one hundred and

3077 ninety-two dollars, and if you make that deduction for depreciation, in my opinion, the fair present value of the property is seven million, three hundred and sixty thousand dollars; more than that

Cross-examination.

Questions by Mr. W. J. Howard:

I am a graduate of Harvard, with the degree of A. B., going to Harvard at the time when they had the lectures and took the lectures for Mechanical Engineer with the addition of a course in banking and economics, and then began the practical engineering education under my father, who was a mechanical engineer. I do not hold an engineering degree,—A. B., and you will find that it takes a year longer. You will find in the Harvard Engineering Association a great many of the boys took the A. B. instead of the other. I took the A. B. in preference to the C. E.

I think I was first employed by the Southwestern Telegraph & Telephone Company on this case about the middle of October or the first of November; I do not remember when they first spoke

to me about it. I completed this appraisal just in time to get on the train.

Mr. J. D. Frank: Took about three months.

Mr. Elias employed me; I would not at all mind detailing the conversation I had with him. He called me in there and asked me,—said he wanted me in the Houston case; he said it

3078 was a complicated case and he wanted me to make a valuation of the property. This is very nearly all he said. He was very careful not to try to lead me in any way. He has conferred with me since that time in regard to my progress on the work, he has been hurrying me. That would hardly be a conference, we have seen one another, but he didn't know anything about the progress of the figures. In fact, we don't know ourselves until we get to the end. That day is always one of great curiosity.

"Q. Then that is about all the conversation, except he communicated with you from time to time to learn the progress of your

report?"

"A. When I would want information—we had access to their Auditing Department to get any information we wanted. We could get any information we wanted from the Company by asking for it. Frequently I called him and I went to see him perhaps four

times."

I talked with other members of the organization, talked with Mr. Waters, the Auditor, about getting some of the papers. I talked with some of the counsel a day or two before I completed my appraisal. I was trying to get more time and I thought Mr. Frank was fooling me about having to be here at the particular start. They merely told me they had a confiscation case at Houston and that they wanted me to value the property for them. After our

work was completed, of course, the attorneys saw it then,—
after our work was completed. They did not make any
suggestions as to how I have handled any of the matters;

I don't think they did.

Mr. D. A. Frank: It was printed before I saw it.

They have gone over it very carefully since then; they went over the figures, I think I probably got as much grilling from them

as from you.

"Q. They told you to come and value this property and gave you carte blanche and plenary powers? They placed no restrictions upon your methods of going about it and no limitations upon the expense?"

"A. I hope not."

No limitations of any kind, just told me to go ahead. I will tell you, Mr. Howard, it isn't customary for clients who know engineering ethics to try to direct an engineer's valuation report. An engineer will resent it, that is, the proper kind of engineer. An engineer isn't an advocate, and he goes on the stand, and if he realizes the solemnity of an oath he understands he is to swear

to what he brings there and he don't like to be directed. tell us they want a reproduction, or an estimate on some different That can be done.

Engineering ethics are very nearly what legal ethics are.

"Q. You went about it, dictated by your own conscience and used your own judgment?"

3080 "A. We wanted to get the best-"

"Q. (Interrupting.) And your idea of what was the right thing to do under the circumstances?"

"A. Yes, sir."

I prepared this valuation and submitted it here as seven and three-quarter million dollars as the value of this property on which this Plaintiff should make a return; that is true

I have stated that I spent many years as the representative of the city in the valuating of public utility properties upon which the

community of St. Louis was to pay a return

I would not say that many engineers allow as low as three per cent for omissions and contingencies. It is entirely a matter of judgment. I do not recall any that have allowed it, but I would not deny that they have. I do not know that there is some difference in this case by the Plaintiff's witnesses; I do not know what the evidence is in the case.

"Q. Don't some engineers take the position that when you are inventorying an established plant and one already constructed, that the item of omissions and contingencies should be practically

eliminated; in other words, very small?"

"A. I don't recall any who take that stand, and if I did, I would think he was rather a foolish engineer, or at least on that point."

3081 "Q. Some other engineer might come along and say that an engineer that does not allow for depreciation is rather · behind the times?"

"A. No, sir, they would say he is ahead of the times. I have heard them say that."

"Q. He was leading in the great part of originality?"

"A. I don't know that they would put it that way. out the truth. For a long time the people believed the world to

be flat.'

"Q. Some time some man might come along with a great vision and find that when you have a plant constructed of switch boards and toll lines and underground conduits and poles, that he might have great enough vision to think you could go over those things and count them accurately, and if you failed, then there might be an omission in an over-count as well as in an under-count. A man might get that big a vision?"

A. I think it would be visionary."

"Q. The whole thing is visionary. You are looking at it, so it comes to the question of counting. What have you got to do but count it?" "A. We know in counting things that we very seldom get them

· all."

"Q. Sometimes you over-count, too, don't you?"

"A. Very seldom."

I would draw a distinction between inventorying a plant that is already constructed and making my preliminary estimate or setup of a plant I proposed constructing; there is a difference between these two propositions. I think you probably

tween those two propositions. I think you probably 3082 allow less, if you were cautious, you would allow less when you had the actual plant and could count it. You see, we have had experience in making a re-count, and when we make an inventory and re-count we always find something more. A very carefully checked inventory, three or four checks and one we make ourselves and go over two or three times, we might allow one figure for ommissions, and one that was checked over just one time we would allow another figure.

"Q. What omissions on a switchboard suggest themselves to

you?'

"A. You know, if I knew them I would put them in."

We might not count all of the silk. I would hardly overlook a switchboard. As to what omissions occur to me in underground conduits, we might not get the deviations, what obstacles would be encountered. That would be an omission; we cannot see them and

they are counted in as omissions.

We get our underground conduits from a map, in this case we got it from an inventory. Ordinarily they keep a map of those things; there might be a falsified map, but I never heard of such a thing and I take it as correct but there is not just as apt to be an error in over-amount as in under-amount; the map of underground stuff, like pipe and conduits, are drawn straight from point to point. We know the pipe and conduits do not run actually straight from point to point; they may encounter sewers and things of that sort that may not be on the map.

There is very great chance for omissions on a pole line. In the inventory of the Houston property, the Houston lighting 3083 property, we went out and counted those very carefully, and I think we counted seven hundred poles the Company had

I think we counted seven hundred poles the Company had omitted from its inventory. I have forgotten out of how many that was. I imagine they have a good many thousand poles. That was five years ago.

I have allowed 5% for contingencies and omissions, and have known of more than that being allowed; I think engineers allow

six.

"Q. Some allow three and some might take the position that I have—that when you have a plant constructed already, it is practically reduced to a negligible quantity."

"A. They might, but I don't know of any that have." I allow for working capital, \$125,000.00, cash capital.

I have taken into account that their bills are billed on the first in advance, and that they get it all paid before the 15th of the month, but that don't change my idea of what it ought to be in a company of this size, I based that upon six weeks' earnings; I took six weeks' earnings. You are mistaken in your statement that I said some

Commissions take six weeks' earnings,-not earnings,-operating expenses; six weeks' operating expenses or approximately \$100,-000.00 in this case. 000.00 in this case. There is really not much reason for it, but it has been taken by Commissions. That is not on utilities that get all their money after they perform the service; the same thing is allowed street railway companies. I do not mean six weeks' revenue, but six weeks' expenses. It has been allowed in street rail-3084 ways, gas companies and in lighting companies.

"Q. All of these companies get their money after they perform the service?"

"A. The street railways do get the actual cash."

"Q. Yes, that is true; I will eliminate that. I have reference to gas and lighting companies. Would you say that a street railway company should have as much working capital in proportion as a gas company?"

"A. It depends on what the street railway has to do."

"Q. This money is to carry them along so they will not run out of money and will have something to operate with; and if they get their money in advance, why would they need much working capital?"

'A. They have a great many expenses."

"Q. They get a great deal of money every day?"

"A. Yes, sir, and they pay out a great deal every day. Since you

want to get off the telephone business-"

"Q. (Interrupting.) No, sir, we will not get off the telephone business; that is somewhat parallel. They get a good part of their money in advance of performing the service. You have taken six weeks' operating expenses as the basis-

"A. (Interrupting.) I did not take that as a base. I simply found out what it was, because it is a figure that is sometimes used. I have estimated \$125,000.00 as a very small amount of actual cash capital that would be necessary to run a plant which has nearly

eight million dollars invested in it. That is one point that 3085 I think is sometimes forgotten. A telephone plant like this

is constantly growing."

"Q. It don't grow very much in six weeks."

"A. The installation of additional property. The money must be there. They must have the money ready to put in."

I have not made any deduction for the fact that they collect their

money in advance.

I get this \$82,000.00, stores and supplies, from the statement of the Company. They do not set that up as the amount of money they think they should have,—the actual amount of stores it had at a certain date. A great many of them get most of their supplies from the Western Electric Company. I imagine there is a branch of the Western Electric Company in the City of Houston; I don't know,-I have never seen it.

I said the fair present value of the property is seven and threequarter million dollars; I got it by estimating the cost of reproducing the property at this time at these prices. As to whether or not they were the only things I considered, it depends upon what you

mean by the word "considered." The value stated here coincides very closely with the cost of reproducing this property new. that is the large factor; the cost to reproduce.

"Q. Your statement is not accurate. You don't mean to say

that?

"A. What?"

"Q. That the value you have given here—seven and three-quarter million dollars-coincides with the cost of reproducing the property new. You don't mean to say that?"

"A. Did I say it?" 3086

"Q. Yes; I knew you didn't mean to say it.

"A. Approximately."

Mr. D. A. Frank: He said it did not.

"A. Approximately it coincides."

As to what I call "Approximately," I have got there seven million, eight hundred thousand dollars, and I get as the cost of reproducing this property new seven million, eight hundred eightysix thousand, one hundred eighty-two dollars and twenty cents. got that by getting my inventory and applying present prices.

"Q. You are mistaken about that. Surely if you stop to think,

you are mistaken about that."

"A. That is my idea of the way I got it."

"Q. I think you are confused."

"A. I think I am right."

"Q. Take your inventory and apply your prices and see what you to the You have done that?"

"A. Yes, sir."

"Q. What did you get?" "A. You mean to say the cost of the physical property?"

"Q. I am talking about what you said."

"A. We got the cost of the physical property."

"Q. What was it?"

"A. The reproduction cost of the physical property is \$6,092, 058.20."

"Q. That is not really correct. You mean to take sub-total sixteen

would be more accurate." 3087

"A. I don't see any sixteen." "Q. Sub-total sixteen."

"A. No, sir. Working capital and supplies could be called physical property. Supplies certainly are physical property. Working capital is-

'Q. (Interrupting.) That is an estimate?"

"A. What? Supplies?" "Q. Working capital."

"A. Yes, sir, it is an estimate."

Mr. D. A. Frank: It is an estimate of a very real thing.

"Q. So the only thing you have done, the only thing you have done is to take the inventory of this property and apply unit prices and material cost, which brings you out \$5,884,000.00, and then you add working capital, which you estimate to be \$125,000.00, and add the supplies, \$82,000.00, which makes the total physical property \$6,092,000.00. Then you add to that \$1,794,000.00, which gives \$7,888,000.00, or, in round numbers, seven and threequarter million dollars, which you tell the Court is the fair value of the property on which to have a return?"

"A. I tell him that is what I think."

"Q. You have eliminated from that everything that might bear upon this ultimate question of value, except the cost of reproduction new?"

"A. No, sir, I haven't eliminated it; I have taken it into con-

sideration."

I have given it very little effect. The fact is this, that 3088 the present value, present fair value, is more closely measured by the cost to reproduce than by any other factor; and if you will assume that a value must have an exchange, or potential exchange-value itself is relative. When measured in money it must have a measure of exchange, or potential exchange. If it could be imagined, or is imagined, that the present operators of this property are going to withdraw, or made to withdraw, and another group comes here with the choice of either putting in a new plant or buying this plant, I would say, and I would advise, if I were their engineer, to buy this property at reproduction cost rather than take the chance of building one, and that is the measure of the plant's Yes, sir, I say they are entitled to capitalize all this rise in wire and copper and poles; certainly it is of value, and if they are entitled to the present value of the plant, they are entitled to that. If this community should not patronize them and they did not use it in serving the public in delivering this service, they would not They would have nothing but a lot of junk, but it realize on it. is the assumption that they are going to be allowed to earn a reasonable return.

As to whether or not I would say that they are entitled to all the advance in materials that have gone into the plant, it is not a question of what they are entitled to. We are trying to find the present value of the property.

deliver lectures on economies at Washington University in St. Louis; it is on Skinker Road. It is quite a large institution,

with an endowment of betweeen fifteen and twenty million dollars. I was very much surprised that you didn't know it was there. Secretary Houston was the Chancellor of Wash-

ington University.

3089

"Q. You are something of an economist. Would you lay it down to your students as a safe economic proposition that if they had their money invested in a property where the market for realizing upon the property and converting it into cash is limited, and narrowly, limited, that that fact would not affect the value of their investment?"

"A. I would be very glad to explain it to you. I think you have

asked two or three questions. Put it distinctly."

"Q. Probably I asked three or four, because you did not answer the first one."

"A. You are asking me if there was a property here which was

not going to earn any return, how I would value it?"

"Q. No, sir; I am asking you here, if there is a property here that depends entirely upon only one source of receiving a return, and they undertake to take their profit upon a rise in material—they have invested certain money, a certain number of dollars in wires and poles and copper, and upon which they have been permitted to earn a return, and they now come in and say: "We are going to capitalize this rise in material, and the people of this city—

Mr. D. A. Frank: We haven't said that. Mr. Howard: That is what you are doing.

"Q. And these people of Houston say: "We will not use your utility upon those conditions." Then what becomes

of the value of this plant?"

"A. You must remember that in stating that this was the value, fair value of the property, it was distinctly stated under the hypothesis that it was to earn a reasonable return. If you assume a case of utility not being allowed to earn a reasonable return, you assume there is no justice in the Courts. And if you assume that—and you are also assuming a market value. The market value of a plant as it exists today takes into account the present earnings of the plant. Those present earnings are in question, they are to be adjudicated. They can not be taken into account in the adjudication, or we would come to the conclusion that they can not be changed, because we would arrive at a value based on their present return. The present fair value of the plant is more closely measured by the cost of reproducing it than by any other element."

I said I was employed in San Antonio to advise whether litigation should be continued there or not in regard to the installation of the \$7.50 and 3.00 telephone service. I made them a report; I

don't think I said anything about the litigation.

"Q. At the time you were representing the city of St. Louis as its valuator of public utility properties you entertained the idea that omissions and contingencies should represent 5% of the properties."

erty, of the physical property, and you entertained the idea 3091 then that no allowance should be made in the item of working capital where the utility collected the greater portion of

its money in advance?"

"A. I am not endorsing these things that you say I entertained."
"Q. You have the idea that notwithstanding the fact that Courts and Commissions have laid down the rule that original cost should be considered in determining the fair value of a property; that when reproduction value is much higher you would make that the sole test. You entertain the idea that going concerns of practically 50%

of the physical property, or 40% of the physical property, should be added to it in the way of intangibles. You entertain the idea that after a plant has been reproduced upon the reproduction theory and it was found to come to a certain amount at present day prices, that although the plant in operation was not a new plant, that it should not be depreciated. You entertain those ideas, and entertaining those views, you undertook to counsel a municipality as to the matter of adopting certain rates, did you?"

"A. Is that a question or a statement?

"Q. I asked you if, entertaining those views-; I asked you if you entertained those views at the time you made the recommendation to Sar Antonio to install this \$7.50 and \$3.00 rate?"

"A. In San Antonio?"

"Q. Yes."
"A. Yes, sir."

I told the City Council at that time that I did not believe in depreciating property; I told it in the report. I do not know whether or not they were men accustomed to analyzing reportof experts upon utility properties. Some of them were very good business men. I gave them that report, both the original cost and the reproduction cost. The case was such that if they took the original cost, it settled it so far as the law suit was concerned.

"Q. Didn't you say in your San Antonio report if original cost was to be considered in arriving at the value of public utilities

"A. (Interrupting.) No, sir, I distinctly avoided it."

"Q. Didn't you say it is often considered, and that it was one method of arriving at the cost of public utilities?"

"A. At the cost?"

"Q. At the fair value of it?"

"A. No, sir, not the fair present value of the plant, and I have used all through that report a term to distinguish it from value. It isn't value at all, it is merely the cost, and I say in this report— Now, in many years my views may have changed and I have learned something, and at that time I had the same views that I have now."

And my view hasn't changed since then. I will show you that I haven't. I say here in speaking of reproduction cost that the theory of cost to reproduce a property at any certain date is one much used in working out estimates of capital entitled to return. Sometimes mistakenly called fair value. I am speaking of reproduction.

"Q. Why do you say it is mistakenly termed fair value, when you say in this case that reproduction new, without any de-

preciation, plus a lot of contingencies and omissions-"

"A. (Interrupting.) I will read it over: "Capital entitled to return, as used by the Commissions, is not fair value." And I have to explain to you that the Commissions over the country have very often gotten away from the idea of value. They have taken what they called capital entitled to return, or they have even taken-"

"Q. (Interrupting.) On the first page of your report don't you recognize and state that reproduction is one of the methods and receives the sanction of the Commissions, although you don't think

it does in the Courts?"

"A. In estimating the cost of reproduction—this is from the San Antonio report-in estimating our cost of reproduction we have not used actual present day prices___"

"Q. (Interrupting.) Will you tell us where you have placed any fair value upon this property?"

"A. I do not. I say that the reproduction cost is the best measure of fair present value. It couldn't be measured in present value un-

less you used present cost."

"Q. They have shown here that you, as the city representative, have recommended and approved these rates in another city. Upon any of these contingencies that have come up between the city and the utility, where the city contended for original cost, where the city contended for but a small going concern value or cost of

3094 establishing business, where the utility contended for a large going concern value and cost of establishing business, and where the utility contended for 4½% for American Telegraph and Telephone Company service and the municipality has opposed it,—what was your idea in valuing the property? Did you coincide with the contention taken by the municipality in these matters?

"A. Of course, that would not be my object,—to coincide. My object is to do what is right. I want to do what is the right thing to do, but since you mention it, there are other places where they coincided. I was on the Board appointed by the Aldermen of the city of Buffalo to make a valuation of the street railway property there. I was the representative of the company, appointed by the

The representative ap-

pointed by the city was Professor Richey, and we coincided and we came out with practically the same set-up as I have here."

company on that Board of Arbitration

On the Board of Arbitration, I was appointed by the company and Professor Richey was appointed by the city. Our set-up of the valuation of the railway was practically what we have here. In making the valuation for the city of St. Louis of the United Railways in 1918, the set-up was practically what it is here. That was in 1918. The Buffalo matter was not before the beginning of the war, it was only a year ago.

"Q. Mr. Allison, as a representative of the city and inquiring about these rates in the city of San Antonio, you never advised the city, or never suggested that it was not fair to have rates based upon price levels where there had been an abrupt rise due to

a specific cause?"

"A. If I suggested it was not fair to take the present fair value of the property, and that would be the reproduction cost, I would have been going against what the United States Supreme Court said."

The United States Supreme Court has said that we must get the present fair value of the property. That is one expression used, and another one is that the value must be taken as of the time of inquiry; that is another expression which means the same thing. Another one, that the value must be taken as of the time of use; those are the leading cases.

"Q. Didn't the Court say anything about it being confined to the property used and useful, and that the public is not to pay more than

the service is reasonably worth?"

"A. I expect they have said that."

I do not think that present day prices are abnormal as compared

There has simply been a change in the price level, and the word "abnormal" does not apply.

In the San Antonio case I may have adopted in toto the operating expenses and report of Mr. Baker and Mr. Pennell; I do not recollect. Q. I notice you refer constantly to Baker and Pennell, and appear to adopt them."

"A. I probably would."

"Q. I don't notice anything in the report where you suggest any issue with any claim made by the Company."

Mr. D. A. Frank: Are you contending he should take issue with

the company in representing the city, and climinate some item?

Mr. Howard: As long as you ask the question, I am in no way questioning Mr. Allison's honesty or his integrity; I am simply making this statement,-that when you come here and produce him as a witness, trying to give it emphasis, probative force by reason of the fact that he was employed by the city and recommended a rate to be installed in a city of this State, that I want to show what his views are.

Mr. D. A. Frank: That he should disagree with the city,

Mr. Howard: No, sir; my idea is that he is looking at the thing through the eyes of the utility. His environment is such that he looks at all these problems from the standpoint of the utility. his environment and associations are much-

Mr. D. A. Frank: Ideas he got while representing the city of St.

Louis and the Public Service Commissions.

Mr. Howard: I am showing his state of mind is such that he has practically approved every proposition that has ever been put forth by the Bell System.

Mr. D. A. Frank: If you can prove that by him, go ahead,

There is a proposition that the American Telephone and Telegraph Company has put forth that I have taken issue with; I take issue with them, but - is not always on account of trying to 3097 get lower figures; it is because I think certain things are

right and certain things are wrong. Let me tell you something: As the Commissioner in St. Louis I started out with this popular idea and ignorant idea that the public utility corporations are all full of all kinds of tricks, and I was on my guard for everything; but I found that they were not, after four years of dealing with them. They gave me facts. I didn't take them for granted, but they did not misrepresent. Even our street railway, which had a very bad reputation, there was no misrepresentation by them in the facts that they presented to us. They knew we were going to the bottom of them, but the facts were, in this four years of dealing with these people, I found they did not go to those little tricks of When they told us anything-I didn't always misrepresenting. agree with them—when they claimed anything, they had some reason behind it. They put up much higher claims in some cases than we allowed them; nevertheless, there was something behind them. I am not in the position of thinking that everything that is put up by a company is a lie, and I do not believe it. You are

not to understand that I have undergone a change in belief; I have simply gotten information. I had an ignorant idea in the begin-I have not been converted to the idea that everything they contend for is all right; I don't think that is necessarily true.

"Q. Inasmuch as you brought in this San Antonio rate-

"Mr. D. A. Frank: He did not, you brought it in yourself."

I understand that San Antonio is about the same size city 3098 as this.

"Q. In recommending that \$7.50 rate you considered that they were entitled to about One and Three-quarter Million going concern value over there upon which the people should pay a return?"

"A. Entitled to what is set up in the report, which is about the same percentage of the physical property as it is here."

This cost of establishing business is a fact. Now, there are two things; there is an amount that has been spent in establishing business. ness. That is the original cost. Now then, to get the present value you would have to get what would have to be spent today to establish the same business, and they are two different figures entirely. We have a cost of establishing business of \$877,000.00 based on

physical property of \$3,353,000.00. That is reproduction.

I did not figure the value of the San Antonio plant on 1918 values; 1916-1917 prices. We figured it there on 1916 and 1917 prices and come in here and figure it on 1919, because we did not know what the prices were at that time. Factories were full of war work and it was a time of excitement, and we did not know whether the prices were temporary or not. Since then, there are no indica-tions of lowering prices and every indication is that they will stand where they are or go higher, which makes a different proposition out of it. I consider that we are at peace; we are not in war.

I did not say that I was a political economist; I say I am a student of economics,-a teacher of economics. All teachers are students, they should be; they are not all students, but they should be,-you never get it all. As a professor of economics

I have kept in touch with the current opinions and expressions of public men.

"Q. Have you ever heard it urged that the present high cost of living was due largely to the fact that we haven't settled conditions on account of peace not having been arranged?"

"A. I think it is the veriest newspaper rot. We have peace."

The facts are, we have peace and are going ahead and doing the same work as if it was signed. There will not be any change at all when they sign that treaty. We are already shipping goods into Germany. I was talking to a man the other day that had been over there to sell to them.

In so far as telephone supplies are concerned there was a marked change in the prices in some of the things the first of December.

This work was done as of December.

"Q. Do you think there has been any change taken place at all

in the world in regard to prices and in regard to commerce—you think our stories are taken as freely in Europe now as three months ago?"

"A. I don't know about that. Europe's ability to pay-"

Cotton is a staple. Cotton exports are not being received rapidly in Europe; we are just beginning to find out they cannot pay for them. I think cotton is declining and I think it probably will decline. I don't know that it is declining, but I think so. If

3100 you say it is I will accept it. I haven't any recent information about trade in the East now in regard to how it was six

months ago.

"Q. Have you talked with any merchants that buy in the East who say there is a change in conditions, the change is very marked, in that they are sending out their representatives and soliciting trade and urging large order, whereas, six months ago they were indifferent and would not fill their orders?"

"A. It would depend upon what line you go into. If you are

talking about dry goods, I know nothing about it."

I know nothing about dry goods and shoes. I know the steel mills are very far behind in their orders, and all the construction materials are far behind. Construction is very expensive now, and there is a great need of construction, and those prices are going to keep up a long time. I would not say that there was a shortage of buildings prior to the beginning of the war; at least in St. Louis we could get office room very readily, and houses were for rent, not excessively so, but could get them, and apartments,-you could get them, a lot of apartments for rent, and now you cannot get them You might say it was somewhat overbuilt just prior to the war, even up as late as 1917 and then for about a year or a year and a half building stopped and there was a cessation of building activities; it seems that that all over the country has created a demand for houses and buildings of all kinds. It will not be caught up with within a year and a half, that is, as soon as this year and a half's shortage has been caught up with. It will take longer than that; people are not going to build so freely. We have all

that; people are not going to build so freely. We have all got to go up so we can show the man a profit in going in;

there has to be a general readjustment.

"Q. In other words, these high prices retard building because people are hoping prices will come down?"

"A. I think they are afraid they are going to come down."

Based upon that proposition if we were without a telephone plant here now I do not think capital would be eager to come in and build a telephone plant such as I imagine here on present prices and take the chance unless they were assured of a fair and reasonable return upon what it would cost them to reproduce it; they would want it practically assured upon these prices.

"Q. If you have a plant that is built here that you have valuated at present prices and added certain things to, and say that is the fair value. You say that it is not the value unless they are

3102 permitted to earn a return?

A. The fair value. The market value would have to be provided for by a fair return on the fair value."

Assuming that these people are entitled to earn a return upon the fair value, then the next question we have got to determine is what the fair value is. We set this property up, take the inventory and apply unit prices and material cost and get a certain figure and say that it is the fair value. If the fact that no other company will come in here and take chances of building a plant like this unless they were guaranteed a return upon the cost of reproduction, to my mind, it would not indicate that the present value of this plant is not as much as it would appear from the application of these material prices and unit costs; the situation would then be that we have here the present fair value, and the tribunals are not going to allow us a reasonable return. We do not assume that,-we assume we will get justice.

Under the injustice or unreasonableness of confiscatory rates which you assume, the market value of the property would not be the fair

value of the property.

"Q. Assuming that you have got a plant that could be sold to others, but the fact is that the prices have increased until they have got up to an abnormal level-

"Q. (Interrupting.) I do not admit that."

I do not admit that, not compared with what the level will be. It is a higher level than it was before. Abnormal is a sudden

bulge.

I have not stated that a man would hardly come into this 3103 community and buy a plant of this kind and take his chances upon these prices remaining at this level. If we establish the fair present value, and he assumes he is going to get a reasonable return, he will come in. If he assumes he will only get a confiscatory return, he will not come in. Assuming he will come in here and there will be established a fair return so long as these prices continue; but if these prices drop down, there would be a readjustment lower of his rate an investor would come in and take a chance at this time, because the reasonable return will take into account the risk. He may think the prices are going higher. He will take the risk one way or the other. That must be taken into considera-The reasonable return must be enough to induce him to do it. My idea is you should fix the return now that would justify him in taking a risk of having the prices drop; he may think they are going up. I do not want to have these prices permanently guaranteed, or a return upon these prices fixed permanently; there are not The measure of fair return is what we think the investor would go in for. That is very simple. The measure of fair return is what the investor would put his money in for.

I am asking you whether any prudent man would come and put eight million dollars in a telephone plant of this kind in this city with the facts staring him in the face that these are highest prices ever known and there is liable to be a drop in these prices,

whereby his rate would be lowered and his return then would be limited to six million or five million instead of eight million.'

"A. The business man takes those chances all the time. investor knew he was assured of permission to earn a reasonable return, that is the return that would induce him to go in. In fixing the return that would induce him to go in, he would take into account the risk of the property going down."

That does not amount to the same thing as guaranteeing him a return upon the property.

"Q. Mr. Allison, you have reproduced here a very pretty new telephone system. What is the purpose in doing that, Mr. Allison?"

"A. Well, it is not a reproduction of a new telephone system. It is a reproduction of the telephone system now in existence."

The idea is that we are going to reproduce that,—reproduce it new. It is an estimate of reproduction to get the fair present value of it, estimate of what it would cost to reproduce its property; to go and build a new plant, that is what my reproducing would be, to go and build a new plant. We are taking a simple estimate of reproducing the physical plant and business in order to make its fair present value. We are simply making an estimate of what it would cost to reproduce it in order to measure the fair present value. Although that plant, when we get it reconstructed going on that basis would be new and this one is not new, in my opinion, it would be the same value. I stated that is rather the test of a man coming in and

3.05 building the plant new and undertaking the Telephone business, and seeking a return upon that price new, that he would do it if he got enough to guarantee him or justify him in taking the risk. In other words, what I mean is that if the return was such that would induce him to come in. I do not mean it should be something over a fair return on the then values; the fair return is the return that will induce him to come in, that will induce general money to come in. If it is not that much he would not come in.

"Q. You then consider a fair return on the existing plant as one that would pay such a return as would induce an investor to construct such a plant at the highest prices possible known in history?"

"A. Well, I say, we mentioned first the present fair value of this

plant. We measured that my reproducing the plant.

Now then, having determined the fair present value of the plant, a reasonable return is that return which would induce somebody to do it. As to whether you may get a fair return in dollars, or in rates of return, you would get from that principle, you might calculate down to dollars in rates. I do not know what figure would be a fair rate of return in this plant; it would be whatever would induce the capital to take it. I remember in my set-up I gave a capitalization for the initial risk so that the fair return would be a return after saying to the man you can earn on 15% more than you put in. My idea in putting in that 15% is that would induce the man to come in and start a new telephone business and he would have a reasonable return on this. That is not an imaginary case because it is done. It is the principle.

"Q. It is imaginary in so far as inducing somebody to come into this territory and put in seven or eight million dollars, but you say this risk would induce him to come in even at these highest prices known in history?"

"A. I calculated it that way."

I say now we will take that 15% and add it to the value of this plant as it is, already in business, and give them a return upon that 15%, because we are trying to estimate the present fair value of this property, and in order to estimate it we have to estimate it at what it would cost to reproduce it in order to get the money.

"Q. So then in addition to permitting them to add to their values the increased price of material and labor over what it would cost them, you have got them up to quite a big figure there, a couple of million, two or three million, but now you say that having been done and these figures having been brought up to these high prices, now inasmuch as any investor that might be induced to come in here to operate the plant would have to have 15% for initial risk, why we will add another 15% to these already appreciated prices in order that we may get a fair return on the property?"

"A. Why, we are measuring the value that is there, the money is already there, and we are measuring the value that is there, on

3107 how much it would cost to reproduce it."

We are giving them the price that it would cost to produce it to-day. It is more than what it did cost, but it is the measure of the present value. I do not know whether you could call it appreciation over the cost or not; it is higher than the original cost, if that is what you want. Appreciation is the converse or opposite of depreciation.

"Q. So your theory would be this: you are trying to gauge these people's rights by what some imaginary person might come in here and do, and if he would come in here now to build a plant and operate it he would have to pay these high prices, the highest known in history. Then you say he wouldn't do that unless he has got inducement to do it. Therefore, we will add 15% to induce him to come in here and go in the telephone business, and there being no such person as this one we imagined, we swing back to the concrete and say here are some people that have invested \$3,000,000.00 in the business—

Mr. D. A. Frank (interrupting): Where do you get your \$3,000,-000,00, Mr. Howard?

Mr. Howard: Oh, we get it from the evidence.

Mr. D. A. Frank: \$4,600,000.00 is the only evidence in the record on cost.

*3,000,000.00, it so happens that owing to a war these prices have gone up so that it would cost \$6,000,000.00 now to put this same material and labor in a plant, and while they should have a return on that, now after fixing this rate we haven't

hardly got enough yet, because some other man wouldn't take their place on these prices, and we would have to put an additional 15% to induce him to do it, we will just give him that 15% and bring it

up from three to right?"

"A. It is not a question of giving these people anything. I say, it is not a question of dealing with per cent at all. It is a question of finding out the measure of value of this present property, and that is what we are trying to do, and what somebody may have made out of it or lost out of it has nothing to do with the present measure of the property."

"Q. But we will get the value so long as we keep in poles and wires and switchboard, and we have sprung that value from \$3,000,-000.00 up to \$6,000,000.00, and we say that is the cost of building it, that is the physical property, and I want to know why you add

that to the record?"

"A. I think I can answer your question by saying what has been paid for the property hasn't anything to do with its present value. The fact that somebody may have come in here at a bankrupt sale or something and bought this property at almost nothing-

Mr. D. A. Frank (interrupting): It may have been given to them.

"A. (Continued.) It may have been given to them; in fact, that question has already been passed on."

The question is not what has been paid for it; the question is its fair present value. Its reasonable present value is not measured by past cost; it is measured by present cost.

"Q. You have got, without the trimmings, you have got up to nearly \$6,000,000.00. Then what I want to know is after you have said these prices have gone into it, whereby they have made a fine investment here and have been lucky, in having their properties appreciated, whereby you get it up to \$6,000,000.00 through this appreciation, that has come to them in this community. Now, I am asking you where you get that other nearly \$2,000,000.00 or \$1,800,-000.00 to tack on?"

"Why, our measure of the value of this property is not necessarily a cost of reproducing merely the physical property. It is the measure of reproducing the property as a Going Concern."

The \$1,790,000.00 that I have added on here is an estimate of the cost over and above the construction cost to create the property as it That is to get the money and to protect the business. on account of high prices, the present prices and cost of all these things, is the only thing you can use in getting at the present value. Now, if you want to know what the value was at the time these things were paid in, that is not present value and that may go back four or five years. The present value is based on the present cost. they have lost or made has nothing to do with its present value.

We are looking at the thing at the present time. What they 3110 have done so far as creating this property or business has nothing to do with its present value. That is a question, the man in the street might say that they are making too much money; that hasn't anything to do with the present value. Cost of business

on going concern value is certainly a fact; it is a cost. I have stated

that cost of establishing business is a fact.

Over in San Antonio is a telephone business, was in 1918, and they had certain physical properties there. They had what I call a Going Concern or Cost of Establishing Business.

Why, if that is an item of "Q. And that was an item of value. value inherent in that property, do you set up in one way \$250,-000.00 and in another \$800,000.00?"

"A. You mean over there?"
"Q. Yes, sir."
"A. The first estimate on original cost was the estimate of what it actually cost to establish that business, what it actually did cost. The second estimate is what it would cost to reproduce it, and that was the estimate at that time, the value at that time. The other had nothing to do with value. It was merely a statement of how much it did cost.'

"Q. It is a specific fact that where you have a definite rule of knowing what a thing cost, yet you will take the reproduction theory to arrive at some sort of an estimate with regard to

what that particular thing-

"A. (Interrupting.) Would cost today?"

"Q. (Continuing:) Would cost?"

"A. Just as if I had an office building here that cost me \$100,-000,00, and it was worth \$200,000.00, I would try to get my rent on \$200,000,00, and I would say that my building is not worth today \$100,000.00, but \$200,000.00. That is the measure of its present value. It may have been worth \$100,000.00 ten years ago, or whenever I built it, but today it is worth \$200,000.00."

This Going Concern value is an estimate of what it would actually cost to get that property as a going concern today. It is an estimate of an actual cost today and that we think is a very close estimate of

actual value.

As to whether or not I think actual cost today, where telephone service is in demand, and where people are highly educated in the use of telephone, and in a thickly settled community, would be higher than it would be in the early days as these plants have progressed, I will say the cost of attaching business, we have taken that into account and used only \$2.00 instead of \$4.00 on account of that education of the community, but when we do that even, we are taking a part of the value created by these people. However, we do take it as an estimate as what it would cost with the present education of the people in the use of telephone. Otherwise, it would have taken \$4.00.

"Q. Now, for the enlight-ment of the City Council over in San Antonio, you set up the cost value and told them one figure would be the cost of establishing a business, \$250,-000.00; then you set up another figure and told them that

the cost of establishing business would be \$800,000.00?"

"A. I clearly stated to them this is what we estimate it already This is what we estimate it will cost today, at the dates we took. One is an estimate of what it did cost. The other is an estimate of the present value."

This \$1,700,794.00 is what we think it would cost today to just go ahead and build a new plant, and we think it is a minimum

estimate if you examine the percentages in there.

We did not group items 1, 3 and 5 on page 6 because we wanted to show as clearly as we could our reason for putting them in there. It is an analysis. We have got the cost of promotion. Initial risk does not come right along about the time the thing is promoted; when they go to get the money; that is when the promoter is an active gentleman.

"Q. That is when he is trying to get the money?"

Mr. D. A. Frank (interrupting): He is not the one that is taking the risk?

Mr. Howard: Oh, no, but it is all right in these hard times.

"Q. Now, we have got the promoter. Then we have got the cost of assembling the capital. I thought he was the boy."

3113 "A. Well, I am sorry Mr. Howard that you don't understand. The promoters don't assemble capital. They get investment bankers to do it."

Promoters don't assemble capital. The name of that gentleman that assembles capital generally he is called an investment banker. An investment banker and broker are the same thing. A broker is not always an investment banker, but an investment banker can be called a broker. He don't like to be called a broker, however. I have not separated these things out of deference to the tastes of the bankers, they come in classes of expense. I did not just put those two things in at one fell swoop because it would not be explanatory.

I divided the other things into cost of supplies and cost of buildings, and here are two different costs. One is the cost estimated to go to the promoter; the other is the cost estimated to go to the investor for taking the risk. The other is the cost estimated to go to the investment banker for assembling the money; it is a very good reason to divide them. I think perhaps I have underestimated the

lawyer.

"Q. Well, let's get away from this imaginary stuff if you don't mind, and let's turn back and see if we can find something about the troubles of this struggling company through the days of its travail and sorrow."

"A. I have nothing to do with that."

I am here to help the court put a fair value upon this 3114 property. It is this property, duplicate of this property.

"Q. Well, now, you first construct a new property, and you talk about all the trouble they are going to have reconstructing it, and you tack on in the aggregate something over \$2,000,000.00, and then you turn back to this property and give it to them new without any depreciation, and say that because this fellow that is coming

down here and going to build this imaginary plant and have to incur all these costs, why you gentlemen have got something that he has, and he has got to pay these things to get them, that is about the process of your reasoning, isn't it?"

"A. That is about the idea."

"Q. All right now. We have gotten back to these people, and if any of this cost of attaching this business and going concern have been paid by the people of this community, would you still say they have got a right to tack on this \$2,000,000.00?"

"A. That has nothing to do with my figures."

"Q. Yes, it does. You can understand now your idea in the abstract of political economy and these fine differentiations that you may make are things in their place, but we want to get the facts and keep in mind, please, that this is not an abstract question, but a concrete question, which is—or incidental to the ultimate conclusion anyhow is the determination of value?"

"A. Of present value."

"Q. Of the property that is here, not an imaginary property, not the one that you have built, and the one that you are theorizing about, or one that you could lecture about, but the one

that is here and is operating, and that we want to get the value Now let's get it. Do you tell me that you have gone ahead just as you have told me you had and reconstructed this plant just as if some new person was coming in here, and these people have something that he wants and hasn't got, then he would have to, if he gets it, put himself in their place, that he would have to pay these prices because those are the prices now, although they were fortunate enough to have bought the material some years ago and that you all applied those prices for that reason, that while their plant is old that for some reason or other we are still entitled to use it as new and we will admit all that. Then you say that because they have got a going business here, a concern that is going and is ready to work and earn money right now and he wants that, he would have to pay what it would cost him to get it because these people have got it and he has not. Now then, finally we are just using him by way of illustration, to illustrate the point, because this thing doesn't exist and there is no such investor, but we turn from this imaginary investor and try to put this plant in its place, and say that is the measure of what they are entitled to, is what somebody, some stranger, would have to pay if he wanted to carry on this plant,

that is true, isn't it?"

"A. If I came in to buy a patent medicine business, and I was asked how much I would pay for it, I would calculate how much it would cost me now to establish that business, and that would be

the measure of what I would pay for it."
"Q. Yes, you have told me that."

"A. And if I was going to buy a haberdashery, or hat store here in town, the measure that I would pay for it would

be the present cost of establishing that business, or if I were going to buy a utility, the measure of what I would pay for it would be what it would cost me to reduplicate it." "Q. Oh, now-

"A. (Interrupting.) Now, I wouldn't care what that man paid for his advertising-

"Q. (Interrupting.) I know that. You don't answer my ques-

tion

"A. Will you let me finish?"

"Q. I would, but there is this suggestion that I would make that cames probably within my rights. When I ask you a question I an entitled to have an answer somewhat responsive. If you will keep that in mind I will be glad to listen to you."

"A. I am trying to do it, but you are probably trying to get me to

say that what it probably did cost-

"Q. (Interrupting.) I didn't ask you that. I asked you just the opposite. I asked you if you didn't take this theory, that because these people have the plant here now operating and going, if some stranger came in here and wanted to operate just such a plant as this, and either had put up one or bought this one, that if he bought this one, first he would have to pay you the inventory at the present prices, that is true, isn't it?"

"A. Yes."

"Q. Because they have got it and he wants it. In the next place they would have to pay him this \$2,000,000.00 for establishing the business because it is a forced proposition. He couldn't do any better, it would cost him that \$2,000,000.00 to establish the business. That is clear, isn't it?"

"A. Exactly."

"Q. Just the reverse of what you thought I had in mind?"
"A. Well—

"Q. (Interrupting.) Now right there. I am asking you to get away from this imaginary man that wants to start this plant, and come back to the present owners of the plant who have all these things; they have the inventory of the property here, and they have all these prices, and they have got a going concern, and got everything that you say is valuable. Now I am asking you, in trying to get at this practical solution of this question from a rate making standpoint, if the community that this utility is serving as distinguished from the new man that would have to come in and start, have collected from this community the cost of establishing that business, whether you would still say that it should be added to the physical property?"

"A. Well, have they collected from this community the cost-"Q. (Interrupting.) Well, I am asking you now if they have. You are experienced and scholarly enough to know that you can base conclusions and base answers on assumptions. Now if they have would you still say this should be added to the physical prop-

erty."

"A. I certainly would. What they have done has nothing to do

with the question of present value."

"Q. If that is your opinion, I will dismiss you right now. I was intending to go over with you and point out to you the facts that

nearly all of these things of making this business has been paid out of operation and paid by the community from the earnings of this plant, that they had been permitted to earn

it and get this business.

"A. Let me answer that. If this community had given these people all of this property and it belonged to them, and we were trying to get at its present value, that fact that they had given it to them would have nothing to do with its present value."

"Q. I have no doubt that you are honest in your views."

"A. That is plain on the surface of it. We are trying to find the present value of this property. If the community had given it to these people—

"Q. (Interrupting.) I have no doubt about your views and about

your honesty in your views, but to my mind that is absurd."

"A. I want to reiterate that if the community had given them this property that wouldn't affect its present value."

Mr. Howard: I have finished. It is no use of me going over this matter with you.

This case is my first employment by the Bell System. I would like to add to my last answer there that if the community itself owned this property, its present value would be measured approximately by the cost of reporducing it. Who owns it has nothing to do with its value. The ownership has nothing to do with it; it is a question of value.

Redirect examination.

3119 Questions by Mr. J. D. Frank:

"Q. Mr. Allison, if a man came to Houston for the purpose of purchasing this exchange, would it be reasonable for him to demand, that you discount the value of the property because a part, or say, all of the cost of establishing a business had been paid out of operating revenue."

"A. I wouldn't care where it was paid, neither would you. Here you have got a property and it has a value, and that is what he would pay on. The source from which you get your capital would

not interest the buyer."

The question is as to what was the value of the property, the present value of the property, the present fair value of the property.

"Q. And what you have done is to estimate the cost of reproducing the business of this company here in Houston which is the same as you have estimated, the cost of reproducing the poles, the wires, the switchboard, and the other physical parts of the company?"

"A. It is assuming the same kind of a proposition."

I made investigation about the cost of this property and did not find it to be \$3,000,000.00. I found it to be \$4,300,000.00 without counting the accounts to be amortized which were paid by this plant that has recently been consolidated, the Houston Home Telephone

There is an account to be amortized there that would add something like \$750,000.00 to that, which would make the actual cost estimate of the property right close to \$5,900,-

As to whether or not I have added 50% of the physical part of this plant for going value as counsel on several different occasions made the statement, I think it is the relationship between \$1,700,-000.00 and \$6,000,000.00; it is about 29%.

It is not a fact that I have considered in arriving at what in my opinion constitutes the value of this property only the cost of re-

producing it; I have considered the other things too.

The qualifications, experience, etc., of the witness, H. P. Topping, are set out herein at pages 973-978 inclusive.

Mr. H. P. Topping, a witness for the plaintiff, was sworn and testified as follows:

Direct examination.

(Questions by Mr. J. D. Frank:)

I have not made an inventory of the properties constituting the Houston Telephone Plant but I have made an appraisal of the property. I got the quantities of property from the Telephone Company, that was furnished me by the Telephone Company. I took a copy of Mr. Hoag's inventory, the inventory which he made in connection with this case.

This book you hand me is Plaintiff's Exhibit No. 13, F. M. Hoag, witness, Southwestern Telegraph & Telephone Company, Houston Exchange, inventory. That is the inventory which I used in making the appraisal of this property. I could not say whether that in-

ventory is correct or not, because I did not attempt to verify 3122 any part of it, but just assumed the inventory correctly listed

the property constituting this exchange, and using that as a basis made an appraisal of the property. I went about it in the same manner that I would have assumed if a client had come into my office and told me he desired to purchase the property and wanted to know the value of that property, or what it would cost to

reproduce that identical property.

To be a little more specific: I determined the labor cost by discussing the labor situation with one or two employers of labor in Houston, to determine the wage scale and other conditions. is, I made a study of local labor conditions in the City of Houston. I was going to reproduce this property and I wanted to familiarize myself with conditions in Houston. That is very essential. I talked with the General Manager of the Houston Light & Power Company, and with the operating officials of the Telephone Company, discussing the wages, the present scale, the possible future of labor conditions, possibility of increases and amount of available help. I found that it occurs very differently that there are other industries who pay

more money than the local institutions can afford to pay, and that the labor situation in Houston is one of the elements which is a very important factor in determining the cost. In building up my unit costs here, I have used present day labor prices and from

all the information I can gather, from my study of the situation, I do not anticipate any reduction in the present scale of wages. I am familiar with labor conditions generally throughout the United States, and I think my answer would be applicable to the labor situation as a whole, that is, generally throughout the United States as well as in Houston. I cannot see any reason, with the present coal situation, railroad situation, steel workers, where there is any opportunity for reduction in wages. I have not heard or known of any reduction in wages recently. I have been engaged in telephone and valuation work for about twenty-two years and during that length of time I have not known of any general reduction in the salaries of labor, but I do know that labor has been gradually going up.

I have stated that I do not expect any reduction in the wage schedules in the future and I based that upon,—take telephone supplies, for example: Labor amounts to approximately 65 to 70% of the finished product in place in the plant. I am speaking of the cost of producing material, that labor is one of the biggest factors in the cost of manufactured material. As labor conditions seem to be on an upward trend, I don't see how you can expect any reduction in prices

in the immediate future. I am speaking now of material 3124 costs. I have used present days costs in making my appraisal

in this plant. In order to reproduce this plant, it would have to be reproduced in the future; it could not be reproduced in the past. I have assumed that I would make contracts with the supplyers for the quantities of material that are in this plant, for deliveries as they could manufacture them. I have not attempted to, or made no allowance for the probable increase in prices over this construction period. In determining the method of procedure in a reproduction case, the first thing that I have done was to determine my economical period of construction and I have determined that it would take three construction years to reconstruct this property. That would be the most economical period. You cannot reproduce it in a year, because you would have to import men-you couldn't assemble enough men to do the work, you would probably have to pay a premium in wages, pay overtime, and you could not get your equipment from the suppliers, and the increased cost would be prohibitive. You wouldn't want to extend the construction over too long a period, because you would have the loss in revenue, and after studying the matter very careful. I concluded that the most economical period would be three years. You would have to purchase your land, you would have to prepare your plans and specifications for your buildings, and after your buildings were erected you would have to install your central office equipment. During the time that you were building your

buildings and installing your equipment, I figure that you 3125 could arrange for and complete the construction work of the

distributing system, or the outside plant.

In order to reproduce a property of this magnitude, it was necessary to make a very careful study. You would have to organize your forces and lay out the work in order to produce it in the most economical and efficient manner. I have prepared an exhibit on that, if you care to see it at this time.

Mr. J. D. Frank: We desire to offer that in evidence as Plaintiff's Exhibit No. 29.

(Thereupon said exhibit was received in evidence and marked Plaintiff's Exhibit No. 29, and said Plaintiff's Exhibit No. 29 is transmitted herewith in exhibit file.)

You will notice down in the left-hand corner there is a heading "productive men." That would represent the men that do the productive labor in placing the physical property. Those men are not qualified to go out and do this work without more trained and more efficient assistance. It would be necessary to place a gang foreman in charge of a certain number of men. A gang foreman can efficiently supervise seven or eight men and it is his duty to see that they produce in the most economical and efficient manner. In a plant of this size, with the number of men that would be required, it

3126 would be necessary to have a supervising foreman, a man who would have charge of a certain number of these gang foremen. In addition to that you would have to have time-keepers, store-keepers, and you would have to have a plant accountant, general supervisors, purchasing agent, office space for these men. You would have to have warehouses and storage yards, and on this chart I have attempted to indicate how I would divide this expense up. Under this item "A," or under the heading "A" appears the material expense. Under the heading "B" is direct labor and under the heading "C" is the indirect labor and tool expense. Attached to the chart I have indicated about how this organization would work out. I have estimated that it would require about 250 men to reconstruct this plant during the reconstruction period of three years. I would not have all of those men employed throughout the construction period, but I would start off with a certain number of them. I would start first by building my pole and underground conduit plant. I would start that work simultaneously, digging the holes, hauling the poles and placing them, and in the first quarter I would put on about 120 men to start with, and then each quarter as the work progressed I would put on additional men. For instance, I would allow the pole plant to progress about six months and then start to stringing aerial cables. After the underground plant had progressed about the same time I would start to placing underground cables, and in about three months

I would start the splicing crews to work splicing the aerial cables and underground cables and as a peak I would have about 250 men at work, during the main part of the construction. Those men would be gradually cut off as the work was completed, until — the end I wouldn't have any men, I would lay them all off. I did not make the estimate as to the number of men I would have to have in reconstructing this plant for the purpose of building

up material costs, that was for the purpose of satisfying myself about the economical construction period. If I had too many men they would be in each other's way, couldn't do the work efficiently, and if

you didn't have enough, the work would drag.

I have made a study of the past history of material prices and the present material costs, and considered what would happen in the future with reference to material prices. I tried to make a very careful study of material prices and went into considerable detail. my best judgment that prices are more apt to increase than they are to remain where they are to-day. I base that upon the fact that I am furnished a price list by various supplyers from time to time, and I have in mind right at this instant prices furnished in August, a price list received August 26th, 1919, and there were a number of increases in various classes of material and apparatus at that time, even over that period.

The Armistice has been signed a little over a year and prices of various material has been going up since that time. are a number of reasons why I do not expect any reduction in

3128 the price of material in the future. As long as labor conditions remain as they are, and the high labor scales are in force—labor represents approximately 65 or 70% of the value of material in a plant—you cannot hope to reduce the material values very materially. In other words, I mean that on the various articles of material that enter into a plant, the cost of those articles, I would say, are divided up about 65 to 70% labor and 30 to 35% material. Therefore, that is one of the things which leads me to believe that the prices of material will not go down. That is on account of the high wage schedules which are being paid at the present time, and, another thing is Another reason is increased freight rates. Another would be higher taxes. This war will have to be paid for, and manufacturers will certainly add their pro rata share to the cost of their The question of supply and demand within the next few wears will be one of the very real problems. For example, during the war period a great many of the utilities, telegraph and telephone companies and electric light companies have postponed all of the construction work they possibly could postpone, they only purchased such construction material as they really needed to maintain their plants, and to keep them up in condition, and as the result there will be a very large demand within the next few years—for the next few years for all kinds of construction material. That, I think, will have a very large influence in regulating the prices. And the item

of gold supply, that has been increased. In my opinion the 3129 war has not been responsible for all of the increase in the price of material in the last few years. There have been certain classes of material that have been advancing even before the war. practically to all of the material which enters into a Telephone plant, the items that run into money fast. In other words, there has been a gradual upward increase in the prices of these materials even before

the war. I have prepared an exhibit on poles. I wanted to determine what has happened in the past ten years with reference to the price of

poles, and I would like to offer that as an exhibit.

Mr. J. D. Frank: We offer that in evidence as Plaintiff's Exhibit No. 30.

(Thereupon said exhibit was received in evidence and marked Plaintiff's Exhibit No. 30 and said Plaintiff's exhibit No. 30 is transmitted herewith in exhibit file.)

I have attempted to indicate on that first page the price of the poles at the woods from 1910 to October 1919. You will observe that in 1910 a 25 foot C Pole cost at the woods, \$1.50. It increased up to 1911, 1912, 1913 and 1914. In 1915 it remained the same,

and there was a little rise in 1916, and from 1916 to 1919 there was quite an abrupt rise, and then a slight rise during 3130

the nine months of 1919. The prices of material are still The price in 1919 was about \$3.60, \$3.55 or \$3.60 as compared to \$1.50 in 1910. Prior to that time there were fluctua-tions in the price of poles, but a gradual increase. That was the 25 C pole that I discussed then. The 25 B cost \$.85 in 1910 and they cost \$4.60 now. The 30 foot C pole, cost in 1910 about \$2.15 and in October 1919 cost \$6.00. There is not anything at the There is not anything at the present time to indicate there will be any reduction in the prices of that material. This is my opinion that there will be no reductions in the pole prices especially because the pole supply is limited, and the demand is constantly increasing and I cannot see any reason why we could expect a decrease in the price. In fact, I really expect the price to increase. Labor conditions would have something to do with reference to the continuance of the high prices of that material, and freight conditions would have some-increased freight rates. I am speaking now of the increases which have been put into effect during the government operation, and in all probability there will be additional increases. I make that statement because the government has been operating the railroads at a deficit, and when they are turned back to the owners in all probability the owners will have to absorb in increased rates the increased cost of operation. It is my understanding that the government is now figuring on re-

turning that property to the private owners within the next Then, in order to take care of these deficits few months. which have been accruing, the railreads will have to increase their rates, they will have to produce a revenue from some source, and that is the only way that I know of that they could produce

it, by increasing the rates.

On the second page of my Exhibit the first pole is the 30 foot B. The price of 30 foot B and 35 foot C was the same in 1910, \$4.50. They both went down slightly in 1911 to about \$4.30, and then from 1911 the prices began to increase and in 1919 the 30 B pole cost at the woods about \$9.15, as compared to \$4.50 in 1910.

On the last page of this exhibit is the average monthly price of Lake Copper at New York, over a period of years from 1900 to Lake Copper is raw copper as it comes from the mines, unrefined. The price of copper does fluctuate more so than the aver-

age item of material in telephone plants.

The curve on that exhibit represents the history of that price

from 1900 to 1919, and if that curve was smoother out it would have a tendency of a gradual increase. During the war the government regulated the price of copper and placed a price of 23½ cents on copper, and that sort of regulated and held it down. After the armistice was signed copper began going down until,

as the curve shows here, a little below twenty cents, and then started up again and in 1919 at one time it went down as low as fifteen cents, and then recovered and went back to approximately 22 cents. It is now on an upward incline,—it fluctuates.

Cross-examination.

(Questions by Mr. Howard:)

I have put in most of my life in telephone work. When I stated that labor has been gradually going up since about 1900 I meant that as far as telephone work is concerned. It has been gradually going up, and I mean by gradually that wages have been gradually increasing from year to year. As far back as I can remember wages have been gradually increasing from year to year. The increase from 1915 to the present time has not been gradual, that was a little abnormal. I haven't an exhibit showing the labor increase in the way that I have the pole increase. When I made my investigation in Houston it showed that labor had increased 54.76 per cent since 1917 which is a pretty abrupt rise. It would be more nearly correct to say that there was a gradual rise up to 1917 and then an abrupt rise.

I have stated that price of both material and labor will increase and I stated that from the investigations that I have made, 3133 and opinion of others on the subject that there is no likeli-

hood of prices receding or labor receding. I do not happen to know who succeeded Mr. Herbert Hoover in his position with the government. I did not see an article by his successor in which he predicted a decline on all things of at least 25% in the next six months, by June, that the cost of living would decrease 25½ by June 1st. I did not see the article but I did see one in the paper the other evening where the clothiers in convention in Chicago stated that clothing would increase in price, spring clothing would be increased from 25 to 40%. From the study and investigation I have made of the conditions, I cannot see any reason to expect a decrease in prices as long as labor conditions remain as they are. It would be possible for labor conditions to take a tumble themselves but it doesn't seem to be probable under present conditions. That abrupt rise in labor prices along about 1917, in this particular locality, I think it was largely due to other industries drawing on the labor of the utilities. Other utilities that were able to pay better wages, such as oil industries. I don't know about any others. Shipbuilding, armp camps, aviation fields and things of that sort. account of the oil industry I would say that labor conditions in Houston are a little different from other places. However, they increase all over. There are prospects of the war being over, in fact, it is over so far as hostilities are concerned but peace is not 3134 signed. I have heard it quoted by wise men all over the country that when the peace treaty is signed that is going to restore conditions but the fact remains the laborers are striking constantly for increases. The coal miners have recently struck. The very fact that they struck threw a good many people out of employment. A great strike movement would disturb conditions, yes, sir. If the coal strike had been continued even until now, the industries of the country would have been seriously crippled.

"Q. Then, if the strike had been continued to now and ended, then there would have to be a reorganization, when men who had been patronizing the bread line and the soup kitchens as they do in times of trouble like that, they would try to seek employment again, and as seekers of employment they would have different conditions

to contend with than when employment is seeking them."

"A. I have endeavored to arrive, after a study, of a fair base, a

fair labor base, which I have used in this case.'

In my judgment I do not think they are going to fall within three years, from the information I could gather there is no possibility. I was informed that very likely these wages would increase in 1920. I have gotten my information in this City from the officers of the

Southwestern Telephone Company and the Officers of the 3135 Houston Lighting & Power Company. They are the men I talked to. They are the men who employed this type of There is no place else to go to get this information. is no place else to obtain this sort of information, because they are the only people who employ this character of labor. I did not know anything about the Houston Lighting & Power Company being threatened with a reduction of its rates because it was earning altogether too much money, earning excessive returns upon its invest-I am not familiar with that. On account of these oil industries paying better wages, it is going to be necessary, as I have been told, to increase their wages if they are going to retain their employees. Labor has a tendency to seek higher wages and higher employment, and if there is any particular place in the country that is paying higher wages it tends to draw labor to it and increase its I don't think that condition would obtain here from the information I have obtained, not the class of men, not the character of men who are used in this kind of work. Utilities have been postponing construction during the war period. There are not many of them carrying it on now. They have been like everyone else, waiting to see if the materials would be reduced. If I had the money to invest I would come to a city like this now and embark in the telephone business and reproduce a plant new and consider that I was embarking on a sound business enterprise. If I wanted to go into the telephone business, and after the study that I have made as to conditions, and the probable future conditions,

3136 I certainly would. I would do that being sure that I was going to get a rate that would pay a return on these values because I would consider that the people in this community would be fair. If I wanted to enter the Telephone business I would invest.

my money at this particular time in the telephone business in a plant the magnitude of this plant. You can't hope to be able to obtain reduced prices at any time in the near future. There are so many elements that are entering the regulation and governing of

these prices that I don't seem how we can hope to do it.

"Q. Isn't that a pretty strong statement that he can't hope to get lower price level than exists under the existing conditions, but under the conditions such as these, if they remain just as they are, if the conditions don't change, that is evident. But I am asking you if the element in this proposition that prices are at an abnormal high level due to a specific cause, isn't sufficient to deter any sane business man from going into a city of this size and constructing a large telephone plant on the present prices, and with a view of making a profit out of it."

"A. It is my opinion that we are entering an era, we are living under new conditions, we will never get back to pre-war conditions, and the quicker we readjust ourselves to the new conditions, the quicker normal conditions, or the approach to normal con-

3137 ditions will be reached."

I can't see any possibility for a reduction in prices and I would be willing to go into it and invest my money as a prudent business man upon the assumption that there would be no decrease in the readjustment of prices. I did say a moment ago that they had been holding off even construction but they are gradually purchasing material and beginning reconstruction work; they are beginning to realize that the former conditions and former prices will not be reached at least for some years to come, if ever. I do not know of any telephone plant of this magnitude having been sold recently.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I have made the statement that I never expect to see the pre-war level of prices reached again and I make that statement by reading the various scientific journals, economists' statements, and general information which I have obtained. It is my opinion that pre-war prices will never be reached again.

With reference to the magnitude of this Houston Plant, or plants of this magnitude, they are not commonly bought and sold upon the market like stock and bonds. That is true with refer-

3138 ence to large properties of all kinds.

I have prepared an exhibit setting forth the detail of my unit costs.

Mr. J. D. Frank: We offer that exhibit in evidence as Plaintiff's Exhibit No. 31.

(Thereupon said exhibit was received in evidence and marked Plaintiff's Exhibit No. 31, and said Plaintiff's Exhibit No. 31 is transmitted herewith and Exhibit file.)

I will take the item of 25 foot 6 inch poles on page 48 and show how I arrived at my unit cost. That is a size very commonly used in the plant. That appears in the top row of figures under the heading "Heights of Poles, Feet," 25, and the next line "Size at Top, Inches," 6. That is similar to the 25 foot Class C pole. In this unit cost detail it is identically the same thing for the reason I simplified the matter by merely indicating the inches at the top. That means it is 6 inches in diameter at the top, but it also means that it is a 25 foot Class C Pole. They are one and the same thing in this case. Under the heading of "Material" the price shown is \$5.50, that is a price delivered at Houston. I obtained that price from a pole Company; in fact, I obtained prices from three pole companies on poles, and have treated those prices that they have given me as f. o. b. Houston. To the price of the poles I have

given me as f. o. b. Houston. To the price of the poles I have added the supply expense, 7%, which gives 38 cents, making the total material cost of the poles \$5.88.

The supply expense is explained thus: In reproducing this plant I would have to have storage yards, warehouses and an organization for the purpose of handling supplies in caring for them from the time they reached destination until they were finally ready to be placed in the plant. In order to take care of this expense I have indicated it under the heading of "Supply expense." Supply expense consists of the rent of the ware houses, storage yards, light and heat, cartage from the freight depot to the ware-house or storage yard. We would have to have temporary shelving in some of my warehouses, partitions, fences around the storage yards, you would have to have night watchmen, stock-keepers and men to look after this material, to receive it, check it, sort it and shelve it, and after that the construction forces would draw on the warehouses for the supplies as they were required in the plant and these same men would have to re-issue this material to the construction forces from time to time as the work progressed. And in addition to that I would have to have a purchasing department, someone to look after these supplies and the purchasing of them, to see that the proper grades were secured. The purchasing department would have to be housed in separate quarters with rent, light and heat, and they would consume stationary and have other incidental ex-

worth of outside distributing plant material to handle that material. That does not apply to land, buildings nor central office equipment. Also, it is customary to make a check of the supplies periodically and then to carry in the supply expense such shortages or discrepancies as occur. I am familiar with the ruling of the Interstate Commerce Commission with reference to this item of expense, and I know that it is an item set out by the Interstate Commerce Commission. Seven per cent is not the figures that is allowed in every case. That depends. I know from my own knowledge and experience that the supply expense runs from five to 10%, but it was my best judgment that in reproducing this plant that I could do the work on the basis of 7%. And I might mention in connection with this, inasmuch as the Fort Worth case has been mentioned.

that in that case I used 9%. I used 9% in that case for the reason that we made an investigation of the Telephone Company's book and found that it is what it was costing the company. I have not made any such investigation in Houston to determine what it would be. In Houston it may be more, and it may be less. In the way I have built up my organization that is my best judgment as to what it would cost to handle the supplies in Houston.

The next item is labor. The labor is figured at \$4.89 and and I arrived at that figure by referring to page 18 of this 3141 same exhibit, under the heading 24' 6" pole, the first item is unloading, inspecting, sorting and piling, the amount is 31 cents. The next item is shaving, 48 cents; the next item is roofing, gaining and boring 46 cents; the next is extra labor hauling 14 cents; the next is locating, 30 cents; the next is digging; \$1.08, and the next is erecting \$2.12, making a total of \$4.89. When I say unloading, inspecting, sorting and piling, I am speaking of unloading the poles from the freight cars upon their arrival in Houston. I have all this in detail in another part of my exhibit showing how I arrived at these figures. On page 12 at the bottom of the page is the heading, "Unloading, Inspecting, Sorting and Piling of Poles. Gang Organization." There I have detailed the number of men, the direct supervision, the indirect supervision, the cost per gand day, and the cost per gang hour. The cost per gang hour is \$4.67. By referring to page 11, under the heading 25' 6" poles, the number of poles per car has been figured at 135, and I have estimated it would take nine hours to unload the car of poles. The cost per gang hour is \$4.67, and makes a total cost of \$42.03. Dividing the \$42.03 by 135 poles would give me a cost of \$.31 per pole. is as to the 25' 6" poles. In other words, I have figured out just how much time would be required to perform the various pieces of work that would have to be done in receiving those poles,

carrying them to the job, and then erecting them. I considered the rate of pay and the time consumed to perform the

various functions necessary.

I have "Hours on Unload" for 25 foot 6 inch poles as nine. do not show that in further detail because that is the basis to work on. I determined how long it would take to do this work. my experience and knowledge of the business I know the operations necessary to go through. Those poles are received at destination and the stakes on the car have to be cut, and skids placed to run them on from the car down to the ground They have to be sorted out by the sizes, if it is a mixed car, the 25 foot poles selected and put in one pile, the 30 foot poles in another, and the 35 foot poles in another, and they have to be handled-in all probability they may have to be moved off the right of way. That is only a temporary location. My estimate as to the time required to do this work was made on my actual experience in the telephone business. have done a considerable amount of that work while working for Telephone Companies and have handled large gangs of men in doing that particular kind of work and been on jobs where the work has been done.

On page 48 the next item of expense in connection with that 25 foot 6 inch pole is "Incidentals, 53 cents." That is worked 3143 out in detail on page 20½, which is an extra sheet in my exhibit. Under the heading of 25 foot poles, hauling the poles we have estimated at 25 cents. It would be necessary to have a team with the erecting crew to transport their tools and the men from one position to another, and this team we have estimated at 28 cents. The incidentals merely include the cost of the team, or means of transportation. It goes not include any labor. I find

as the cost in place of one of these poles \$11.30.

me a cost of \$12.71.

I will take up and explain the item of aerial cable which is on page 29 of the same exhibit. Fifty pair size is the size most commonly used. Up at the top is indicated the cable, 22 gauge, and the type of the cable. This type of cable happens to be N. A. which is a lead antimony sheath with small diameter. The size of the cable is indicated across the top of the next line, and the gauge directly following. The next line shows the weight of the cable and reels per thousand feet of cable. This is shown for the purpose of determining the freight. Under Material Cost, the cost of the cable f. o. b. Hawthorne, Illinois, is shown as \$194.00 per thousand feet of cable. The freight from Hawthorne, Illinois to Houston, Texas, car load lots on this class of material is 65 cents per hundred. Sixty five cents per hundred on the total weight of 1,465 pounds equals

the freight, \$9.52, to which I have added the war tax of 3%, 3144 28 cents. The next item is splicing material. Splices will average approximately 2 per thousand feet, and the splicing material would cost \$5.98. In addition to that I have included in my unit the splicing material necessary to place the terminals, 3.6 terminals per thousand feet. I obtained this average by taking the total amount of cable in the plant and dividing it by the total number of terminals in the plant, which indicated that to each thousand feet of cable there was an average of 3.6 terminals. That is based on actual facts as to the number of terminals here in Houston, and the amount of cable that we have here in Houston. That gives

The next item is miscellaneous material. In stringing this cable we use a soft soap, and I would use it, to lubricate it so it will slip easy. That is insignificant, and probably amounts to only 50 cents per thousand feet. That gives a sub-total of \$222.99 per thousand feet, to which is added supply expense of 7 per cent, and obtain a total of \$238.59. This has been indicated as Total A, but represents the total material cost of one thousand feet of this type of cable.

My next item is labor. There are certain operations that you perform regardless of the size of the cable. Those operations I have indicated there as "Constant A." Constant A is shown in detail on page 37 of this exhibit No. 31. There again I have set up the labor as I would arrange it, to do this class of work. You

will notice the first heading there is "Labor Placing Messenger." That I have estimated at \$19.04 per thousand feet. The next item is "Labor Placing Cable." That I have estimated at 51 cents.

That is not the entire labor cost, that is boring the holes, for messenger hangers, and placing hangers averaging 9 per thousand feet of cable. The next item is labor placing rings on strands, \$8.16 per thousand feet of cable, then the labor of jacking up the reels, taking off the lagging, stringing, is figured at \$19.04 per thousand feet. Then after the cable is strung it is necessary to send a man back over it — space the rings, and I have estimated that at \$1.63 per thousand feet, making a total of \$48.38, and I have indicated this total as "Constant A." Then by again referring to page 29 you will observe that is the amount I have used. The next process was to determine additional labor for splicing, which I have used as "Constant B." That fluctuates a little, but I can explain it in detail by referring to page 41 of the same exhibit. That is, the detail of Constant B is shown on page 41 of the exhibit. Down about the center of the page is the item of labor. The labor necessary to make the straight splices in the cable which is indicated under the heading "50 pr." is shown 7½ hours time two equals 15 hours. In

other words, there are two splices per thousand feet of cable, 3146 and it would take 15 man hours to make those splices. The rate of pay for this particular class of construction amounts to \$1.02 per hour. Fifteen hours at \$1.02 gives me the figure of

\$15.30.

The next item is terminal splicing. Of each thousand feet of cable there are 6.3 splices, and it would require 6 man hours to produce each splice, or a total of 21.6 man hours at the rate of \$1.02 per hour would cost \$22.08. That \$1.02 per hour is not for two workmen but that is the man hour rate. This has all been reduced workmen but that is the man hour rate. to man hours, and makes the compilation a whole lot easier. next item is placing terminals and boxes. There are 3.6 terminals to be placed for each thousand feet of cable and I have estimated it will cost \$1.00 for each, and there are other miscellaneous items, Placing Cable Grounds and Bonds \$4.00 per thousand feet. I get a total as Constant B amount to \$47.93, which is shown on page 29, last item under labor. That gives me a total labor cost of \$106.31 per thousand feet of cable. The next item, "Incidentals, \$4.89." I have worked that out on page 43 of my exhibit. Down the left hand column is shown the size of the cable. In the next column is shown the number of feet of cable per reel-that is standard length-and in the next column is shown the number of reels per load. In the next column is shown the number of trips per

3147 day, which equals a total of 6,000 feet of cable per day. At a cost of \$8.00 per day for transportation that would equal \$1.33 delivery charges per thousand feet of cable. That is the first item indicated below, the item "Hauling," \$1.33. I am still talking about 50 pair cable, I am following that fifty pair cable all the way through. Then, there is a charge of returning empty cable reels of 90 cents per thousand feet of cable. That is, returning it to the common concentrating point, or storage yard. Those cable reels are charged up when they are shipped by the suppliers, but I have not charged them into this job, because when they are returned credit is given, credit is allowed for them. Therefore I have not figured in

my appraisal the value of those cable reels. This cable would be pulled with a team, and the next item is "Team Pulling Cable, \$2.66" making a total incidental expense of \$4.89 per thousand feet of cable, and that is the amount I have shown on page 20 of this exhibit.

On one page of this exhibit I have labor divided up into direct supervision and indirect supervision. That is explained thus: It would be necessary in reproducing a plant of this size and magnitude to have a well organized force do the work economically. I have started from the ground and built up my productive men, and have organized gangs which a foreman could reasonable supervise. I

have estimated that a foreman could supervise efficiently 3148 about eight men. In addition to that it would be necessary

to have supervising foremen who would have charge of probably various gangs, and in addition to that we would have a general plant superintendent, some one who is in charge of the entire work. The indirect labor consists of the General Plant Superintendent, his office force, his expenses and office rent, stationery, light, heat and so forth.

I have introduced in evidence exhibit No. 29 which is to show among other things what part of the labor is direct and what part is indirect, explaining how I have built up my organization. They all go to the cost of performing this particular work, and I have divided it up into the men who actually do the work, and the men who supervise the doing of it. And I might explain, in addition to that, that in there is the item of tool expense. Tool expense covers the tools that are worn out during the construction, or broken or stolen, or the tools that are actually consumed in doing the work. I have considered that as a part of the cost of doing the job, and included it in indirect supervision. Before I leave that I would like to explain that by adding the total material of \$238.59, and the total labor of \$106.31, and total incidentals of \$4.89, I obtained a total of \$349.79 as the cost per thousand feet of cable in place. That

also includes the cost of placing the associated material.

That is everything that goes with the cable.

Cross-examination.

(Questions by Mr. Howard:)

Of course, I did not try to employ any men to build this plant nor did I try to buy any material to build it with. I obtained prices for material on the assumption that is would be built. Noboly knew but what I would build it when I asked for the quotations on the material. The suppliers when they furnished me the prices didn't know whether it would be built, or not. On poles I obtained quotations from the Page & Hill Co., whose general offices are at Minneapolis, Minnesota. Also, on poles from the Volentine-Clark Company, whose offices are at Minneapolis, Minnesota, and also from the National Pole Company, whose offices are at Escanaba, Michi-

gan. I got from those dealers the prices that I have used in my They were all the same, all alike on each class of pole. They happened to be all alike. I wrote to three different suppliers and each of them gave me the same figures, except on some Western cedar poles, they were a little different in their figures, but I am referring to Northern White cedar poles. I don't know whether there

is some sort of combination or not, but those are the replies that I received. When I wrote them I did not tell them that I was going to build a big telephone plant here in the City and would like to get bids. I merely asked them for quotations on various sizes of Northern Cedar Poles, and specified the sizes There is a way of getting competition in contracts for furnishing poles to a big plant like this, and I thought I was doing that when I asked the three companies for prices. If I was going to build a telephone plant they would send a representative to visit me, they would be interested enough to send a representative down here. That is what happened in this case, Paige & Hill sent a representative down. He has an office in Kansas City and came up to see me, came to see why I wanted the quotations.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I have prepared an appraisal of this property and have marked that "Valuation of Plant.

Mr. J. D. Frank: We offer that in evidence as Plaintiff's Exhibit No. 32.

(Thereupon said exhibit was received in evidence and marked Plaintiff's Exhibit No. 32, and said Plaintiff's Exhibit No. 32 is transmitted herewith in exhibit file.) 3151

This appraisal contains a summary and recapitulation. The recapitulation is shown on sheet one and 1-A, and the summary is 1-B and 1-C. My final figures are shown in the summary, the total reproduction cost new of the physical plant is shown on pages 1-A and 1-B showing the total physical plant with the working capital and

cost of establishing business attached.

The first item that I have on page 1 is land. I find as the value of the real estate, of the land \$204,144 and that includes all of the land used and useful in connection with the operation of this Houston Plant. That is shown in detail on page 2 and page 3 and page 4. The way I arrived at the values which I have placed on these various items of land is I obtained an opinion from two local real estate men, Mr. E. N. Mills and Geo. L. Wilson. They are both real estate dealers in Houston. After I obtained their figures I used the lowest figures, that is, the lowest figures submitted by either one of those real estate men.

I don't know what figures Mr. Hoag was using on this land. Mr. Hoag and I have not worked together in making our respect-3152ive appraisal of this property, only insofar as he furmished me the physical unit without any prices attached. Up until the time I entered the Court Room here Friday and heard Mr. Hoag testify as to the value of this property I did not know what value he was placing on it. Our work in making our respective appraisals has been entirely separate and independent and I have not changed my figures any since I heard Mr. Hoag, my report was all complete by that time.

The next item on the recapitulation on page 1 is the buildings. find as the value of the Preston Building, \$332,541. The Hadley Building \$64,118, the Taylor Building \$33,675 and the warehouse at \$300.00, making a total for the buildings of \$430,634.00. appraising those buildings I obtained from the engineering department of the telephone company the original cost of the buildings the years they were built. I then consulted contractors to determine how much material and labor, building material and labor has increased since that time, and I was told they had increased from 80 to 100%. I wanted to be conservative and I adopted the figure of 85%, and to the figures furnished me by the engineering department I added 85%, plus architect fees of 5% and in that manner determined the reproduction cost of the building. That is, that applied to the Preston and Hadley Buildings. The Taylor Exchange is a different type of building, and those materials have increased

only on an average of about 50%, so I adopted 50% on the Taylor Exchange. I got a figure of \$175,000.00 as the original cost of the Preston Building. I got that figure from the engineering department of the Telephone Company. That figure is supposed to include everything that went into the building, such as the wiring and the elevators and things of that kind, that is the figure that I desired to obtain. As a matter of fact, I have since learned that it did not include all the cost, but my figures were all made up and I couldn't change them. I learned that since I came to Houston in the last few days and the error, if there is an error in that, would be against the company instead of in favor of it. I have since heard what the original cost of that building was and it was around \$200,000.00, making a difference of something like \$25,000.00. used that as the original cost of the building and did not change my If I had corrected that it would have made an addition of figures. \$25,000.00 plus 80% of \$25,000.00 which would be about \$20,000.00more in order to make my figure correct on the basis on which I was proceeding, in order to determine the present cost of reproducing the buildings at the present time I conferred with contractors to dewhen, as a matter of fact it was \$200,000.00 in order to make my computation correct I would add the \$25,000.00 plus 85% of

3154 that in order to arrive at the present cost of reproducing that That would add about \$25,000.00 to it, but this information reached me so late that I didn't change my figure and allowed it to remain just as it was.

I had a figure of \$33,500 as the original cost of the Hadley Build-

ing. I have since learned that that figure did not include the whole of the building. I got my figure with reference to what was supposed to be the original cost of the buildings from the engineering department of the Telephone Company. I have not investigated the books to see what the original cost of the buildings were, I assumed that the information they furnished me was correct.

I got a figure of \$21,500.00 as the original cost of the Taylor Build-

ing.

The figure I used for the warehouse down there is not supposed to be the original cost of the building but that is my estimated cost. That is my estimate of what it would cost to reproduce that building.

In my investigation with reference to the present prices of material for the purpose of arriving at what it would cost to reproduce those buildings at the present time I conferred with contractors to determine how much building labor and material had increased

since these buildings were erected, and I was told it had increased from 80 to 100 per cent. By contractors I mean building contractors. And then I adopted the figure of 85%, and since that time I have learned that the Interstate Commerce Commission's Bureau of Valuation are using 85% as their base. I didn't know that at the time I used it in my report. That is, in estimating the present cost of reproducing buildings of that kind they are using the figure of 85 per cent as the increase in prices in the last few years. I think that is supposed to cover from 1912 down to 1919.

Cross-examination.

(Questions by Mr. Howard:)

The figure of \$175,000.00 was given to me as the original cost of this Preston Building. I was supposed to have gotten the entire original cost of the building but it seems that was not the entire original cost, that the original cost was a little more than \$200,000.00. The value that I arrived at as the value of that building is \$331, 187.50.

That set up on page 1-B is the cost of the building, plus the overheads. With the over-head added to it I get the building finally at

\$405,700.00.

Mr. J. D. Frank: I got that mixed up myself; I thought I had the page where he showed his final figures, but I see I did not. That was the figure I was intending to question you about, and I thought I had the final figure on that.

Mr. Howard: That is what I am concerned with, his final figure.

Direct examination.

(Questions by Mr. J. D. Frank:)

I show the land as \$204,144.00 and on page 1-B \$249,066.00. The figures as shown in the recapitulation, pages one and two, correspond with the detailed figures of the bare physical plant as shown

throughout the inventory, without the items of Engineering, Contingencies and Ommissions, Interest during construction, and the other expenses that have been included as overhead expenses. This figure is larger because I have added the overheads. If you will notice, on page 1-A I have added the overhead expense to the plant collectively, when on page 1-B in the summary I have added the overheads to the individual items of plant. In working out my overhead expense I have taken a weighted percentage and applied that to the property as a whole, and that would explain why I have such items as Engineer-

ing, Ommissions and Contingencies, etc., charged up against land. Instead of taking particular parts of the property and

saying I would have omissions and contingencies,—for example, if the distributing system is 8 or 10% and there are no ommissions and contingencies on some other part I have taken all the property as a whole and have gotten the weighted average percentage for ommissions and contingencies on all of the property. And I have treated these other items of overhead expense in the same way. It would not have been any different if I had figured it out as to the various parts of the property and applied the actual figures to them.

Then, on buildings I get as my final figures, in the summary on

1-B including overheads \$525,374.00.

Cross-examination.

(Questions by Mr. Howard:)

On page 1 I put the land in at \$204,144.00 and on page 1-B I put the land in at \$249,000.00, a difference of \$45,000.00 which is the overhead expense.

"Q. What overhead expense?"

"A. Items of contingencies and ommissions and engineering——"
"Q. What ommissions and contingencies do you have on that

land? You don't loose any land?"

"A. I merely took and weighted it out for convenience sake, by applying it to the property as a whole. That is the customary practice with engineers, to apply the over-

heads to all property."

If I took the method of taking the items and figuring them out upon an accurate basis I would obtain the same result exactly. You might eliminate the engineering from the land, but it would be increased on others items of plant so the final figures would amount to the same thing.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I don't remember exactly how much the contingencies and ommissions would be on the distributing system if I worked it out as to the distributing system. I have worked it out once or twice,

but I know that when it is worked out in detail it is very much higher than it would be by weighting it out over the entire property. The result has always been the same, and this is a much simpler method of getting the answer, and consumes far less time. It would have been considerably more than 4%, 8 to 10%. Instead of figuring out the ommissions and contingencies as to

for the property as a whole. In some items of property it would be considerably in excess of 4%, and some it would be considerably less than 4%. As figured here the contingencies and ommissions on the Preston Building would be something like \$13,000.00. That is, by applying the 4% it would be something like \$13,000.00. After I figured it out I actually found an ommission which amounted to something like \$45,000.00. I am not considering that in arriving at this 4 per cent, I didn't expect that ommission. I know those things happen invariably in valuation work, that is the reason we make that allowance. That is the method generally employed by reputable engineers and the method I have used in other valuations made by me.

This increased figure that I have here on page 1-B for the building amounted to \$525,374.00 includes among other things the architect's fee. It does on the increased value of the building, and I assume that has been taken care of in the figure they furnished me as the original cost of the building. That also covers my interest

during construction and the other overhead items of expense.

It is a human impossibility to valuate property of this size without considering ommissions and contingencies. I would like to give you an example in the Fort Worth case, and I refer to it because it has been referred to before. In the Fort Worth case the City and the Telephone Company agreed to make a joint count of the physical property, and that was very carefully checked in detail. The count made by the Telephone Company was checked by the City, and the count made by the City was checked by the Telephone Company, and we used every precaution we knew of and could use to make an absolutely accurate field count of the prop-When we finished our work and checked up, we found that an item of 6-way conduit, amounting to something like ten or fifteen thousand dollars has been omitted in the compilation of the In other words, after they were tabulated, in transcribing them on the sheets to be priced that item was omitted, and we also We found, I believe, a coal-chute arrangement found other items. on the building, and other items that had been omitted, so I know from my experience that you must take into consideration contingencies and ommissions, for they always happen. I have divided contingencies and ommissions into these three classes: Intentional,

Unintentional and Contingencies.

The intentional ommissions are the ommissions that we know exist, but are taken no account of in building up the unit. For instance, sag in aerial cable, sag in wire, short ends of cable, short

ends of messenger strands. In every cable splice there is a loss of some two to four feet, and loss of material by workmen, 3161 material is sometimes stolen, and sometimes burned. I

know of one instance where a carload of poles was unloaded on the right of way, and the next day the entire car was burned up. Loss of material by breakage, temporary guards to protect the public, sometimes necessary to re-dig holes to satisfy property owners, and in digging holes we might strike sewer pipes or gas pipes and have to change the location of the pole. Re-routing cables and wires to satisfy subscribers' loss of production due to foreign wires; delivery of material to the wrong location; wrong kind of material, slow deliveries; the truck may break down and hold up the work. Supplies are sometimes lost in transit and hold up the work; in the business district it is sometimes necessary to do the work at night and Sundays to avoid the interruption of traffic. That causes an increase in the expense of doing the work. That is not shown when you go out to make an inventory of this property and make an appraisal of it.

Ommissions of such items as extension bells, ground rods, switches, jacks, push buttons, bolts and other inconsequential items of equipment. Re-sodding of lots after buildings are completed; pumping water out of the basement; water pumped out of manholes; and sometimes it is necessary to redecorate or repair the operating room after equipment is installed; necessary to enlarge openings in the

buildings to permit equipment to pass through; temporary wiring for electric lights; stoves and other conveniences for

the use of the installers; it is often necessary to use a better grade of insulated wire in certain localities; abnormal cost of excavating due to sheet water; stenciling poles and cable terminals; re-inforcing poles; sometimes in placing underground conduit it is placed on the inside of the curb, and it is necessary to re-sod for the property owner. Sometimes necessary to re-route the pole leads. Dead drops have not been counted in this inventory; abnormal weather conditions sometime- decrease the amount of production. I have proceeded on the theory that I would have normal weather conditions and I have not allowed in my unit for abnormal condi-There is an additional cost due to embankments caving in and damage due to heavy rains. Sometimes it is necessary to work overtime to rush the work; in a big job like this you would have to maintain a blacksmith shop to keep the tools in shape; unavoidable delays due to accidents on the work; it is easy to miss certain items of underground cable plant; frequently the cost of aerial cable construction is increased because the workmen are delayed while the electric light company gets their wires out of the road; and ommissions of bridle wires on poles; circular loom very hard thing to detect on the wire; there would be delays due to subscribers objecting to wires being run across their property. Additional, cost sometimes in refilling a trench with mud. Delays and danger of building

the conduit system under railroad switch yards; cost of digging test holes which cannot be used later. Occasionally necessary to lay the conduits either wholly or partially under water.

Sometimes necessary to pay damages by reason of blocking traffic in alleys or narrow streets. Occasionally in narrow streets where traffic is heavy excavations must be bridged and all material must be transported either by hand, or in wheelbarrows: subsidiary cables and subsidiary conduits sometimes are not run directly from the manholes to the terminal of the building, and in measuring it the field man has no way of determining that, and they measure and Sometimes in placing underground cables the air-line distance. conduits become plugged and it is necessary to dig up and open the conduit in order to clear the obstruction; water in manholes; manholes are often located under streets where the work has to be done at night. Cable sometimes sticks in the conduit, and it is necessary to pull it out, which increases the cost. And there is the element of human errors. By that I mean that sometimes we make mistakes. That underground cables for example: It is ordered by standard reels and those lengths are measured off before the cable is ordered from the factory, and it is ordered from the factory in these specific lengths, and they are put on the reels and marked with the specific length on them. It is very often in delivering these reels the

wrong lengths are delivered; workmen go in for material 3164 and get the wrong kind of material. There is an element of human error in every class of work. None of those things would appear when you started in to appraise the property which you find in the City of Houston, they would not be appraised. You could not tell from an inspection of the property that these things did actually happen, but I know from experience in the telephone business and in construction work, that those things do happen. would happen again if I started in to reproduce this plant.

I will give you a few examples of unintentional ommissions.

Mr. Howard: You didn't intend all those that you have read over-they are not intentional ommissions?"

Mr. Topping: Those are what I have termed intentional ommis-

sions.

Mr. Howard: That is what I thought; you treated all those you have read over as intentional ommissions?

Mr. Topping: Yes, sir. Mr. D. A. Frank: You don't mean that, do you?

Mr. Topping: Under unintentional ommissions such items as ommissions of plant, errors in compilation of field data, 3165 Under contingencies—there might arise a and so forth. labor dispute which would delay the work; there might be extremely unfavorable climatic conditions. You sometimes have demurrage charges on cars. All of those things I know have happened and are likely to happen and will happen again, and from my knowledge of the business and my experience I know that they usually allow from 3 to 5% for the item of contingencies and ommissions, that is, as to the property as a whole, and I have adopted the percentage of 4% as a fair allowance in figuring the reproduction cost new of this property.

Cross-examination.

(Questions by Hr. Howard:)

Under intentional ommissions I have such things as water in manholes and delivering the property to the wrong place, and the other things I have mentioned here. These were the intentional ommissions.

"Q. Then you get a whole lot of things like that, and make a whole lot more, and add \$350,000.00 to this plant for good measure?"

"A. I have added 4 per cent."

"Q. \$350,000.00 practically?"

3166 Mr. D. A. Frank: Is that added for good measure?"

"A. No, sir, that is the overhead expenses."

That is based on the allowance made by the Courts and commissions and experience. I have had considerable experience in valuing plants of this magnitude, but not in building them, but I have been associated with work of this magnitude. The inventory at Fort Worth was made jointly by the City and the Telephone Company, that is, the field count of the property. We made a careful inventory and went over it again and found an item of approximately ten or fifteen thousand dollars. Also we found an attachment on a building, I don't remember exactly what, but it seems to me that it was some sort of coal conveyor. It had been overlooked. Also the sidewalks and fences had been omitted, around the buildings and some fences around some yards. That is all I can recall at this time.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I do not go around after I have made an inventory of property in this way, and have made my appraisal and check it up to try to discover ommissions which have been made, and that 3167 was not done in the Fort Worth case. The property was counted jointly by the Telephone Company and the City and we made a careful check of that before we finally completed the inventory for the purpose of discovering whatever errors existed. These other things which we accidentally discovered, were after we had made a careful check of the inventory. We do not go around and re-check these things after we have made our valuation of the property, for the purpose of discovering the ommissions. Even if we were re-checking and looking for ommissions we could not determine what contingencies existed.

Yesterday afternoon in response to questions propounded by Counsel for the City I used some figure- of two and three-quarter

million dollars with reference to the Fort Worth property. That was my estimate of the reproduction cost, new, of the physical property. As a matter of fact, the Master found as a fact, from the records, that the value of the Fort Worth property was something over three million dollars. As compared to the Houston Telephone Plant the Fort Worth Plant has about half the amount of plant and approximately half the amount of stations that the Houston plant has.

In my ommissions and contingencies I have allowed 4% 3168 in this case. I do not always allow 4% in every case, but it varies from 3 to 5%, according to how the units have been built up, and other facts in connection with the plant. In the Fort Worth case I allowed in the units for loss and waste of material, which I didn't allow in the Houston units. I therefore added that item into my contingencies and ommissions, using 4% in this case. That is why I used a higher percentage in this case than I did in the other.

Cross-examination.

(Questions by Mr. Howard:)

In the Fort Worth valuation I represented the City of Fort Worth. I did not put a final value on that property. I was requested only to determine the reproduction cost new, and that was the figure I submitted. I was requested by the City not to include anything for going value. My figure, as compared with the same thing as determined by the Company's engineer, was a little lower but I do not remember exactly how much, along about 7% lower. I did not go into the record cost for the City of Fort Worth in that hearing, but built it up on the reproduction cost. We both adopted the reproduction cost, new, theory up there.

3169 Redirect examination.

(Questions by Mr. J. D. Frank:)

My next item of overhead is engineering, 5%. The item of engineering includes the salaries and expenses of the engineering department necessary in preparing the plans and specifications for the construction work, the preparation of estimates and reports, and the checking of the plans and specifications and completed work, and the cost of testing and inspecting the work after it has been completed. Proper engineering is one of the very essential expenses, for it insures the most practical plant, most economically distributed, and placed in the most advantageous position so that every dollar will produce the largest return. The engineers inspect the work. They first lay out the work for the construction forces, and they periodically inspect the work to see that it conforms to the specifications, and when the work is finally completed, they inspect it to see that there is no faulty construction. It requires a corps of engineers, draughtsmen, stenographers, and is one of the real factors

in the erection of the plan. Those men do not just prepare the plans and specifications and then let the matter drop but they follow it up and inspect the work as the work progresses, and then when the work is finished they make a final inspection. It would not be possible to construct a property of this magnitude

when the work is finished they make a final inspection. It would not be possible to construct a property of this magnitude 3170 without any system whatsoever without the employment of these engineers. If you wanted to produce a plant in the most efficient and economical way it would not be possible to construct it without having the supervision of competent engineers. I used the figure of 5% there. That is a percentage that I have always used. I have found from my experience that it is reasonable and fair, and it is the commission's and court's usual allowance. In other words, in order to construct \$100 worth of property, you would have to have an item of engineering expense amounting to \$5.00 on each \$100.00 worth of property. That is the allowance usually made by engineers and commissions. They do not always make an allowance of 5%, but it varies from 4 to 6%. Five percent is the amount that is customarily allowed.

Cross-examination.

(Questions by Mr. Howard:)

I would not say how many men it would take to engineer this plant and do it right because I haven't attempted to figure that out in this case. I haven't given it any thought. I know five per cent to be a reasonable and fair allowance, and one that is customarily used by reputable engineers and allowed by the courts and commissions. Various commissions have allowed it.

3171 Mr. D. A. Frank: Every one of them.

I have given it consideration but I haven't worked it out in this case. I never worked it out in any case but that is the recognizes percentage that is usually allowed. Five per cent of six million dollars would be three hundred thousand dollars for employees in this particular line of work in the construction of this plant and I would consider it money well spent, and wouldn't expect to be able to reproduce this plant with any less expenditure. I do not put that in there just because somebody else said it was the right thing to do, but from my own knowledge of the business I know that expense is incurred in the construction of every plant if it is constructed in an intelligent and economical manner. I haven't figured it out in detail, but have adopted it from others.

Redirect examination.

(Questions by Mr. J. D. Frank:)

In connection with some of the overhead expenses the question of the economical construction period arises. I have prepared an exhibit treating that subject. Mr. J. D. Frank: We offer this exhibit in the economical construction period in evidence as Plaintiff's Exhibit No. 33.

3172 (Thereupon said Exhibit was received in evidence and marked Plaintiff's Exhibit No. 33, and said Plaintiff's Exhibit No. 33 is transmitted herewith in exhibit file.)

The first step in attempting to arrive at the value of this property would be to consider the processes that a man would natually pass To reproduce this property it would require, as I have estimated, one year to do the preliminary work. That is, a man would first want to employ able counsel to search the statutes of the State to see if there were any objectional features, or any reason why he wouldn't care to make an investment of this magnitude in this State. After he had satisfied himself on that, to next step would be to determine whether or not the community would patronize and support the class of service he would have for sale. In connection with that he would have to make a commercial egineering study to determine approximately how many telephones ne could secure, and the approximate amount of money that would be required. After that he would secure from the City a franchise or permit, and that usually takes some time, and I have estimated to do the preliminary work would require approximately one year's time. I take three years as the actual construction period.

At the end of the preliminary year I am ready to purchase the land. I would purchase the land and in the first six months I would arrange with the architect for designing and drawing the

plans and specifications for the building. I would then start 3173 the erection of the building, and as soon as the building was far enough along I would begin the installation of the central office equipment. In the meantime other work in the plant would be in progress. As soon as the central office has been located, work would start on the underground plant and the pole plant. In other words, I wouldn't do the work by piecemeal construction, but would have the various parts of the plant going up at the same time. place it just as fast as I could economically. I have estimated that it would require three years from the time I started the plant until it is finished and finally come into service. In other words, that is the construction period. I do not believe it would be possible to do that construction work in less than three years' time-it might be possible, but in my opinion if it was reproduced in less time it would cost more money.

The next item of expense under overhead is "Public and Employees' Liability Insurance and Taxes, Legal and Administrative Expenses During Construction 4 per cent." I got that 4% from my experience in the business and I know that this is a fair and reasonable allowance. If I was attempting to reproduce this property I would not carry the risk of suits brought by employees, or by the

public in accidents that occur during the construction period.

3174 I would prefer to pay a premium for that protection. That is generally done by all large employers of labor that is, they carry this employees' liability insurance in order to protect themselves against damage suits due to accidents.

That item of Taxes there is an expense during the construction period, money that would have to be paid out from capital. is no revenue from which to pay these taxes, and it is an expense which is properly a capital charge. I know that the Interstate Commerce Commission has made a ruling with reference to that, they make allowance for Taxes during the construction period. the rules of that commission it is treated as a capital charge. matter of fact there is no revenue coming in during the construction period and that is why it is capitalized.

The next item is "Legal and Administrative Expense During Con-That is the legal expenses that would be incurred during the period, and the administrative expense, such as general supervision by the executives in the administration of the business. administration expense, as I understand it, is what is sometimes referred to as general expense. I have made a competition for the purpose of determining whether or not that 4% is a fair and reasonable allowance. I knew from experience that 4% was a conservative

figure to cover those items and I adopted that, and then later 3175 on as a check I worked it out to substantiate it.

Taxes, I have estimated at \$88,408.00. I determined that by taking the actual amount of money paid in taxes by the Telephone Company in taxes for 1919, and dividing by the amount of physical property obtained the rate of 1.16 per cent of the reproduction cost I have assumed that I would pay the same taxes which were paid in the year 1919 and I took that as a base to get a percentage upon which to work. I have, in making this computation, made allowance for the fact that under the laws of this State you have only to pay taxes on such property as is owned by you on January 1st of I get as the total amount of taxes \$88,408,03. each year.

The item of Public and Employees' Liability Insurance, I got a figure of \$64,836.08 on that. The insurance is based on so much per \$100.00 pay roll. I estimated the approximate number of labor- in the plant and then applied a rate per \$100.00 and got the total amount of \$64.836.08. I made a competition with reference to the other item and worked it out in dollars and cents, and got as the total \$293,990.55. That does not work out 4% of the reproduction cost new of the physical property, it worked out 5.26 per cent. Four per cent would amount to \$223,532.88 and that is the figure that I

have used, in this case,

3176 The next overhead expense is interest during construction. The reason I figure interest during construction in making an estimate of what it would cost to reproduce this property is because the money would be invested in the plant with no revenues derived therefrom, and the investment would lie idle during the construction period of three years. In figuring interest during construction it is my practice to take one half of the money for all of the time, or all of the money for one half of the time but in this particular case I have taken all of the money for one-half of the time. I used a rate of interest of six per cent because I wanted to be entirely reasonable. I think that is a low rate of interest. However, in my opinion I could not go out into the open market and get money at 6% to invest in a public utility of this kind, in a Telephone Plant. I base that statement upon the fact that I have had considerable experience in the last few years in endeavoring to secure bonds for Telephone Companies. I might cite one instance where we made a valuation for one company, and the property valuated something like \$140,000.00 or \$150,000.00. It was during the war period and the pole lines were overtaxed, and this particular plant had borrowed money here and there endeavoring to keep up and furnish the proper toll facilities, and he wanted to bond the property and assemble them all in one lump sum. He

tried to bond it for \$100,000.00, but the best offer he could get was \$85,000.00. That was on a valuation of \$140,000.00. I know of other instances where bond men told us that they

were not interested at all in a telephoen proposition on account of the rates, the rates were too low, inadequate to pay a reserve and allow a return. They could invest their money in first class real estate and farm loans and be perfectly safe. That is, the hazard would be greater in an investment of this kind than it would be where they had their money which they had to loan out in a safe and secured lien. I know that the Interstate Commerce Commission makes provision with reference to the inclusion of interest during construction. In figuring the interest on that I took the rate of 6%, that is the equivalent to 1/2 to 1 per cent per month. I then took the total construction period of 36 months, and one-half. of 36 equals 18 months. At 1/2 of 1 per cent per month would equal 9 per cent, as the total amount of interest. I got as the total amount for the item of interest during construction \$502,948.98. That is the total amount which I have included in my estimate as the interest which would have to be paid during the construction period.

We have covered all of the overhead expenses. On page 1-B my summary the next item of material there is equipment. The first item under equipment is Central office. Central Office equipment consists of the switchboards, the terminal frames, the testing apparatus and other electrical devices used in connection with the operation of the plant. I have included there as the cost of reproducing the central office equipment \$1,894,837.00. And as other equipment of central office \$17,167.00 giving a total equipment of \$1,912,004.00. That other equipment of central office consists of the furniture and fixtures, operators; chairs and all of the equipment in the office not attached to the circuit, or a part of the central office equipment.

In estimating the cost of reproducing that property I wrote a letter to the Western Electric Company at Chicago and furnished a list of the equipment and asked them to make a price for installing this equipment at this time. I am now speaking of central office

equipment which does not apply to the other equipment of the central office. The reason I wrote the Western Electric Company is because they are the Manufacturers of this equipment. They are engaged in selling this equipment to the public generally, they sell it to the Bell Telephone Company and also to independent companies and to anyone who wishes to purchase that particular property. When I ask them to make an estimate of what it would cost to reproduce that central office equipment I did not explain to them what the purpose of my request was, I just merely asked

what the purpose of my request was, I just merely asked them to furnish a contract price at which they would reproduce this equipment at this time. I did not write to any other Company in regard to Central Office equipment because there are no other companies that manufacture this identical equipment and that is the only place at which I could have gotten it. The price furnished to me was furnished to me as if I was an independent telephone man, or some man who wanted to reproduce an exchange of this kind. I sent them the quantities of property and asked them to submit a price, what it would cost to reproduce that property in Houston, installed complete, and then I adopted the figures which were given to me by them.

Cross-examination.

(Questions by Mr. Howard:)

The Western Electric Company is the only company that manufactures this particular equipment. However, other companies manufacture equipment that is used for the same purpose. But I was obtaining a price on this identical equipment. I presume that equipment furnished by the other companies would perform the functions reasonably well. In facing this proposition of reconstructing this plant, or reproducing this plant, I did it upon the assumption that I would be compelled to buy my material

of the Western Electric Company because that is the only place I could buy it. That is the only place, and I made my figure based upon that assumption, that I would have to go to them for the equipment. I did not inquire as to whether or not I could get substantially as good equipment from some other com-

pany, because I was pricing the identical equipment.

I am not qualified to say what relation exists between the Southwestern Telegraph & Telephone Company and the Western Electric Company. As to whether they are closely allied companies is all

hearsay on my part.

Redirect examination.

(Questions by Mr. J. D. Frank:)

The next item of property is "Subscribers' Station Equipment." That is divided into five classes, Apparatus Installations, PBX, Box

wires, Booths and Special Fittings. Those matters are treated in detail on the following pages, beginning on page 10.

The first item there is station apparatus which is the deskstand, wallset and so on. I have not included transmitters, receivers and induction coils for the reason that it was my understanding they are not owned by the Southwestern Telegraph & Telephone Company. I got my price on this material from the Western Electric Company. The total apparatus, as shown on page 1-B is \$362.295.00.

The next item on page 1-B is the installation. That is the cost of the inside wires and the labor in stalling the telephones. That amount I know from my experience in the business is the reasonable amount to allow. In other words, I have figured out the cost of making these installations and included them. That is the wiring and equipment that goes inside of the house other than the telephone sets themselves, that is the wiring and ground rods and labor necessary to place the telephones.

The next item here is PBX which is Private Branch Exchange. These small switchboards placed around in commercial houses and hotels where they have a number of telephones. I got my prices on that from the Western Electric Company who are also the Manufacturers of that particular equipment.

The next is the block wires. We built up the unit costs and arrived at this figure of \$7,649.00 as the cost to reproduce this class of plant. That appears on page 1-B.

The next item is Booths and Special Fittings. I got my prices on that from the western Electric Company. Counsel asked me a few minutes ago with reference to other equipment. If I got prices on other and different equipment than the equipment which is in use here, when I got those I would not have an estimate of the cost of reproducing this exchange, but would have an estimate of the cost of reproducing something else. What I am trying to do is to estimate the cost of reproducing this particular exchange.

I get as the total subscribers' station equipment \$539,240,00.

Cross-examination.

(Questions by Mr. Howard:)

I did not get prices from anybody else on any of these items because this equipment was all Western Electric Equipment, manufactured by them. However, there are concerns that manufacture similar equipment.

Redirect examination.

(Questions by Mr. J. D. Frank:)

When I say similar equipment I mean it is similar to the kind in use in Houston, but not the identical equipment.

3183 Cross-examination.

(Questions by Mr. Howard:)

I don't know whether it is as good equipment as this, or not. I wouldn't expect to find it any better, because I know the Western Electric Company is constantly experimenting to keep their equipment up to date. The other companies may also be constantly experimenting, but because of my connection with the Western Electric Company I know that to be a fact.

Redirect examination.

(Questions by Mr. J. D. Frank:)

There is no other Manufacturing Company in the United States as large as the Western Electric Company, not to my knowledge. I know that they do sell to Tom, Dick and Harry as well as the the Bell Telephone Company, they sell to the general public, anyone that cares to buy. They send out their catalogues to all telephone companies throughout the United States and actually sell material to the various telephone companies throughout the United States.

The next item of property is the distributing system. Under distributing system I have included poles, aerial cables, aerial wires, underground conduit main, underground conduit subsidiary,

underground cable main, underground cable subsidiary, and 3184 right of way. I have already told you how I got my prices on poles. I wrote to several supply houses and got their figures. I got my prices on aerial cable by writing three or four manufac-turers asking for quotations, and I was unable to get a quotation from anyone except the Western Electric Company. I mean that then others did not reply to my letters. I wrote the Standard Underground Cable Company, and they replied in this manner: "Your communication of November 4th addressed to our Home Office at Pittsburg has been referred here for attention. We note you have asked for prices based on the A. T. & T. specification. We are familiar with the A. T. & T. specifications only to the extent that specifications of the A. T. & T. or Bell properties are very occasionally submitted to us in connection with inquiries for cable to be purchased by properties allied with the A. T. & T. interests. It is sometimes possible for us to quote to those specifications as they are written, but more often it is necessary that we deviate from them in order to quote on our standard product. Aside from the fact that the list of sizes and descriptions submitted in your letter would entail a vast amount of clerical work for which we have no one available at this time, we believe that you can be much better served by submitting your request to the telephone cable manufacturer who is most familiar with the various A. T. & T. specifications

and is constantly building cable of those specifications for various interests. We are sure that they would be better able to give you accurate information than this company

would. Answering the closing paragraph of your letter, we would not attempt to forecast what the prices on telephone cable would be a year hence, or even three months. Prices on telephone cable as on any other manufactured product depend almost entirely upon the fluctuations in the cost of materials, labor and transportation. These factors of cost are more disturbed and erratic now than they ever have been, and any prediction as to what the cost of any product would be a year hence would be the merest guess work so that one person's guess would be perhaps as good as another."

I was unable to get quotations from these people. And I have also written to the Stromberg-Carlson Telephone Manufacturing

Company and they replied:

"Replying to your letter of November 5th, requesting the present market price on various sizes of paper insulated lead encased tele-

phone cable.

"As we do not manufacture this class of cable, we respectfully refer you to the American Electrical Works, Phillipsdale, R. I., whom we know will be glad to furnish you with the information you desire.

"Regretting our inability to serve you at this time, we remain."

3186 I also wrote the American Electrical Works at Phillipsdale, Rhode Island, and they replied:

"We beg to acknowledge receipt of your esteemed favor of November 5th, and regretting exceedingly that it is impossible for us to comply with your request in this instance owing to the changing values of raw materials and our manufacturing costs through which we are passing at this time our cost department is simply swamped with work. It would be impossible for us to even start work upon this under two month-.

"We would like to be accom-odating but the above is the situation and we cannot afford to delay our regular cost work which is necessary in our business daily, and inasmuch as you state you desire prices by November 15th, it is utterly impossible for us to take care

of you."

Then I wrote the Western Electric Company and they furnished me the prices on the cable.

"Q. Take up these other items, Mr. Topping, and tell us what prices you have used on them. Take underground conduit Main and subsidiary, and cable Main and Subsidiary, and tell us where

you got your prices on them."

"A. In the underground plant I obtained prices on the vitrified clay conduit from the Clay Production Company of Brazil, Indiana. On the fibre conduit, from the Fibre Conduit Company, of Orangeburg, New York. On the Brick used in the underground work, from Barthold and Casey, at Houston, Texas. On Manhole

from Barthold and Casey, at Houston, Texas. On Manhole 3187 castings from the Lloyd Metal Company, Houston, Texas. On Iron pipes, from the F. W. Heitmann Company, Houston, Texas, and on cement and sand from W. L. Macatee, and on Gravel

from the Texas Gravel Company, both of Houston, Texas. Then I applied my prices to build up my unit cost, as I have heretofore explained, and arrived at the cost of reproducing these various

items of property.

The last item I have down there is right of way, \$32,565.00. It is my practice to allow \$1.00 per station as the right of way charge, and that is based upon my experience and knowledge of the business. I know that there are problems coming up that cannot be charged to any other class of plant, and I usually set them out under this heading of right of way. It has been my experience and observation when engaged in the telephone business that the expense in connection with the right of ways will average \$1.00 per station. In reproducing a plant of this size, it would be necessary to have someone, or one or more persons to look after right of way matters, to see property owners and get permits, cables would have to be attached to buildings, and you would have no authority to attach the cable to the buildings without the permit of the owners, nor would I, without his permission as it would be expensive to remove them in the event he objected, and in order to play safe I would secure his permission. Sometimes it is necessary to pay for the privilege

3188 of putting it on private property. And I understand in Houston the City requires the telephone company to take out a pole permit, for which a charge of 25 cents per pole is made for each pole set, and in addition to that a charge of 50 cents for each 500 trench feet of conduit. I get as the total cost of reproducing the

distributing system, \$3,527,340.00.

Cross-examination.

(Questions by Mr. Howard:)

"Q. Mr. Topping, you read off a while ago a list of six or eight material men, and as I understood you, aside from the aerial cable, you sought bids from only one person or firm. On aerial cable you had several letters."

"A. We asked for other bids. For example, on iron pipe we asked the N. O. Nelson Company to furnish prices on iron pipe, and they replied in this manner: "We are not in position——"

"Q. (Interrupting.) This is just a small branch of the N. O.

Nelson Comoany?"

"A. I merely understood they handled iron pipe and wrote to them."

I did not tell them I was going to build a telephone exchange and would need a lot of pipe, I merely asked for prices on 3189 pipe. I did not ask for prices on 100 feet or 1,000 feet. I

did not go to anybody except the Texas Gravel Company for gravel, nor to anybody else except the Macatee Company for Cement. I think we went to someone else besides the Lloyd Metal Works for castings. I did not tell anyone I was going to build a big telephone exchange in Houston, but I told them that I would like to have prices on this material for use at Houston. I didn't tell them how much or how little I would need. Yes, I regard that

as a good way to get prices when I am in earnest on a problem of constructing a property.

Redirect examination.

(Questions by Mr. J. D. Frank:)

I am familiar with the character of other Telephone Companies in comparison with the Telephone plants which are constructed by the Bell Telephone Company. They are not, generally speaking, better telephone plants than the plants erected by the Bell Telephone Company, but as a matter of fact, the plants erected by the Bell Telephone Company in nine cases out of ten are more efficient than the ones constructed by independent companies.

The next item on page 1-C is General Equipment. The 3190 first item under General Equipment is furniture and fixtures,

local. I have estimated as the cost of reproducing the furniture and fixtures, \$27,788.00. In arriving at that I took the original cost of the furniture and fixtures and attempted to price them. and I found that the manufacturers of a large part of the desks and so forth have since gone out of business and it would be practically impossible to get accurate information. I then made a study to determine how much furniture and fixtures have advanced, and I found it ranged from 50 to 100%, in some cases more, on practically all of the items except typewriters and adding machines, and some of the standard equipment. I used the price of the typewriters and adding machines and to the balance of the furniture and fixtures I added approximately 50 per cent. That was the only way that I could get a fair estimate on it. I merely took 50% of the local furniture and fixtures. There are furniture and fixtures located in Dallas from which this property is supervised by certain officials, and if those officials were located in Houston I have estimated that it would require 50% more furniture. That is, if all the operating officials connected with the Company had their office in Houston they would have to have additional furniture. I used the same prices on that, the same identical prices that I used on the local furniture and fixtures. I merely took 50% of the local furniture and

fixtures. I do not mean that if all the general officers were located in Houston, but those that would be necessary in the operation of the Houston property. Just those officials who

would necessarily be used in supervising the property.

The next item is "Tools". I have figured for tools \$10,591. That is my estimate of the reproduction cost of the tools. I did not take the original cost and add something to that but I figured out the reproduction cost of the tools based on present day prices.

The next item I have there is motor vehicles and I find as the cost of reproducing the motor vehicles \$12,467.00. That is the cost of the vehicles as furnished by the Telephone Company. In other words, I took the original cost on that. I took the original cost because the information that I had at hand was not applied as

to the years the cars were purchased, and it would have been necessary to have gotten complete information as to the year and the model of the cars, so I took the original cost on that, it being a small item.

I get as the total general equipment \$65,739.00. I get as the total physical property \$6,817,753.00.

The next item that I have here on page 1-C of my appraisal is "Working Capital." It includes supplies and cash. I have estimated that amount to be 4%, or \$272,710.00. That is 4% of the estimated cost of reproducing the total physical property.

192 of the estimated cost of reproducing the total physical prop-

erty.

Working capital covers cash on hand necessary in the payment of bills, and other expenditures that are incurred, and the supplies represent the stock on hand which is necessary in the conduct of the business to keep the plant in operation. It would not always be possible to obtain items on short notice and it is necessary to maintain a stock so that prompt replacement can be made in case of storm or things of that kind. That covers not only the cash which is re-

quired to run the business, but also the supplies.

The reason I have taken 4% is because from my experience, working capital usually works out around 4% and I considered that, after considering all the facts in this case, to be a reasonable percentage. It is customary to make an allowance of that kind in these valuation cases for supplies and cash. I know the percentage that is usually allowed, of the total physical property, and it runs from 3 to 7% in telephone cases and a list that I have of Telephone cases tried before Public Service Commission, it ranged from 3 to 7% and the weighted average for the fourteen properties amount to $4\frac{1}{2}$ %.

Cross-examination

3193 (Questions by Mr. Howard:)

I got that list of telephone cases from my office in Kansas City. I don't just remember where I did get it, but I don't think I got it from a Telephone Company. It may be possible. We have a lot of information coming in there. We get these P. U. R. reports constantly, and we tabulate information from those reports. The Telephone Company did not furnish me its Bank balance for any particular day during the time I was making this estimate. I began the work on it on the first of November and completed it about the 15th of December. They did not show me how much money they had in the Bank for carrying on the business that day. They asked me to furnish this value based on my knowledge and experience of the business. I did not go into the field of conjectures and estimates because I am familiar with the amounts that have been allowed before.

"Q. But I am not asking what the commissions have allowed, I am asking you why you take and why your valuation engineers, and the Commissions for that matter, go off into the field of conjecture

about matters that are susceptible of being exactly determined. Did they tell you what supplies they had on hand during the time you made this estimate of reproduction?"

"A. Why, just a few items."

3194 They told me just a few items but the items did not consist of the amount that would be required to handle a property of this size. Possibly they could have furnished me that and possibly they could have furnished me their bank balance but what I am endeavoring to do is to determine an independent value of this property. I am not trying to determine something that does not exist, but I am trying to determine a fact. I am trying to determine, in my opinion, the value of this property.

"Q. All right, now, you have gone and determined a lot of it by estimating what it would cost to reproduce it, then you have gotten that far along, we understand that, and then after you get that far along, there is a certain definite property that they have on hand, why do you go out and figure and estimate and try to find out what other Commissions have allowed, when all you have got to do is to look at the property and appraise it? What is the sense of it?" I am trying to get your idea now, as a practical engineer. Why do you resort to that indirectly when you have got a direct and simple method of telling us just how much supplies and cash these people had investigated in this plant, at that time?"

"A. I wanted to determine in my opinion what is the value of this property. The Telephone company may have had an

3195 excess of supplies."

"Q. Oh, I understand, you have told us two or three times that you reproduced it according to this inventory and put in a little or overhead charges and omissions and contingencies; we have got that all in and gotten this plant up to nearly eight million dollars. We'll let that go, but that you are trying to reproduce this plant, the value of their properties, now in addition to those things that have gone into the plant, we all understand they have got to have something to run their business and what they are entitled to is whatever they have got in this business. Why didn't you find that out? Why didn't you tell us about that instead of telling us about this conjecture?"

"A. They may have had too many supplies on hand.

"Q. Well, if they had them on hand, they would be in service here, wouldn't they, and be a part of the plant?"

"A. What I was trying to determine was what was the fair value

of the property."

"Q. Yes, and I am asking you this simple question. Instead of going around, these methods of indirection and conjecture about it, why didn't you say, what have you got on hand here? What are you using? How much money have you got in the Bank to handle

the pay roll and things like that?"
"A. Because I know that this measure would give me a reasonable

value."
3196 I didn't know that the other measure would.

The other measure would not give the exact value because they may have had too many supplies on hand or had too small a quantity of supplies on hand. They couldn't run very well if they had too small a quantity but they may have orders in for other materials, but they had not arrived yet. I have not undertaken to determine how much should be on hand for supplies as distinguished from the pay-roll, but I just used the flat four per cent. That is the general practice among reputable engineers.

"Q. And the more value you get in determining the value of the plant, the more that will fluctuate, if you happen to get a value of eight million dollars on it instead of six million five hundred thousand, the way Mr. Hoag did, why your amount for supplies and cash on hand would vary?"

"A. It would vary, yes sir?"

"Q. Did you ever give any thought to the idea of how the supplies and working capital of a utility that collects its money in advance compared with one that collects its money at the end of the month?"

"A. Well, I haven't given any consideration to that."

I don't know that telephone companies collect a great part of their money in advance. I have been in the Telephone business a long time. But I don't know about local conditions with reference 3197 to that.

Mr. J. D. Frank: Some of them never do pay their bills. You are not going to undertake to prove in this case that we collect all of

our bills in advance?

Mr. Howard: No, but you collect enough in advance that you don't have to keep on hand a fictitious amount for working capital, and my suggestion is you don't do it, or you would come in here and show us what it was.

Mr. J. D. Frank: Well, we'll show you that by our accountants.

There is no fictitious amount in here at all.

I don't know how much the pay-roll of the Company is, I did not inquire into that. I have made an entirely independent estimate. I do not think it would be more proper to base the percentage upon the monthly earnings than upon the cost of the plant.

Redirect examination.

(Questions by Mr. J. D. Frank:)

What I have done is to make an estimate of the amount of working capital that would be required in an exchange of this size, with the number of subscribers that it has. I have assumed that this would

be a fair and reasonable allowance. I am basing that upon 3198 what has been done in other cases. I know that in a number of cases the average allowance for working capital is $4\frac{1}{2}\%$ of the total reproduction cost new.

Mr. Howard: I suggest, if you are putting the books in evidence, you do that without going over that and proving it up by the witness.

Mr. Duls: The Accounts will do that, Judge.

Mr. J. D. Frank: We are going to give you the exact amount, but

it is customary for engineers to do this.

Mr. Duls: You see, Mr. Topping made his estimates independently of the company. We didn't know a thing that he was doing. He was just asked to value the property.

The Telephone Company did not instruct me how I was to make a valuation of this property. They merely instructed me to determine in my own way the value of the Houston property and that is what I have done in this case, absolutely. I have used my own judgment and attempted to make a valuation of the property.

Mr. Howard: They told you they had a rate hearing on down

here, didn't they?

Mr. J. D. Frank: Why certainly, he knew that was why he 3199 was employed.

Mr. Howard: What is that?

Mr. J. D. Frank: Why, certainly. Mr. Howard: Well, I am asking him.

They told me they had a rate hearing on down here and that they wanted to use my report as evidence in the case. I knew that. They furnished me the Hoag inventory and told me they wanted prices ap-

plied to that. They furnished me the plant units.

With reference to the manner in which I secured quotations as to the prices of various items of material, on some of that property I secured quotations on carload lots, that is, on the major items. Carload prices are considered wholesale prices. On some of the property I did not get wholesale prices, but I used catalogue prices less the cash I have not figured out what per cent of the entire property that I have secured prices on the wholesale basis on and on what per cent of the prices without reference to quantity, but I would estimate that of the material value, that 80% has been figured in carload lots and the remaining 20% I figured without reference to the quan-

"Q. Would it have made any material difference with refertity 3200 ence to that remaining 20% if you had gotten prices on wholesale quantities instead of taking it without reference to the quantity?"

Mr. Howard: He didn't do it and I don't see how he could answer

Mr. D. A. Frank: Well, he could answer that question.

Mr. Howard: I don't see how he could, until he knew what he could have gotten.

Mr. D. A. Frank: Well, you could answer if you bought stamps down here in the Post Office w-ether you got it at wholesale or retail. Mr. Howard: Well, but that's not sand and gravel

Mr. D. A. Frank: Well, that's the way with sand and gravel.

Mr. J. D. Frank: That is what I want to bring out.

Mr. Howard: I don't think people would agree with you.

Mr. D. A. Frank: Well, the mere fact that you don't agree with it is no reason why it is not proper.

3201Mr. Howard: He says he hasn't done it, he wouldn't know until he tried to do it, that's the idea.

Mr. D. A. Frank: If he had done it before, he would know.

I would like to explain in connection with that on that balance of 20% in taking the catalogue price, we took the quantity price, but that didn't mean carload price. For example, if the prices are quoted in 500 lots or less, 500 to a thousand, or a thousand and over, we took the thousand and over price. I took the largest quantity price in the catalogue but that may not have been the carload price. There would be a great many items of material on which I did not have the carload price. I got the wholesale quantity prices as to the majority of the items constituting the plant here, all of the major items. If I had gotten wholesale prices as to the remaining 20% of the items there, in my opinion it would have made no appreciable difference whatever. It would have been something less than 1%, I would estimate. That is, it would be 1% of the 20%, or the items on which I did not get carload prices.

Page 1-C of my appraisal shows the total physical property, including the working capital, \$7,090,463.00. The next item

that I have down there is Cost of Establishing business. the cost of establishing business I have taken 20%, or \$1,350,603.00. That is 25% of the reproduction cost new of the physical property, not including general equipment or working capital. I got that 20% from my experience, from studies that I have made in other plants similar to this I know that it would run around 20%. The allowance that engineers make usually in estimating the cost of establishing business varies from 10 to 45% That 45% I think was a gas case or waterworks, but I am not sure. I have included that item because the value, the figure that I have shown, total physical property, including working capital, is not all of the value of the plant. There are other expenses that are incurred. I have endeavored to reach an estimate that would represent what it would cost to reproduce the physical property and attach the business. The property would be of no service if it didn't have subscribers connected. It costs additional money over and above what I have considered in the value of the physical property to establish this service. I did not attempt to work out this cost of establishing business but I just took this percentage.

If I were to come into Houston, and there was no telephone plant in existence, the first thing that I would do would be to employ competent lawyers to examine the statutes of the State to determine

whether there were any laws that would be adverse to the industry. After I had determined that, I would employ a competent commercial engineer to make a study of the proposition, to canvass the town to determine approximately how many telephones I could secure, to determine whether or not this class of service would be one that would be patronized by the public and used by the public and after I had satisfied myself in that regard, I would ask the City of Houston for a franchise. It would probably take about one year's time to make these preliminary studies and arrangements. During the construction period, there would be items of maintenance and depreciation, your building would be completed, and you would have to have

electric lights and elevators and janitor service in the building. You would have the first cost of issuing the directory. You would have the cost of developing and training a personnel. By that I mean you would have to have employees that were competent to handle various positions in the plant. You would have to have operators, those operators would have to be schooled and instructed and taught how to operate the board. You would have to develop supervisors and chief operators. You would have to train wire chiefs and plant men, cable men, linemen, and you would have advertising, a certain amount of publicity. It costs money to build up records in the various departments, it costs money to sell the service. Undoubtedly a large number of subscribers would come to the exchange and apply for the

3204 service without the necessity of going out and soliciting business from them, undoubtedly they would, but if they did there would be a cost attached to connecting the business. There would be commercial employees who would have to take the subscribers' contracts, explain to them the rates, and determine the class of equipment that the subscriber desired installed. There is an expense of entering the contracts on the records. From this contract is written an order, which goes to the three departments, plant, traffic and commercial, and that order is made in several copies. The Plant Department would arrange for the line facilities, one man in the plant department would assign the cable pair, another set of men would run the drop and install the telephone, and the traffic department would assign the number. Those transactions are all matters of record. I know that the telephone company is actually spending money for those purposes all the time. This is not some intangible thing that I add to the value of this property. In other words, I have attempted to estimate the cost of reproducing this business just as I estimated the cost of reproducing the physical property itself. This is an expense that I would have in addition to the cost of reconstructing the physical part of the plant itself. I have estimated that it would cost something to build up the organization, an organization of this kind. I could not go out and get employees from any and everywhere

to run this business, they would have to be qualified. I would have to take all of these employees and train them and of course, I would have to pay them while I was training them. connection with my consideration of the cost of establishing business, I have not proceeded upon the theory that this business would pay from the first day that I opened the business for serving the purpose, I would assume if I worked it out in detail that it would require about two years development period. I mean I would assume that I could reasonably expect to have 50% of the present number of stations connected at the time the plant was opened for service and that I would connect the balance, or other 50%, within the development period of two years. It is proper to consider operating deficits during that two years development period, that is, it is proper to consider the difference between the expense and the amount of income. That is due to the fact that you haven't the full number of subscribers there, the revenue or income would be insufficient to take care of the expense during that period of time.

Cross-examination.

(Questions by Mr. Howard:)

"Q. Mr. Topping, I believe the first thing we would do when we started to distribute this million, three hundred and fifty thousand dollars, is to hire some competent lawyers. What did you

3206 say you would have them do for you?"

"A. The first thing I would have them do would be to examine the statute books of the State to see whether or not there would be any laws that would be adverse to the investment of the State of Texas."

"Q. The Telephone Investment?"

"A. Yes, sir."
"Q. Wouldn't you naturally suppose under the existing conditions where the telephones have been operating here for twenty years and seem to be getting on nicely, others coming in, that you would not anticipate any great trouble about these laws when you would operate telephones?"

"A. I would want to satisfy myself that that was a fact."

"Q. All right, what else would the lawyers do for you? I am trying to get an idea now about what is proper to attorneys' fees."

"A. These lawyers would assist when they draw up a draft on a franchise and attend the council meetings."

"Q. Oh, yes."

"A. And assist in securing a franchise."

"Q. Did you investigate local conditions about what it would be necessary to do in that regard?"

"A. I know the usual steps of procedure."

"Q. Now, how much did you figure you were going to pay these lawyers?"

"A. I didn't figure."
"Q. You didn't figure that at all?"
"A. No, sir." 3207

- "Q. You don't know anything about then how much your lawyer was going to be paid?"
 - "A. No, sir, I haven't figured that out in detail at all. "Q. Well, let's say twenty-five or fifty thousand dollars?"

"A. I haven't figured it out."

"Q. But you just think it is worth something, but you don't know what?"

"A. There is an expense connected with it."

"Q. Notwithstanding that the telephone business has been going on and this plant has been operating here for a long time, you didn't go over to the City Hall where they have a competent young man over there that they pay the magnificent sum of Two Hundred Dollars a month, that prepares these franchises; they all run along about the same?"

"A. No, sir, I didn't take into consideration."

"Q. One is about a copy of the other and they all run along about the same, you didn't take that into consideration at all?"

"A. No, sir, I know that it would consume time and money in obtaining a franchise."

"Q. Would consume time and money?"

"A. Yes, sir."

"Q. You didn't know that you could come down here before business commissioners like ours and present your own fran-

chise and that the services of a lawyer wouldn't be necessary for the machinery at all, you didn't find that out, did you?"

"A. I wouldn't present a franchise without it having been passed by the lawyers."

"Q. You would have one passed on by the lawyers?"

"A. Yes, sir."

"Q. But the one that would be finally entered would be one that the City lawyers would approve, wouldn't it?"

"A. Well, it might or might not."

"Q. It wouldn't be very apt to get in there until the city lawyers approved it, would it? Now, another thing, we have already had one set of lawyers in this thing. Now, I thought they were doing some of the work of some kind, what are they going to do, just draw the \$7,500.00 a year?"

"A. Those are the legal services during the construction period of three years. This service that I referred to is incurred in the first

year."

"Q. Didn't you mention getting the franchise this morning would be one of the things that these lawyers did, and finding out the laws would be one of the valuable services these attorneys would render for you?"

"A. No, I was speaking of the preliminary year."

"Q. Why not have it all done at one time?"

"A. In explaining my exhibit, I was explaining why I have shown a four year period on the exhibit. One year, the first year, was the preliminary year or the year in which these matters would be taken care of. The other years are the

construction period."

"Q. Now, you are speaking from your experience. What has been your experience in regard to what lawyers charge you for

doing all this work?"

"A. Well, whenever they have charged me personally, they have

charged me plenty."

"Q. Well then, you don't know anything about the services of these lwayers or what you are going to pay them. Well then, the next thing you are going to get this competent commercial engineer. What is he going to do for you?"

"A. He is going to make a preliminary study of the situation."

"Q. How long is that going to take him?"
"A. That would consume several months."

"Q. Well, about how many months?"

"A. Well, he ought to complete his work in six months."
"Q. Well, what you are you going to pay him a month?"

"A. I haven't attempted to-"

"Q. (Interrupting.) You don't know what those men are worth.

You have told us now, you see you are coming in here, Mr. Topping, and saying that the people of this community are going to pay you upon these investments and we want to learn something about them. Now, haven't you investigated enough to know about how much that kind of an engineer knows?"

3210 "A. I could work out that entire cost of establishing business in detail. I have worked it out a number of times."

"Q. I don't care for you to demonstrate your knowledge, but I wanted to see upon what basis you have set up these expenses in the past. It is what you have done in the past that is interesting us now; what you have done to familiarize yourself with the value of that commercial engineer; you have any idea? Approximate it."

"A. I haven't attempted to figure it out in this case."

"Q. A thousand dollars a month would be good enough."

Mr. D. A. Frank: He doesn't mean one man.

"A. Well, I mean by that, one man and his organization."

"Q. Well, how many men in his organization?"

"A. I haven't figured it out." "Q. Have you any idea?"

"A. What they do, an engineering study would mean they they would go out and spot the houses and divide them up into various classes.

"Q. It wouldn't take much of an engineer to do that, would it?" "A. Well, the field men might not be of as high a type as the commercial engineer, but it would take a man of ordinary intelli-

gence.

3211 "Q. Well, have you any vague idea or appr-ximately close idea about how much—what that organization exists of?"

"A. No, I haven't worked it out in thise case."

"Q. Haven't worked it out at all?"

"A. No, sir."

"Q. Well, suppose we would take a guess, would \$50,000.00 be a pretty good amount for that work?"

"A. I wouldn't care to answer it because I haven't worked it out

in detail."

"Q. Or these Lawyers' fees, suppose you get \$50,000.00 for these lawvers?" How about this franchise, what is that going to cost vou?"

"A. I haven't attempted to analyze that."

"Q. You haven't attempted to analyze that at all?" "A. I know that it would cost a sum of money."

"Q. How much?"
"A. Well, I don't know."

"Q. An idea of whether it would cost Two hundred and Fifty Dollars?"

"A. I haven't figured that out."

"Q. Or twenty-five thousand dollars?"

"A. I haven't figured that out."

"Q. Well, let's talk about this maintenance. Can you give us any light on that? That is No. 4 on the set-up?"

"A. There would be maintenance on the plant during the development and construction period."

"Q. About what would that be?"

3212 "A. I haven't figured it out." "Q. Don't know anything about it?"

"A. No. sir, except I know there would be an expense there."

"Q. All right, then the next thing that seems to be of first importance is printing the directory, what is that going to cost you? "A. I haven't figured it out."

"Q. Any remote idea at all about what it would cost?"

"A. I haven't figured it out in this case. I know there is an ex-

pense incident to that first directory."

"Q. Well, we are dealing now with that million, three hundred and fifty thousand dollars and I would kind of like to get it analyzed. That probably would cost three or four thousand dollars?"

"A. I have no idea."

"Q. You couldn't even approximate whether that would cover it or not?"

"A. I haven't worked it out in detail."

"Q. Let's see, the next thing is training girls. You can tell about how many girls it would take to operate this plant, can't you. You have been in the telephone business a long time, Mr. Topping. Now, we want to know approximately about how many girls you are going to use to operate this plant?"

"A. I don't know but I would estimate there is something like five

or six hundred girls."

"Q. All right, we have got something to go on. How 3213 much is it going to take to train a girl?"

"A. I haven't attempted to figure it out."

"Q. You haven't attempted to figure that out at all?"
"A. No, sir."

"Q. You don't know whether it would take ten, fifteen, or twentyfive or one hundred dollars to train a girl?'

"A. I haven't attempted to figure it out at all."

"Q. Well, before you can figure, we have got to have some fundamental knowledge of what we are dealing with, and you are a valuation engineer?"

"A. I have worked up the cost of establishing business in other cases and I am familiar with all the expenses incurred and I know what has been allowed in other cases and plants similar to this."

"Q. I am not speaking about what has been allowed, I am speaking about the cost of it, I am asking you as a valuation engineer familiar with the telephone business, you have come here to tell us now about training girls and printing directories and employing girls, something about the value of it, and you can't tell us how much it would cost to train one girl?"

"A. I haven't figured it out."

"Q. Or how much to train five hundred. Would it cost as much to train one girl or would it cost as much to train five hundred girls proportionately as it would one girl?" What is your answer?"

"A. Why, it would be my judgment that it would cost 3214 more to train one girl than it would if you were training a large number of girls per operator."

"Q. Do you have any idea how much more?"
"A. No."

"Q. All right. What advertising are you going to do?" "A. Why, you have advertising in the newspapers."

"Q. For what?"

"A. Various things. That you were building your telephone plant."

"Q. Everybody in the City would know that if you were build-

ing a big telephone plant here, wouldn't they?"

"A. They probably would."

"Q. Well then, why would you put it in the paper and pay advertising rates on it?"

"A. You would have announcements in the newspapers."

"Q. For what, what announcements?"

"A. Matters of interest, a matter of education."

"Q. Who would it educate and how?"

"A. It would educate the public."

"Q. What are you going to tell the public? Let's see whether you are going to educate them, or not?"

"A. Why, you would advertise like any other manufacturer of

goods. You would advertise your company."

"Q. Keep an ad running in the paper all the time, that we are going to build a telephone plant and we are going to give service, is that what you mean?'

3215 Mr. D. A. Frank: Absolutely.

"Q. (continued). Well, everybody would know that, everybody would know that you were going to build a plant here and are going to attach subscribers and are going to charge for it when you got through, you are putting substantial things in here upon which you are going to attach a return. Now, let's know what you are going to do?"

"A. Why, any manufacturer advertises his products."

"Q. I know that a man that is selling shoes does some advertising and I know a man that is selling patent medicines does a good deal more, but let's get down to telephone companies where there is just one and everybody in town knows it and knows that they are going to have a new telephone company; now, what are you going to advertise and what are you going to tell them when you advertise?"

"A. You would run an educational campaign."

"Q. To educate who and what?"
"A. As to the service."

"Q. Did you investigate conditions here, Mr. Topping, to know whether the people are familiar with the telephone service or not? You are building this plant up here in Houston with 160,000 people, we are people-

"A. (Interrupting.) Yes, sir."

"Q. Did you make any study to determine whether or not these

people were bright or broke on the question of telephone service?"

3216

"A. No, sir."
"Q. You didn't make any investigation about that?"

"A. No, sir.'

"Q. Well, then, let's assume you are going to build us a plant here, let's assume that you are building a plant where there is already one in existence, or you can assume that this one had been burned down or destroyed one way or the other and the people without telephone service. Then in this community you build this new plant where as is the case here, everybody knows how to use a telephone, they are not afraid of them any more at all. Not everybody that wants a telephone can get one, but they are clamoring for telephone service, they are trying to get 'phones, the Company isn't going out trying to get them to attach the business or to subscribe but they are imploring the company to give them 'phone service. Now, you build a plant like this in that sort of a community. What advertising are you going to have?"

"A. You would have some expense in that even."

"Q. Well, tell us what the educational expenses are now, you were talking about education, how are you going to educate them? To what? "A. There would be some people that wouldn't come to your

office."

"Q. Wouldn't come?"

"A. No, sir, there would be certain classes of subscribers that wouldn't come. If you were going to reproduce the Houston plant to-day, I would venture an opinion that you

would have to solicit a certain number of subscribers."

"Q. Why would you have to do that? They know the value of it, it is established; their 'phones are here now, and they are paying for it very much and they won't give them up to let people that want to use them have them. Now, why would you have to solicit that kind of business?"

"A. Well, I am assuming that Houston is no different from other

localities and in other localities these expenses have occurred."

"Q. Occurred when, in the early days?" "A. In the development of the business."

"Q. Way back in the long ago people were afraid to take hold of them, afraid they would have a kick-back, but we have passed that stage long ago. There is not anybody afraid to pick up a receiver?

"A. But there are certain people that are still slow about taking

telephone service."

"Q. But here you have got a City here with 27 thousand telephone subscribers, we have got I don't know how many more that are trying to get service and if this was discontinued to-day, this service, and then it was afterwards restored, they would still be anx-

ious to have them, now, what sort of campaign would you have to carry on?" I am talking about any material amount. I am not talking about putting an announcement in the

paper."

"A. You would have certain expenses if they come to your office." "Q. Well, we'll get down to that. We would just eliminate that advertising expense?"

"A. No, sir, there would be some advertising."

"Q. What is it?"

"A. I haven't figured it out."

"Q. I am asking you the amount in dollars and cents, I am asking you what the nature of the advertising would be.'

"A. And I have attempted to explain it several times, that it would

be along educational lines."

"Q. But that was before I explained to you that these people had been educated up to the point where they wanted more telephone service than they can get, so when you get a man through college, you don't send him through college again. He might could learn more but you don't send him over that same route. So under these conditions, you have no educational campaign, so far as the people are concerned?"

"A. I should say you would."
"Q. What is it? That's what I want to know."
"A. It would be publicity work, announcements.

"Q. What announcements?"

"A. Announcement of the progress of your work and when 3219 the subscribers could expect service and when the plant would be open for service and when the directories would be ready and suggesting that the public arrange for the service so they would get their names in the first directory.'

"Q. Now, about selling the service?"

"A. It would cost money to sell the service."

"Q. In what way?"

"A. In the way that you would have to have people at your counters to attend to the public, even if they came to your office."

"Q. All right. I agree with you there. Let's say we want to spend some of this money to get some little idea about it. About how large a book-keeping force would that take?"

"A. I haven't made a study in this case, I have merely used

a flat percentage."

"Q. Just used a percentage that you have gotten from some other place?"

"A. That I know from my experience and in the work, is appli-

cable to the Houston plant.'

"Q. And yet you can't tell us anything about the cost or any of the items that go to make up this grand total?"

A. I could work it out, but I haven't worked it out."

"Q. You could work it out, but you are going to adopt the proceedure of giving us the fact and then going out and finding out whether it is correct or not?"

"A. That is the percentage that has been allowed in other

3220 cases.'

"Q. Mr. Topping, is that all you have got to say to us upon this item of one million three hundred and fifty thousand dollars of going value?"

"A. That is, the 20% is a fair and reasonable allowance."

"Q. Although you can't tell us anything about the cost of any of the items? I am not confining you to any one, I am asking you about—to pick out any one of the things that you say go to make up this million three hundred and fifty thousand dollars and tell us what you paid, what you paid for it?"

"A. I have told you practically all the operations that enter into it, but I have not attempted to valuate, or place a sum for each

of the individual operations. That I can do.

"Q. Well, you have told us that it would take at least one year to attach 50% of this business, and now I am asking you again if in making that statement, you were familiar with the proposition that this is a community that is educated up and anxious for telephone service and that they are going to apply for it and are applying for it now to a greater degree than they can be served?"

"A. Now, I have taken into consideration the fact that there would be a certain number of subscribers that would come to your office."

- "Q. Is there any reason you can give me why they wouldn't call come, because they have all demonstrated that they want this service and are accustomed to it and won't relinquish it?"
- "A. Even if they did come, there would be come cost."

 "Q. I understand. Now, we are getting down to something substantial. That would be getting out your contracts and the cost of getting out your subscribers and putting them on the books?"
- "A. Yes, you would have to have a commercial organization."

 "Q. Now, can you give us some idea of how much that organization would cost?"

"A. No, sir, I haven't worked it out at all."

"Q. So then, on this one million, three hundred and fifty thousand dollars, we have got nothing to stand on but a lot or generalities."

"A. No, I would say—"
"Q. That is all, Mr. Topping."

Redirect examination.

(Questions by Mr. J. D. Frank:)

"Q. Mr. Topping, Mr. Howard has spoken very lightly of the proposition of going down to the City Hall and securing a franchise in a few minutes from a handsome young man down there who is paid \$200.00 a month for the purpose of dishing out these franchises to public utilities. From your experience in the Telephone

business, do you know it to be a fact that sometimes the company has to dicker and barter with these City Councils for two or three years before they can secure a franchise?"

"A. I know it takes considerable time, sometimes."

It is not such an easy matter as Mr. Howard has painted it to be, I have never run across such a case in my experience. Counsel has also referred to advertising and said that everyone in the City knew that the telephone plant is here. I presume everyone knows that the large department stores like Levy Brothers and the Main Dry

Goods companies are located in Houston also. Yet, those large companies advertise just the same. It is also true that street railway companies where they are the only company operating in a particular town do considerable advertising. It is also true of light companies and railroad companies and such utilities as that. The cost of attaching business is not the only thing that enters into the cost of establishing business, that is only one of the few numerous items. That is a small item of the total expense. If the Houston plant was blotted out entirely and I started in to reproduce it in three years, I would not expect to get back all of the original subscribers that I had at the time the plant was blotted out of existence, not at the beginning of the operation. As a matter of fact I would get back but very few of the subscribers, I would estimate about 50%. People are changing, moving about, and leaving the City and new ones coming in all the time.

3223 I have considered the cost of reproducing this property new. I have also made an investigation for the purpose of determining the per cent condition of the physical property constituting the Houston Telephone Plant at the present time and have

prepared an exhibit with reference to that.

Mr. J. D. Frank: This exhibit, which is headed "Reproduction cost new, less depreciation," is offered in evidence as Plaintiff's exhibit No. 34."

(The document was thereupon received in evidence and marked Plaintiff's Exhibit No. 34, and said Plaintiff's Exhibit No. 34 is transmitted herewith in Exhibit file.)

For the purpose of determining the per cent condition of the physical property constituting the Houston Telephone Plant I made a trip over Houston inspecting the property, inspecting the poles and cables, the wireless and various parts of the plant. On this inspection, I selected various portions of the City and in some cases clumb the poles to determine the condition of the cables and the condition of the wires and looked around the poles, and probably covered 75% of the outside plant. It took me somewhere around eight or ten days to make this investigation, inspecting the property for the purpose of determining the condition of it. I spent that time in examining the various parts of the plant. I covered about

75% of the poles, in other words, I saw about 75% of the 3224 poles in Houston, and in going over the pole plant, I had an instrument and would dig around the base of the pole to determine the condition and I would climb poles to inspect the condition of the cable, the messenger strand, and the wires and drops. I visited the buildings and inspected them from the basement by floors. I also inspected parts of all of the plant for the

purpose of determining its condition.

This exhibit, in the left hand column is indicated the class of plant, the first column headed "Reproduction cost without overhead," the next column is headed "Reproduction cost including overhead," the next column is headed "Net salvage value in per

cent," the next column "Non-depreciable property," the next column "Depreciable property," and the next column "Per cent condition," and the last column "Reproduction cost less depreciation."

Take for example, the item of apparatus, that is under "Subscribers' Station Equipment." The reproduction cost of the apparatus including overhead is \$362,295.00. The net salvage value in per cent is 10%. That net salvage value does not depreciate. Therefore, I have deducted the non-depreciable property from the reproduction cost and that leaves the depreciable apparatus at \$326,-I have estimated that to be in 95% condition. Taking 066.00.

95% of the \$326,066.00, gives the reproduction cost new less depreciation, of \$309,763.00 for that item of plant. 3225

I have treated all of the other items of plant in exactly the same manner as that, with the exception that there was no net salvage value. I have not taken that factor into consideration. For example, on poles, there is no salvage, although with the present

price of wood, I think there ought to be.

The second page of that exhibit shows the reproduction cost less depreciation of all of the preceding items of the depreciable property is \$5,021,143.00. I then took the non-depreciable property of \$1,-387,863.00 and find the total reproduction cost new less depreciation as \$6,409,006.00, to which I added my working capital, cost of establishing business, and obtain the reproduction cost new less depreciation, including working capital and cost of establishing business as \$8,032,319.00.

Cross-examination.

(Questions by Mr. Howard:)

When I determined the per cent condition of this plant, I am after the accrued depreciation in the physical property. I went out and gave the plant a personal inspection, spent eight days looking it over, yes.

"Q. All right, and you found the plant to be what, found 3226 what depreciation?'

"A. I found that the depreciable property amounted to-" "Q. (Interrupting.) No, I mean the per cent, condition. didn't depreciate the amount, did you?"

"A. No, sir."

"Q. You didn't depreciate anything but what are known ordinarily as depreciables?"

"A. You mean, in per cent. Condition?"
"Q. Yes, the per cent condition."

"A. I found the depreciable property in 92.57 condition."

"Q. Or a depreciation of 7.43?" "A. Of the depreciable property."

"Q. All right, now what does that include?" "A. That includes the accrued depreciation."

"Q. In what way, how do you arrive at it, includes rust and wear, does it?"

"A. Yes, sir."

"Q. What else does it include?"
"A. It includes rust, rot and decay."

"Q. What else?"

"A. That had accrued in the property."

"Q. What else."

"A. That's all that includes." "Q. That's all that includes?"

"A. Yes, sir."

3227 Redirect examination.

(Questions by Mr. J. D. Frank:)

I find as the total cost new of the physical property \$6,817,753.00. That is, the total reproduction cost new, less depreciation \$6,409,-006.00.

I climbed a good many of the poles to make a physical inspection

of the wire in the plant.

I am familiar with the original cost of this plant as shown by the books and have taken that into consideration in arriving at the valuation which I have placed on this plant. I am also familiar with the gross additions which have been made to this plant for the last five or ten years. I have just made a rough approximate as to the amount of money which would be required to make extensions or additions to the plant within the next ten years. suming that Houston would continue to grow and develop as it has in the past, I would estimate that it would require about Three million dollars additional money. That is, in the way of extensions or additions to the plant within the next ten years and enlargements to meet the growth.

My opinion is that there is need for such a plant as this in Houston and I think that the Plant is economically justified. opinion there will be an increase in the demand for telephone The demand for service service in this particular locality.

I know that the demand for service has in-3228 will increase. creased in the past with the growth of the City. This plant is well constructed and it is favorably located, and the buildings are located in the proper places in the City. It has been, and is, well engineered. This property is in good condition, in fact, I have inspected a great many plants, and this property is as good a property and in as good condition as any property that I ever inspected. I have made a study, in a general sort of way, with reference to the history of this community. I obtained a book issued by the City in 1917 and familiarized myself to a more or less degree with the City. That book is entitled "Illustrated City Book of Houston, 1917." I don't know whether that was gotten out by the City or by some commercial organization. I just know that the covers indicate City Book. It contains reports from the Mayor and various officers of the City and also contains an analysis of the City by the Chamber of Commerce. I learned with reference to the

growth of the City that in 1900 the book indicated that Houston had a population of something like 44,633 people, that in 1917, the population was approximately 150,000 people, that is an increase of 336% or an average yearly increase of 18%. The manufacturing capital in Houston increased from 1909 to 1914, 53.3%. At this period, there were 365 factories, employing something like 10,000 people with a combined pay roll of approximately \$10,000.

000.00. That would indicate then that the business in this 3229 City is fairly good. I found that Houston was headquarters for several of the largest oil industries in the United States with a combined capital, aggregating over \$100,000,000.00. The wholesale trade of the City amounted to approximately \$125,000,000.00 and the retail trade at \$57,000,000.00. Houston also claims the distinction of being the financial center of the State of Texas. I would concede it personally. From my investigation I would say that the City has enjoyed a gradual, steady growth. From what I have learned as to the past history of this community I would expect it to grow equally as rapid, if not more so. The bank deposits show a constant increase. It has access to the Gulf, it is a large lumber center, and something like 15 or 17 railroads center at Houston, and it is only natural to assume that Houston will have and enjoy a continual growth. I am familiar in a general way with the financial history of this telephone company here whose property I have been valuing. I know what conditions have been made to the plant in the last eight or ten years and what money they have had to put out for that purpose. I have seen Mr. Scott's exhibit with reference to the outstanding stock and bonds of the company. In my opinion you would have to take into consideration the value of the stocks and bonds outstanding in arriving at the value of the property here. I have given due consideration to all of these

3230 matters in arriving at what in my opinion constitutes the value of this plant. Basing my opinion on these matters, that is, the original cost, and the cost of reproducing the property, less depreciation, the history of the community and the number of subscribers that we have, the additions that have had to be made to the plant in the past, what money will probably have to be put into the plant in the future, what in my opinion the value of the plant constituting the Houston Telephone plant is in round figures eight million dollars.

Cross-examination.

(Questions by Mr. Howard:)

"Q. Mr. Topping, are you an engineer?"

"A. Yes, sir.

"Q. A technical engineer?"

"A. No, sir, my training has all been practical."

"Q. You spoke a while ago about this plant being well engineered, and having been well-engineered in the past, what do you mean, that the lines and the conduits have been laid out well with reference to the City as it grew from time to time?"

"A. Yes, sir, and that it has been placed in the most advantageous

position."

"Q. That has not been affected at all by the development of the City in different portions? What I mean is this, Mr. Topping: If this engineering was done and well done at the 3231

time and served the community but later on a big addition was opened up some distance removed from the center, would that or not tend in any way to affect the desirability of the location of these lines?"

"A. It might have some effect on it. In engineering a plant, an

engineer foresees into the future as far as he possibly can.'

"Q. But he necessarily can't foresee as well as he can backsee, does

"A. No, the fore-sight is not as good as the hind-sight."

"Q. If you were to build this fine plant you have been telling us about here in this City now, would you rely upon your own judgment as to the matter of where you would run your conduits and your lines and things of that kind?"

"A. I would, partially, I would have to have some assistance on it. One man couldn't engineer this entire property. It is too big a

job."

"Q. Well, is it a job that you would undertake to oversee and engineer? There must be a supervising engineer in any big construction like that. Would you assume that rôle?"

"A. I would assume a general supervision."

"Q. You mean that you would employ you a first-class engineer and consult with him at times?"

"A. No, sir, I mean this, that if I were reproducing this property, looking after all of it in detail, I couldn't handle 3232

the entire detail.

"Q. Well, my point is this, Mr. Topping. Can a man who is, conceding to him a very high degree of intelligence and efficiency, who has secured his knowledge of the business from working in it, in the different parts of it, and growing up with it, get that knowledge that will enable him to lay out construction work in the same way or to the same degree that a technically trained engineer could get?"

"A. I would say that he is better equipped."

"Q. You would say that he is better equipped?"
"A. Yes, sir, because he has the practical experience. A technical man may be trained but then before he could go and lay out that plant, he would have to have the practical experience."

"Q. Did you ever lay out any plants of any great magnitude?"
"A. Not as large as this one. I have been associated with work in the engineering department."

"Q. Are there any improvements being made in the telegraphic or in the telephone service, and general improvements?"

"A. Do you mean as to any particular class of plant?"

"Q. Yes, first are there being any made, and if there are, in what respect?"

"A. Well, they are constantly making improvements."

"Q. Of any great magnitude. What do they affect mostly, anything that affects your central office equipment? A switch-board that was installed seven or eight years ago, is that susceptible or likely to be improved any in the near future or supplanted?"

A. Well, they are using and in some of the cases where it is necessary to replace existing office equipment, installing automatic

equipment."

"Q. But the manual equipment and the manual switch-boards, as these are, there are no improvements immediately to be consummated that will improve the character very much?"

"A. Well, not that I know of, nothing except the automatic equip-

ment."

The automatic equipment is a "Q. The automatic equipment. thing that is on us right now, isn't it?"

"A. Some companies are using it where they are replacing worn

out central office equipment." "Q. It is recognized in the telephone world as being a great laborsaving equipment, is it not?'

"A. Yes, sir."
"Q. It will do away to a great extent with the operators?"

"A. Yes, sir."

"Q. Does it have any other advantages in a labor-saving way?"

"A. No, I can't say that it does. It doesn't eliminate all of the help in the central office."

"Q. Oh, it would not eliminate all the operators, I know." "A. But it requires more highly trained and experienced

men to take care of the equipment." 3234

"Q. But it is well recognized as a very great and economical labor-saving method over and above the manual method?"

"A. It does save some labor."

"Q. A very considerable amount too, doesn't it?"

"A. All the operating expenses, yes, sir."

"Q. Say probably 75 or 80 per cent of that wouldn't it?"

"A. Well, I haven't give that any study. I don't know what part of it, but it saves-

"Q. (Interrupting.) Saves a great part?"

"A. It saves considerable of the operators' expense."

"Q. Would the installation of automatic switch-boards and the automatic telephone system necessitate any general change in the plant?"

"A. It would necessitate changing the equipment at the sub-

scribers' stations and the central offices."

"Q. Remodelling the building?"

"A. It is possible that some of the buildings would have to be remodelled."

"Q. You don't take those things into consideration in stating your per cent condition of the plant?

"No, sir, not in determining per cent condition.

"Q. Obsolescence should to taken into consideration in determining accrued depreciation, should it not?"

"No, sir, not unless it has accrued. If it has accrued, than I would take it in.

"Q. But if it is imminent?"

Mr. D. A. Frank: There is no testimony here that it is 3235 imminent.

It may be. Mr. Howard:

Mr. D. A. Frank: Well, it won't be credible if it is.

"Q. I asked him if the change was imminent, whether or not it wouldn't be taken into consideration in determining accrued depreciation, assuming that the obsolescence and inadequacy is imminent, it should be taken into consideration, should it not?"

"A. I would say that unless it had occurred at the time of the inspection, I would not take it into consideration, unless it was ap-

- "Q. (Interrupting.) Now, do you mean to say as a valuation engineer that if you had a plant here, that your lines and conduits were entirely out of place, from a good engineering standpoint, although they had not been removed, and that your central office equipment was located in the wrong place, although it had not been removed, that you wouldn't take those things into consideration in determining-
- Mr. D. A. Frank (interposing): Per cent. condition of the property?"

Mr. Howard: No, I didn't ask him about that. Mr. D. A. Frank: That is what you were asking him 3236 about.

Mr. Howard: I was talking to him about accrued depreciation.

- Mr. D. A. Frank: That is where you get per cent condition. Mr. Howard: Per cent condition and accrued depreciation, I don't thing for a minute, you would contend for a minute is the same thing."
 - "A. I am talking about per cent condition for the plant now."

"Q. But you termed it though, "accrued depreciation," when I asked you about it a while ago.'

"A. Upon my inspection-

"Q. (Interrupting.) You didn't mean, when you were talking about per cent condition you didn't mean accrued depreciation?" "A. I mean, that this much value had been wasted or rotted.

"Q. Yes, you told me that the only things you considered was waste, wear and decay?"

"A. Yes, sir, I considered only the factors that had really happened

at the time of my inspection."

"Q. And would you say, Mr. Topping, now, as a professional valuation engineer that if you had a plant that was in 92% condition, that is, all its switchboards and its 3237 & 3238 poles and its wires and its conduits and all those things compared with their original condition were in 92% but as a matter

of fact, the conduits were misplaced, they were not where they best served the purpose, not in the most economical place, and the Central Office Equipment was not located in its proper place, or that anything was about to happen that would require following the law, proper law of economics, to replace any part of the plant, that this plant that you determined the per cent condition of, would be as valuable as one where these engineering defects have been corrected."

"A. No, I wouldn't think it would be as valuable."
"Q. You wouldn't think it would be as valuable?"

"A. No, sir.

Direct examination.

(Questions by Mr. J. D. Frank:)

"Q. Mr. Topping, would the fact that some of the conduits were misplaced, or bad judgment had been shown with reference to the location of some of the buildings, have anything to do with the per cent. condition of the property?"

"A. It wouldn't have anything to do with the per cent condition

of the property."

3239 In the District Court of the United States for the Southern District of Texas, at Houston.

In Equity.

No. 108.

THE SOUTHWESTERN BELL TELEPHONE COMPANY, Plaintiff,

VS.

CITY OF HOUSTON et al., Defendant-.

Præcipe.

To the clerk of said court:

The clerk will please incorporate in the transcript of the record on appeal the following portions of the record which the plaintiff, the City of Houston, submits in addition to the rest of the record herein, for the consideration of the United States Supreme Court, in connection with the appeal of The Southwestern Bell Telephone Company:

The portions of the testimony of the witnesses, Lamar Lyndon and C. A. Gates, filed in this cause on the first day of February,

A. D. 1921.

W. J. HOWARD,

Solicitor for Defendant-, City of Houston et al.

Service hereon accepted on this the first day of February, A. D. 1921.

D. A. FRANK, JOSEPH D. FRANK, WM. H. DULS,

Solicitors for Plaintiff, The Southwestern Bell Telephone Company.

LAMAR LYNDON, a witness for the defendant, testified as 3240 follows:

The inventory furnished is, I think, satisfactory to us. It is susceptible of absolutely accurate determination, and when I have gotten that, I have gotten to a well defined border and have crossed the border line and gone into the land of uncertainty. One can set down most any character of figures, and vary them any way he wants to take them, either by taking a five years' average, that is, taking five years and averaging them up, or he can take 1919 prices and apply them, or he can go back and take the trend price and apply those from the start. That is a matter of detail, and one could fix that by the use of a half dozen different methods.

"Q. Well, then, eliminating the different prices owing to the different times, different averages, and depending entirely on what period you take, would you meet with any other difficulty in getting

prices for what you call a phantom telephone plant?"

"A. Simply this, and it is applicable to any character of construction work,-that if a manufacturer or contractor is asked for a price, a quotation, on furnishing any apparatus or doing any construction work which he knows he is not going to get the con-

tract for, his figures will be mosty cursory and not trimmed down to a fine business point. It is not natural, nor is it

human, for a man to make a complete, clear and detailed estimate of a piece of construction work that he is not going to get the job to do and has no hope of getting it, and so all that could be obtained would be something that would be indicative of a maximum cost,-it would be indicative of a maximum cost."

"Q. Well, would the estimate or quotation which you would get, in the nature of things, be higher or lower than the actual cost in

case where you had real construction work?"

"A. It would unquestionably, in every instance, be higher; as I

say, it would be indicative of the maximum cost."

"Q. Well, now, that's another thing that would render this second step in the so-called reproduction method at this time confusing and misleading, and cause you to lose your way in trying to get anywhere after having departed from the inventory, and leave you groping. No, Mr. Lyndon, in trying to bring some light here upon this question, you should know about the effect of prices generally, and whether they have been abnormal and are chaotic, and conditions are worldwide and everything is unsettled; and aside from the fact that you are not completing-not doing any construction work, but merely bothering the manufacturer who is making up estimates You find, through a system of years, starting modestly, for you-

but building up one concern, has gradually acquired the telephone industries until in the United States today it has 3242

acquired four-fifths of them, and the concern that owns this four-fifths of these operating telephone exchanges or plants also owns a gigantic supplier,-the Western Electric Company,-and then it appears that along side of this gigantic supplier there are one or two pigmy competitors,—I think you know them,—the Kellogg Company, I think, is the most important; you find then that the only competition that this supplier that's owned by the same owner that operates the exchanges, consists of these one or two little concerns; I mean little comparatively speaking; that this supplier will put these goods in without any arm's length contract, no competition, no freedom of action, no freedom of trading, no suggestions upon the one part that you are too high, and I could do a good deal better, would you consider that would embarass or lend any uncertainty to a proper valuation upon a reproduction theory?"

"A. Well, it would simply fix the reproduction valuation at a figure that would be produced by the charges of costs set up by one of the members of the same family. It would be difficult, if not impossible, to make a reproduction valuation of a Bell Telephone system without taking into consideration the prices charged by the

Western Electric Company.'

"Q. All right, Mr. Lyndon, having looked over the field and considered all the company's affairs, with a view of trying to 3243 determine and to assist those charged with the duty of de-

termining what would be a fair rate of return and fair earning of this utility, you made an investigation and report and certain computations, I believe; did you not?"

"A. Yes, sir."

"Q. Mr. Lyndon, I believe in trying to arrive at this, you connected with your work of 1914, when there was no dispute between the city and the telephone company at that time in regard to a

valuation that was made?"

"A. There wasn't any particular dispute. We found certain figures and the Company submitted others, and we were not a great distance apart. Of course, it is not normal for a public utility to accept a real valuation, and we always expect some objections and some increases, but the ones they were able to suggest were not very great.

Mr. Howard: Mr. Lyndon has resorted to the method of preparing some exhibits, and we are going to pass them around. Will you mark that as Lyndon Exhibit No. 1?

(The statement was thereupon received in evidence, marked: "Lyndon's Exhibit No. 1," and is filed herewith.)

(By Mr. Howard:)

"Q. Mr. Lyndon, this exhibit I believe you have marked: "Valuation physical plant of the Houston Exchange, Southwestern Telegraph and Telephone Company. Basis of reproduction

244 cost in 1914, plus the actual costs of additions 1914 to 1920."

Mr. Lyndon, I will be glad if you will take that exhibit up briefly and explain it,—just how you have arrived at it and how you get this."

"A. I would expect to find everything here, and in the quantity

and classifications as set forth in the inventory.

"Q. But not as to the long distance and toll equipment, you

would not-

"A. (Interrupting.) I would not know anything about this unless it is set forth in here. This is toll equipment and this is not, and I should assume that is a correct statement."

"Q. It is a fact that all equipment here is used more or less in

handling long distance tolls, as it is in every exchange?"

"A. Oh, yes; the local equipment is used for long distance service;

they constitute the terminals.

"Q. Now, Mr. Lyndon, you have a summary, I believe, on the top of the first page of your Exhibit No. 1, have you not?"

"A. Yes, sir."

"Q. Now, Mr. Lyndon, referring to your Exhibit No. 1 here, I see you have set up here "The reproduction Cost in 1914." Mr. Lyndon, first I will ask you how you arrived at that,-at any reproduction cost at that time?"

"A. Took an inventory." 3245

"Q. Who took an inventory?"
"A. The Southwestern Telegraph and Telephone Company took the inventory and we checked the inventory and found it correct, except in occasional items,-found a little deviation, I should say, within one-twentieth of one per cent. It was negligible. Then we took the items and got the prices and added to those prices what we regarded as a reasonable overhead."

Mr. D. A. Frank: When was that?

"A. In 1914; and in that way we found-

Mr. D. A. Frank (interrupting): Now, this refers only to the physical property?"

(By Mr. Howard:)

"Q. I understand-

We found that the cost of reproduction "A. (Interrupting.) on that basis was \$2,080,935.00."

"Q. Now, that's in the column headed: "Lyndon and Elrod?"

"A. Yes, sir."

"Q. Now, I notice in the other column to the right you have: "S. W. T. & T. Co." I suppose that's the Southwestern Telegraph and Telephone Company?"

"A. Yes, sir."

"Q. What do these two headings mean?" What is their significance?"

"A. It means-that, as a matter of fact, those two head-3246 ings refer first to the Lyndon and Elrod reproduction value in 1914, and to the Southwestern Telegraph and Telephone Company's reproduction value in 1914, for the physical property. Now, we found \$2,080,935.00. Then the Southwestern Telegraph and Telephone Company's figure for these same items, and inclusive of the same overheads, that is, the same classification of overheads-not

the same amount of overheads, was \$2,326,940.000."
"Q. Now, Mr. Lyndon, as I understand it, while you used the same inventory, you checked it and made it your inventory, and there was some little difference, and you call one the Lyndon & Elrod-

"A. (Interrupting.) But we used the same inventory in both

cases."

"Q. But in some little cases it didn't correspond?"
"A. It was so far negligible we simply adopted the Southwestern

Telegraph and Telephone Company's inventory."

"Q. Both you and the Company at that time seem to have made an appraisal of the property as shown by that inventory, did you not?

"A. We did."

"Q. Mr. Lyndon, where did the Company get its figures for the

appraisal; do you know?"

A. No; they furnished us the figures and we put them in the report to show the comparative amounts of the two appraisals."

"Q. Now, did you, by this method of inviting estimates of costs from the suppliers, obtain certain figures yourself at that

"A. Yes, sir."

"Q. And to whom did you apply; do you remember?"

"A. Various suppliers. The Kellogg people gave us the price on the switchboard; I think that the Southwestern Company's prices on the sub. sets were taken; on the poles we got prices from several people; the cables and wire, I think the National Conduit & Cable Company, and the Standard Underground Cable Company gave us those prices; I am not sure about that. It is seven years ago, but we went to the suppliers, to the well recognized standard manufacturers of the materials."

"Q. How did the prices you received compare with the prices used

by the Company?"

"A. Well, the Company's estimate was about 10% higher than ours."

"Q. On the appraisal?"

"A. On the appraisal; \$2,080,000 to \$2,386,000." "Q. And in this summary you show both figures?"

Yes, for comparison; and that's what those two sets of figures

mean under the title of "Reproduction Values-1914."

"Q. Under what circumstances did the Southwestern Telegraph and Telephone Company furnish you this inventory; do you recall?"

"A. We were making a report on the property to determine whether their rates were too high or not, and they gave us the data.

"Q. Gave you what purported to be a complete inventory 3248 of their property?"

"A. Yes, and we checked it."

"Q. Do you recall whether you had any discussion with any of the

officials of the Company at the time, after you completed the ap-

praisal, as to the values?"

"A. Nothing definite, except that there was exception taken to only a few of our prices. They did not agree with us on the pole prices; I remember that very specifically. But we had put the plant high enough, at least to be sure of our ground there, and there were some other small differences that finally aggregated this difference of about \$250,000."

"Q. Then you have here then as a starting point that you have adopted in this report a double standard; you have one shown by your appraisal and the one shown by the Company's appraisal upon

the same inventory?'

"A. Yes, it is the identical inventory."

"Q. Now, in order to bring, or arrive at, the present values, just confining ourselves, now, to what the physical properties are, as I understand it, what else does this exhibit show, Mr. Lyndon?"

"A. It shows their additions and the actual cost from 1914 to 1920. Now, by their actual cost I do not mean exactly, as set forth by the books. There are two modifications from the book charges.

One is, that the aerial wires are shown on the books to have a 3249 certain value, while the Telephone Company's own inventory and own statement show that that value does not exist We substituted for the Company's books on that item-

(By Mr. D. A. Frank, interrupting:)

"Q. You are talking about 1914 now, aren't you?"

"A. Talking about 1914."

(By Mr. Howard:)

"Q. What item did you mention there?"

"A. The aerial wire. We substituted for the Company's books or book record the Company's own later record of existing wires and other costs. That is, we took, of two Company records, we took the one which appeared to be the rational one.

"Q. Why do you say the most rational?"

"A. Because the Company stated that all the wire that they had or had in sight, or could account for, or that was shown by the inventory, was so much and it cost this much money; and I regarded the does not represent existing property. That is one modification of the existing property as the rational one, and not some other item that Company's books or cost records is that covering the circuits and subsequent valuation of the Houston Home Telephone Company. Company paid some \$700,720.00, not exactly, but approximately, and

I will use that figure as an approximate figure, subject to be made exact later. The Company paid about \$700,000.00 more for the Houston Home Telephone Company's property

than the cost or the value of the property, -- physical cost-"Q. (Interrupting.) What do you mean,—how do you arrive at that?"

"A. By an inventory and valuation. This excess of Seven Hundred and Twenty odd thousand dollars was then written into the Company's costs and valuations as, I think, cost of establishing business, but it was written into the Company's record-"

"Q. (Interrupting.) Did you want the summary?"

"A. Yes, about the details of that transaction, the Houston Home (Paper handed to witness). It states here it is written up as an intangible value. Well, the City, of course, denied that the Company could make purchases of existing property already in the service of the public in the City, at a figure greatly in excess of its value, and then adding up that value, that excess amount, as a proper sum on which dividends should be paid. Of course, if that were not true, why mutual companies could just buy from each other and keep going right up till there was no limit. Therefore we took only the value of the Houston Home Company's property which remained in the service of the people of Houston as the addition which should be allowed to cover that purchase. Those are

the two modifications that were made from the Company's books in order to reach this sum of addition, 1914 to 1920. Further actual purchase of materials, further expenditures

for labor or any other cause or reason, has been put down exactly as the Company's books show these costs to have been incurred."

(By Mr. D. A. Frank:)

"Q. You mean our plant?"

"A. Oh, yes; our plant, remember,-physical plant only." "Q. Not including either working capital or supplies?"

"A. No. sir."

(By Mr. Howard:)

"Q. Physical plant, eliminating working capital and supplies? Mr. Lyndon, was there some method, or is there any method by which-did you determine the number of stations that had been added since 1914 up to the present time?"

"A. We did not determine them. We took the Company's statement."

"Q. Well, you determined them only in that way?"
"A. Yes, sir."

"Q. You took the Company's-"

"A. (Interrupting.) Took the Company's figures."

"Q. You familiarized yourself with the properties in that manner?"

"A. Yes, sir."
"Q. Did you get any comparison or arrive at the cost or increase per station?"

"A. Yes. sir.

"Q. Did you determine what that amount was?"

"A. Yes, the increase in the actual investment by the Company, with the modifications which I have mentioned applied 3252 to the increase in the number of telephone stations, amounted to around \$310.00 per station."

"Q. Now, that is excluding this something like \$700,000.00 that

they carry on their books as intangibles?"

"A. Yes, excluding that." "Q. Even excluding that?"

"A. Yes, sir."

"But had that been included, that would have made the addition amount to something like \$2,000,000.00, wouldn't it?"

"A. Oh, yes; the additions would be over \$2,000,000.00 if that

was included."

"Q. What would that be, approximately; can you figure it quickly? About how much that would be a station?"

"A. Well, the increase per station of forty-six hundred sta-

"Q. (Interrupting.) It would add about fifty per cent?"

"A. About fifty per cent to the cost; it would run around \$450.00

per station as the cost of the increase.'

"Q. Is that regarded as a rather normal or natural and anticipated, looked for, cost of an extension per station?"

"A. It is very extraordinary."

"Q. Very extraordinary. Well, taking the other figure first, of \$310.00; is that ordinary or extraordinary?"

"A. That is extraordinary. That is shown in this manner.

3253It will — clear that the cost of additions per stations is less than the total cost per station. There is no increase in the building, real estate, nor the switchboard equipment, assuming that the boards are of a certain maximum size; there is no increase in any of those items, only the wires, the instruments and some of the auxillary apparatus, so that the cost per station for extensions must always be less than the cost per station, the total cost per station, taking in all of the stations and all the costs. Of course, that has certain limitations. It does not mean that if the cost per station calls for another telephone station and trunk line that that is true; but as long as the conditions remain the same, in that the number of exchanges is not increased and the size of the building does not have to be increased, the cost per station for increases is less than the cost per station for all the stations divided into the total cost. I think that is clear and obvious to a layman or to anybody. The statement of the American Telephone and Telegraph Company for 1918 shows that, taking over the whole United States and inclusive of long distance lines, the average total cost per station was \$153.00. I believe the report, the annual report of the American Telephone and Telegraph Company, to be correct. I have no means of check-I recite that it was received from that source. Here in Houston, the expenditures from 1914 to 1920, for extensions only,

has been double, just double this amount which the American Telephone and Telegraph Company sets up as the total 3254cost per station taken throughout the United States. For this

reason I say that \$310.00 is excessive."

"Q. And in allowing \$1,400,000.00 for these additions, that, to say the least, appears to be liberal?"

"A. Yes, sir.

"Q. A very liberal expenditure, considering the number of stations attached?"

"A. More than liberal; but as the Company's books show that amount expended——"

"Q. (Interrupting.) The amount has been paid?"

"A. It has been paid. We assume it to have been paid and we accept it,—we don't question it; but we do call attention to the fact

that it is a great deal of money for a station."

"Q. The causes of that, and the reasons for it, while they may be proper and, when pointed out, may fully explain it, as I get it, it strikes a man who investigates this question as rather startling that that cost per station should appear?"

"A. It does."

"Q. Then, if it should appear that those stations cost \$450.00, why, of course, that would be not only extraordinary, but——"

"A. (Interrupting.) It would require more explanation still."
"Q. It would require much more, but, of course, that part
3255 of it based on that cost and allowing it, you can account for
that \$700,000.00, and, to your way of thinking, it should be

rejected?"

"A. That was a financial trade; that had nothing to do with supplying the City of Houston with telephone service; on the contrary,

to remove a competitor."

"Q. And to set that up and allow an earning on it would be to superimpose on the community a charge of about \$150.00 per station, where it appears that the extraordinary charge for some reason or other, possibly a proper one and economical one and a legitimate one, has been added, would be an unreasonable burden, in your mind, upon the public?"

"A. It not only would, but it seems to me it would set a most dangerous precedent, because there is no limit to what such sales could be carried, if the profit one side to another can be admitted,

and if they can be admitted once, why not ten times?"

"Q. Then, as I understand it, arriving at these physical properties, you take that starting point in 1914, the two horns of it and build on to both of them; you have got a kind of two-legged proposition, and you add \$1,400,000.00 because you find that as amount actually expended upon the Company's books; then checking that against the number of stations that have been added since the starting point, in 1914, you find that it, so far as being fair to the Com-

pany is concerned, that it checks; and in addition allows 3256 what you call an extraordinary amount for stations for what

the community has received?"

"A. Apparently so."

"Q. Now, Mr. Lyndon, I believe in 1914, in their appraisal as distinguished from their inventory, which we agree with, the Company has added certain other amounts, has it not, to the figure that you give here of \$2,326,940.00?"

"A. Yes, sir."

"Q. Upon what was that amount, and what was the basis of the

set-up?"

"A. The claim was that they had extra charges, had spent costs over and above those which was included in the unit prices, and

that these costs included such things as taxes during construction, insurance during construction, and other items of like character."

"Q. Ordinarily called loading charges?"

"A. Yes, but there are such loading charges that are perfectly allowable, that are really actual part of the costs, and then there are others that are fictitious, but these charges, which they claim are inseparable from the methods of the Bell Company, amounted to \$348,271.00 more than the \$2,326,940.00, which was the reproduction value coming from applying loaded unit charges to the items of the inventory."

"Q. But those loaded unit charges had appeared in the cost

prices set up on the books, did they not?

"A. Well, that is, these are reproduction values." 3257

"Q. Oh, yes." "A. These are outside-

"Q. (Interrupting.) Yes, upon the reproduction of 1914?"

"A. Yes; the books were not consulted on these. costs of reproduction, so that this is an additional amount that are added overhead charges; they are not all the overhead charges; most of the overhead charges, and all that were considered essential were included in the unit costs, but these are additional overhead charges which the Southwestern Telegraph and Telephone Company claims that they were subjected to, amounting to \$345,271.00, or about nearly eleven per cent of the whole reproduction value under

"Q. (Interrupting.) Now, let me see if I understand you, Mr. You took this inventory of the property and applied the unit costs and material prices, and you got a total in 1914 of

\$2,080,955.00?"

"A. Thirty-five."
"Q. Thirty-five dollars. Well, now, wouldn't there be such loading charges,-wouldn't there be a mere addition of the sum set opposite,-don't this figure represent the mere totaling of the appraisal set opposite the different items in the inventory?"

"A. Yes, that reproduction value means the Lyndon and Elrod value; means unit prices plus all the loading that was usual

3258 in engineering and would be considered rational."

"Q. Oh, yes, you added those in your prices when you applied them to your inventory?"

"A. Naturally."

"Q. For instance, if you had a pole there of a certain class and you put down the pole not f. o. b. Houston or the factory, but the pole as set up in the plant?"

"A. Yes, sir.'

"Q. Added the cost of digging the hole and the cost of hauling the pole out and putting it up?

"A. Engineering and supervision."

"Q. Engineering and supervision, and everything of that kind; you applied it as you went along to each item of the inventory?"

"A. In most cases. In some cases we merely made a lump percentage at the end."

"Q. And included it in the appraisal of this figure?-\$2,080,-935.00?"

"A. Yes, sir."

"Q. So then, when you get through with the appraisal you have a reconstructed plant ready to operate?"

"A. Yes, sir,-physical plant."

3259 "Q. Mr. Lyndon, next can you give us the amount that you arrive at by adopting the second of these methods?-that is, your reproduction value as of 1914, applying the cost that you obtain to the inventory that you checked?

"A. In 1914 we found the reproduction value of the then existing physical plant to be \$2,080,935.00; the additions from 1914 to 1920, according to the Company's books, with the exception of the two modifications already cited, have been \$1,427,633, so that the present value, on the basis of reproduction in 1914 and additions at the high price levels from 1915 to 1919, would be \$3,508,568.00."

"Q. The total amount of the physical plant, value of the physical properties in the plant as distinguished from some other properties?"

"A. Yes, sir."
"Q. Is how much?" "A. \$3,508,568.00." "Q. \$3,508,568.00?"

"A. Yes, sir."
"Q. That includes the property of the Home Telephone Company that was used in this plant?"

"A. Yes; that still exists here in Houston and is attached-"Q. (Interrupting.) And does not include some seven hundred odd thousand dollars that is carried by the Company now in the way

of an intangible?" "A. It does not." 3260

"Q. But it does include all the property of the Home Telephone Company-physical property, retained in this plant; although it might, and does, you say, to a certain degree duplicate property then owned and used by the old Company, or the Southwestern Company?"

"A. Yes, sir."
"Q. You have made no deduction on account of the fact that that is probably a duplication, and not necessary in the proper conduct

of the business?"

"A. None; and to do so would require a survey of the two systems, to say exactly what amount and to what degree these duplications might occur and what prospect there might be for the use in the future of any duplications,—and it would be somewhat speculative; and though it has simply been included in these set-ups at the full cost price as of the original cost."

"Q. Would that, in the matter, in trying to judtly arrive at the investment of this utility in the service of this community, be in

favor of or against the amount of the investment?"

"A. It is obviously in favor of the investor. Wherever a doubt

arises it usually is fair to resolve it in favor of the investor; that is, doubts of this kind, and I believe it is customarily done; certainly, I always do it."

"Q. And you think it is the fair thing to do?"
"A. Yes, sir."

3261

"Q. Now, as it is done here, where a company is serving the public and they have lines and conduits that reasonably and properly serve the territory, and another company has lines paralleling them that they don't particularly need, and they buy that property, although it is not necessary, and use it in the conduct of the

business, why should they be allowed for that?"

"A. Well, if the amount of duplication is very great and a survey is made of the amount of that duplication, and it is well established, and the prospect for the growth of traffic does not indicate that it will never be useful, why, an approximation can be made of the value of the property which is not and never can be useful to the public, and that, of course, should be deducted."

"Q. Suppose the use is remote?"

"A. It then is no longer a question of doubt. It then becomes

a substantial certainty."

"Q. But why should a utility be permitted to acquire property not needed in the industry or in the operation of the business, and earn a return on that investment pending the time it does become useful? I am not speaking now of where there is a reassnable apprehension of growth, when it is originally constructing its plant; but why should it be permitted to take over another plant and let those lines lie idle

until some time in the future when it may become ad-

visable to use it?" 3262

"A. It should not. But if the use is remote and the dupli-

cation is established-

"Q. (Interrupting.) But whether useful or whether it will ever be useful, or remotely useful, it has been allowed to them in this set-up?"

"A. It's all in these computations."

"Q. Now, Mr. Lyndon, taking up the third method of valuing this property, which involves the reproduction by the Company, itself, in 1914, and with the overheads and accessories claimed by it, together with the actual additions from 1914 down to the end of

1919?"

"A. The Company's own reproduction value in 1914, including a number of overheads and accessory charges, like warehouse charges and a number of others which we regarded as hypothetical and that they were not entitled to being converted into real money, was \$2,672,211.00. It was \$592,000.00 in excess of the reproduction value which we figured for the same year,—approximately 20% more."

"Q. Well, how much is this figure that they arrive at, or will arrive at, allowing them all that they claim on the physical property used

in the plant itself?"

"A. And including all these overheads?"

"Q. Including all the overheads which it claims."

"A. With the additions from 1914 to 1920, the total would 3263 become \$4,099,244.00."

Mr. Howard: I will next introduce this paper as Lyndon's Exhibit No. 4-"Value of Working Capital as of January 1, 1920."

(The Exhibit was thereupon received in evidence, marked: "Lyndon Exhibit No. 4; witness, Lamar Lyndon," and is filed herewith.)

(By Mr. Howard:)

"Q. Mr. Lyndon, what is the next item that you add to the property value or capital account of this Company used in the service of this Houston exchange?"

"A. Working capital, by which is - an amount to represent a sufficient sum in cash, kept on hand by the Company to properly

conduct the business."

"Q. How much do you add for that purpose?" "A. I have computed the working capital to be \$37,923.00 in this manner; that the amount of cash required should not be in excess of the expenditures for forty-five days. The total operating expenses for the year 1919 were \$632,000.00 for the whole year, and forty-five days is approximately 6% of a year. Wait a minute,there is another element in there; that the bills rendered by the

Company are in advance of service, and the cash needed should not exceed one-half to two-thirds of the expense for one month, due to the fact that a large proportion of the 3264 income for the month is collected in advance; and taking twenty days as the total amount for which the Company should have working capital over and above that which comes in from collections in advance and referring it to the \$632,000.00 for one year, the amount the Company should have on hand is \$37,923.00, and that is the method by which that sum of money is determined, which looks Now, however, that is not used, but a round sum of \$60,000.00 which, in conjunction with the \$40,000.00 for stores and supplies, makes a round addition of \$100,000.00 to the Com-

pany's physical property." Well, Mr. Lyndon, that in a spirit of liberality?"

"A. In a spirit of liberality, sure."

A. In a spirit of liberality, sure." "Q. Mr. Lyndon, the proof,—I believe the proof in this case shows that there is no, what you call as in the street railway case or a traction company, no advance payment upon the month's service. The most that happens is that the bills are rendered on the first of the month and payment is not thought, I believe, until the tenth; in any event, there is no default until the tenth. I believe the proof is that only 40% of the bills are paid before the middle of the month; it might not be as much as 40%—

Mr. J. D. Frank: They are not cut off until about the fifth of the succeeding month. 3265

(By Mr. Howard:)

"Q. Mr. Lyndon, a few of those facts having developed, could you revise this working capital account so as to eliminate any idea of advance payments and give them what you consider a fair work-

ing capital?

If, on the assumption that I made, which was that "A. Easily. the bills would be paid on or about the tenth, substantially most of them, that would leave twenty days that the Company could operate with money collected in advance; add to that another twenty days and a specific sum of money to cover that, means forty days that I had in mind. No, if they had forty days of operating expenses without the collection of any money in advance, it would be naturally double what it would be for twenty days, and for twenty days it was found to be \$37,923.00, or \$38,000.00; and if that amount were doubled, it would be \$76,000.00. That would give forty days of continuous operation without a dollar being derived from any other source for that purpose."

"Q. In view of the fact that they have no means of collecting,in forcing collection until after the expiration of the month, would

it not be fair to allow it on that basis?"

There is \$60,000.00, which "A. That basis is nearly allowed. means of that \$76,000.00 there is only \$16,000.00 to be collected within twenty days of the month, and that is a very small proportion of the monthly income of the Company. 3266

Q. You will consider, then, that \$60,000.00 is sufficient

to equip them in the matter of working capital?"

"A. I should regard it as ample for condition, as the necessity for working capital is to pay only for satisfactory and convenient operation of the Company. It is not meant to take care of any improvements or betterments, because they are advanced in another way, and the financing is paid for by charges of interest during construc-You can not charge interest during construction on an amount of money and also add it to capital account and let it draw interest as a portion of your capital account. Those two must be separated."

"Q. Well, Mr. Lyndon, I would like you to then carry forward some figures on the different methods that you have pursued in valuing this property,-to add these different items to the depreciated values you have given us. You have given us the depreciated value, and we would like to have you add to that value of the physical plant,—the physical property of the plant, the items of stores and supplies and of working capital as you found them to be,

and give us those totals in each instance."

"A. On the basis of cost of the property less depreciation and the addition of stores and supplies and working capital, the present value is \$2,845,248.00. On the basis of the Company's reproduction value in 1914, and subsequent additions as made at cost from

1915 to 1919, duly depreciated, and the additions of stores and supplies and working capital, the value is \$3,281,-844.00,-a difference of about \$450,000.00."

"Q. I didn't understand you. Which method of arriving at the value of 1914 did you pursue?"

"A. I have given you both; one is the Company's claim in 1914, plus the additions made since, as per the books; and the other is the actual cost from 1901 to the present time."

"Q. Now, this one included the overheads claimed by the Com-

pany?"

"A. The Company's reproduction cost did include the overheads paid by the Company."

"Q. And this one you have used of 1914 basis-"

"A. (Interrupting.) Yes, sir.

"Q. (Continuing:) And added the additions since?"

"A. Yes, sir."

"Q. And stores and supplies and working capital?"

"A. (Interrupting.) Have been added to those. That's \$100,-

000 even, sixty and forty,—the sum of these two items."
"Q. Now, let me understand that, Mr. Lyndon. By the first method you have added to the cost of the plant as depreciated, stores and supplies and working capital?"

"A. Yes, sir."

"Q. And you get what figure?"
"A. \$2,845,248.00."

"Q. And how did you arrive at the other,-what was the

other computation you made?" 3268

"A. The Company's reproduction value in 1914, plus book

cost of additions made since that time, plus-"Q. (Interrupting.) Well, first let's get the amount you started with in 1914 of the Company's reproduction."

"A. \$2,672,211.00."

"Q. That included those overheads they claimed?"

"A. Yes, undepreciated."

"Q. Now, with the additions since 1914, and stores and supplies

and working capital, you get what total?"

"A. \$4,199,844.00. Now, deducting from that the depreciation of \$918,000.00, there remains as the present value on that basis \$3,281,844.00."

"Q. Now, Mr. Lyndon, what else,-what other things, if any, have you added to the actual value of this capital account, or property value of this Company?"

"A. Well, in 1918 we added an arbitrary figure, call it going concern value, of \$75,000.00. We haven't any justification for it, but the addition of some nominal amount for that is customary, and it wasn't a particular harmful thing for the public, so we simply included it more as a matter of custom. We haven't any real basis for it, except one of assumption, which-

"Q. (Interrupting.) Mr. Lyndon, I would just like to get the figures all carried forward before this examination closed. Now, I would like to have you add the amount you have allowed for going concern or cost of establishing business,-

whatever you call it, and give us your totals"

"A. On the basis of book cost less depreciation and the addition

of the ancilliary amounts, less depreciation, we find the final value \$2,920,248.00; while, if the basis of the Company's reproduction value in 1914, plus additions, be taken, we find the present value is \$3.356.844.00."

"Q. Now, Mr. Lyndon, are those the only things that you have added or taken into consideration, or think should be taken into

consideration in arriving at the value of this property?"

"A. I know of nothing else."

"Q. I will ask you, Mr. Lyndon, from the investigation that you have made and from your experience in the valuation of this property, and for the purpose of rate making and establishing the value of this property as a basis of a return to be paid by this public, what you consider the present value of this property to be,—what, in your opinion, the present value of this property is?"

"A. The present value of this property, in my opinion, is its original cost less accrued depreciation, and represented by the figures, which are \$2,920,248.00, or, in round numbers, \$3,000,

000.00.

"Q. That is what you consider the fair value of this property for the purpose of rate making?"

3270 "A. Yes, sir."

"Q. Mr. Lyndon, we referred a moment go to this cost of establishing business, or going concern. Mr. Frank asked you if you allowed that \$75,000.00 out of a spirit of liberality, and you answered, I think, that you could see no reason for allowing it,—that it was done more out of custom. Now, Mr. Lyndon, let's look at that a little bit. Isn't there bound to be something in the nature of an established business and a business that stands ready to operate, as distinguished from one which is not? Isn't there some advantages over an established and going business—in an established and going business?"

"A. In a measure, that is true of a utility. Of course, there is always a tendency to confuse a little bit, good will with going concern. No such thing as good will can adhere to a public utility that has a monopoly. But in the case of a going business, while there is an advantage in having it a going business, it must be remembered that this going business was produced to the advantage of the utility itself; that is, the utility started and grew and it extended by reason of a demand for whatever service it might supply, and in making these extensions and in performing this service, it has made a profit; it has always made a profit; if it has not made a

profit, then by an amount which is the deficiency over the 3271 profit it should have made, it is entitled to set up a figure in its capital account as cost of establishing business. The cost of establishing business must be a real amount of money; it must be something the Company has experienced."

"The chances are that material like copper and wire and poles, where they are lying in a warehouse and not susceptible to furnishing a demand anywhere, the amount that the particular material,

as applied to a specific purpose, it is removed from that general demand, is it not?"

"A. Yes, sir."

"Q. And it must then be sold to whoever will come along and buy whatever is constructed of this particular material?"

"A. If the plant is a constructed, operating utility."

"Q. So then, the only way of realizing upon this advanced value would be finding somebody who would buy the utility based upon this advanced price?"

"A. Yes, sir."

"Q. The number of purchasers of public utilities are necessarily quite limited, when considered in connection with ordinary buildings and construction, are they not?"

"A. As far as I know, there are none now."

"Q. Mr. Lyndon, then is there any way,—in your judgment, then, is this so-called advance merely theoretical, or an actual advance upon which the owner of poles and wire

and copper can take a profit?'

"A. It's only theoretical, in that it is impossible for the owner to take the profit by any method I can conceive to dismantle and sell parts of the plant. He might be able to dispose of it as junk, but to sell the plant as an operating utility at anything like the theoretical value which would be given, I would regard as commercially and financially impossible."

"Q. Practically absurd, would it not?"

"A. It so seems to me."

"Q. In your opinion, would any shrewd man, even though he had the desire to embark in the telephone business, pick out a time when prices had abruptly changed their !evel and taken a level around 100% higher, where he knew that that absurd change was due to a specific cause and the cause was not yet removed,—would any reasonably shrewd business man embark in a venture at that time?"

"A. I will answer that by telling you the policy adopted in my office about the middle of 1914,—the beginning of 1915. We occasionally have requests to report on projected enterprises, particularly hydro-electric development, although Mr. Frank insists my limitations are the storage battery; I have always stated to prospective clients that there was no use in making reports for the then

development of any water power with long distance trans-3273 mission connected with it, because the investor would run

the risk of seeing his values diminished and diminished permanently; and he would sustain a permanent loss that he could not hope to collect interest on, simply because the plant would have been developed at an unpropitious time. Now, that is the policy I have adopted in my office and that is the best comparison of my views."

3274 C. A. Gates, a witness for the complainant, testified as follows:

The cost of the subscribers has not been paid for by the public, or anything of the kind. I am not referring to the subscribers we have here.

"Q. But you are talking about this imaginary plant, the losses you are going to run into in the imaginary plant, but keeping in mind that we are concerned primarily with this plant, I am pointing out to you that this plant wasn't built in four years, and you couldn't get your subscribers attached and run into a deficit, but I am pointing out to you under this head and am trying to determine the rate upon which you can go along contemporaneously with the growth of the plant and attach your subscribers. Now, that cost of attaching your subscribers is paid out of the operating expenses; that's true, isn't it?"

"A. As I have stated to you, after the plant is in operation, the

cost of advertising and canvassing is operating expenses.'

"Q. That happens, then, here in the plant today?"
A. That is not represented by this set-up here."

"Q. I am not concerned at all with your imaginary set-up. It is very pretty, but I am not concerned with it. So, then, that is true-

my statement is true that his cost of establishing business, such as advertising and soliciting and attaching the subscribers, has been paid for out of the operating expenses?"

"A. Not the cost I have put in the appraisal."

"Q. I am talking about the Telephone Company, not the imaginary one; I am talking about this one. You know what I mean by that. Isn't it a fact that the cost of getting these subscribers from year to year, as the plant has grown and developed, has been taken care of in and paid out of the operating expenses? I am asking you the question, and we are going to go all the way through with this, and there is no use in your trying to divert it. I am asking you that question, if it isn't a fact that these expenses, such as advertising, salaries of soliciting agents and similar expenses calculated to add subscribers, have not been paid out of the operating expenses of this particular plant?"

"A. Of the plant in Houston today, as it exists?"

"Q. Yes, sir."
"A. I could not tell you that with absolute certainty, because I am not familiar with the books."

"Q. But don't you know that it is a fact?"

"A. I know that at the present time the cost of advertising and canvassing is charged to an account known by that name, and is charged to operating expenses now, but the bookkeeping methods

have changed and I have not been through the books of the Company in years gone by, and I do not know where that

money was charged.'

"Q. But the truth is, and you know, as a public utility man, that since the installation by this Company of the system of keeping books under the Interstate Commerce Commission regulations, that a great many things that had theretofore been charged to operation were taken out of operation and made chargeable to other accounts. and a great many of them to Capital Account?"

"A. I know that a number of changes were made in the account-

ing system.

3276

"Q. As far as this plant is concerned, these things have been paid for out of operating expenses?"

"A. No, I will not agree to that entirely."

3277 The above and foregoing Statement of Testimony and Proceedings taken and had at the trial of the above styled and numbered cause having been submitted to the Court by counsel for Plaintiff and Defendants, the same is hereby approved this 2nd day of February, A. D., 1920.

GEO. WINFIELD JACK, United States District Judge.

The parties hereto, Plaintiff and Defendants, waive service of notice and agree that the foregoing Statement of Testimony and Proceedings had in the trial of this cause may be approved by the Court and filed as a part of the record on appeal.

IN THE

Supreme Court of the United States OCTOBER TERM, 1921.

THE CITY OF HOUSTON.

Appellant,

VS.

SOUTHWESTERN BELL TELEPHONE COMPANY,
Appellee.

APPEALED FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF TEXAS.

BRIEF FOR APPELLANTS

STATEMENT

On Ocober 22nd, 1909, the City of Houston, acting under its charter power granted it by the Legislature of the State of Texas, which power is not questioned, enacted an ordinance fixing the charges that could be made by any person. firm or corporation engaged in the business of furnishing telephone service and connections to the citizens of said City of Houston. The maximum rate that could be charged under this ordinance by any exchange having in excess of 3,000 subscribers was \$5.00 per month for business or office connections, and \$2.00 per month for residence connections, and for party line service, business or office, \$3.00 per month, and residences, \$1.50 per month. The ordinance provided a penalty and any person violating same could be prosecuted and fined. (Record p. 5.) The appellee, Southwestern Bell Telephone Company, the same as The Southwestern Telegraph & Telephone Company referred to in the record, which was engaged in furnishing telephone service to the citizens of the City of Houston and had and has more than 3,000

subscribers, filed this suit against the City of Houston and its mayor, council and other officers, to enjoin it and them from enforcing the said ordinance. The ground upon which the injunction was sought was that the rates fixed by said ordinance were confiscatory, unreasonable and insufficient to permit it to operate and maintain its said telephone exchange without actual loss, and that such rates were wholly insufficient to permit it to earn any return whatever upon its property and investment that such ordinance continued and fixed confiscatory rates and was unconstitutional, void and unenforceable and contrary to and in violation of the Constitution of the United States, and particularly the Fourteenth Amendment thereto, prohibiting the taking of property without due process of law, and guaranteeing to all persons the equal protection of the law. (Record p. 10.)

The defendants excepted to the bill for want of equity and denied the allegations of the bill and affirmatively pleaded that the company was estopped from claiming any earning or return on any amount other than the capital actually invested, by reason of what is known as the "Merger Ordinance," same being Sub-section "E" of Section 1 of an ordinance passed May 10th, 1915, by the City Council of the City of Houston, entitled: "An ordinance authorizing the consolidation and merger of the Houston telephone exchange of The Southwestern Telegraph & Telephone Company (the same as the Southwestern Bell Telephone Company (Record p. 796), and the telephone exchange of the Houston Home Telephone Company, providing the terms and conditions of such consolidation and merger," it being provided in such ordinance that plaintiff could earn a fair return upon only the capital actually invested in the Houston plant, it being agreed that for a term of 5 years from said date a fair return upon said capital and investment should not be less than 7 per cent or more than 8 per cent. That the said telephone company accepted the said ordinance, whereby it contracted, agreed and bound itself not to require a return or earning upon anything other than the capital invested in the Houston plant. (Record p. 27.) The cause being at issue, it was, on August 25th, 1919, referred to a special master to take evidence and report his findings of fact and conclusions of law thereon. (Record p. 28.)

Thereafter, on June 7th, 1920, the Special Master filed his report (Record pp. 29-45), in which he found the value of the property used by the plaintiff and necessary to the service rendered to be \$6,003,000, divided as follows: Physical Property, \$5,500,000; Going Concern Value, \$765,000; Working Capital, \$238,000. He approved the 25 per cent allowance to the local exchange for handling the long distance tolls, approved the 41 per cent license contract, whereby the American Telegraph & Telephone Company appropriated 41 per cent of the gross revenues of the local exchange for certain apparatus furnished and services claimed to be rendered, allowed an annual Reserve for Depreciation of 6.33 per cent, approved all allocations of expenses incurred generally by the plaintiff in operating a number of telephone exchanges, fixed 8 per cent as the lowest rate that would not be confiscatory, and recommended a decree enjoining the enforcement of the ordinance.

To this report of the Special Master the defendant City of Houston excepted. (Record pp. 46-49.) These exceptions are as follows:

"1st. For this, that the said Master has found, decided and reported, as appears on page 9 of his report, that the reproduction method affords the strongest evidence of value and that the original cost furnishes but little evidence of present value, and in attaching more weight to the testimony of the value based on the reproduction theory than that based alone on the historical or cost value.

Whereas, the Master should have found, reported and decided that at least as much, if not more, weight should have been given to the historical or original cost, than to the value based upon the present cost of reproducing the Houston Telephone Exchange the property involved herein.

2nd. For this, that the said Master has found, decided and reported, as appears on page 11 of his report, that the property owned by the plaintiff company, used and useful in the telephone service, in the City of Houston, is of the value of \$6,000,000.

Whereas, the Master should, from the evidence, have found, decided and reported that the value of the property of the plaintiff used and useful in the telephone service in the city of Houston is of the value of \$3,000,000.

3rd. For that the Master has found, decided and reported, as appears on page 11 of his report, that the value of the physical property, in its present condition, used and useful by the plaintiff in the telephone service in the use of the City of Houston, is \$5,500,000.

Whereas, the Master should have found decided and reported that the value of the physical property of the plaintiff used and useful of the telephone service in the City of Houston, was not more than \$2,750,000.

4th. For this, that the Master found, decided and reported, as appears on page 11 of his report, that in addition to the physical property of the plaintiff, used and useful in the telephone service of the City of Houston, such property had an intangible value, styled "Going Concern Value", amounting to \$750,000.

Whereas, from the evidence, the Master should have found, reported and decided that the intangible assets, including "Going Concern Value" or cost of establishing business, was not in excess of \$50,000.

5th. For this, that the Master has found, decided and reported, as appears on page 11 of his report, that the plaintiff is entitled to an allowance for working capital of \$238,000.

Whereas, from the evidence, the Master should have found, decided and reported that the plaintiff was entitled to working capital not in excess of \$100,000.

6th. For this, that the Master has found, decided and reported as appears on page 13, of his report that 25 per cent of the toll revenue collected in Houston, which the company credits to the Houston exchange as owners of such exchange, is a fair allowance to such exchange to cover its part in the operation of the toll lines and for billing and collecting the toll accounts.

Whereas, the Master should have found that all the property of the Houston exchange was in addition to the service it furnished to local subscribers, being also used jointly with the toll lines of the plaintiff company, to earn a large amount of tolls, same being for the year 1919, approximately \$400,000, and that the value of the property of the Houston exchange used and useful for furnishing local telephone service in the City of Houston should be reduced by the proportionate use of such property in handling such long distance tolls, and should have further found, decided and reported that 25 per cent was not a sufficient amount to be credited to the revenues of the Houston exchange, but that at least 60 per cent of such toll collections should be credited to such Houston exchange.

7th. For this, that the Master found, decided and reported, as appears on page 17 of his report, that the charge of 4½ per cent on certain gross receipts of the Houston Exchange, amounting to approximately 85 per cent of the total gross receipts of the Houston exchange, which is paid to The American Telegraph & Telephone Company in payment for certain services and the use of certain instruments owned by The American Telegraph & Telephone Company, and leased to plaintiff Company, was a proper operating charge against the said gross income received by the plaintiff company from the operation of the Houston telephone exchange.

Whereas, the Master should have found, decided and reported that the cost of said services and the use or rental of said instruments was not shown by plaintiff and that for this reason the said charge should have been either greatly reduced or wholly disallowed.

8th. For this, that the Master found, decided and reported, as shown on pages 17 and 18 of his report, that it was the right and duty of the plaintiff, in order to enable plaintiff to replace its property used and useful in the Houston telephone service, when it should come to the end of its useful life, and to take care of wear, tear, rust, rot, obsolescence, inadequacy changes in the art, business demands requirements and casualties, the sum of 6.33 per cent upon

the value new of the physical property, or \$348,150 for the

year 1919, as a reserve for depreciation.

Whereas, the Master should have found, decided and reported that 4 per cent upon the value, new, of the physical property at a valuation of \$3,000,000, or \$160,000 for the year 1919, was a proper and sufficient amount set aside as a reserve for depreciation.

9th. For this, that the Master found, as shown on page 19 of his report, that the total expenses of the company for the year 1919 were \$1,204,262, and that its total revenue was \$908,258, showing that the company operated its property in the Houston telephone exchange for the year 1919

at a loss of \$306,204.

Whereas, the Master should have found, decided and reported that the expenses of the plaintiff in operating the said Houston telephone exchange in the year 1919, after allowing the proper depreciation reserve, were not in excess of \$1,000,000, and that many of the items making up such amount were excessive and that others should have been wholly disallowed and that the plaintiff company, not having disclosed all the revenues resulting from the operation of the said Houston exchange, that it was impossible to determine the amount of such revenues, and for that reason unable to determine what the net earnings of such plaintiff company was, for the year 1919, in the operation of its Houston exchange.

10th. For this, that the Master found, decided and reported, as shown on page 20 of his report, that anything less than 8 per cent return on plaintiff's property would be confiscatory.

Whereas, the Master should have found, reported and decided that a return of as much as 6 per cent on the value of such property would not be confiscatory.

11th. For this, that the Master found, as is shown on pages 20 and 21 of his report, that the plaintiff company is not estopped by subdivision "E" of Section 1 of the Merger Ordinances of 1915 to make a claim for a fair return on its property, fixing the value thereon on any theory other than the cost thereof.

Whereas, as shown by the evidence, the Master should have found, decided and reported that the plaintiff company was so estopped by reason of the said subdivision of said merger ordinance from claiming a return on any value other than the original cost of its property.

12th. For this, that the Master found, reported and decided, as appears on pages 21 and 22 of his report, that the plaintiff company is entitled to be heard in a court of equity and to the relief sought therein.

Whereas, the Master should have found, decided and reported, that, as shown by the evidence, the plaintiff company did not make such a full and complete disclosure in regard to its revenues and particularly in regard to the amount which would be deducted from the value of the property of the Houston telephone exchange on account of the additional use and service such property was put to by the plaintiff company in earning other revenues, to-wit, its long distance tolls; and on account of the said plaintiff company failing to disclose the result of its financial dealings with the Western Electric Company and the profits resulting therefrom, involving the purchase by the plaintiff from the Western Electric Company of large amounts of property equipment and supplies, both the plaintiff and the said Western Electric Company, as appears from the evidence, being owned by the same company, to-wit, The American Telegraph & Telephone Company, in the following manner, that is to say, that the said American Telegraph & Telephone Company owned practically all of the stock of both the plaintiff company and the said Western Electric Company, and the Master should have further found that the said plaintiff company was not entitled to relief in a court of equity, because it made no effort to do equity and has not come into the court with clean hands.

13th. For this, that the Master found, decided and reported, as appears from pages 22 and 23 of his report that the rates fixed by the ordinances of 1909 applied under present condition to prevent plaintiff from obtaining a fair return on the value of its property used and useful in rendering telephone service in the City of Houston, Texas, and

that such rates are, therefore confiscatory and that the enforcement of said ordinance under such conditions should be enjoined.

Whereas, the Master should have reported that on account of the fact that the plaintiff company had not made a full and fair disclosure of its affairs, and particularly had not shown that the telephone exchange of the City of Houston was credited with the proper and sufficient part of the toll earnings and no disclosure was made as to the extent to which the value of the property used by the plaintiff company in furnishing the telephone service in the City of Houston should be reduced on account of such additional service and use to which the said property was put in earning the toll revenues and further that it had not made a disclosure of the profits realized by the parent company. The American Telegraph & Telephone Company, which owns the plaintiff company in the manner above stated, on account of the purchases of the equipment and supplies from the Western Electric Company, which is also owned by the said American Telegraph & Telephone Company, in the manner above quoted."

The exceptions came on to be heard by the court and Exception No. 11 was by the court sustained and the amount upon which the plaintiff company was entitled to receive a return was by the court fixed in the amount actually invested, which the court found to be the sum of \$4,691,567, instead of \$6,003,000, as found by the Master. In all other material respects the exceptions of the defendant to the special master's report were overruled. (Record pp. 50-59.)

The City of Houston assigned errors to the judgment and presented a petition for appeal, which, on November 15th, 1920, was granted by the Honorable George Whitfield Jack, Judge of the District Court of the United States for the Western District of Louisiana, who presided at the trial of said cause, and this cause was thus brought to this court for review. (Record pp. 61-65.)

ASSIGNMENTS OF ERRORS.

FIRST ASSIGNMENT OF ERROR.

"The Honorable District Court erred in holding and finding that the plaintiff, Southwestern Telegraph & Telephone Company, has invested in the Houston exchange, as shown by its books, the sum of \$4,671,567, upon which it is entitled to earn a return, for the reason that the proof shows that in the said amount so shown by the books there was included a very considerable amount of property used exclusively in handling long distance tolls; and, further, that the sum of \$700,000 was not being used and was not useful in rendering telephone service to the people in the City of Houston who were subscribers to such service."

SECOND ASSIGNMENT OF ERROR.

"The Honorable District Court erred in sustaining against defendant's Exception No. 6 thereto, the report of the Special Master, approving and division of the receipts derived from the long distance calls originating in the exchange of the City of Houston, whereby only 25 per cent of such receipts were credited to the local Houston Exchange and added to its receipts, for the reason that the proof showed that such 25 per cent would not pay the expense incurred by the said exchange in the City of Houston in handling such long distance callss, and the plaintiff which owns both the local exchange and the long distance lines, both of which were engaged in handling such long distance calls made no attempt to show to what extent the local exchange property was valuable in handling such long distance and to what extent it should participate in the profits derived from handling such long distance calls."

The said Exception No. 6 was as follows:

"6th. For this, that the Master has found, decided and reported as appears on page 13 of his report that 25 per cent of the toll revenue collected in Houston, which the company credits to the Houston exchange, as owners of such exchange, is a fair allowance to such exchange to cover

its part in the operation of the toll lines and for billing and collecting the toll accounts.

"Whereas, the Master should have found that all the property of the Houston exchange was in addition to the service it furnished to local subscribers, being also used jointly with the toll lines of the plaintiff company, to earn a large amount of tolls, same being for the year 1919, approxmately \$400,000 and that the value of the property of the Houston exchange, used and useful for furnishing local telephone service in the City of Houston, should be reduced by the proportionate use of such property in handling such long distance tolls, and should have further found, decided and reported that 25 per cent was not a sufficient amount to be credited to the revenues of the Houston exchange, but that at least 60 per cent of such toll collections should be credited to such Houston exchange." (Record p. 46.)

Said exception was by the court overruled.

THIRD ASSIGNMENT OF ERROR.

"The Honorable District Court erred in overruling defendant's Exception No. 7 to the Special Master's Report. and in approving the report of the Master that the 41 per cent of the gross revenues of the Houston Exchange, paid to the American Telephone & Telegraph Company, under what is known as the A. T. & T. License Service Contract, whereby the American Telephone & Telegraph Company collects from the exchange in the City of Houston 44 per cent of its gross earnings in payment, as claimed by the American Telephone & Telegraph Company for certain instruments furnished and certain service claimed to be rendered such Houston Exchange under said contract, was a legitimate operating expense to be deducted from the earnings of the local Houston Exchange, because the proof showed that the American Telephone & Telegraph Company owns ninety-nine and a fraction per cent of the stock of the plaintiff, the Southwestern Telegraph & Telephone Company, which operates the Houston Exchange and only the cost of such service should be deducted from the revenues and charged to the expense of operation, and there was no attempt made by the plaintiff to show the cost or rental value of the instruments furnished, or the

cost of the service claimed to have been rendered the Houston Exchange."

Said Exception No. 7 was as follows:

"7th. For this, that the Master found, decided and reported, as appears on page 17 of his report, that the charge of 4½ per cent on certain gross receipts of the Houston Exchange, amounting to approximately 85 per cent of the total gross receipts of the Houston exchange, which is paid to The American Telegraph & Telephone Company in payment for certain services and the use of certain instruments owned by The American Telegraph & Telephone Company, and leased to plaintiff company, was a proper operating charge against the said gross income received by the plaintiff company from the operation of the Houston telephone exchange.

"Whereas, the Master should have found, decided and reported that the cost of said services and the use or rental of said instruments was not shown by plaintiff and that for this reason the said charge should have been either greatly

reduced or wholly disallowed." (Record p. 47.)
Said exception was by the court overruled.

FOURTH ASSIGNMENT OF ERROR.

"The Honorable District Court erred in approving against defendant's Exception No. 8, that the allowance was excessive, the report of the Special Master, allowing the plaintiff as a reserve for depreciation a rate of 6.33 per cent on \$4,671,567, the value of the property as found by the court, for the reason that such a rate is excessive, the weight of the evidence showing that \$4.00 per station or 4 per cent annual annuity was sufficient to create a proper reserve for depreciation."

Said Exception No. 8 was as follows:

"8th. For this, that the Master found, decided and reported, as shown on pages 17 and 18 of his report, that it was the right and duty of the plaintiff, in order to enable plaintiff to replace its property used and useful in the Houston telephone service, when it should come to the end of its useful life, and to take care of wear, tear, rust, rot, obsolescence, inadequacy changes in the art, business demands requirements and casualties, the sum of 6.33 per cent upon the value, new, of the physical property, or \$348,150 for the year 1919, as a reserve for depreciation.

"Whereas, the Master should have found, decided and reported that 4 per cent upon the value, new, of the physical property at a valuation of \$3,000,000, or \$160,000 for the year 1919, was a proper and sufficient amount to set aside as a reserve for depreciation." (Record p. 47.)

Said exception was by the court overruled.

FIFTH ASSIGNMENT OF ERROR.

The Honorable District Court erred in overruling defendant's Special Exception No. 10 to the Special Master's Report, and in approving such report and finding of the Master, that the plaintiff should receive a return of 8 per cent upon its capital invested in the exchange in the City of Houston, and that any rate of return less than that would be confiscatory, for the reason that such rate of 8 per cent is much in excess of the legal rate, which is 6 per cent, as fixed by the Statutes in the State of Texas, and as disclosed by the proof is much in excess of the generally prevailing conventional rate on well secured loans in the community, and much in excess of a rate that could be deemed confiscatory within the meaning of the Fourteenth Amendment of the Constitution of the United States."

Said Exception No. 10 was as follows:

"10th. For this, that the Master found, decided and reported, as shown on page 20 of his report, that anything less than 8 per cent return on plaintiff's property would be confiscatory.

"Whereas, the Master should have found, reported and decided that a return of as much as 6 per cent on the value of such property would not be confiscatory." (Record p. 48.)

Said exception was by the court overruled.

SIXTH ASSIGNMENT OF ERROR.

"The Honorable District Court erred in overruling defendant's Exception No. 12 to the Special Master's report, and in not holding that the plaintiff had failed to do equity and had no standing in a court of equity, and in failing to dismiss plaintiff's bill for want of equity for the reason that it appears from the proof and from the findings of the Master, and the findings of the Trial Court that The American Telephone & Telegraph Company owns practically all of the

stock in the plaintiff's company, namely the Southwestern Telegraph & Telephone Company, which operates the local exchange in the City of Houston, and also practically all of the stock of the Western Electric Company, which manufactures the greater part of the supplies and equipment that are used in the extension and the operation of said local exchange, and the plaintiff made no full or fair disclosure as to the prices charged and the profits realized by the Western Electric Company, on the supplies and equipment so furnished to such local exchange, and upon which prices the rate of return to plaintiff is sought to be based, but it was affirmatively shown from the evidence that the said Western Electric Company, on the supplies and equipment furnished the Houston Exchange, charged excessive and exorbitant prices upon which prices it is basing the rate of return on its property, to be collected from the subscribers to the service furnished by said exchange to the people of the City of Houston."

Said Exception No. 12 was as follows:

"12th. For this, that the Master found, reported and decided, as appears on pages 21 and 22 of his report, that the plaintiff company is entitled to be heard in a court of equity

and to the relief sought therein.

"Whereas, the Master should have found, decided and reported, that, as shown by the evidence, the plaintiff company did not make such a full and complete disclosure in regard to its revenues and particularly in regard to the amount which would be deducted from the value of the property of the Houston telephone exchange on account of the additional use and service such property was put to by the plaintiff company in earning other revenues, to-wit, its long distance tolls; and, on account of the said plaintiff company failing to disclose the result of its financial dealings with the Western Electric Company and the profits resulting therefrom, involving the purchase by the plaintiff from the Western Electric Company of large amounts of property, equipment and supplies, both the plaintiff and the said Western Electric Company, as appears from the evidence, being owned by the same company, to-wit, The American Telegraph & Telephone Company, in the following manner, that is to say, that the said American Telegraph & Telephone Company owned practically all of the stock of both the plaintiff company and the said Western Electric Company and the Master should have further found that the said plaintiff company was not entitled to relief in a court of equity, because it made no effort to do equity and has not come into the court with clean hands." (Record p. 48.) Said exception was by the court overruled.

SEVENTH ASSIGNMENT OF ERROR.

"The Honorable District Court erred in not holding that the plaintiff had no standing in a court of equity and in failing to dismiss plaintiff's bill, for want of equity, because it appears from the evidence that the plaintiff owns not only the local telephone exchange in the City of Houston, but also the long distance lines connecting with such exchange and that all the expense of handling the long distance calls is charged to the local exchange, including its operating expense, and that large sums are received as tolls for long distance calls, which are handled by both the local exchange and the long distance lines and no attempt was made by the plaintiff to effect a division of such receipts between the local exchange and the long distance lines in any fair or equitable manner based upon the amount invested by each. or the services performed by each, or upon any other basis with a view of accuracy, but the plaintiff merely arbitrarily apportioned to the said local exchange only 25 per cent of the receipts for outgoing calls."

EIGHTH ASSIGNMENT OF ERROR.

"The Honorable District Court erred in not dismissing plaintiff's bill for want of equity, it appearing that The American Telegraph & Telephone Company, which owns practically all of the stock of the plaintiff company which operates the local Houston Exchange, arbitrarily deducts from the earnings of the local exchange 4½ per cent of its gross earnings, without attempting to show what it costs it further appearing that the plaintiff, which, under the to supply the service for which the 4½ per cent is taken, and domination of The American Telephone & Telegraph Company, pays to the Western Electric Company practically all of the stock of which is owned by The American Telephone &

Telegraph Company, 4 per cent on all purchases of supplies and equipment, purchased by the local exchange without attempting to show what the cost of such purchasing agency is, thereby making it impossible to determine the revenues and expenses of the local Houston exchange."

NINTH ASSIGNMENT OF ERROR.

"The Honorable District Court erred in holding that the ordinances of the City of Houston, prescribing the rates that could be charged for telephone service in the City of Houston were confiscatory and violated the Fourteenth Amendment to the Constitution of the United States, and in rendering judgment, enjoining the defendant from enforcing such ordinances, because it was impossible to determine from the evidence what the revenues received by the plaintiff from the operation of the Houston Exchange were or what the expenses incurred in the operation of such exchange were."

QUESTIONS INVOLVED

While there are several assignments of error raising minor questions, the principal propositions upon which the appellant City of Houston relies, are that:

(1). On account of the failure of the telephone company to make any fair or proper division of the expenses incurred in and the revenues received from the long distance tolls which the local exchange assists in handling, and on account of the failure of the plaintiff to disclose the profits realized from the purchase of material and supplies from the Western Electric Company in the operation of the local Houston exchange by The American Telegraph & Telephone Company, which practically owns both the Houston exchange and the supplier, the Western Electric Company, it is impossible to ascertain even approximately the net return or earnings received by the plaintiff from the telephone service furnished to the citizens of the City of Houston and

(2). It appearing that The American Telegraph & Telephone Company owns both the Southwestern Bell Telephone Company, which operates the local Houston exchange, and

also the Western Electric Company, from which the greater part of the material and supplies used in operating such local exchange are purchased, and no fair disclosure of the profits on such material and supplies having been made, but the proof affirmatively showing that such profits were grossly excessive, the plaintiff Southwestern Bell Telephone Company had no standing in a court of equity, and its bill should have been dismissed for want of equity.

BRIEF OF ARGUMENT ON ASSIGNMENT OF ERROR No. 1, RELATING TO THE COST OF THE PROPERTY.

(Record p. 62; this Brief p. 11.)

The cost of plaintiff's property used in the local Houston exchange, as found by the court, was \$4,691,567. The plaintiff's accountant testified that it was \$4,810,385.40. (Record p. 75.) The difference is practically accounted for by the court's reduction of the amount of working capital. (Record p. 55.) The cost of the property included \$754,000 in cost of the property as set up by plaintiff's accountant, and as found by the court, included \$754,000, known as intangibles, being the difference between the price paid by the plaintiff for the Home Telephone Company's properties and the physical value of the property so purchased now in use, plus the amount of salvage, which difference is carried as intangible capital. (Record pp. 70 and See also plaintiff's Exhibit No. 10, Record p. 102.) appears from the foregoing that of the cost and value of said property, as found by the court, the sum of \$754,000 is not used or useful in furnishing telephone service in the City of Houston and it is submitted that for such reason this amount should be deducted from the cost found by the court. Simpson vs. Shepard, 230 U.S. 434; 57 Law Ed. 1156; Smyth vs. Ames, 169 U.S. 545; 42 Law Ed. 849.

BRIEF OF ARGUMENT IN SUPPORT OF SECOND ASSIGNMENT OF ERROR, RELATING TO THE LONG DISTANCE TOLLS.

(Record p. 62; this Brief p. 11.)

There is no public service commission in the State of Texas, and all public utilities except railroads are unregulated as to rates, except such regulations as may be prescribed by the municipalities, so the plaintiff company is not regulated in the matter of rates that can be charged for its toll or long distance service.

The appellee, Southwestern Bell Telephone Company, in addition to furnishing telephone service to the citizens of the City of Houston, owns and operates a great many local exchanges throughout the State of Texas, and also nearly all the long distance lines in the State which connect with lines without the State. All the property used in opreating the local Houston exchange is also used in handling the long distance tolls. It initiates the greater part of the tolls and terminates nearly all of them. It houses the long distance equipment. All the expenses of handling the long distance tolls, except possibly the maintenance of the property used exclusively for long distance toll purposes, are charged to the local exchange and included in its operating expenses. This will more clearly appear from the following testimony:

DIVISION OF TOLLS

F. M. Hoag, a witness for plaintiff, testified as follows: Cross-examination.

Questions by Mr. Howard:

Q. Mr. Hoag, in making this inventory, just what property in the City of Houston belonging to the Southwestern Telegraph & Telephone Company did you exclude?

A. The property not used or usable for telephone pur-

poses.

Q. Briefly, what was that?

A. That was the Houston Home Telephone Company lot and building, the lot and building acquired by the Southwestern when they took over the Houston Home Telephone Company in Houston Heights at Harvard and 5th. A small lot, 20x20, which was a storeroom lot owned by the Houston Home Telephone Company, and the old Taylor central office lot and building at the corner of Center and Taylor streets. Those three pieces of property. I also excluded all the dead drops. That is the wire that is not connected to working telephones, and also the wire in the buildings that are not connected to working telephones, and in residences, it being our practice in our accounting system to charge that part of the property off at the time the telephone is disconnected.

Q. Anything else excluded?

A. The transmitters, receivers and induction coils, which are not the property of the telephone company, the Southwestern Telephone Company. Also the furniture and fixtures used by the district men who have their headquarters here in Houston was excluded, in that those men have no supervision over the Houston exchange.

Q. Anything else?
A. I think that is all.

Q. My question involved all property owned by the Southwestern Telegraph & Telephone Company located in the City of Houston.

A. Yes, sir.

Q. You have overlooked, I believe, long distance—A. (Interrupting). Yes, sir, I was considering the Houston local exchange property.

Q. I said all the property of the Southwestern.

A. Yes, sir, all the long distance property has been excluded, and that is long distance switchboards, the toll underground cables, the toll poles and wires and cable boxes, all parts of the long distance plant, including the toll test boards and telegraph equipment and other associated apparatus.

Q. That property, of course, is all owned by the same company?

A. Yes, sir.

Q. And is just a difference in the way you inventory and the account you charge it to, and all that?

A. Yes, sir.

Q. Matter of classification and segregation?

A. Yes, sir.

Q. Has the property you excluded as performing long distance toll purposes been used exclusively for long distance toll service?

A. Yes, sir.

Q. And you have not undertaken to exclude from the inventory any property that is jointly used by the long distance service—for the long distance service and the local exchange service?

Every telephone in Houston connected to the Houston Exchange might be used for long distance purposes, as well as local purposes.

In fact, it is used? Q.

A great many of them are; yes, sir. A.

Q. You inventoried, of course, all those lines and those exchanges?

A. Yes, sir.

Q. And those lines leading to individual telephones? A.

Yes, sir.

Q. You included all the buildings, the exchange buildings?

A. Yes, sir.

Q. Four of them, I believe, in this city? A. Three central office buildings.

Q. And another exchange, isn't there?

The Capitol central office equipment is housed in the Preston central office building. There are four central offices, but three central office buildings.

All those central office buildings are used by the long

distance tolls?

In that long distance calls, when completed over a subscriber's telephone, passes through the central office equipment in those buildings; yes, sir. Q.

The buildings house the long distance equipment,

don't they?

There is no long distance equipment in the Taylor central office building, nor in the Hadley. All of the long distance switchboards and equipment is in the Preston central office building.

Q. Housed in the Preston building?

A. Yes, sir.

It is necessary that they have a home for this long distance toll apparatus? A.

Yes, sir.

And that apparatus is quite considerable, and quite Q. expensive?

Yes, sir.

The business done and revenues received from the long distance service is very extensive, and amounts to a great deal of money in the course of a year?

Yes, sir.

If the earnings were pooled of the long distance service and of the local exchange, the long distance service originating here, and formed one general fund, have you any idea about what proportion the revenues received from the long distance service would bear to the whole fund?

- A. No, sir; that is an accounting matter.
- Q. That you didn't go into?
- A. I cannot answer it.
- Q. Who handles that branch of the matter?
- A. Our auditor.
- Q. Can you give me the name of the man that probably handled it?
 - A. Mr. Scott.
- Q. Then, I believe you say that a great many of the lines, in fact, all the lines, the individual exchanges, the individual telephones are all ready to receive long distance service, and to carry on and transmit a long distance call to the subscriber, and do it whenever the subscriber has a long distance call.

A. The telephone company has for years advertised to the effect that each telephone is the center of the system. There are over seventy-eight thousand places in the United States that can be reached from any local telephone connected with the Houston exchange.

Q. And they are a part and are used in that long distance service, and help to produce the long distance revenue, every individual telephone?

A. Yes, sir.

Q. Depending, of course, on the number of calls the particular individual subscriber receives. Some are very active in handling and carrying on long distance service?

A. Yes, sir, however-

Q. (Interrupting.) And some are very seldom used for that purpose?

A. Yes, sir, however—

Q. (Interrupting.) But all of them are equipped and

ready for that service at all times?

A. Yes, sir; but if this is a proper answer to your question: The development of the local telephone rate was carried on simultaneously with the development of the local telephone exchange.

Q. I don't know that I just get what you mean.

A. The rates for local telephone service were developed as the local telephone exchange was developed. The rates for long distance service was developed along with the development of the long distance lines, and in my judgment the rate for a long distance call is between the long distance switch-boards.

Q. It should be?

A. Yes, sir.

Q. But, in fact, it is not. It is from the originating indi-

vidual subscriber, say in San Antonio, to the individual subscriber in Houston to whom the message is transmitted.

A. In my judgment; no sir. My opinion is that rate is from the long distance switchboard in San Antonio to the long distance switchboard in Houston.

Q. In other words, it is chargeable only and properly to the long distance?

A. Yes, sir. And those earnings are necessary to carry

the long distance calls.

Q. In that event the service of continuing these calls, transmitting them and carrying them to the long distance central office, and delivering them from the long distance central office in Houston to the subscriber is in the nature of a donation by the local exchange to the toll service?

A. Not by any means. The local exchange is credited with a precentage of the long distance earnings, which per-

centage is intended to cover-

Q. (Interrupting.) That refutes your answer of a moment ago, doesn't it?

A. No, sir.

Q. That is what I thought was done—both service are recognized in making up the grand total of that charge?

A. If I can finish my answer, I think I can make it clear

to you.

Q. I think it is clear. My idea is clear. I would like to

get yours.

A. The earnings from the long distance lines—that is, a percentage of those earnings is credited to the local exchange.

Q. Exactly.

A. That, in the case of Houston, being 25 per cent.

Q. We will get to that 25 per cent later.

A. That 25 per cent cares for the cost of completing

those long distance calls in the Houston exchange.

Q. That is what we will want to ascertain later on, whether it does, or not. It is just facts I am getting at. Not whether or not it is a correct conclusion. But at any rate, the fact I am getting at, every individual telephone is available for handling long distance calls?

A. They advertise that fact and are proud of it.

Q. And you do it?

A. Yes, sir.

Q. And they are used?

A. Yes, sir.

Q. That is the practice and custom?

A. Yes, sir.

Q. The local exchange buildings are carried in the in-

ventory as you do here—they house the long distance equipment?

A. The Preston central office building does.

Q. Has offices where the long distance management is conducted and carried on?

A. But in apportioning the furniture and fixtures— Q. You are getting into that accounting business—

Mr. J. D. Frank (interrupting): Let him answer the ques-

tion and he will explain it.

A. In the inventory we only apportion a portion of the furniture and fixtures used in the handling of the business of the Houston Local Exchange.

Q. I caught that as you went over it before.

A. Yes, sir.

Q. But, nevertheless, the building itself is used by the general officers, a part of which is the management of the long distance service?

A. Yes, sir; we apportioned the office furniture and

the fixtures.

Q. I understand you did in your inventory, the fixtures and the furniture?

A. Yes, sir.

Q. But you did inventory the entire building?

A. Yes. sir.

Q. And inventoried it as the property used in the local service?

A. Yes, sir.

Q. And you inventoried every individual or local telephone?

A. Yes, sir.

Q. Substantially?

A. Yes, sir.

Q. And every sub-station?

A. Yes, sir.

Q. As the property in the local service?

A. Yes, sir.

Q. You didn't undertake to set aside or apportion any part—I know you couldn't in kind, but in percentage—the part of that equipment that goes to long distance service and the part that goes to local service?

A. All of the property inventoried in the Houston exchange is necessary in the rendering of local telephone serv-

ice in the Houston exchange.

Q. It is also necessary, is it not, in rendering first-class up-to-date long distance service?

A. Yes, sir; just like local service.

Q. It is to the joint interest of both of them?

A. Yes, sir.

Q. All this wiring and local sub-stations, and conduits and all this splicing, and poles, and everything of that kind is a joint enterprise, and they are used in that way, so when it becomes a matter of accounting, which I understand you didn't go into, to try to segregate and show how much of the property is used on one, and used on the other, if you had to make a division between the two as to earnings and expenses?

A. No, sir; the answer to that is the answer which I gave you just previously, which is to the effect that all of the property inventoried in the Houston exchange is necessary in the rendering of local telephone service in Houston.

There could be no sub-division made.

Q. You answered the question a while ago that it was all necessary also to an up-to-date, first-class long distance service. You couldn't have a first-class long distance service in this city today without those very things that are being used in the local service?

A. We couldn't have any long distance service in Hous-

ton without telephones.

Q. That is very true; there is no question about that, is there?

A. No, sir.

Q. The local exchanges are the feeders and the revenue producers for the long distance enterprise; are they not?

A. To a great extent; yes, sir.

Q. That is, you could, in the old days, before they had many local exchanges—I guess you and I remember when the telephone came into existence?

A. Yes, sir.

Q. And the telephone would run through a town and the people would go in there and talk over the long distance exchange, and would get their messages in that way, and it was used very seldom; very extraordinary for a man to use long distance telephone service before they had exchanges?

A. Yes, sir.

Q. And then as the business progressed and the exchange were built up, and people began talking to their neighbors and to their wives, and then they began to feed the long distance lines?

A. Naturally the easier you make it for people to talk long distance, the greater the amount of business you get

from them.

Q. So then, we get back to the original proposition that they are mutually beneficial to one another, the long dis-

tance helping the local exchange, and the local exchange helping long distance. That is true, isn't it, Mr. Hoag?

A. Yes, sir. But I wish to reiterate that the proper inventoried is all necessary for the local telephone service.

Q. I know that; that is obvious. But at the same time it is just as obvious that it is necessary for the long distance service?

A. It is necessary for long distance service, although long distance service can be rendered without the local tele-

phone exchange.

Q. And it is also true that a good local service could be carried on in the community without the long distance service?

A. Yes, sir; that is true.

Q. It comes right back to the point that they are mutually beneficial, one to the other?

A. Yes, sir. (Record pp. 149-155.)

A. E. Scott, a witness for plaintiff, testified as follows: Cross-examination.

Question by Mr. Howard:

Q. Mr. Scott, in arriving at your expenses in operating this exchange, you primarily, upon your books, set up all expenses, including the taking care of the toll?

A. Yes, sir.

Q. Then how did you get the toll expenses out of the

general operating expenses?

A. We don't take them out of it, in the making up of my figures, I attempt to get away and do get away from estimates as much as possible, my figures are actual expenses, and we have—I know we have in our expenses all our toll expenses.

Q. You have all your toll expenses?

A. Yes, sir; but to offset that we put in this 25 per cent revenue, which is the usual revenue allowed to other companies—and that allowance is there.

Q. Have you any way of telling or determining what additional expense you are put to in the way of operating by

handling this toll charge?

A. I have never made any figures which would tell what the operating expenses were for the toll business, the two are so interlocked that the only way to get at it would be by making arbitrary estimates and making prorate of the various accounts, a very involved proposition, and very inaccurate when finished.

Q. You would not undertake to say that even 25 per

cent would pay the additional cost of taking care of the toll traffic?

I would take into consideration the fact that taking that 25 per cent basis, with companies in Texas that 25

per cent would be about right.

I am talking about your books, you are here as an accountant and not as an advocate for the company, I take it?

Well, I haven't made any study as to whether that

is right or that is wrong.

Q. You don't know? No, sir; I don't know.

Well, aren't your books so kept that it is possible to segregate the toll expenses from the general operating expenses?

A. No, sir; the two are so interlocked that you could only get the toll expense out by, as I said before, by arbi-

trary estimates, by prorates.

Then the proposition is, as I understand it, you come here with a lot of intermingled accounts, some of which are occasioned by the local exchange, some of which are occasioned by handling the toll traffic, and say we have had so much expense, but to offset that, why, we will pay you

25 per cent on the outgoing toll charges?

Well, the fact that the figures are so intermingled and the fact that I am dealing with the records of the company, as shown by the books, is my reason for handling it in this way; it is more satisfactory to make one estimate, if you want to call the 25 per cent an estimate, than to take something out of one account and another account and all the accounts that would be involved.

Well, you cannot tell us from your books how much of these general expenses was occasioned by the taking care

of the toll charges?

No, sir, the books don't show a division between toll and the exchange expense as in regard to the use of expense; of course the toll expense in connection with the plant outside of Houston is kept as a toll expense and not included in any of my figures-that is purely toll expense; but common expenses are all included in my figures.

Isn't it susceptible of determining every expense occasioned by any one telephone call, that you can take a telephone call as a unit and ascertain the expense of that

call?

Well, that would be simply an estimate, you try to A. deal with a unit as small as a telephone call, you are getting down to a very small item, you will find you cannot confine it to that one particular thing; in connection with your toll business you have your overhead, just the same as you have with your exchange business; you might in that one direct case, on that particular call, but that does not end the proposition—you have got building expense, for example, you have got your toll property, property in the same buildings with your exchange property, you have got to prorate there or make an estimate of some kind; and so it goes all along the line, all kinds of estimates and prorates would have to be worked up in order to get a figure that would be presumably correct—and then you would not be able to say it was absolutely correct, it would be a matter of opinion of the men who were making the estimate.

Q. As to that item of toll expenses, then, we have got to remain in the dark?

A. Well, I think the allowance of 25 per cent being-

Q. (Interrupting.) Well, I understand, you have told me the 25 per cent.

A. That is accepted by seven hundred companies in Texas and appears to be satisfactory.

Q. Well, are these toll companies—you are speaking of—independent companies?

A. Yes—that is, all the different companies throughout the State that make any connections with us.

Q. Are there seven hundred different telephone companies in Texas?

A. Yes, sir.

Q. Seven hundred local exchanges?

A. Well, I say seven hundred local—there are seven hundred companies that do some long distance business and who have contracts with us on this 25 per cent, or 12½ per cent basis, or some similar proposition.

Q. In these cases the Southwestern controls the long dis-

tance toll line?

- A. No, indeed not; a great many of them, the little companies in one particular have toll lines themselves, are connected with us at some point—perhaps at this exchange or some other point; in some cases their own toll lines run into our board.
- Q. But in most cases where you have got this arrangement there is no long distance toll line owned by the local company?

A. Probably every local company has some toll lines.

Q. It has some? A. It has some.

Q. But then in order to get in connection with the out-

side world they necessarily have to use a long distance line

of the Southwestern company?

Well, not necessarily; the Mackay people are down there, the Postal people are here, the Western Union Telegraph, they all have a line.
Q. What proportion of it; have you any idea?

No, sir; I don't know.

Well, that is all. (Record pp. 147-149.)

(A. E. Scott, a witness for plaintiff, cross-examination.) Q. So, then, in short, the way this thing is set up on the books a part of the local and a part of the tolls are confused in that they are inseparable and a small part of it, maintenance and some taxes and the operators that are working where there are independent exchanges are not allocated, and, then, instead of trying to carry the scheme of allocation all the way through, so far as the expenses are concerned, and so far as the plant investment is concerned, why you just allocate this 25 per cent as a sort of an offset of compensation?

It is a compensation in lieu of the expenses incurred

by the exchange in performance of toll work.

Q. Although you don't know upon what basis you could actually settle with the local exchange in regard to the expense?

Well, as I have said before, there is a number of com-

panies that are accepting that-

(Interrupting.) No, I am talking about the actual expense; you can't come here and tell us what the actual expenses are that this exchange incurs for handling the tolls?

A. No, sir; I can not.

You could not do that? A. No, sir; I could not.

Q. Then the 25 per cent is founded upon some sort of a guess or approximation?

It is not a guess or approximation, it is a special percentage made by ourselves with all our connecting lines and by connecting lines with-in their dealings with us.

And that make it sufficient to pay the cost, regard-

less of what the costs are?

A. It must be pretty nearly right or the other fellow would not take it.

That is your conclusion about it; you are an accountant, and your mind is supposed to dwell upon-

A. (Interrupting.) That is why I deduct the 25 per cent.

You mean you initiate this 25 per cent?

A. No.

Q. You take 25 per cent because the executives of this company tell you to take it?

A. But if I had not taken 25 per cent, I would have had

to make a lot of apportionment.

Q. What is your attitude towards this company, an accountant or a director of policies?

A. I have no attitude; I am an accountant.

Q. Then you could talk to me about the accuracy of your figures and bookkeeping without mingling it up with whether it is for the company or against the company; you can make those differentiations, can't you?

A. I think so.

- Q. Now, foregoing for the time being, what the policy of your company is, I am asking you whether this is an accurate conclusion and whether it has been arrived at with accuracy or whether it has an element of inaccuracy in it? That is a simple question, it is either accurate or it has an element of doubt, and inaccuracy.
- Mr. J. D. Frank: You assume there must be some inaccuracy in your question.

Mr. Howard: Well, if it is inaccurate he can tell me so.

A. If an allocation or a prorate—if the use of an allocation or a prorate means that your statement is going to be accurate or inaccurate, even my method of doing it or the method you are suggestion, either one, would be right or it would be wrong, because I have taken some allocations and I have not taken some that you are suggesting.

Q. Any allocation that you take, in other words, is but an

approximation?

A. It is an approximation. It is an estimate based upon

the best we have available.

Q. No, Mr. Scott, have you ever made any computations to find out; you have figured it out here what Houston is earning and you have probably figured out what all the different exchanges are earning, have you ever taken the trouble to take the earnings of the toll lines and the value of its property and its operating expenses and determine the annual return over and above all operation expenses, including maintenance and depreciation?

A. No, sir.

Q. Earned by the toll lines?

- A. I don't think that has ever been done, Mr. Howard. It has not been done by me and I don't believe anybody else has ever done it.
 - Q. It can be done, can't it?

I don't know whether it can or not. I don't think I would be able to do it.

You don't think you would be able to do it? Q.

Q. Well, now, let's see the process involved. The first thing you would get, the value of the toll lines, that would be comparatively easy to get, approximately correct?

No, that would be very difficult. It would mean an inventory and an appraisal of the toll lines throughout the

entire State of Texas.

Well, we will take it the way you have it on your books.

Well, I can't start out with that assumption. mean go to the books and find out what the amount on the books is for toll property?

You have got an inventory of your entire toll lines in

the State haven't you?

A. No, sir.

Is this company operating without having an in-Q.

ventory of its toll lines?

Yes, it took them about three months to take an inventory of the property here in Houston alone. We have no inventory of the properties in the State.

You haven't any inventory of the tool property in the

State?

A. No, sir.

How do you set up the number of poles you have?

That is simply accumulated record of a number of items, just like my books are and an accumulated record of an amount of money; that is not an inventory.

Do you mean to say, Mr. Scott, that this company is today not in position to tell how many poles it has in the

operation of its Statewide business?

A. It has a figure in the record of a number of poles which they think they have and I can tell you, Mr. Howard, on the side, that it is very wrong, the number on the record.

Well, then, how did they keep any account of their

business, if they have not any record?

The number of poles we have is not important. A.

Whether you have one hundred poles or a million? The number is not valuable. It is a nice statistical record and probably some department may have some use for it, but it is not important.

Q. So what you do know about what this toll equipment cost-

We have a record, the accumulated book record of the cost of the tolls property, that is the toll lines. We have the toll switchboard included on the books in our exchange

switchboard account. There is no separation there.

Q. Well, your books have been kept then so you can't separate the toll lines from the exchanges at all; you can't even give me an approximate amount of property that is invested in tolls as distinguished from local?

A. I said I can't tell the amount shown by the books of

the toll lines.

Q. Well, let's assume if we can get over this approximately, if you want to set it up that way, or get it from the books, just assume it can be done, it is human possibility. Then once we have the valuation we have got a start towards finding the earnings of the toll lines.

. Once you have the valuation, you have a basis to start

with, of course.

Q. Then the next thing is the amount of your earnings?

A. That is about all you want then.

Q. All right, well now, we have got too rather important steps in making this computation; now, the next thing that would concern us, would be our operating expenses, including maintenance and depreciation, would't it?

A. Before you could find your net returns, you surely

would have to determine what your expense was.

Q. Well, we deducted then, we get the operating expenses and we deduct it from our revenue, wouldn't we?

A. Yes, sir.

Q. What would be our next step. Then we have our net return in round dollars?

A. Yes, sir.

Q. Then, to reduce it to percentages, we would divide our net return by our capital investment?

A. Yes, sir.

Q. Now, have you any way of disputing the proposition that that computation, as Mr. Kelsey said, would amount to forty per cent on your toll line investment, as segregated and separated from your exchange property?

A. Mr. Kelsey is undoubtedly so far wrong—

Q. (Interrupting.) I know you think he is wrong.

A. We think he is wrong.

Q. You think he is wrong, but you have never done it.

Your mind can't grasp the idea?

A. It would be my opinion that—that if we were making forty per cent on our toll business we probably would not have any toll business; it would be more than the traffic would bear.

Q. But it would help the traffic mightly wouldn't it? If all the operating expenses were paid by somebody else

that would tend very largely towards making the toll lines

a handsome enterprise, wouldn't it?

A. If we had enough toll lines and would make one hundred or two hundred per cent profit on it, we could give exchange services free, Mr. Howard.

Q. Yes, and isn't that the reason what you claim-for

showing the deficit here since time began?

A. Because we have been giving service, not only free,

but for less than what it cost.

Q. And haven't you been giving what you call an apparent deficit, because, as a matter of fact, there was no real deficit and because the operation of this exchange was an auxiliary to the operation of the toll lines and that you are making money all the time out of the property in its dual capacity?

A. No, sir. (Record p. 142-146.)

Ninety-nine and a fraction per cent of the stock of the Southwestern Bell Telephone Company, which is the changed name of the Southwestern Telegraph & Telephone Company, is owned by The American Telegraph & Telephone Company, otherwise known as the Bell System. (Record p. 422.) The Bell system owns and operates four-fifths of the telephone business in the United States. (Record pp. 681 and 709.) In addition, it owns a large amount of stock, less than a majority, in other so-called telephone companies. In this situation the plaintiff company adjusts the expenses and earnings in the State of Texas between the local exchanges and the long distance lines, both of which are engaged in handling the long distance messages, by arbitrarily crediting the exchange with 25 per cent of the initial or outgoing calls.

This it does without any effort to arrive at what would be an accurate or a fair division of the tolls as between the local exchange and the long distance service; in fact, it appears from the record that it is impossible to separate these earnings, that is, to determine what percentage should be allowed to the local exchanges, based upon the property used for handling the tolls and the services performed in handling them. (Record pp. 142 and 143.) To justify this 25 per cent the plaintiff, the telephone company, introduced evidence of contracts with many other companies upon the

25 per cent basis. (Record p. 143.) It is submitted that in view of the conditions above detailed, that such evidence forms no criterion for determining the amount of revenue that should be credited to the Houston exchange by reason of its property engaged in and the service rendered in handling the long distance tolls. There is no freedom of contract and cannot be under conditions prevailing. In Houston, as in most other points in Texas, the same company owns both the local exchange and the long distance lines, and it is, of course, to its interest to have such earnings as it can appear in the service that is not regulated, and where there is no limit on the amount it will be permitted to earn. The contracts made with so-called independent companies, as will appear from the foregoing statement, are made where the local exchange is under the disadvantage of having to procure the long distance service upon such terms as the owner of the long distance will grant to them, or failing to accomplish such conditions, forego the use of long distance service.

It will be seen from the statement above set out that practically all the property of the local exchange is used in a dual service. First, furnishing local telephone service to the local subscribers; and, second, in handling the long distance tolls. It will be suggested that the City of Houston has no power to regulate rates outside its limits and that the earnings of the long distance lines cannot be taken into consideration in arriving at the earnings of the local ex-This would clearly be true if the local property was not used in earning the long distance tolls and it would perhaps be true if the ownership of the local exchange was different from that of the long distance lines, and had made a contract for the 25 per cent, no matter how unfair such contract might be, and regardless of the disadvantages the local exchange was under in entering into the contract, but here, where the ownership is the same and the local properties are used in producing the long distance revenues, it is not only just and proper, but legal, to have the long distance tolls divided upon a fair and, as nearly as possible, an accurate basis, and while it is further probably true that

all tolls should be regarded as long distance earnings, still the rate regulating body would have the right to make an adjustment by depreciating the value of the local property to the extent that it is useful or used in handling the long distance tolls. In other words, the capacity of the local property is not exhausted by furnishing the local service, but is also used in handling the long distance tolls, and the investment should be divided on a proper basis between the regulated local lines and the unregulated long distance lines. This, of course, would decrease the investment in the local exchange and thereupon decrease the amount of earning necessary to show a proper return. All expenses, except the maintenance of the toll lines in the City of Houston, are charged to the local exchange. (Record p. 147.) The record shows that the 25 per cent is not even enough to take care of the cost of handling it, to say nothing of a return upon that portion of the value of the property that is used in handling the long distance tolls. (Record p. 156.) This was testified to by Mr. Player, one of the plaintiff's witnesses. It was testified to also by defendant's witness, Mr. Lyndon, (Record p. 169.) But the local exchange should not be confined to the mere refunding of the expenses incurred by it if the long distance service shows profit. The local exchange and the long distance lines are in the nature of joint enterprises and the profits should be ratably divided according to the investment each has in the service which produces the profits. The plaintiff company took the position that the city had nothing to do with the long distance business and declined to make any disclosure of the earnings from such service, but it was shown by the defendant from statements taken from the books of the company that the long distance service was paying about 34 per cent. (Record p. 169.) This does not seem unreasonable when it is understood that all expenses, other than the maintenance of the toll lines, are paid by the different local exchanges throughout the State, for which such exchanges receive 25 per cent of the revenue, leaving 75 per cent of all the revenues as a return upon the bare long distance lines, with no expense other than the maintenance of such lines. The long distance

revenues initiated by the local Houston exchange during the year 1919, which seems to have been taken as a basis for determining the revenues and expenses incurred by the plaintiff company, was something over \$400,000. (Record p. 961.) About \$100,000 of this was credited to the local exchange. This would barely pay the expenses incurred. leaving the large sum of \$300,000, which was earned by the joint property of the local exchange and the long distance lines, with no showing as to what proportion of this should be allowed the Houston exchange. There should first be deducted the prorata portion of the expense of maintaining the long distance lines, and then the balance of this money should be divided between the Houston exchange and the long distance lines in proportion to the amount of property of each engaged in rendering the service. The burden is upon the plaintiff company to show confiscation and with large items like this unaccounted for, it is impossible to arrive at the earnings of the local exchange, and consequently, whether or not any confiscation appears. State vs. Public Service Commission (Missouri Supreme Court, 233) S. W. Rep. 431-2.)

BRIEF OF ARGUMENT IN SUPPORT OF ASSIGNMENT OF ERROR No. 3, RELATING TO THE A. T. &. T. 41 PER CENT, APPROPRIATED FROM THE GROSS REVENUES OF THE HOUSTON EXCHANGE.

(Record p. 63; this Brief p. 12.)

The appropriation of this 4½ per cent is made under what is referred to by the plaintiff telephone company as the Four and One-half Per Cent License Contract. However, the term "contract" is a misnomer. The American Telegraph & Telephone Company (which, for the sake of brevity we will hereafter designate as the A. T. & T. Co.) owns the Southwestern Bell Telephone Company in the sense that it owns 99 and a fraction per cent of its stock, and of course any contract between the two companies would reflect merely the desires and purposes of the A. T. & T. Co. In consideration of this 4½ per cent of the gross revenues so appropriated by the A. T. & T. Co., it furnishes what is known as the instrument service, same being the

use of little devices known as the induction coil, transmitter and receiver, and in addition to this, certain claimed general services, without any attempt to show what either of such services cost. (Record pp. 281-294.) The portion of this 41 per cent, so appropriated, which is absorbed by furnishing the little instruments above referred to, is sought to be arrived at in different ways, that is, the plaintiff company, for the purposes of this hearing, undertook to show the value of same by computing the return on the investment, depreciation, etc. In this it valued the set, consisting of the induction coil, transmitter and receiver, at \$5.70, showing in this way, according to its contention, that the service was of the value of \$28,541 per annum, leaving \$14,251 remaining of the 41 per cent so appropriated for the general services claimed to have been furnished, as above stated. (Record p. 340.) The city, however, contends that such valuation of the instrument service is much too high. It will be understood that this 41 per cent appropriation is not analyzed or classified at all as set up by the books of the company and they merely furnish these little instruments and preform or claim to perform certain general services and arbitrarily appropriate 41 per cent of the gross revenues. As stated, the only tangible thing included in the 41 per cent appropriation is the use of the induction coils, the transmitter and the receiver. These are cheap little instruments, the manufacturing cost of which is very small. The reasonable value of the service for furnishing these instruments, based upon a rental or upon allowing a fair return over and above maintenance, as testified to by defendant's witness, Mr. Lyndon, is approximately \$13,000 per year. (Record p. 470.) And as testified to by defendant's witness, Mr. Kelsey, \$11,700. (Record p. 491.) The 41 per cent charge upon the gross receipts amounts to approximately \$42,000 per year. (Record p. 340.) To account for this additional \$30,000, which is so deducted from the earnings of the Houston exchange, the plaintiffs brought down from New York City many witnesses. These witnesses have carefully worked out what they call an analysis of the work done by the A. T. & T. Co. for the local exchange owned by

them. In their testimony, which is to voluminous to permit of review, they deal in glittering generalities. (Record pp. 176 to 469.) It appears that they have quite a number of pamphlets bearing upon the telephone business, which they send out to the different exchanges and occasionally an engineer makes a trip to some of the local exchanges. They undertake to point out in several instances where they render service, such as saying that they look over the city and see in what way the plant should be developed and this, notwithstanding the fact that the local exchange has competent local engineers and also district engineers capable of doing the work. These witnesses have a carefully prepared line of testimony which they offer in rate hearings throughout the country. (Record p. 406 and 494.) As illustrative of the things they claim to do, we cite this instance: There is a bug that can bore or drill through the lead sheath which encloses the cable and at times does some injury to the cable. These witnesses have taken this bug in a bottle around to the different hearings, claiming that they are working upon a method to prevent the bug's operation. The injury done by this bug is trifling and becomes interesting only as a scientific study, but is illustrative of the practical work testified to by these witnesses. They had as witnesses on these hearings officers from two different telephone companies known as independent companies, who enlarge upon the benefits of this contract, but the proof shows that the A. T. & T. Co. owns 34 per cent of the stock in these two so-called "independent" companies. (Record p. 406-413.) All this testimony is very vague and indefinite and is in a general form only. (Record pp. 176 to 469.) It would support apparently a 25 per cent deduction from the gross earnings as easily as 41 per cent. There would seem to be no limit to an estimate of the value of the services performed. Viewed from the standpoint of the Bell employes, they are invaluable. Viewed from the standpoint of the independents, they are almost negligible. (Record pp. 469-519.)

However, our contention is that no matter how efficient these services may be or how valuable, it is not a question

of efficiency or value, but a question of the cost of furnishing them. The A. T. & T. Co. owns 99 and a fraction per cent of the stock in the plaintiff company, which operates the Houston exchange. It is to all intents and purposes the owner, for we take it the court is not going to look at the form of this matter and ignore the substance. So then, the cost is the only thing that should appear in the operating expenses which are deducted from the revenues. There is no reason why the A. T. & T. Co., which owns the operating company, should, in addition to the return that it receives from the payments made by subscribers to the telephone service, receive in addition thereto certain indirect revenues or profits through such agencies as it is here sought to have invoked. If these services are reasonable and necessary, the cost of same should be deducted from operating expenses, even though such cost is in excess of 41 per cent, and if the cost is less than the 41 per cent, still nothing but the cost should be deducted. This question, so far as we know, has never been acted upon by this court. It has been allowed by some commissions and rejected by others. The plaintiff company admits that it has made no effort to determine the cost of this service (Record p. 814), and we submit that the burden is upon it to do it before it can be deducted from operating expenses. This we do not consider a technical contention. If schemes such as this are to be permitted, there will be no way of checking the operating expenses. State vs. Public Service Commission (Missouri Supreme Court), 233 S. W. Rep. 432.

BRIEF OF ARGUMENT IN SUPPORT OF THE FOURTH ASSIGNMENT OF ERROR, RELATING TO RESERVE FOR DEPRECIATION.

(Record p. 63; this Brief p. 13.)

That the company is entitled to set aside out of its earnings a certain amount for depreciation, of course, is not denied, nor will it be denied that this amount should be ample to keep the investment at all times up to 100 per cent, or to replace the property at the end of its useful life. The dispute regarding this matter arises purely upon the amount necessary for this purpose. The Master made an allowance

of 6.33 per cent, based upon a valuation of \$5,500,000, upon all physical property except real estate and working capital. (Record-p. 41.) This amounted to \$348,150. The court modified this allowance (Record pp. 41 and 59), by using the same percentage but applying it to the cost of the property, making \$289,380 to be set aside annually as a reserve for depreciation. The testimony upon this subject is too voluminous to make it practical to undertake to review it. It will be found in the Record, pages 519 to 617. The percentage of 6.33 was the one assumed by Mr. Hoag. the chief engineer for the company. (Record p. ---.) Both Mr. Kelsey, who had more than 25 years practical experience in the telephone business, both as an operator of telephone exchanges and as a manufacturer of telephone equipment, says that \$146,000 per annum would be sufficient annual reserve fund. (Record p. 591.)

The record in this case shows that this local exchange is in 92 per cent condition, in other words, it lacks 8 per cent of being as good as new. (Record p. 1401.) But turning to the exhibit (Record p. 806), introduced by the plaintiff company, showing its realized depreciation, that is, the amount actually expended to keep the plant in its present high state of preservation, such realized depreciation is nothing like the large sum allowed by the court for this purpose and is so much less than that sum as to point to the irresistable conclusion that the annual allowance for a reserve for depreciation is much too high. It is true plaintiffs show an average of 6.8 per cent for the last eleven years, but this included the deferred betterments for the first eight years, when the plant was new and which were made in subsequent years, making the average for the whole period much less than 6.33 per cent.

BRIEF OF ARGUMENT IN SUPPORT OF ASSIGNMENT OF ERROR No. 5, RELATING TO RATE OR RETURN.

(Record p. 63; this Brief p. 14.)

The evidence of all but one of plaintiff's five witnesses concerning interests rates in the vicinity of Houston, and which will be found in the Record pages 619 to 660 is to the effect that loans upon business property in the community bear from 6 to 7 per cent. This should measure the maximum of a return, or 7 per cent, and is all that should be allowed by the rate-making body. There is, however, a distinction between a confiscatory rate and a fair rate. We feel safe in saying that no court or commission has ever held that a rate of as much as 6 per cent was confiscatory. City of Knoxville vs. Knoxville Water Co., 212 U. S. 1; 53 Law Ed. 371. Lincoln Gas & Elec. Co. vs. City of Lincoln, 230 U. S. 255; 64 Law Ed. 968.

It is true that in the last mentioned case it is suggested a return of 6 per cent might be confiscatory in a community where loans were made at 8 per cent and the "legal rate was 7 per cent," but here loans are made on good security at from 6 to 7 per cent, and the "legal rate is 6 per cent." Articles 4974 and 4977, Revised Statutes of Texas, which are as follows:

Art. 4974. "'Legal Interest' is that interest which is allowed by law when the parties to a contract have not agreed upon any particular rate of interest." Article 4977: "On all written contract ascertaining the sum payable when no specified rate of interest is agreed upon by the parties to the contract, interest shall be allowed at the rate of 6 per cent per annum from and after the time when the sum is due and payable."

BRIEF OF ARGUMENT IN SUPPORT OF ASSIGNMENTS OF ERROR NUMBERS SIX, SEVEN AND EIGHT.

(Record pp. 63-64; this Brief . 15-17.)

It is submitted that right at the threshold of this inquiry the plaintiff telephone company is met with the maxims that "he who seeks equity must do equity," and that "he who comes into a court of equity must come with clean hands." The plaintiff company has not shown itself in position to obtain relief from a court of equity for in at least two important matters it has failed to disclose its earnings:

(a) It has failed to show what proportion of the profits resulting from the use jointly of the local property and the toll lines was earned by the local property and should go into its revenues. We have discussed this quite fully in our Argument in Support of the Second Assignment of Error (This Brief p. 19-36.) to which we refer.

It has made no attempt, except in the most general way, to show the profits derived on account of its relationship with the Western Electric Company. The proof shows that the A. T. & T. Co. is the owner of 99 and a fraction per cent of the stock of the plaintiff company, the Southwestern Bell Telephone Company, which operates the Houston exchange. Also that the A. T. & T. Co. is the owner of the Western Electric Company, which is a manufacturing company engaged in manufacturing telephone equipment and supplies. (Record pp. 707 and 708.) The plaintiffs do not deny this, in fact, admit it, and the master has found that the A. T. & T. Co. owns practically all of the stock of the plaintiff company and the Western Electric Company. (Record p. 44.) This finding is approved by the court. (Record p. 56.) The A. T. & T. Co. in the same manner owns also the "Bell System" (Record p. 322), which does four-fifths of the telephone business in the United States. (Record pp. 681 and 709. The Western Electric Company furnishes the equipment and supplies to this system. (Record p. 705.) From this it will be seen under what difficulties competitors of the Western Electric Company operate. Of course competition is practically stifled. Under these conditions the only effort to make a disclosure of the profits received by the parent company, the real owner of the plaintiff company, vis.: The A. T. & T. Co., in furnishing equipment and supplies to the Houston exchange was the following:

One of the plaintiff's witnesses, Mr. Cox, an employee of the A. T. & T. Co., by whom it is sought to support the A. T. & T. Co. license contract of 4½ per cent, volunteered on cross-examination, but not in response to any question asked by defendant, that the profit made by the Western Electric Company was 8 per cent, but he furnished no data or expense bills or any other figures to support such conclusion. (Record p. 693.) Aside from this there was nothing other than the incidental and general statements by plaintiff's employees that the supplies and equipment were pur-

chased as cheap or cheaper from the Western Electric Company as they could be purchased elsewhere. Opposed to this slight testimony, the defendant city made proof that the profits realized from the manufacture of certain telephone equipment was enormous (Record pp. 490 and 491), and that competitors of the Western Electric Company, even considering the conditions they are forced to operate under, would furnish switchboards, which constitute a very considerable part of the property used in the telephone service, at a very much lower price than that at which they were purchased at for the local exchange from the Western Electric Company. (Record pp. 713-723.)

It will be remembered that by the Constitution and laws of the State of Texas the power to fix rates of public utility companies in the City of Houston is vested in the Council of the City of Houston. That body primarily has jurisdiction to determine and fix the rates to be charged by public utilities. Its action on such matters is presumed to be correct. City of Knoxville vs. Knoxville Water Co., 212 U. S. 1;53 Law Ed. 371. And before the jurisdiction of the court is invoked, it should appear that said body has refused to grant relief after a proper showing that relief should be granted. In fact, in what was known as the "Merger Ordinance", introduced in evidence (Record p. 765), it was specially agreed by the plaintiff company in 1915, in consideration of a merger with the Home Telephone Company that the plaintiff company would not increase its rates unless it appeared on a satisfactory showing, to be made before the City Council of the City of Houston, of all receipts and disbursements that a necessity existed for an increase in charges in order that said company might earn a return upon its capital actually invested in the Houston plant. However, in the absence of this agreement it seems obvious that before the plaintiff could invoke the aid of the court, it must have applied to the Council and made such full disclosure of its affairs as would enable the Council to determine whether or not the application for an increase in rates should be granted, and it appearing that the company was using its local property both in earning local revenues

and long distance tolls, a proper disclosure should be made regarding the profits resulting from the long distance service, based upon the property furnished by the local exchange, and that furnished by the long distance lines, and the services performed by both or either, and it appearing that the real owner of the local exchange was also the owner of a manufacturing company which furnished the equipment and supplies to the local company, a full and complete disclosure of the profits realized on such equipment and supplies should have been made. The City Council would be well within its rights in refusing to increase the rate until such disclosures were made, and failing to make such disclosure the plaintiff company, when resorting to a court of equity, would be met with the proposition that it must come with clean hands and it should offer to make such disclosure and should make good such offer before it would have any standing before a court asking to have the power of the rate-making body suspended.

However, the defendant in this case did not rely upon such presumption or upon the proposition that the plaintiff, before it could successfully maintain its application in the courts for an increase in rates, was under the duty of making a disclosure of its dealings with its manufacturing branch, and also a disclosure relating to the results of the joint enterprise in the matter of the long distance toll earnings. It affirmatively undertook to show that in both these matters the company was making additional earnings which it had not credited the local exchange with. Even if the amount of such additional earnings was not defintely established, the defendant having shown that there were such additional earnings, it is obvious that the burden was then upon the plaintiff company to show the amount of same before any determination could be made as to whether or not it was so limited in its earnings by the rate-making body as to amount to confiscation of its property.

The evidence in regard to the long distance tolls is referred to in the argument under the Second Assignment of Error, this Brief page ——.

In regard to the relation with the manufacturing branch,

the defendant's witness, Mr. Kelsey, who was shown to have had a great many years' experience not only in the management and operation of telephone companies and exchanges, but also in the manufacture and sale of telephone equipment and supplies, and who is now engaged in manufacturing telephone equipment, testified in regard to the induction coils, transmitters and receivers, which the plaintiffs attempt to value at \$5.50 per set. (Record p. 489.) His testimony upon this matter was as follows:

"* * * Q. You said you manufacture these instruments, there are three of them, for 50 cents apiece, didn't you?

A. Well, this started with this idea that Mr. Wilson advanced—

Q. You are talking about prices now.

A. I am talking about getting down and turning these things through the machine. And you can turn the induction coil through the machine for 40 cents apiece.

Q. The transmitter for 50 cents?

A. Yes.

Q. And this receiver for 50 cents?

A. Yes.

- Q. That is, for \$1.50, then adding another 50 cents, which would be thirty-three and one-third per cent to \$1.50, you have \$2.00 for the set of three. You have got 30,000 sets of this exchange here and that is an investment of \$60,000.
- A. Well, where you stopped was the misleading factor and you have got some freight and you have got a lot of things coming down here that have to be handled. I think \$2.50 is about right.

Q. You think \$2.50 is about right?
A. Yes. * * * " (Record pp. 490-491.)

He further testified in regard to the manufacture of these coils, that they are manufactured by punch press and punched out by the thousand.

Again Mr. Kelsey testified concerning the Preston and Capitol Exchange equipment, that they were appraised in the Hoag inventory, introduced by the plaintiff (Record p. 713), as \$750,000, without including numerous additional charges, such as contingencies, omissions, engineering expenses, etc. He further testified that other companies could manufacture this equipment for \$600,000 net, including all the items that the plaintiff added to the sum of \$750,000.

(Record p. 715-724.) He further testified that the completed equipment as contained in the said inventory including the additional charges above referred to would run to \$1,027,000, and that the companies other than the Western Electric Company could furnish this equipment for \$600,000, or more than \$400,000 less than the figures of the Western Electric Company included in the inventory. (Record p. This reduced to percentages would show that the companies other than the Western Electric Company, concerning which Mr. Kelsey testified, would furnish this equipment for 48 per cent less than the Wertern Electric Company would furnish same. (Record p. 77), In the face of this testimony, and although the plaint. was repeatedly asked to furnish the expense bills and show the cost of manufacture by the Western Electric Company and although it had it in its power to do so, it contented itself by mere statements of some of its employees, that is, employees of the A. T. & T. Co. to the effect that the equipment could be purchased from the Western Electric Company as cheap as or cheaper than it could be purchased elsewhere, and with the volunteered statement of an employee of the A. T. & T. Co. that the Western Electric Company made 8 per cent, without any data whatsoever to support such statement. This, we submit, did not, in view of this record and the affirmative proof made by the defendant, amount to a full or reasonable disclosure of the profits that the parent company, the A. T. & T. Co., which is the owner of both the manufacturing branch and the operating company, was indirectly making from the Houston exchange by selling the material and equipment that went into its plant and the supplies used in operating same.

While it has been affirmatively shown that better prices can be obtained from companies other than the Western Electric Company, still if such better prices could not be obtained the plaintiff company, before it can claim confiscation, will be required to show, within reasonable limits at least, the profits it is realizing by the manufacture of material that is included in the capital value in the local exchange and the supplies it is furnishing such exchange for

the purpose of operating same. This is especially true when, as the Record shows (p. 681-709), and it will not be denied, parent company, which, as before stated, owned both the Western Electric Company and the operating company, controls four-fifths of the telephone business of the United States, and the supplies for this four-fifths is exclusively furnished by the Western Electric Company. Other manufacturing companies cannot live in competition with it without incurring overhead expenses that greatly increase manufacturing costs, such competing companies being so limited in the sphere of their operations that they are working at a great disadvantage, and under these conditions, for plaintiff to say it purchases as cheaply from the Western Electric Company as it can elsewhere, is not to meet this issue.

One of plaintiff's witnesses an employee of the A. T. & T. Co., testified as follows:

" * * * Q. Well, not trying to dodge the issue, hasn't it become the condition in this country and still growing more so, that there is one gigantic telephone company that also owns and monopolizes the manufacture of the equipment?

A. To the great advantage of both.

Q. Whether it is to the great advantage of both, that is the condition in America today that the one monopolistic concern controls the operation of telephones and that it also controls almost to a monopolization extent the manufactured articles that go into the enterprises?

A. Well, I think that is substantially correct. * * * "

(Record pp. 707 and 708.)

We could enlarge very much upon this proposition, but we think what we have said is sufficient to demonstrate that it is impossible to determine from the showing made what the revenues, both direct and indirect of the plaintiff company in the operation of the Houston exchange, are. The fact is they are in position to even show a large deficit in the operation of the exchange, when, in fact, considering the additional revenues or profits they are making out of the long distance tolls and which they are making, and are in position to make, out of the manufacturing branch, they are realizing great returns. Under the showing made the rate-making body could not determine whether the claim

that the company is losing money is true or not. We respectfully submit that from such showing neither the trial court nor this court can determine the question. The burden was upon the plaintiff to make such a showing as would permit that question to be determined.

The rate-making body should not, when it appears that the real operator, the A. T. & T. Co., is in addition to the local revenues paid by the subscribers to the service also getting other profits from the long distance tolls and also getting certain other profits from the manufacture and sale of material and supplies used both in the construction and in the operation of the plant and paid for by the people of the City of Houston, be required to take the plaintiff's general statements at face value and assume that the company is making no more out of the manufacturing branch than it is entitled to. But the plaintiff, before it could claim confiscation, should make a full and fair disclosure in regard to such dealings, which it has persistently failed and refused to do, notwithstanding the fact, as appears from the testimony above set out, they are realizing more, both from the long distance tolls and from the manufacturing branch to the detriment of the Houston exchange, than they are This is an imposition upon the people entitled to receive. in the City of Houston. The City Council has refused to grant relief while this imposition is being practiced and we respectfully submit that the courts ought not to tie the hands of the council thus rendering it powerless to oppose this imposition.

In this connection we wish to say the defendants throughout the hearing insisted upon a fair showing and disclosure in regard to the long distance tolls and also in regard to the profits of the Western Electric Company realized from the placing of material and equipment in the local exchange.

It appears on pages 700-702 and 713 of this record that the plaintiff was notified that the defendants desired the expense accounts and cost data to show the cost of this material and the profits realized thereon by the Western Electric Company. One request for this information was made on March 9th, 1920. The hearing was not completed until

about the 1st of May, 1920, and yet plaintiffs made no attempt to show their relations with the Western Electric Company or the profits that were being realized by the real owner of the Houston exchange in the manufacture of material, equipment and supplies used in such exchange other than general statements of its employees hereinbefore referred to. No officer of the Western Electric Company was placed upon the stand, though the defendant had no means of requiring their attendance upon the court. The plaintiff could have required their attendance and could also, as the owner of the Western Electric Company, have furnished the data so often requested by the defendants, because all the officers and employees of the Western Electric Company, as well as all the data, were within the control of the A. T. & T. Co., the real plaintiff. The record in this case embraces over 4,500 pages. Over the repeated protest of the defendant, the plaintiffs read into the record much immaterial matter. They caused to come to Houston from great distances many witnesses, nearly all employees of the A. T. & T. Co., to testify in regard to the 4½ per cent license contract. The testimony of the different witnesses was cumulative upon this point. They placed on the stand five witnesses, who testified at great length in regard to the reproduction cost of the property of the Houston exchange. The testimony of all these witnesses was cumulative. The reading of this record will disclose that a great part of the testimony was immaterial, a great many other parts cumulative of matters not controverted, and yet this plaintiff, although repeatedly requested so to do, entirely failed upon the two important features of the case, viz.: the matter of the long distance tolls and the matter of the profits of the manufacturing branch, to make any disclosure except to say they arl itracily allowed the Houston exchange 25 per cent of the outgoing tolls and regarding the manufacturing profits, it contented itself with the mere general statements above referred to.

The Master, in his report (Record p. 44), says that for the plaintiff to come into court with clean hands "does not mean that to have clean hands it must produce all evidence avail-

able or possible to be furnished, but only sufficient evidence to demonstrate that its property is being confiscated."

We have never contended that in order to show that it is entitled to equitable relief that plaintiff must have produced "all the evidence available or possible to have been furnished." We readily agree that if it has furnished "sufficient evidence to demonstrate that its property is being confiscated" it is entitled to equitable relief, unless it is by statute, as we will hereinafter attempt to show, made an outlaw, which is barred from a court of equity. For the present, however, that plaintiff failed to furnish sufficient evidence to show that its property is being confiscated, is just the contention we make. It comes into court showing that it is in a position to exact from the Houston exchange enormous profits and revenues by way of indirection, because it owns the manufacturing branch, which places material in the plant at arbitrary prices and also furnishes supplies for the operation of the plant at such prices as it may see fit, and it has not, as we have attempted to demonstrate. shown that it has not taken advantage of this position. Not only that, but its evasion of the issue is such as to convict it of having so taken advantage of its opportunity to impose upon the Houston exchange. In the first place, the relation is one that ought not to exist, because it creates a temptation to impose upon the public. But if such relation is to be tolerated, surely the plaintiff should bring forward the best evidence, or at least evidence that reasonably shows that it has not yielded to the temptation, but that it has dealt fairly with the public, and this duty and burden is not discharged by mere general statements that its own manufacturing branch furnishes the material as cheaply as it could be purchased elsewhere, especially so when competition has been practically destroyed by it and when it has been affirmatively shown, as it was in this case, that the property is being put in by the concern that owns both the operating and manufacturing branches at prices highly inflated. This evidence should be overcome by clear and positive testimony, the best that can be obtained, viz.: the books and data of the Western Electric Company showing the

manufacturing costs and expense bills and all data that would reasonably bear upon the profits realized from the sale of such material to the local exchange.

The court below, referring to the question under discus-

sion, says:

"The scope of the inquiry in this case cannot be extended to the determination of a fair rate of profit to The American Telephone & Telegraph Company on its capital invested, or to such a rate of profit to the Western Electric Company, which is not a public service corporation, but a private corporation engaged in the business of manufacturing telephone apparatus. The problem presented by the relations of such holding and subsidiary corporations are serious ones, which vitally affect the public interest, but they are problems which primarily call for legislative consideration.

"The fact that The American Telephone & Telegraph Company dominates and controls both the plaintiff company and the Western Electric Company, is sufficient to cause the courts to very closely scrutinize any dealings between these corporations whereby any unjust advantage might be taken by the parent company, or the effect of which might be to enable it to receive a larger return than that which forms the basis of the established rate for telephone service to the public. Such corporations, however, are not debarred from entering into contracts with each other, and where such contracts are fair and advantageous to the subordinate corporation, they will be recognized and given effect." (Record p. 57.)

It is respectfully submitted that the honorable trial court has not met our proposition. Its holding seems to be based upon the proposition that the relation here complained of is not prohibited by statute and that being the case they will be recognized and given effect as fair. This again raises the question that this relation is not a fair one, or at least it has not been shown to be, that the presumptions are against it, and that the slight evidence offered by plaintiff, especially when opposed to the affirmative proof offered by the defendant, is such as to clearly indicate an evasion of the issue and that such evasion and want of frankness will deprive the plaintiff of any standing in a court of equity, regardless of whether or not Congress has acted in the matter. It is our understanding that this court will not be bound by the Master's finding, even when ap-

proved by the trial court, but will review the evidence in cases such as this City of Knoxville vs. Knoxville Water Co., 212 U. S. 1.

If the A. T. & T. Co., which, of course, is the real plaintiff in this case, chooses to carry on these different enterprises, such as manufacturing telephone material and equipment and furnishing same to an operating branch of its own business at whatever profit it may see fit to impose, and also sees fit to mix up with its business of furnishing local telephone service to the people of Houston, its long distance toll business and use the local property in earning long distance tolls and, further, to take from the earnings of the local property a part of its earnings under the guise of a so-called 41 per cent service contract without undertaking to show the cost of such service, it might, in the absence of statutory regulation, have the right to so conduct its business and different enterprises. This is one thing. Invoking the aid of a court of equity is quite another thing. While it might, if the people will submit to it, pursue the course it is pursuing, working such impositions as it can, it does not follow that courts are going to compel submission by the public to such imposition. While courts are not administrative and do not, of their own motion, reach out to correct business abuses or punish wrong-doers, still it is the pride of our civilization that our courts are clean and a litigant who invokes equitable relief, which, in accordance with our institutions, courts have the power to extend, is required to purge himself before he can even cross the threshold of a court of equity. This plaintiff, one of the mere subsidiaries of the A. T. & T. Co., is, as the proof in this case shows, in connection with the business which is under investigation, conducting other enterprises by some of which additional returns are made and by others of which additional burdens are imposed, and no real attempt is made to enlighten the court concerning the effect that the associated enterprises have, upon the earnings and the expenses of the business under investigation or on the value of the property, and, although the defendant has shown that the property has other returns than that which the plaintiff

credits it with, the plaintiff says: "Oh, that is something we don't want inquired into. We have given what we think is right, and with that the public must be satisfied," and although the defendant has shown that the local business is burdened with expenses of the associated enterprises, the plaintiff says: "Yes, this is true, but we cannot separate the expenses and will, therefore, burden the Houston exchange and the public, who is paying the return upon the property with whatever part we see fit," and although the defendant has shown that the real owners of the Houston exchange also own the Western Electric Company and furnishes most of the supplies and material used in such exchange and charges any price it may see fit for same, which the public has to pay, and in addition purchases for the exchange such material and supplies as it does not itself furnish, charging large commissions therefor, to this the plaintiff answers: "We buy as cheaply from the Western Electric as we can from any other supplier," without making any offer or attempt to show the profits that are realized by the A. T. & T. Co., by having its manufacturing branch manufacture and furnish goods to the exchange, the operating branch, and in this connection it appears that the parent company, the real plaintiff in this case, has so monopolized the telephone business of the entire country that any other supplier is insignificant as compared with the Western Electric Company, which has a monopoly upon all the business of the Bell System, which is owned by the A. T. & T. Co., and which System comprises four-fifths of the telephone industry of the United States. Although the defendant has shown that from the gross earnings of the Houston exchange, 41 per cent is appropriated by the A. T. & T. Co. under the so-called license contract, which purports to be a contract for certain services, the plaintiff has made no effort to show the cost of this service, but in a very vague and general way claims that it is very advantageous. Do these propositions appeal to a court of equity? If they do. what is the meaning of the maxims: "That he who seeks equity, must do equity," or, "That he who comes into a court of equity, must come with clean hands?" Indirect

hidden profits, lack of frankness and obscured issues form but a poor basis for equitable relief. The plaintiff in this case is not in a position to seek the aid of a court of equity and ask to have the enactments of a law-making body, acting within the scope of its legislative power, set aside and held for naught. It should, in entering the court asking for equitable relief, be required to pursue the same path that other litigants are required to pursue. It has only to free itself from the bewildering maize in which it is now operating and be in position to come into court and make a full and complete disclosure, informing the court of the exact condition of its affairs, which it has in this case fallen far short of doing. Until such time, if it pursues the course it is pursuing, it should be left to work out its own salvation and not receive aid from the court in perpetuating its impositions upon the public.

RELATIONS SUCH AS EXIST BETWEEN THE PLAIN-TIFF COMPANY AND THE WESTERN ELECTRIC COMPANY HAVE BEEN DENOUNCED BY CONGRESS.

It is submitted that the relation existing between the A. T. & T. Co., owner of the plaintiff company, and the Western Electric Company, is an illegal one, and for that reason, if no other, all presumptions are against its dealings being fair. Such relation has been condemned by Congress. (Art. 8835-i. Revised Statutes of the United States.) This article forbids such relationship where the annual sales are in excess of \$50,000, and makes it a criminal offense to furnish supplies in excess of that amount, except on competitive bidding. As heretofore shown, practically all equipment and supplies of the Houston exchange are purchased from the Western Electric Company, and the item for reserve for depreciation alone, exclusive of repairs, is, as found by the court, nearly \$300,000 per annum. It is true that by said article the date when it goes into effect has been postponed for two years and it is our understanding that there has been another postponement of the date when it is to

go into effect. This doubtless is to give great corporations, such as those under consideration, ample time in which to sever their relationship. However, the fact that the date for enforcing the penalty has been postponed in no way changes the fact that the relationship has, by Congress, been denounced as constituting a crime meriting heavy criminal penalties. So, then, this plaintiff stands before the court admitting a relationship which has been by Congress denounced as a crime, but with sentence suspended, and the mere fact that a penalty will not be inflicted upon it is no reason why it should receive affirmative aid from the court in collecting profits which at least might be, and for all the court can tell, are the fruits of a criminal act. The burden is upon the plaintiff, where there is a proper presumption against its innocence, for it is only natural to presume that the criminal relation having been created, it was not idly created, but that it was created for the purpose of profiting thereby. The probability and source of illicit profit in this case is in furnishing equipment and supplies by the manufacturing branch to the operating branch by plaintiff, A. T. & T. Co.

Perhaps we have dwelt upon this matter even to the point of being tedious, but we feel strongly that an imposition is being worked upon the public, not so much by the very considerable matters of taking away the 4½ per cent, under the guise of a service contract, and in allocating many unnecessary charges in determining the operating expenses of the plant, but, to a very great extent in the matter of the long distance tolls and the manufacturing profits. These indirect profits may rise to such magnitude as to render regulation absolutely nugatory, and it is respectfully submitted that the relief prayed for by the plaintiff, the extraordinary relief of suspending the powers of a co-ordinate branch of government, should not be granted, until by a fair and honest disclosure the plaintiff has shown that it has met with imposition at the hands of such legislative body.

BRIEF OF ARGUMENT IN SUPPORT OF NINTH ASSIGNMENT OF ERROR, RELATING TO THE CLAIMED DEFICIT.

(Record p. 65; this Brief p. 17.)

While upon their face the statements of the appellee's revenues and expenses for the year 1919 show that the cost of operation, including approximately \$300,000 annual reserve for depreciation, exceeds the revenues for that year, it is submitted that even for the year 1919 it was impossible to determine not only whether or not there was a deficit, but whether or not the appellee did, during such year, make a fair return upon its investment. In addition to what we have said in regard to the matter in the discussion of the Second, Sixth, Seventh and Eighth Assignments of Error, we wish to add that this court will take judicial knowledge of the fact that the year 1919 witnessed the peak of high prices, resulting from the World War, and of the further fact that prices have declined since the year 1919 to such an extent that the operation for the year 1919 no longer furnishes any criterion whatever for determining the costs of operation incurred by the appellee in the operation of the Houston exchange at the present time. Lincoln Gas & E. L. Co. vs. the City of Lincoln, 230 U. S. 255; 64 Law Ed. 968.

In order that justice may finally be done to the parties, the appellant prays that the judgment of the court below in this case may be reversed and rendered with costs.

IN THE

Supreme Court of the United States.

OCTOBER TERM, 1921.

No. 219.

CITY OF HOUSTON,

Appellant,

VS.

SOUTHWESTERN BELL TELEPHONE COMPANY, Appellee.

No. 220.

SOUTHWESTERN BELL TELEPHONE COMPANY,
Appellant,

VS.

THE CITY OF HOUSTON,

Appellee.

APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF TEXAS.

BRIEF ON BEHALF OF THE SOUTH-WESTERN BELL TELEPHONE COMPANY.

As Appellee, Case No. 219—Part I. As Appellant, Case No. 220—PART II.

Statement.

The Southwestern Bell Telephone Company, plaintiff in the court below (hereinafter referred

to as the Company) owns and operates a telephone exchange system in the City of Houston, Texas, furnishing local telephone service. The Company also owns and operates similar local exchange systems in many of the important cities and towns in Texas, and in the states of Missouri, Kansas, Arkansas and Oklahoma, and in addition to these exchanges for local service, owns and operates a separate toll system connecting these exchanges, and also connecting with the toll lines and exchanges of other telephone companies. This case involves only the rates for local or exchange telephone service in Houston.

This is a suit in equity for an injunction, instituted by the Company in the District Court of the United States at Houston to enjoin the City from compelling the Company to continue in effect a schedule of rates for local telephone service prescribed by the City by ordinance in 1909, on the ground that the rates are confiscatory.

The rates in question are \$5.00 per month for business or office connections; \$2.00 per month for residence connections; \$3.00 per month for party line service, business or office; \$1.50 per month for party line service, residence.

The ultimate question in this case is whether these rates so prescribed by the City in 1909 are shown by the record to be confiscatory.

The case was referred to a Master on August 25, 1919, who, after an exhaustive hearing, submitted his report to the court on June 5, 1920 (Report of Master, R. I, 29-45). The Master reported his specific findings as to the value of the Houston property of the Company, revenues under the rates complained of, expenses of operation, and fair rate of return, and found that under these rates the Company not only failed to obtain any return

whatever, but in 1919—taken as the test period—it suffered an actual net loss of \$306,204. The trial court, approving the Master's report as to most items but disapproving it and substituting other figures as to certain items, hereinafter considered, found that the Company sustained for the year 1919 a net loss of \$247,434. These figures take no account whatever of any return upon the property. The loss stated is the amount by which expenses exceeded gross revenues.

The trial court entered its decree adjudging the rates confiscatory and the ordinance void, and granting an injunction against their enforcement.

The City appealed from the decree and seeks a reversal.

The Company has filed a cross appeal. The Company assigns and prosecutes error upon certain rulings of the trial court upon exceptions to the report of the Master, as will appear fully hereinafter.

For the convenience of the court we have embodied in this one brief the Company's brief as appellee in answer to that of the City, Part I hereof, and the Company's brief as appellant in support of its own assignments of error, Part II hereof.

The Master found that the value of the Company's property used and useful in furnishing local telephone service in the City of Houston in 1919, the period to which the inquiry related, was \$6,003,000 (R. I, 38); that a fair rate of return upon the property was 8% per annum (R. I, 43); that the Company's total revenues from the Houston exchange for 1919 under the rates in issue were \$908,258 (R. I, 36); that its total expenses were \$1,214,462 (R. I, 42); that the net loss of operation

to the Company in 1919 under the contested rates was \$306,204 (R. I, 43).

The court found that by virtue of a merger ordinance enacted by the City in 1915 the Company should be held to rates which would yield it a fair return upon "its capital actually invested in the Houston plant", which language of the ordinance the court construed as meaning the cost of the property (R. I, 53). The court did not disturb the Master's finding as to the property's value of \$6,003,000 but found its cost to be \$4,691,567 (R. I, 58).

The court approved the Master's finding of 8% as the fair return (R. I, 58).

The revenues for 1919 from the Houston exchange, the court found, in agreement with the Master, were \$908,258 (R. I, 55).

The expenses for 1919, as found by the Master, the court approved except with respect to the item "reserve for depreciation". As to this item the court approved the Master's finding of 6.33% as the proper annual rate for depreciation, but held that it should be applied to the cost of the property, \$4,691,567, as found by the court, instead of to its value, \$6,003,000, as found by the Master (R. I, 58). So calculated on the cost instead of the value, the court found the amount for annual depreciation to be \$289,380 (R. I, 59). This is \$58,770 less than the amount of \$348,150 found by the Master for this item (R. I, 42). Deducting this \$58,770 from the amount of the expenses as found by the Master, the court found the Houston expenses for 1919 to be \$1,155,692, or that the Company's net loss in Houston in 1919 under the rates complained of was \$247,434 (R. I, 59).

The Master found, in other words, that at a fair

return upon the value of its property in 1919 the Company was entitled to earn \$480,002. That it lacked \$306,204 of earning anything. That its total loss, therefore, from operating at these rates was \$786,206.

The court, computing the fair return at the same rate of 8% but upon the cost of the property, found that the Company was entitled to earn \$371,325. That it lacked \$247,434 of earning anything. That its total loss, therefore, from these rates was \$622,759.

The Master's report and the trial judge's opinion appear in full in the record, Volume I, pages 29-45 and 50-66, respectively.

These are the actual results. The rates complained of are not experimental. They are rates which the City prescribed by ordinance as just and reasonable rates in the year 1909. Thereafter they were continuously in effect until they were increased by the Postmaster General for a short time during government control.

Prior to 1915 there were two companies furnishing telephone service in Houston-the Company and the Houston Home Telephone Company. The two companies and the City agreed upon a plan to eliminate this duplication of service, whereby the Company was to purchase the plant of the Home Company and consolidate the two plants In 1915 the City passed the "merger into one. ordinance" giving the necessary consent. By the terms of this ordinance the 1909 ordinance rates were continued in effect temporarily, but it was provided in effect that these rates should be increased whenever the Company should make a showing to the City Council that an increase was necessary to enable it to earn a fair return upon its investment.

The pertinent provision of this ordinance is subsection (e) of Section 1, as follows:

"The Southwestern Telegraph and Telephone Company agrees that it will not increase rates as at present charged by it for service in the City of Houston, unless it appears upon a satisfactory showing to be made before the City Council of the City of Houston, of all receipts and disbursements, and said showing must, in order to justify or warrant a raise in the rates, reasonably prove that there exists a necessity for an increase of charges in order that said Company may earn a fair return upon its capital actually invested in the Houston plant. And it is agreed for a term of five years from this date that a fair return upon said capital and investment is not less than seven nor more than eight per cent." (Italics ours.)

(The full text of the merger ordinance is found in the record, II, pp. 764-7.)

In 1917, pursuant to this provision, the Company made the required showing and filed with the City Council a schedule of reasonable increased rates. Hearings were had but the City Council took no final action. In August, 1918, the Federal Government took over all the properties of the Company and operated them through the Postmaster General. He increased the ordinance rates and, the City attempting to enforce the ordinance rates, the Postmaster General sued out an injunction (Southwestern Telegraph and Telephone Company vs. City of Houston, 256 Fed. 690) and charged increased rates under its protection from February 1 to August 1, 1919. The United States returned the properties to the Company on July 31, 1919, and the City promptly thereafter notified the Company that it must return to the schedule of rates prescribed by the ordinance of 1909 (Opinion of the trial court, R. I, 50-1). Thereupon the Company brought this suit.

Since 1909, when the City prescribed these rates as just and reasonable, the cost of rendering telephone service, like the cost of nearly everything else, has enormously increased as the result of conditions brought on by the world war. This is shown by an abundance of testimony and without contradiction in this record, and indeed is a matter of common knowledge. Upon this subject the Master said:

"If the rates for furnishing telephone service are fixed at presumably fair rates, and subsequent to the fixing of such rates the cost of furnishing the service is largely increased, it would naturally occur to the man in the street that some corresponding increase in rates would be necessary to afford a profit. That such increase in the cost of operation has occurred is a matter of common knowledge and is generally recognized with regard to other public utilities, especially the railroads. It applies to every business under present conditions" (R. I, 44-45).

The present plant in Houston has been largely constructed, and reconstructed, since 1909 when these ordinance rates were fixed, during a period of constantly mounting capital costs, so that it is a far more costly plant than that with which the City Council had to deal in 1909 (R. I, 102). In 1919 the plant had grown to $3\frac{1}{2}$ times its size in 1909. Since 1910 more than $4\frac{1}{4}$ millions of dollars have been spent on the Houston plant (R. III, p. 1545).

In 1909 the number of telephones in the Company's Houston exchange was 10,630. In 1919 the

number had grown to 26,693 (R. I, 102). It is shown by the record without contradiction (R. III, 1326-7) that the cost per telephone of rendering local telephone service increases as the number of telephones in the exchange increases.

That the value of the service to the subscriber becomes progressively and correspondingly greater as the number of telephones in the exchange in-

creases is obvious.

In the face of these facts the Company has been forced to continue in effect rates that were no more than adequate in 1909. Under these conditions the figures of losses incurred during the last few years, of which those above shown for the year 1919 are but typical (R. II, Ex. 42, p. 961), will occasion little surprise. Exhibit 42 shows net losses at Houston, for the year 1916, \$136,762; for 1917, \$132,281; for 1918, \$201,791, these figures being excess of expenses over revenues, or those amounts less than no return whatever upon the investment.

The City's Propositions.

The City's propositions are these:

1. That the trial court erroneously held that the amount of the Company's investment in the Houston exchange, upon which it was entitled to earn a fair return, was \$4,671,567, because included in that amount was an item of so-called intangible capital in the sum of \$754,000, a part of the amount paid in 1915 for the property of the Houston Home Telephone Company when the two properties were united under the merger ordinance. First assignment of error, page 11; argument thereof, page 18 of City's brief.

- 2. That 25% of the long distance tolls credited by the Company to the Houston exchange on account of long distance business, and approved by the Master and the trial court as a fair and just amount, was not sufficient, but at least 60% of such tolls should have been credited to the exchange. First, second, and seventh assignments of error, City's brief, pages 11 and 16.
- 3. That the payment made by the Company to the American Telephone and Telegraph Company (referred to herein as the American Company) under the License Contract between the two companies for services rendered and telephone instruments furnished by the American Company pursuant to the contract,—which received the approval of the Master and the trial court as fair and advantageous to the Company—was not a proper operating expense, solely because of the American Company's large ownership of stock of the Company. Third assignment of error, City's brief, page 12, argued at page 36.
- 4. That the allowance by the trial court, in approval of the Master's report, of 6.33% as a proper rate for annual depreciation was excessive and should not have been more than 4%. Fourth assignment of error, City's brief, page 13, argued at page 39.
- 5. That the trial court erred in approving the Master's finding of 8% as the fair rate of return and should not have found a higher rate than 6%. Fifth assignment of error, City's brief, page 24, argued at page 40.

6. That the bill should have been dismissed for want of equity. The City's sixth, seventh and eighth assignments of error, pages 14 to 16 of the City's brief, challenge (a) the adequacy of the credit to the exchange of 25% of the tolls, (b) the legality of the License Contract payment to the American Company, and (c) both the legality and fairness of the dealings between the Company and the Western Electric Company, Inc. (referred to herein as the Western Company).

While these three assignments are grouped together by the City at page 41 of its brief, (a) and (b) above are, respectively, propositions 2 and 3 above, and are separately covered by previous assignments, and separately argued in the City's brief, as already stated. The only new subject matter dealt with in this part of the City's argument, therefore, is that with respect to (c) the Western Electric Company relationship. The City contends that the proof failed to show equity because (1) the amount of the profits of the Western Electric Company is not shown, and (2) its profits are excessive.

7. The City's ninth and last assignment of error is general, alleging that the court erred in adjudging the rates confiscatory, etc. City's brief, page 17, argued at page 56.

In a word, on the questions raised by the City, the case involves these subjects, namely, (1) Amount of property investment; (2) Credit to the exchange in connection with the toll business; (3) The License Contract payment to the American Company; (4) The Amount for Depreciation; (5) The Rate of Return, and (6) Purchase of supplies and certain services from the Western Company.

Property. No challenge is made by the City of the amount of the Company's investment in the Houston exchange property upon which the court found the Company entitled to a fair return, except with respect to the item of \$754,000 of so-called "intangible capital"—a part of the price paid in 1915 for the Home Company's property.

Revenues. The City does not question the accuracy of the amount of the Company's revenues as found by the trial court, except with respect to the credit to the exchange for services in connection with the toll business.

Expenses. It makes no attack upon the amount of the Company's expenses, except with respect to (a) the License Contract payment to the American Company, and (b) the amount for depreciation.

- (a) With respect to the License Contract payment, the City claims that \$13,000 is all that should be allowed as an operating expense, one of its witnesses fixing the amount at this figure (City's brief, While challenging this payment to the American Company as an improper operating expense, except as to \$13,000, the City does not question the fact that the services and instruments covered by the payment are worth the full amount of it and more, that they are necessary to efficient and economical telephone service, and that they cannot be obtained elsewhere for less than this Company pays for them, but bases its objection solely upon the proposition of law that the American Company's ownership of stock in this Company makes the contract and the payment under it illegal.
- (b) With respect to the question of the amount to be charged as an expense for depreciation, the

City challenges the trial court's allowance of a rate of 6.33% and claims that 4% is a proper rate for depreciation (City's brief, pp. 13-14).

We believe it will conduce to clearness of presentation if we take up the City's several propositions and argue them *seriatim* in the order in which they are argued in the City's brief, which is in the numerical order of the assignments of error. We shall accordingly follow this course in the argument, except as regards our first counter-proposition, which is:

Conceding, for argument, every contention of the City with respect to the only issues it presents that affect the local exchange rates in litigation, namely, its claims as to the amount of the investment in the property, the credit to the exchange in connection with the toll business, depreciation, and the License Contract payment to the American Company, the rates in issue are still plainly shown to be confiscatory.

ARGUMENT-PART I.

Upon the Appeal of the City of Houston (Case No. 219).

I.

Conceding every claim of the City as to the contested items, the rates are confiscatory.

The only contested items that have any material bearing on the exchange rates are (1) the amount of the investment in the property, (2) the credit to the exchange of 25% of the toll revenues, (3) the amount of the annual depreciation charge, and (4) the License Contract payment to the American Company in consideration of services rendered and telephone instruments furnished to the Company.

If the City's claims as to all of these items, and its claim that 6% instead of 8% is the fair rate of return, be conceded, the rates are still plainly confiscatory. To demonstrate this proposition we submit four tables, showing, in Table "A", the investment, revenues, expenses and rate of return as found by the trial court, and then in tables "B", "C" and "D" the same items according to the several contentions of the City.

We use the investment as the basis for earnings in each table because more favorable to the City than the value of the property.

TABLE "A".

Conclusions of Trial Court.

Investment—Physical Property (R. I, 58)	\$4,571,567.00
	\$4,691,567.00
Revenues.	
Exchange (At Contested Rates) (R. I, 42 and 55)	\$764,484.00
Total Exchange and Miscellaneous	\$ 786,956.00
and 55)	\$908 258 00

Net Income Return on Investment of \$4,691,567.00	\$43,971.00 0.9%

^{*} See City's Brief, page 37, value of instrument service as claimed by one of City's experts.

** See City's Brief, page 14, where 4% is stated as the proper rate for Depreciation Reserve.

TABLE "C".

Based on City's Claim as to Investment, (that is Deducting the \$754,000 contended as Erroneously Included in Amount Found by Trial Court), and Other Contested Items as claimed by City and set out in Table "B".

This is identical with Table "B" except that the investment is reduced by \$754,000.00 as claimed by City.

Investment—Physical Property Working Capital	\$3,817,567.00 120,000.00
Total	\$ 3,937,567.00
Revenues.	
Exchange and Miscellaneous 60% of Toll Revenues	\$786,956.00 275,662.00
Total Revenues as claimed by City.	\$ 1,062,618.00
Expenses.	
Expenses (Exclusive of License Contract Payment and Depreciation). Instrument Service	\$822,784.00 13,000.00
\$3,817,567)	152,703.00
Total Expenses as claimed by City.	\$988,487.00
Net Income	\$74,131.00 1.88%

TABLE "D".

Based on City's Extreme Claims as to All Contested Items.

This is identical with the two preceding tables except that the valuation is reduced to \$3,000,000 with the corresponding adjustment in reserve for depreciation.

Lowest Amount Suggested by City—City's Brief, page 14 Working Capital	\$3,000,000,00
*	\$ 3,120,000.00
Revenues.	
Exchange and Miscellaneous 60% of Toll Revenues	\$786,956.00 275,662.00
Total Revenues claimed by City	\$1,062,618.00
Expenses.	
Expenses (exclusive of License Contract Payment and Depreciation Reserve)	\$822,784.00 13,000.00
Total Expenses claimed by City	\$955,784.00
Net Income* *Return on Investment of \$3,000,000.00	\$106,834.00 3.56%

^{*}The lowest valuation claimed by the City is \$3,817,567. First Assignment of error, page 11. The suggestion of \$3,000,000 is contained in the City's eighth exception to the master's report, which is the subject of the Fourth Assignment, but this assignment in no way touches the question of valuation (City's brief, pages 13-14).

These simple calculations dispose of the City's appeal.

Its extreme claim as to the value of the property, or the investment in the property, is \$3,000,000. Although this figure is not open to the City, because no error is assigned that involves it, we have nevertheless used it in table "D" because it is suggested in the eighth exception to the Master's report. City's brief, fourth assignment of error, page 14.

Its extreme claim as to the percentage of toll revenues which should be credited as exchange revenues is 60 per cent. City's brief, second assignment of error, page 12.

The only item included on account of license contract payment is the \$13,000 claimed by the City to be reasonable for the instrument service alone, leaving nothing whatever on account of the many other more important services. Tables "B", "C" and "D" eliminated from the expenses of the exchange every part of that payment except this \$13,000, so that nothing whatever is included on account of the other more important services furnished under this contract.

The City's extreme claim as to reserve for depreciation is 4 per cent. of a \$3,000,000 valuation of the property, or \$120,000. City's brief, fourth assignment of error, pages 13 and 14.

It asserts that 6 per cent. is a fair rate of return. Fifth assignment of error, City's brief, page 14.

Since, therefore, with all these extreme claims of the City allowed, the Company cannot earn under the rates in issue in excess of 3.56 per cent. on even the lowest valuation of only the physical property, or amount of investment in the bare physical prop-

erty, contended for by the City, it cannot be denied that the rates are confiscatory.

It is clear that the decree of the court below must be affirmed. A consideration of the assignments of error in detail leads to the same conclusion.

II.

The Property Investment.

(The City's First Assignment of Error.)

The facts are not disputed and the question is purely one of law.

The trial court held as a matter of law that the Company is bound under the provisions of the merger ordinance of 1915 to accept the cost of the property in lieu of its value as the amount upon which the fair return is to be computed. The court found the cost to be \$4,517,567 and substituted that amount in place of the fair valuation of \$6,003,000 found by the Master (R. I, 36, 54).

In its first assignment of error the City contends that the court erroneously included an item of \$754,000 of "intangible capital". (This first assignment also deals with the matter of the proper treatment of the exchange property in relation to the toll business but the City does not argue that point in its discussion of this assignment. See City's brief, page 18. That point is dealt with by the City in the argument of its second assignment of error, City's brief page 19. We shall therefore omit it here and discuss it in the next section of this brief. In the assignment as printed on page 11 of the City's brief this item is given as \$700,000, but this

is corrected in the argument of the proposition on page 18 of the brief, where it is correctly stated as \$754,000.)

This item arises out of the Company's purchase in 1915 of the property of its local competitor, the Houston Home Telephone Company, the City having given its consent to the transaction by enacting the merger ordinance, under and in full compliance with which the purchase was made and the two plants consolidated.

Under the Interstate Commerce Act the Company is required to keep its books in compliance with the accounting rules of the Interstate Commerce Commission. This transaction is governed by Section 13 of the "Uniform System of Accounts for Telephone Companies", made effective by order of the Commission on January 1, 1913, which is as follows:

"13. Plant and equipment and other property purchased.-When any property in the form of a going or completed plant is purchased, an appraisal of the property so acquired should be made, and the different constituent elements of the plant (and equipment, if any) or other property acquired should be appraised at their structural value; that is to say, at the estimated cost of replacement or reproduction less depreciation to the then existing conditions through wear and tear, obsolescence and inadequacy. If the actual money value of the consideration given for the plant or other property was at the time of the acquisition in excess of such appraised value, the excess should be charged to Account No. 204, 'Other Intangible Capital', and the appraised values of the constituent elements should be charged to the appropriate fixed capital accounts as hereinafter designated. If the actual money value of the consideration given was not in excess of such appraised value, such

actual money value should be distributed through the said accounts in proportion to the said appraised value of the constituent elements approximate to the respective accounts. Companies should be prepared to furnish the Commission, upon a demand, a full report of the contract of acquisition, the consideration given therefor, the determination of the actual money value of such consideration if other than money, the appraisal, and the amounts charged to the respective accounts for each plant or other such fixed capital purchased". (R. I, 71).

These rules were complied with by the Company in making the entries of this transaction upon its books. (R. I, 71; II, 973-4). The book entries as they were actually made are shown in Plaintiff's Exhibit No. 172 (R. II, 973-4). The item of \$754,000 was the amount required to be charged to I. C. C. Account No. 204 "Other Intangible Capital", and it was so charged.

There is no dispute that this sum of \$754.000 was actually paid by the Company as part of the purchase price. There is no dispute that the amount of it was correctly arrived at, nor that the entries were properly made as required by law. No phase of the transaction is called in question by the City upon its appeal. In holding that the Company was bound by the merger ordinance to accept the cost of its total exchange property in Houston as representing the amount of its investment upon which it is entitled to earn a fair return to avoid confiscation, the court sustained the position which the City took in its answer to the Company's bill of complaint, Section (b) of paragraph 29 (R. I., 26-7). But the court held itself bound to include the entire cost, there being no question that it was actually and honestly incurred, and accordingly included the entire purchase price of the Home Company's property, regardless of how the items were designated on the books. The City insists upon the exclusion of this three quarters of a million dollars of the actual cost.

The City's position seems to be that it should be excluded because it is a so-called "intangible" item. This position is untenable. It is none the less a part of the capital which the Company has actually invested in the property in Houston. We have no doubt that the very purpose of this provision of the ordinance was to insure to the Company the right to earn a fair return upon the whole of the purchase price and to protect the Company against the very sort of contention the City now urges.

The entire physical property purchased was appraised as required by the accounting rules. In such consolidation there is always, in the very nature of the case, some excess of physical property that has to be taken out and salvaged, for it is the duplication of plant, for one thing, which makes this competitive service expensive and burdensome to the public. The portion of the property purchased which was in duplication of that of the Company then in service has been displaced and salvaged. The amount realized in salvage has been reinvested in plant in Houston. The City does not question the fairness and accuracy of either the appraisal or of the salvage.

What the Company did was to take the amount actually paid for this property; from this it deducted the physical property discarded in connection with the consolidation, deducting on this account the amount at which this specific physical property had been taken onto the books at an appraisal in connection with the consolidation, less

the net salvage on account of it, which went back into the plant (R. I, 70-4; II, 973-4). The physical property which was retained in service, at the appraisal figures, added to the net salvage reinvested in plant represents the "structural value" entry on the books; the price paid less this amount is the item of "intangible capital".

The Interstate Commerce Commission's accounting rules lend no support whatever to the City's contention, but clearly sustain the Company's position. What Section 13 says in effect is that the entire purchase price shall be treated and recognized as proper capital investment. For the purpose of proper bookkeeping, and in order that the book entries shall truly reflect the accounting facts, it is provided, in effect, that the actual investment in such property shall be divided into two parts, one, tangible capital, representing the "structural value"; the other, which is as much "capital" as the first, called "intangible"—the difference between the price paid and such structural value. Both are capital items, go into the capital account, and are treated alike.

The City denies that the Company is entitled to a return upon the present fair value of its Houston property and says that the Company is estopped to claim more than its cost. (The Company contests this position upon its appeal, which is argued in Part II of this brief hereinafter.) The court has held with the City on this proposition but in doing so has recognized the obligation to allow the entire cost, and when the City goes further and insists upon subtracting this large amount, there being no charge that it was not actually, honestly, and fairly incurred, it takes an untenable position.

III.

Credit to the Exchange for toll services.

(The City's First, Second and Seventh Assignments of Error.)

The Company credits to the Houston exchange 25% of its gross receipts from toll messages at Houston to compensate the exchange for its services in connection with the toll business, as hereinafter explained. For the year 1919 this amounted to \$121,302. Both the Master and the trial court found this amount fair and adequate and approved it.

Upon this finding the City assigns error and claims that a larger percent (its extreme claim being 60%) should be credited to the exchange.

The Facts Out of which the Question Arises.

It is necessary to understand clearly the relation between the Company's two classes of telephone service and property—(1) exchange service and property, and (2) toll service and property. The Company furnishes local or exchange telephone service in the cities and towns by means of its exchange property. It furnishes long distance or toll service between the cities and towns by means of toll property. The toll lines connect not only the Company's own exchanges but also connect with the toll lines and local exchanges of other companies, the so-called "independent" companies in which the Company has no interest. There are several hundred such independent companies in the state of Texas alone (R. I, 108). The Company's toll sys-

tem extends generally throughout the five states in which it does business and also connects with the long distance system of the American company, affording the subscribers of the Houston exchange a nation-wide long distance telephone service.

The exchange system in Houston comprises four central offices, the exchange switchboards therein, the subscribers' lines extending from these switchboards to the subscribers' places of business and residences, the subscribers' telephones, generally referred to as "stations", and the equipment which goes with these several classes of the exchange property. These make up the exchange system for furnishing local telephone service. It functions in the same way and embraces the same property that an exchange system does where there is no connection with any toll system.

The toll system, by means of which long distance communication is furnished between Houston and other cities and towns in Texas and throughout the United States, consists of the toll switchboard in Houston, which is housed in one of the central office buildings of the Houston exchange, the toll lines extending from this toll switchboard to the distant cities and towns and terminating generally in toll switchboards in those cities and towns, together with the miscellaneous toll equipment used in connection therewith.

A portion of the toll property is thus seen to lie within the area of the Houston exchange, that is, within the city limits. Such portion is the toll switchboard in Houston, its attendant equipment and that part of the toll lines within the City limits. But this part of the toll property within the area of the Houston exchange is not part of the exchange property, any more than is the toll property outside of Houston. It is

entirely separate and distinct from the exchange. The toll property located within the exchange area is a very minor part of the total toll property employed in furnishing long distance communication to the people of Houston (R. III, 1501). Toll calls go out from Houston to all parts of the country. Outside the city are thousands of miles of poles, copper wires, expensive repeaters and loading coils, etc. In each of the cities and towns with which Houston is thus connected are the toll switchboards and attendant equipment similar to that in Houston.

When long distance telephony originated there was no connection between the exchange system and the toll system. Persons desiring to talk over the long distance lines went to long distance offices which were not connected with the exchanges (R. I, 154), and paid the toll rate in accordance with the established toll tariff.

Improvements which attended the development of the art made it possible and practicable to connect the exchange system with the long distance system so that the subscriber could talk from his exchange telephone to the distant point. The connection between the two systems was through wires called trunks extending from the exchange switchboard to the toll switchboard. The subscriber calling from his own telephone got the operator at the exchange switchboard just as in the case of any local call. Then, instead of a local number, he asked for long distance and was connected with the operator at the toll switchboard, who took his long distance call and put up the long distance connection. Thus it has come about that, in holding a long distance or toll conversation, the subscriber talking over his instrument makes use of exchange facilities as well as toll facilities. One value of the exchange equipment and service to him is the ability to do this, instead of having to go to a toll office for the purpose, as he would be obliged to do if there were no local exchange, or no connection between the local exchange and the toll system.

This ability of the subscriber to command and have toll service directly over his exchange instrument likewise adds to the efficiency and dispatch of the toll service. But the use of the exchange facilities in connection with a toll call does not change that equipment into toll property. Nor does the use of the toll equipment in connection with the exchange equipment, because it enhances the use and value to the subscriber of the exchange service, change the toll equipment into exchange property.

An exchange rate should not be made to bear the toll expenses or afford a return on toll property. A toll rate should not be made to bear exchange expenses or afford a return on exchange property. But what does the exchange rate cover and what is exchange property; what does the toll rate cover and what is toll property?

The simple way of coming at once to the heart of this whole question and clearing it of all confusion, both with respect to the separation of exchange and toll property and the separation of exchange and toll service, is to determine what service is covered by the exchange rate and what by the toll rate. This is the true basis for classifying the properties which will afford reasonable certainty in the ascertainment of the proper basis of either class of rates.

It is simply the determination of the services for which the respective rates are paid. That ought to be, and in this case is, definitely known. If we are able to identify each service, we can readily identify the property used in rendering it, as well as the revenues derived from it and the expenses of it.

The original rate structure, adopted when there was no connection between the two services and property, has been retained ever since. The exchange rate covers every use made of the exchange property, and always has. The exchange subscriber, in consideration of the monthly rate he pays for exchange service at Houston, has the same right of access to the operator at the toll board that he has to the operator at the exchange board. If his toll call is completed so that he gets the long distance connection, he is charged for the toll call the regular toll rate. This rate is from the toll switchboard in Houston to the toll switchboard at the distant point, and has always been If he does not get the toll connection, no charge is made. In either case, whether the toll call is completed or is not, the exchange rate covers the use of the exchange facilities. The toll rate takes no account of the exchange property or services, and vice versa. The two services, property and rates are separate and distinct (R. III, 1317).

The exchange rate covers the entire local service, whether that service be used for a local call alone or for a local call in connection with the toll lines. The service within the exchange is a service furnished by the local exchange to the local subscriber. It is not a service furnished by the local exchange to the toll company. This is why the local subscriber pays for it and why the toll company does not and should not pay for it.

If the exchange rate pays for the service which embraces every use made of the exchange equipment, whether for local calls or in connection with toll calls, that equipment is necessarily to be treated as wholly exchange property. The fact that it is used in connection with toll property does not make it toll property, any more than the fact that toll property is used in connection with exchange property makes toll property exchange property. They are separate and distinct.

It is upon this basis that the toll and exchange properties were divided in the proof and findings

in this case.

As the case involves only the exchange rates, whether they are confiscatory or not is determined by the return they afford upon only the exchange property. Therefore the toll property lying within the exchange area, that is within the City, had to be excluded to arrive at the investment or valuation in this case. Such property was excluded—long distance switchboards, toll underground cables, toll poles, wires and cable boxes, every part of the long distance plant (R. I, 150). The property which the Master valued, and the property of which the court found the cost to arrive at the Company's investment, included no portion of the toll property.

This disposes of the question of the separation of the entire property in Houston as between the two classes of exchange property and toll property.

It leaves for consideration the question of the expenses of operation as between the two services.

Here again, logically, the inquiry becomes: What service with respect to long distance communication is covered by the toll rate and what, if any, by the exchange rate?

The toll rate, we have shown,—and the record shows,—covers and pays for the service from toll board to toll board (R. I, 152). The exchange rate covers all local exchange service, whether on local calls or on such calls in connection with toll calls.

In connection with the rendition of the toll service, some operating is necessary in order to connect the exchange switchboard with the toll switchboard and to put through the call. There is also some accounting and collecting. It is more economical for the local exchange to perform these toll services than for the toll company to perform them itself.

It is to compensate the exchange for these services that are properly toll and not exchange services, that is for the toll operating and switching between the exchange and the toll lines, sometimes called "originating and terminating the business", and for the exchange's expense in billing and collecting toll accounts, that the credit is given to the exchange of 25 per cent. of the toll revenues (R. I, 110; 132-3; 143).

All service rendered in or by the exchange in effecting such communication, except that just mentioned, is necessarily exchange service, because until the toll connection is made, no toll rate is put in operation, no toll revenue accrues, and the service is in no way dissimilar from the service rendered in any other local call. It is through making the connection that the exchange is made to perform a function beyond that which it performs in ordinary local calls. For this service and for the toll operating, billing, collecting and accounting, performed for the toll company the exchange is compensated out of the toll revenues.

The fallacy of the position of the City is the assumption that the exchange rate exists for only local calls. It does not. No more than the ex-

change exists for purely local calls. The exchange rate is for every service rendered by the exchange within the exchange. In long distance communication that includes every service from the subscriber's instrument to the toll board or vice versa. What it does not include is what is necessary to make the exchange equipment available in the long distance communication, namely, making the connection on the toll board between the exchange and the toll line and the toll operating.

The City has no power to regulate rates for toll service, which extends outside the City and throughout the state of Texas and throughout the country. If the exchange rates, which the City has power to regulate, do not cover the service between the subscriber's telephone and the toll board in Houston, as the City here contends, then, since the toll rate does not now cover it, the Company is entitled to make an additional charge for that part of the service, either in the form of a separate charge for connection with the toll board or as an addition to the toll rate. In case of an uncompleted toll call this would necessarily be a separate charge; in the case of a completed toll call it would naturally be added to the toll rate. Yet if the Company should attempt to increase its revenues in that way, can there be any doubt that the City would resist it and make the claim that access to the toll board has always been understood to be included in the exchange service, covered by the exchange rate? The City would rightly contend that this has always been the practice at Houston and is the universal practice in telephony in this country.

The Question Presented.

This brings us to the question:

Was the allowance of 25 per cent. of the toll revenues sufficient, according to the record, to compensate the exchange for the services performed by it in connection with the toll business?

The Master found that it was, and the court likewise so found (R. I, 36-38; 55).

On page 35 of the City's brief is the statement that one of the Company's witnesses, Mr. Player, testified that the 25 per cent. allowance "is not even enough to take care of the cost of handling it"—referring to the service rendered by the exchange in long distance communication. This statement is a mistake. Mr. Player's testimony on this subject is contained in Volume I, pages 156-7 of the Record. It contains no such statement as that attributed to him.

The Master found, as did the court in approving his report, that the 25 per cent. allowance amounted to an average allowance to the Houston exchange of 14.9 cents per long distance call, and that this amount was greater than the amount allowed for the same services to any one of the eight largest independent exchanges in the state by independent long distance systems with which they connect (R. I, 37).

He found, as did the court, that this allowance to the Houston exchange is larger than the Company pays for the same services to over 300 independent exchanges in Texas with which its long distance lines connect (R. I, 37).

Also, that no one of the four largest independent toll systems in Texas pays to any independent exchange with which it connects more per call for the same services than under this allowance is credited to the Houston exchange by the Company (R. I, 37).

And further, that the testimony tended to show that the percentage used here is the one customarily approved for the same services by state commissions throughout the country (R. I, 37).

It is the percentage which has been made for the same purpose and to cover the same services by the Missouri Public Service Commission and the Oklahoma Public Service Commission in over 100 cases before those commissions (R. I, 155).

It is the customary percentage used for the purpose by the Company as to all of its local exchanges where the conditions are similar (R. I, 109).

It amounts to an average payment to the Houston exchange of 14.9 cents per long distance call. The average amount per long distance call paid by the Company to 362 independent exchanges owned by independent companies in Texas with which its toll lines connect, for the same services, is 4.13 cents. See Exhibit 48, Testimony of H. B. Copes (R. III, 811) and testimony of H. B. Copes (R. I, 113).

There are between 600 and 700 independent companies in Texas (or individuals operating independent lines) with whose local exchanges the toll lines of Company connect, which for the same services accept as satisfactory the same percentage (R. I, 108; 148).

It was the basis adopted and put into effect with respect to the same services by the Federal Government on taking control of telephone lines during the late war (R. I, 119-20).

No one of the eight largest independent exchanges in Texas receives for these services as much per call handled from independent long distance lines connected with it, as the Houston exchange receives under the allowance (Exhibit No. 50, R. II, 812; I, 116-17).

No one of the four largest independent long distance systems in Texas pays per call handled for these services to any independent exchange with which it connects—exchanges which those systems do not own—as much as is paid the Houston exchange (Exhibit 49, R. II, 812; see also Testimony of H. B. Copes, R. I. 114-115).

The average amount per call paid for these same services by the four largest independent systems in Texas to independent exchanges with which they connect is 4.2 cents (R. I, 115).

The average amount per call received for these services by eight of the largest independent exchanges from independent companies with which they connect is 7.1 cents (R. I, 116-17).

It thus appears that the percentage is a standard one and of usual adoption. That it is a standard percentage for the purpose is of itself proof of its fairness. It is larger than independent companies in Texas, not under common ownership or control but dealing with each other at arms length, pay each other.

That it is a standard percentage; that it is accepted as satisfactory by between 600 and 700 independent companies in the same state having exchanges with which the toll lines of the Company connect; and that it exceeds the amount paid for the same services by independent companies to each other, affords ample proof, we submit, that it is fully sufficient to cover the expense of the services for which it is paid and is, therefore, fair and just.

Counsel for the City attempt to weaken the force of this testimony by pointing out that the Bell System owns and operates four-fifths of the telephone property in the United States. From this they conclude that "the contracts made with so-called independent companies, as will appear from the foregoing statement, are made where the local exchange is under the disadvantage of having to procure the long distance service upon such terms as the owner of the long distance will grant to them, or failing to accomplish such conditions, foregoing the use of the long distance service" (City's brief, p. 34).

But the argument ignores the facts. The finding of the master and the uncontradicted testimony are that the independent companies, in which Bell Companies have no interest, universally allow this same percentage to Bell companies with which they connect; the independent companies when dealing with each other make the same allowance; and the Bell companies make the same allowance to the independent companies.

The City argues that the allowance to the exchange is made inadequate because the toll rates are not regulated by public authority, whereas the exchange rates are, making it profitable to keep down the exchange revenues to make the exchange show inadequate earnings in a rate investigation. There is nothing in the proof to support this suggestion, and it is entirely beside the question. If the allowance is adequate, the motive becomes immaterial. If the allowance is inadequate, a good motive would not save it.

But aside from this, the argument fails. In Texas there is no state commission, it is true, but in every other state save Delaware and Iowa there is a state commission which regulates both exchange and toll rates. The testimony shows that 25 per cent. is the customary allowance made by state commissions throughout the country (R. I, 146; 155-6).

The City's own expert, Lyndon, whose testimony counsel cite and rely upon in their brief, really lends more support than opposition to the adequacy of the 25 per cent. credit. He testified that "it just about meets the cost"—that is, the cost of the services compensated for by it; that he believed "in 1919 it showed a slight profit", though, "as far as he was able to determine", there was "some" loss under it in 1914 and 1918 (R. I, 169).

He testified further upon the point, and it is important to note what he said:

"The Master: If this was an independent company operating this local exchange here in the City of Houston, would it be to their advantage not to connect with the toll lines

on that basis?

Mr. Lyndon: On that basis if they had to put an investment into toll apparatus, provide a building, and add the depreciation charges and operation that is true. I mean that on the basis of net returns, the long distance convenience to the public, I think the local exchange would be far better financially if—they conducted as a separate enterprise,—on the basis of 25% only. If that percentage is carried to 30%, I believe, that it would be about even; if carried to 35%, I believe it would show a profit for the local exchange" (R. III, 1134).

In the first place he assumes that the exchange is to carry the investment in the toll property and provide for all depreciation. In our case the toll property investment is not carried by the exchange.

That has all been excluded from the appraisal and valuation (R. I, 150). In our case the depreciation charges on the toll property are also borne by the toll property and are not charged to the exchange (R. II, 985).

In the next place, even upon his assumption, at the 35% rate the exchange would make a profit equal to 5% of the toll revenues.

It is fair to say, therefore, that even upon this testimony of the City's own witness, and if we accept his view of the proper basis of payment, the 25 per cent. payment in this case is ample. This is clearly so because the investment in the toll property plus depreciation, which his assumption makes the exchange carry, and which in our case is excluded from the exchange property, would offset the additional 10 per cent. which he thinks should be allowed.

The only material point is to see that the expenses of the exchange are not enhanced by expenses incurred in performing a non-exchange service, and that, if any such expenses are originally incurred by the exchange, it is made whole on account of them. This test has been met here, according to the findings of the master and the trial court, and the proof overwhelmingly sustains the findings. The City has no right to require more. It has no right to demand that the exchange make a profit, at the expense of the users of the toll service, out of the switching at the toll board, and the billing and collecting, which it does for the toll company.

It is clear that this payment to the exchange for what it does outside the exchange business and in aid of the toll business is adequate and proper, and that the City's claim that there has been a failure of proof of what the payment from this source should be, and that it is thus impossible to determine whether there is confiscation or not, is without foundation. The finding of the Master, approved by the trial Court, that the amount credited is fair and adequate, is fully sustained by the record.

IV.

Payment to the American Telephone and Telegraph Company under the License Contract.

(The City's Third Assignment of Error.)

In the expenses of operation as found by the master and the trial court there is an item of "payment for services and instruments" (R. I, 42). This payment is under a contract made in 1889 (R. II, 877) and continuously in force since that time, under which the American Company licensed the Company under its patents and undertook to furnish to the Company the instruments (subscribers' telephones), which it uses in its business, and to perform for it various other services relating to all departments of its business. The payment under the contract is measured by a per cent. of the gross revenue and amounted, in the year 1919, to \$43,528,—(R. II, 965; also Exhibit, R. II, 961)—equal to \$1.65 per telephone station for the year.

This contract was approved by both the master and the trial court. They found as follows:

"That plaintiff gets full value from the amount of money paid to the parent company is clearly and decisively shown by the testimony. * * * I unqualifiedly approve this 4½% payment as an operating charge against the gross income received by the company" (R. I, 41).

"The weight and preponderance of the evidence compel a finding that the 4½% payment made the American Telephone and Telegraph Company is made for valuable and amply sufficient services" (R. I, 44; 59).

The City's Contention.

The City does not question the facts. The proposition presented by it is purely one of law, which is stated in its brief as follows:

"Because * * * the American Telephone and Telegraph Company owns 99 and a fraction per cent. of the stock of the plaintiff * * * only the cost of such service should be deducted from the revenues and charged to the expenses of operation, and there was no attempt made by plaintiff to show the cost * * "" (City's brief, p. 12).

The proposition advanced by the City is further defined at pages 38-9 of the brief, as follows:

"However, our contention is that no matter how efficient these services may be or how valuable, it is not a question of efficiency or value, but a question of the cost of furnishing them."

The brief continues, on page 39:

"The A. T. & T. Co. owns 99 and a fraction per cent of the stock in the plaintiff company which operates the Houston exchange. It is to all intents and purposes the owner, for we take it the court is not going to look at the form of this matter and ignore the substance. So then the cost is the only thing that should appear in the operating expenses which are deducted from the revenues."

The City admits that (p. 39) the cost of the services to the American Company would be a proper operating expense of this Company, even though it exceeded the amount of this payment.

No other challenge of the payment is made. The City does not suggest that the contract should be abrogated and the services dispensed with. It does not question that the services are fully worth to the Company the amount of the payment; that they are of great advantage to the Company; that they are necessary to enable the Company to render efficient and economical telephone service to the public: and that they cannot be obtained anywhere else for less than this payment amounts to. The City's sole contention is that, because the American Company owns the stock of the Southwestern Company. it should render the services at cost, and as the Southwestern Company did not show what the cost to the American Company was, there was a failure of proof essential to the cause of action.

At the time this contract was negotiated, thirty-three years ago, the American Company owned no stock in the Southwestern Company. It acquired its first stock interest in connection with making the contract (R. II, 877). Later, from time to time, it added to its stock holdings. In 1895 it owned 30% of the stock (R. II, 877), not until 1902 did it acquire a controlling interest (R. I, 422), and it continued thereafter to acquire the stock until at the time of the trial it was the owner of practically all of it.

The sole proposition presented by the assignment of error is that in some way the fact that the American Company became the owner of substantially all of its stock changed the relations of the parties under this contract, and that thereupon the American Company became bound to furnish these services at cost, instead of at the contract price. The City claims that the evidence shows that upon this basis \$13,000 would be a fair allowance for the instrument service alone (City's brief, p. 37) and denies that any further allowance should be made on account of the contract, solely upon the ground that the Company failed to show what was the cost to the American Company of furnishing the other services. We remark, in passing, that with respect to the instrument services alone, which the City values at \$13,000, the proof shows that it would cost the Company to furnish them for itself approximately \$28,000 a year (Exhibit 147, R. II, 939-40; Exhibit 121, R. II, 822; R. I, 278-80).

To sustain their contention we submit that counsel must successfully maintain either (1) that the acquisition of substantially all of the stock of the Southwestern Company operated to merge the two corporations, so that they were no longer separate legal entities and so that the entire expenses of the Houston exchange, including those in question, became the expenses of the American Company in fact, or (2) that when the American Company became the holder of substantially all of the stock there arose a new obligation upon its part as a stockholder, namely, the obligation to render the services to the Company without charge. Neither of these propositions can be successfully maintained.

The Company's Contention.

The Company's position is that, as the two corporations are separate legal entities, they may lawfully enter into contracts with each other, and the fact that one of them owns practically all of the

stock of the other in no way impairs this right under the law: and that there are no facts present in this case which take it out of this general rule.

The law applicable to the questions presented, has been many times announced by this court and is well settled.

United States v. Lehigh Valley R. R. Co., 254 U. S. 255, at pages 255 and 256.

The law of these cases is that the ownership by one corporation of a majority or all of the stock of another corporation does not operate to merge the corporate identity of the latter into the former. The two corporations are fully competent to contract with each other.

It is true that to correct or prevent a wrong courts have announced seeming exceptions to the rule, broadly stated as (1) that the separate corporate existence will be viewed as a legal fiction and disregarded when necessary under such conditions to remedy some wrong, and (2) that under such conditions it may be disregarded where a corporation is so organized and controlled and its affairs are so conducted as to make it merely an agency, instrumentality or department of the stockholding corporation. These seeming exceptions are not in fact exceptions. What the court does is not in either case to hold that the corporations are identical, but to hold that for the purpose of correcting some wrong it will treat them as if they were identical. instant case comes within the rule, not within these seeming exceptions. Here there is no suggestion of any wrong. The two corporations have separate businesses, they conduct them independently under the direction and control of their separate boards of directors and officers. The stockholding corporation has not assumed actual control, direction or management of the other. The latter has not become to all intents and purposes a mere department or instrumentality of the former. Their dealings with each other have been, in fact, fair, so that they commended themselves to the master and the court below, and the City does not challenge

these findings.

In the late case of *United States* v. Strang, supra, the question was whether an agent of the United States Shipping Board Emergency Fleet Corporation, all of whose stock was owned by the United States and which, under the direction of the President, had and exercised a specified portion of the power and authority with respect to ships granted to him by the Congress, was an agent of the United States. The court held:

"Notwithstanding all of its stock (the Emergency Fleet Corporation stock) was owned by the United States, it must be regarded as a separate entity."

In Peterson v. Chicago, Rock Island and Pacific Railway Co., supra, the court said:

"It is true that the Pacific Company practically owns the controlling stock in the Gulf Company, and that both companies constitute elements of the Rock Island System. But the holding of the majority interest in the stock does not mean the control of the active officers and agents of the local company doing business in Texas. That fact gave the Pacific Company the power to control the road by the election of the directors of the Gulf Company, who could in turn elect officers or remove them from the places already held; but this power does not make it the company transacting the local business.

This record discloses that the officers and agents of the Gulf Company control its management. The fact that the Pacific Company owns the controlling amounts of the stock of the Gulf Company and has thus the power to change the management does not give it present control of the corporate property and business."

In the Pullman case, supra, the court said:

"The Missouri Pacific Company had bought the stock of the St. Louis, Iron Mountain and Southern Company, and has effected a satisfactory election of directors, but this is all. It has all the advantages of a control of the road, but that is not in law the control itself. cally it may control the company, but the company alone controls its road. In a sense, the stockholders of a corporation own its property, but they are not the managers of its business or in the immediate control of its affairs. Ordinarily they elect the governing body of the corporation, and that body controls its prop-Such is the case here. ertv. The Missouri Pacific Company owns enough of the stock of the St. Louis, Iron Mountain and Southern to control the election of directors, and this it has done. The directors now control the road through their own agents and executive officers, and these agents and officers are in no way under the direction of the Missouri Pacific Company. If they or the directors act contrary to the wishes of the Missouri Pacific Company, that company has no power to prevent it, except by the election, at the proper time and in the proper way, of other directors, or by some judicial proceeding for the protection of its interest as a stockholder. Its rights and its powers are those of a stockholder only. It is not the corporation, in the sense of that term as applied to the management of the corporate business or the control of the corporate property."

The same doctrine is announced by this court in the Porter case, supra, in the following language:

"The mere fact that Crawford owned a majority of the stock did not give him a legal control of the company; nor from such ownership can the legal inference be drawn that he dominated the board of directors."

In contrast with this case is that of Chicago, Milwaukee and St. Paul Railway Company v. Minneapolis Civic and Commerce Association, supra, in which this court held that the separate corporate identity of the switching company, whose stock was owned by two other railroad companies, would be disregarded. In that case the stock ownership was resorted to "not for the purpose of participating in the affairs of a corporation in the normal and usual manner, but for the purpose, as in this case, of controlling a subsidiary corporation so that it may be used as a mere agency or instrumentality of the owning company or companies." Through the instrumentality of the switching company the railroads were unlawfully collecting an extra charge from the public for rendering by indirection a service which as common carriers they were legally required to render without such charge under the conditions of operation which prevailed at Minneapolis. Not only was this the purpose in the accomplishment of which the stock control was exercised, but in order to accomplish it the stockholding corporations had caused a contract to be entered into which took away from the board of directors of the switching company the normal legal control of its affairs in several most important respects, as pointed out and enumerated in the court's opinion.

None of the exceptional elements referred to by

this court in that case are present here.

This Company was incorporated in 1882 under the laws of Missouri.

The American Bell Telephone Company (prede-

cessor of the American Telephone and Telegraph Company) was incorporated in 1880 under the laws of Massachusetts. The American Telephone and Telegraph Company, herein called the American Company, was incorporated in 1885 under the laws of New York.

This Company and the American Company are therefore distinct legal entities. They are and always have been engaged in separate and independent businesses.

This Company operates telephone exchanges for local service in the cities and towns throughout five southwestern states and a toll system connecting the exchanges throughout the same territory, and owns all of the property devoted to these services.

The American Company, on the other hand, does not and never has owned or operated any telephone exchanges (R. I, 222). It owns and operates a long distance system extending over the larger part of the United States, furnishing long distance telephone service that is supplementary to the toll service furnished by this Company and by other so-called Associated Companies of the Bell System in the different sections of the country. The American Company does no telephone business in Texas (R. II, 736).

It appears, therefore, that the property and businesses of the two companies are separate and distinct, and separately owned and operated. They are independently managed, each by its own board of directors and officers.

The circumstances under which the American Company acquired the stock of the Southwestern Company have already been stated.

These are the undisputed facts.

They negative the idea that the Company is merely an instrumentality of the American Company. They negative the idea that the American Company is attempting to accomplish any wrong, either through the Company or otherwise. These companies are separate entities, performing separate functions. When the court looks beyond their separate legal identity it sees nothing that is illegal or inequitable.

The record shows that the American Company has an identical contract with each of the "Associated companies" of the Bell System. One of these companies is the Southern New England Telephone Company. When the contract was made with it the American Company owned forty-three shares, an insignificant part, of its stock (R. I, 422). It now owns 33% (R. I, 421). Another is the Cincinnati and Suburban Bell Telephone Company of whose stock the American Company owns approximately 30% (R. I, 389). If identity could be argued in the instant case from these relations, it could be argued with like force in these other two cases, where the holding is a minority holding.

This license contract is the basis of the organization that permits the subscribers of the Company and of the Southern New England Company and Cincinnati Company to talk to each other. It is the basis which permits the development of their telephone business along common lines. It is the basis which affords to each one of them all that is new and good in the art. The relationship to each so far as the American Company is concerned, is identical. If one of these companies is an instrumentality of the American Company then each of them is an instrumentality of the American Company. The stock ownership does not determine the question of separate identity, but is something that is entirely independent of it.

The authorities demonstrate that the fact that the American Company is the owner of all of the stock of the Southwestern Company does not in

law merge the two corporate entities; they are separate corporations. Counsel do not in terms deny this. Their contention, therefore, must rest upon the legal proposition that there is an obligation on the part of a stockholder who is a sole stockholder to furnish services to the corporation without charge for them. Putting it concretely, their proposition must be that this contract, admittedly valid when made; admittedly valid when the American Company acquired additional stock, and admittedly valid as it continued to acquire additional stock, was abrogated by the fact that the American Company became the controlling stockholder, or practically the sole stockholder. This is novel doctrine as to the rights and obligations of stockholders. The American Company, because it has invested its capital in this public enterprise by purchasing the stock of the corporation which owns and conducts it, is to be penalized in this way. Counsel say that the American Company gets dividends on the stock (though not any from Houston) and therefore must be denied any profit from the contract. But this confuses the two relationships; the dividends are the reward of capital invested, and have nothing to do with services rendered.

It being established that the corporations are separate legal entities, and that no facts are present here which can operate to impair their right to contract as such, there can be no doubt that, there being no charge of bad faith or improvidence, whether this contract should be continued or not is solely a question for the management.

Chesapeake & Potomac Telephone Company v. Manning, 186 U. S. 238. Interstate Commerce Commission v. Chicago, Great Western Ry. Co., 209 U. S. 108. Southern Pacific Co. v. Interstate Commerce Commission, 219 U. S. 433.

Northern Pacific Ry. Co. v. State of North Dakota, 236 U. S. 585.

Great Northern Ry. Co. v. State of Minnesota ex rel. Railroad and Warehouse Commission, 238 U. S. 340.

Chicago, Milwaukee and St. Paul Ry. Co. v. State of Wisconsin, 238 U. S. 491.

This disposes of the assignment of error and we might dismiss it here without further discussion. But as the continuance of this contract is of the utmost importance to this Company, as it is also to all of the operating companies of the Bell System throughout the United States, their business being founded upon it and their entire organization, methods and equipment shaped in conformity to it and in reliance upon its continuance, we feel constrained to set forth the character and importance of these services in somewhat greater detail, in order that there may be no possible inference that we are standing upon a technical position, as well as in order that there may be no doubt in the minds of the court concerning the fairness and value of the contract to this Company. It is not too much to say that it is largely due to the operation of this contract from the inception of telephony that the art has developed to its present high state and that the industry in this country has always stood preeminent, far in advance of any other country in the world. importance of this subject to the public, no less than to the industry, justifies this further detailed consideration, if the contract needs any further defense than the matters already set forth in the preceding pages.

Origin and Development of the License Contract.

The American Bell Telephone Company, predecessor of the American Company, acquired from Alexander Graham Bell, the discoverer and inventor of the telephone, his original letters-patent of the United States, No. 174,465, granted March 7, 1876, and No. 186,787, granted January 30, 1877 (R. II, 881), which mark the beginning of telephony.

From the beginning the American Bell Telephone Company followed the plan of granting licenses to others to use the company's instruments in designated territories under a "License Contract". It did not itself engage in the business of furnishing telephone service but left that field to those who sought and obtained territorial licenses.

The telephone instrument acquired from Professor Bell would now be considered very crude. His great contribution was the scientific conception. Before a practical telephone could be offered to the public both the telephone instrument and auxiliary apparatus had to be created. Practically the entire art had to be created (R. I, 208; 214; 270).

A practical telephone instrument was early developed by the parent company, and there followed a ready demand for territorial license contracts. At least as early as 1885 the state of Texas had been covered under a license contract entered into with a company known as the "Erie Company", and it was already operating under this license in that state in that year (R. II, 876-7).

In 1889 The Southwestern Telegraph and Telephone Company took over the rights of the Erie Company in Texas. On July 27, 1889, the license contract between The Southwestern Telegraph and Telephone Company and the American Bell Telephone Company was entered into (R. II, 877). This contract is found in Exhibit 146 (R. II, 876-901).

While there have been many modifications, in broad essentials this original contract defines the relationship that has existed between the two companies ever since.

The parent company pursued the same business policy throughout the United States and used the same form of license contract. Such contracts were early entered into generally throughout the country. In this way what came to be familiarly known as the "Bell Telephone System" was formed, comprising the American Company, commonly known as the parent company, and the several licensee companies, the operating companies, which have come to be known and are generally referred to in this record as the "Associated Companies" of the Bell System, of which this Company is one (R. I, 205-6).

The business at the outset was comparatively simple and crude. "Switchboards" and "centrals" were unheard of. There were no call bells, signaling the party called to the telephone. In fact almost none of the thousands of parts that now constitute the equipment of a telephone plant were then in existence (R. I, 208).

The American Company applied itself from the start to the development of the science and art.

It developed the switchboard, which displaced the private lines and made possible a community service through central offices.

Then, one after another, the American Company developed or acquired and patented, whenever patentable, improved transmitters, hard drawn copper wire, the common battery system, fine wire cable, loading coils, repeaters, etc. (R. I, 271-2; 215; etc.).

These are merely a few typical examples.

Under the license contract the Associated Companies had the right to use all these patents and improvements within their territories. This has been true as to all patents and improvements ever since and applies to the 5,000 patents owned or controlled by the American Company to-day, covering nearly everything in the telephone art. The payment to the American Company under the license contract has always been the consideration for these rights.

The Associated Companies required the expert advice and assistance of the American Company's staff in order to utilize these improvements and inventions, and the staff grew rapidly in numbers and in specialization in order to meet the demands made upon it by the Associated Companies (R. I, 208-9).

The original line of separation of functions has continued. The American Company devotes itself to the development and research, specialized engineering, specialization in every phase of the industry; the Associated Companies to operation. The parent company has never engaged in the exchange business, though it has, as stated, for a long time owned and operated a long distance system throughout the country, supplementing the toll systems of the Associated Companies.

If there were nothing else of value to this Company and the public under the License Contract but the services now being rendered and actually utilized in the conduct of its business today the payment would be more than justified. But no doubt the greatest single feature of the contract

is the undertaking by the American Company that it will continuously prosecute the work of improving the art and science through development and research and will make available to the licensee company the results of that work, both as represented by all patents that the American Company develops or acquires, as well as all methods, systems, etc., that it develops (R. I, 208-10; 408-9, and much other testimony).

The license contract has been modified from time to time dating almost from its inception, although, as stated, it has retained its original fundamental character.

Every change in the contract from first to last has been in the direction of larger benefits to the Associated Company and smaller payments to the American Company (R. II, 877; I, 335). This appears here without dispute.

In the matter of the payment to the American Company, originally this was for the right to use (they have never been sold) a set of instruments. The original payment was \$14.00 per set per annum (R. II, 877; I, 335). Later it was modified so that the sum varied according to the amount charged the patron, which had been made to vary according to the class of service.

In 1902 the basis of the payment was changed. A percentage of the exchange revenue, with certain minor exclusions, was taken as the basis. This was fixed by agreement at 4½% of such revenue. This change constituted a further considerable reduction in the amount of the payment (R. II, 877; I, 335). The payment today remains at 4½% of the exchange revenue of the licensee, with certain minor exclusions. In this case it amounted, in 1919, to the sum of \$43,528, or \$1.65

a year, or less than 14 cents a month per telephone.

Under the license contract today the American Company provides for the Company at Houston, the following:

- (a) Telephone transmitters and receivers, with induction coils, including a surplus supply to cover current demands;
- (b) Rights under all patents owned or controlled by the American Telephone and Telegraph Company covering the use of telephonic devices, apparatus, methods and systems;
- (o) The right to use all standardized new and improved apparatus and methods developed through research and experimental work;
- (d) A guarantee of freedom from royalties, damages and expenses, on account of patents, arising out of recommended uses of apparatus, methods and systems;
- (e) An organization to prosecute continuously the fundamental work of research and investigation to the end that safety, economy and efficiency in the business may be promoted;
- (f) Advice and assistance in general engineering, plant, traffic, operating, commercial, accounting, patent, legal, administrative, and other matters involved in the efficient, economical and successful conduct of the business;
- (g) Advice and assistance in the financing necessary in order to develop and enlarge its plant;
- (h) Assistance, co-operation and support in promoting the health and welfare of employees, including the Plan for Employees' Pensions, Disability

Benefits and Death Benefits, with a provision for guaranteeing the integrity of the funds provided by the associated companies for this purpose.

(i) The right to extend to its connecting companies, for the general betterment of the service, the benefits of such engineering and other technical advice and information as the licensee may have received from the American Telephone and Telegraph Company.

This relationship under the license contract involves no duplication of functions (R. I, 208-9; 280-1; 345; 371; 393; 395; 398-9; 417; and other testimony). This Company is an operating company purely, while the business of the American Company now under consideration is not a public utility business at all. It is that which it engages in as the owner and licensor of telephone and related patents, as consulting telephone engineers, as a company engaged in scientific research and development in telephony, etc.

Instrument Service.

This includes, as already explained, furnishing to the Associated Companies the vital parts of the telephone instruments—the receivers, transmitters and induction coils, the repair of the instruments, and their replacement when outworn or a better type is developed.

The advantages of this service to the Associated Companies are: (1) telephone instruments of the best class; (2) an adequate supply of such instruments at all times, including emergency requirements, with no temptation, for the sake of economy, to keep them in use longer than is consistent with the best service; (3) standardization of instru-

ments (R. I, 338-9). Without this standardization, a universal telephone service is not possible. Nor can there be an efficient service.

In 1919 it would have cost the Company \$25,540 to duplicate for itself the instrument service of the American Company, or approximately two-thirds of the total contract payment (R. I, 340).

Patents.

From the date of Dr. Bell's discovery until today the entire telephone art has been covered by patents. As a part of its patent service the American Company has not only extended to the Associated Companies rights under its own inventions but has acquired for their use rights under all other patents which were essential to the economical and efficient development of the art. What it has undertaken to do is to provide an absolutely free field for the development of the art along the soundest and best lines (R. I, 269-76). The record shows some 5,000 or 6,000 patents of this class (R. I, 269, 354).

Research and Development.

For the benefit of the Associated Companies the American Company maintains a department (of which Brig. General John J. Carty, a Vice President of the American Company, is the head), made up of a large staff of highly trained, specialized experts, exclusively engaged in the search for what is best in the telephone art, a service unapproached by any other organization in the world.

The discoveries of these experts in every branch of the science, the improvements they bring about in the way of any device, apparatus, equipment or method, are directly available to the Associated Companies. This staff is subdivided into an executive staff, a legal staff, an engineering staff, a financial staff, and an accounting staff.

The engineering staff, alone, comprises 550 persons, of whom 275 are expert engineers (R. I, 207-219). Its achievements range from wireless telephony to the prevention of cable trouble by insects; from developing a cheaper cable sheath, more usable and durable cords for switchboard connections, to problems in induction and electrolysis, etc. (R. I, 220 and following; 336, 348).

The development by the engineering staff of hard drawn copper wire to take the place of iron wire has made possible the expansion of the business

into a system (R. I, 255-6).

Cable development is another great result of the work of the engineering staff. Its work in this development covers a period of thirty years. An early cable contained 50 wires, insulated in rubber—an unsatisfactory insulation. By 1892, it was possible to put 200 wires, or 100 pairs, in a sheath. By 1895, it was 300 wires. In 1896, 400 wires. In 1900 and 1901 it was 600 and 800. In 1902, 1,200. In 1912, 1,800. And in 1914, by the use of No. 24 gauge wire it had reached 2,400 wires (R. I, 227-8).

By the use of this latest type of cable, it was possible in 1914 to place in one duct of underground conduit as many wires as the 1888 type of cable would have required twenty-four ducts to accommodate (R. I, 229).

There have been 66 different types of transmitters standard at one time or another and furnished to the Associated Companies, but which through development are now obsolete and supplanted by a better type (R. I, 275).

These are merely illustrative things that the American Company has placed at the use of the Associated Companies under the license contract.

General Advice and Assistance.

Under this service the Associated Companies receive advice and assistance as to general engineering of plant, traffic, operating, commercial, accounting, patent, legal, administrative and other matters relating to the successful conduct of their business. This service is constant and of great volume. It is specific as to particular matters, by conferences, correspondence, and field work, as well as general through bulletins, circulars and periodical publications (R. I, 205-210; 222; 336; 370).

Financial Services.

These cover advice and assistance in financing, aid in obtaining funds on fair terms for new construction and other expenditures, as well as direct loans from the American Company; and active assistance in marketing the Company's securities, with such other necessary financial support and assistance as will tend to serve the best interests of the Company (R. I, 440-450; 370).

On one transaction alone, involving the sale of notes owned by this Company, the American Company saved it \$38,000 (R. I, 441-2).

Accounting Services.

These include accounting standardization; periodical auditing; expert advice on accounting methods, and all sorts of statistical advice (R. I, 336).

The Services are Necessary for the Efficient Conduct of the Company's Business.

A mere recital of the nature of the services renders this not debatable.

The Value of Only a Few Easily Evaluated Services is Several Times the Total Payment.

The proof is specific here.

Statement of the annual savings through a few evaluated services:

	17,000
New alloy for cable sheaths	2,200
Improvements in switchboard cords	14,100
m 4-1	2169 940

If the savings on account of instruments be deducted from the total payment and from the total savings, there remains a balance of the payment amounting to \$17,988 on account of all the other services covered by this contract, four of which are evaluated at \$137,300 (Exhibit 152, R. II, 941; I, 353-4). These figures are significant but their chief significance is in what is omitted. It is impossible to evaluate the benefits of universal service, the benefits that are derived from patents, the benefits that come from the assurance that whatever there is good and new in the art shall be available to this Company, the benefits that come from efficient and standardized operating methods, the financial benefits, the benefits that arise out of mistakes that have not been made, with the elimination of an experience account. These are the big things that find their ultimate expression in the recognized pre-eminence of the telephone service of the United States, both as respects its quality and universality, and as respects what it costs the public.

The license payment of this Company for the year 1919 amounted to \$1.65 per telephone station per annum. Of this amount Mr. Pennell testified \$1.10 per station would be required by the Company to cover the instruments alone, leaving 55 cents per station to pay for all the other services (see also the testimony of Mr. Rhodes, Plaintiff's Exhibit 121, R. II, 821, and R. I, 280).

The mere enumeration of these other services is sufficient to convince any reasonable mind that they are worth more to the Company than 55 cents per station a year. Fifty-five cents a year amounts to 4.6 cents per month per station, and is an amount so small that its effects could not be reflected in any rate schedule. A subscriber could not tell whether he had paid the charge or not.

Mr. Pennell, this Company's Chief Engineer, testified that if it undertook to do for itself the work that is done for it by the American Company under the license contract, it would cost the Company more than the amount of the payment (R. I, 388); and that the payment "saves us (the Company) far more than we ever put into it" (R. I, 360-370); also, that there is no other way than through the license contract that the Company can obtain the services for its Houston exchange, because there is no "other body of men in existence in the world that could render that service" (R. I, 371).

Mr. Blair-Smith, Comptroller of the American Company, testified with respect to the financial services alone that there could be "no doubt whatever that it has been most advantageous to the Southwestern Company" (R. I, 452).

Mr. McBurney, Assistant General Manager of the

Cincinnati Company, in which the American Company has a minority holding of 30%, testified that the contract is "very advantageous" to the Cincinnati Company, that "it is worth more than we pay for it," and is "indispensable, because the services we obtain from the American Telephone and Telegraph Company cannot be obtained from any other source" (R. I, 393).

Mr. McBurney further testified that if his company did not have the contract with the American Company he would "most emphatically" consider it a sound business proposition to enter into it, and that the executives of his company, as a whole, consider it "very valuable" and know that they are getting their money's worth (R. I, 394, 411).

Mr. Moran, President of the Southern New England Telephone Company, in which the American Company has a minority holding of 33%, testified that his company continues the license contract with the American Company because it considers the arrangement of very substantial value to it, and further that if the company did not have the contract he would consider it advisable and advantageous to make it (R. I, 415). He testified further that this arrangement has been in effect for about 40 years, and that throughout its history it has worked to the entire satisfaction of his company, and that his company has considered its interests best served by the continuance of the contract (R. I, 420).

The proof is overwhelming that the services received by the Company in return for the payment are worth many times what it pays for them. This fact alone is sufficient to negative any possible contention that its officers have practiced any abuse of discretion in continuing the contract in force.

The Services Cannot be Obtained Otherwise by this Company for Less than is Paid for Them Under the Contract.

The record is again clear here.

Mr. Rhodes, Engineer of the American Company, testified that he did not know of any other concern or organization anywhere that could furnish the services at all (R. I, 280-1).

Mr. Blair-Smith's testimony is to the same effect. He testified "my opinion is that the Southwestern Company could not get such an arrangement with any other company in the world; the benefits to the Southwestern Company are far greater than the outlay and the cost to it" (R. I, 465).

Mr. McBurney testified his company could not perform the services for itself even if it had the money to prepare for them; and if it had the money and capital to render the services for itself it could not get the advantage of the accumulated experience of the Bell System (R. I, 395).

Mr. Pennell, the Company's Chief Engineer, testified that the Company could not afford, from a financial standpoint, to have a department such as the American Company maintains, even on a small scale; that even if it undertook to provide a small department, the services it could render would not approach in value the services received from the American Company (R. I, 345).

Counsel say in their brief that this Company has its own engineers who are competent to handle its problems and that therefore the engineers of the American Company represent a duplication. But the record shows that the contrary is the fact. This Company's engineers are competent. But they are operating engineers in the field, whereas the engineers of the American Company are development, research and consulting engineers (R. I, 217; 417). Each is a specialist in his own field (R. I. 213-14;

217).

The contract makes directly for an avoidance of duplication. If the general research and development work done by the American Company were undertaken by the Associated Companies, it would be carried on simultaneously in a number of places all over the country. Under the contract the work is done by a department centralized in the American Company and by men who are specialists in their field, transmission engineers. induction engineers, electrolysis engineers, etc. The American Company has the advantage of the experience and knowledge gained in this Company's territory and in the territories of all the other Associated Companies. The record is that the arrangement results in better work being done, better service afforded, and an avoidance of duplication (R. I, 208-9; 280-1; 345; 371; 393-5; 398-9; 414; and much other testimony).

Not only is this true, but independent development such as has been mentioned would necessarily be along divergent lines, which would not only destroy the economies which grow out of standardization (R. I, 246-7; 255-6), but would render impossible the universal service that is characteristic of the United States and is based upon standardi-

zation.

This Company's managing officers had the right to act as ordinary business men and gauge the value of this contract by its value to this Company. Judged by this standard it is beneficial and advantageous.

The board of directors needed only to ask themselves, (1) are these things reasonably necessary in our business, (2) are they worth what they cost, and (3) can we obtain them for less? If a reasonable board of directors might reasonably,—that is, in the exercise of a sound business discretion,—answer "Yes" to the first two questions, and "No" to the third, neither the City nor the court could gainsay them.

To disallow the payment is to hold the contract void. The American Company is under no obligation to furnish these instruments, patents, and services except the obligation of the contract. If that is void the Company must obtain these things on other terms. Would the people of Houston be better or worse off if this Company, for example, should be obliged to pay specific royalties on all the patents; to create and maintain its own Development and Research Department; to employ its own expert staff; and so on? How much would it cost? How much of the benefits it now obtains under this contract would be lost to the Company and to the public? That it would not cost less is settled by the unchallenged finding of the court below in this case. That much would inevitably be lost is shown by the uncontradicted proof. If it were obliged to pay on a quantum meruit basis, how much would it. amount to? These are the alternatives.

V.

Depreciation.

(The City's Fourth Assignment of Error.)

The Master found that 6.33% was the proper rate of depreciation, applied to the value of the physical property alone, of \$5,500,000 (R. I, 41-2). The trial court aproved this rate applied to the amount of the investment, as found by the court, of \$4,671,567 and allowed 6.33% of that amount or \$289,380 (R. I, 58). The City contends upon this assignment of error that the rate should have been 4% instead of 6.33%.

In the rendition of its telephone service the company uses up the property which constitutes its plant. The property so consumed, less what is realized as net salvage, constitutes a part of the cost of rendering the service. This cost item must appear in the operating expenses if they are to correctly reflect the cost of the service. As to the accounting methods applied to these facts, the company is without any discretion. They are prescribed by the Uniform System of Accounts established by the Interstate Commerce Commission for the use of telephone companies (R. II, 799). In effect, the requirement is that during the period of the useful life of the property there shall be charged to operating expenses and credited to the account called "Reserve for Accrued Depreciation" an amount equal to the property used up, plus the expenses incident to its retirement, less the amount of any salvage. These charges and credits are to be made in equal monthly installments. The total amount charged is to be based upon rules derived from consideration of the company's history and experience (Plaintiff's Exhibit 11, at page 67 thereof, R. II, 799).

The practical application of this rule requires that there be determined as matters of fact the useful life of the property and the net salvage; that is, the salvage after the payment of the cost of retiring the property. If a switchboard be taken as 100%, and it be determined that in fact its life will be fourteen years and the net salvage will be 30%, then, deducting the 30% from the 100%, there remains 70% to be provided for through charges to operating expenses and credits to the account "Reserve for Accrued Depreciation" during this fourteen years of useful life. amount to be so charged during each year would obviously be 1/14 of 70%, or 5% of the original factor, and during each month 1/12 of this 5%. When these factors have been worked out as to each item of depreciable plant, it is merely a matter of mathematics to obtain the composite percentage which should be applied to the entire plant.

In passing, it may be noted that while in the accounting rules the term "Reserve for Accrued Depreciation" is used to designate the account to which the credits are made, corresponding to the charges to operating expenses, no reserve, in the sense of a special fund set aside, is actually maintained. The money represented by the charges to operating expenses and the credits to this account is invested in plant, so that as capital is used up other capital replaces it and the total capital is not impaired.

It is perhaps worth while to note also that the amount of these charges is wholly independent of the question of renewals. The material question is the expense on account of property used up in rendering the service. This expense is the same whether renewals are made or not. If a switchboard is used up, neither the fact that the expense is incurred nor its amount can be in any way affected by whether the switchboard is ever replaced or not, or when it is replaced. As a matter of fact, it is very seldom that any property is actually renewed. Where property is displaced almost invariably what is substituted for it is property of a different character.

The proof adduced by the Company was in accordance with the accounting rules that have been referred to (R. I, 519-58, II, 559-71; II, 800-809). Based upon the experience of the company over a long series of years, it established from the lives of the different parts of the plant a composite life of the plant as a whole, with the amount of net salvage which experience showed might be anticipated, and from these factors deduced the percentage which was approved by the Master and by the court below as the proper percentage to be applied in order to carry out the requirements of the system of accounts prescribed by the Interstate Commerce Commission, as well as the one necessary to adequately protect the company upon this item of expense.

The only testimony presented by the City upon this question was that of Mr. Kelsey, who is referred to in the City's brief, page 40, as having had "more than twenty-five years practical experience in the telephone business". But Mr. Kelsey testified that he had never made a study of the rate of depreciation that should apply to the different parts of the plant (R. II, 574), and when interrogated on the subject of the average life of the

property, stated, "I know nothing about average life" (R. II, 606). What he did was to apply a rule of thumb that "total maintenance"—the sum of current maintenance and depreciation-should be \$11.00 per station per annum, and that depreciation to be allowed in any year would be the difference between this amount and the actual current maintenance, whatever that might happen to be (R. II, 572). This rule, which is as arbitrary as it is artificial, and wholly ignores the requirements of the Interstate Commerce Commission's accounting system, he would apply irrespective of the value of the property (R. II, 612) or the proportion of long lived underground plant to relatively short lived aerial plant (R. II, 576), or the changes in the cost of current maintenance due to changing price levels (R. II, 574-5). And when he was asked whether any court or commission had ever accepted his method for computing depreciation he answered. "A court or commission don't concern me: I never made a dollar out of a court" (R. II, 606).

Counsel comment upon the fact that the plant was in excellent physical condition at the time of the trial. If a switchboard has a life of fourteen years and a net salvage value of 30%, the physical condition of the switchboard at any time during this period does not affect the amount of the periodical increments which must be charged to operating expenses and credited to the depreciation reserve to provide for the 70% that is being used up during the period of its useful life.

In this connection counsel point to the difference between what they call the "realized depreciation", that is, the amount of the charges to the depreciation reserve on account of property renewed in any year, and the amount of the credits to the reserve for accrued depreciation during the same year. But this argument shows a plain misapprehension by counsel of the effect that rapid and continuous growth in plant has upon the relation of these two In this case the book cost of items to each other. the property in 1919 was thirteen times its cost eighteen years prior to that time, in 1901. plant that is being renewed is the old plant. Where a plant is growing so rapidly as this one, if the average life be assumed to be about 14 years, today the small plant that existed fourteen years ago is being renewed, while the credits to the reserve for accrued depreciation are based upon the large plant existing to-day, which will have to be renewed fourteen years hence. If the account "Reserve for Accrued Depreciation" was built up on the basis of the plant being renewed today, it obviously would only be large enough to provide for such a plant and would be an entirely inadequate provision for the very much larger plant of today.

As the average plant in use grows year by year the amount in dollars of the credit to this account increases year by year. As the charges to this account on account of plant displaced are made year by year they will also increase, but they will always be smaller because the plant displaced is the old. small plant, so long as the plant continues to

grow.

In the absence of facts showing an abuse of discretion, the provision which should be made for depreciation is a matter within the jurisdiction of the management of the corporation. Its determination requires the exercise of judgment because through these charges provision is being made for future contingencies. Just as the actuary of an insurance company cannot tell when any person insured by the company will die, so it is impossible to say exactly when any pole or building or switchboard, or any other piece of plant, will go out of While this is true, it is also true that the recorded experience of the telephone engineer covering a long series of years, like the experience available to the actuary, enables him to predict average results with remarkable accuracy. management requires that the integrity of the service and the integrity of the property be insured by adequate provision for expense items which cannot be exactly known in advance. long as the action of the management is predicated upon intelligent judgment honestly exercised, it should not be interfered with by courts or regulatory bodies.

VI.

Rate of Return.

(The City's Fifth Assignment of Error.)

The Master found that 8% would be a fair return under present conditions and the trial court approved this finding (R. I, 58). The City assigns error, claiming that this should be reduced to 6%.

In its opinion, the district court cites Lincoln Gas & Electric Company v. City of Lincoln, 250 U. S., 256, and quotes what this court said there on this subject, as follows:

"It is a matter of common knowledge that owing principally to the World War, the cost of labor and supplies of every kind have greatly advanced since the ordinance was adopted, and largely since this case was last heard in the court below. And it is equally well known that annual returns upon capital and enterprise the world over have materially increased, so that what would have been a proper rate of return for capital invested in gas plants or similar public utilities a few years ago, furnishes no safe criterion for the present or for the future."

The Company introduced a considerable amount of testimony of bankers and other men of Houston whose business it is to be informed upon this subject, and who showed themselves fully conversant with the facts (R. II, 619-660). Their testimony would sustain 10%. It is true, as the City's brief says, that some of them testified to a rate as low as 6 or 7% on business property in the community. But this testimony has reference to first mortgage loans on the best and most favorably situated business property in Houston, in an amount not to exceed 60% of its value, the borrower to pay all commissions and expenses incident to making the They regarded such loans as prime, giltedged investments, involving a hazard practically Loans on choice residence property negligible. to an amount not to exceed 50% of its value, and otherwise on the terms above stated, were commanding 71/2 and 8% and, in some instances, as low as 7%; first mortgage loans on unimproved farms, 8%, improved farms as low as 7%; prime commercial loans, short time, the money remaining on deposit in the lending bank, so that the bank retains the use of the greater part of the money, 63/4 % to 7%. They regarded the security for all these loans as excellent.

In order to sell telephone stock, local investors would demand practical assurance of dividends of 10%. The investor would not be concerned simply with the value of the physical property of the utility but would require assurance as to its earnings which, in view of the attitude of the city government in the past, would not be forthcoming. Under existing conditions, very little capital would be found available in Houston for investment in telephone stock (R. II, 619-660).

There is much additional testimony in the record concerning the current return on capital invested in other lines of business, in banks, manufacturing and mercantile lines, in bonds of public utilities, etc. All of it supports the finding in this case. We do not deem it necessary to take space to review that evidence.

The only testimony on this subject offered by defendant is that of the City's expert, Lyndon. He testified:

"But I am very definitely on record in a large number of cases, that 8% is a proper, rational return and, under ordinary conditions, for any public utility, and that 7% is a proper return until we get away from this period of inflation of wages and every other cost that a utility and an individual now suffers. I do not think that every increase in price should be passed on to the consumer, or to the user of your service and then a continuous flat 8% be maintained" (R. III, 1217).

If 8% is the fair rate of return under ordinary conditions, as this witness testifies, it is clear that 10% would not be excessive under present conditions.

Mr. Lyndon did not know of any place where plaintiff could get money for less than 8% (R. III, 1217).

The record shows that 10% on loans is lawful, that is, not usurious, in Texas (R. II, 624).

Much more significant than the legal rate of interest as provided by the statutes of Texas are certain statutory provisions covering the rate of return which public utilities shall not be deprived of the right to earn, by the cities in the exercise of their power to regulate rates. The legislature has fixed 10% per annum "upon the investment" or 10% per annum "on the actual cost of the physical properties, equipments and betterments" as the minimum rate of return.

Article 1018, Complete Texas Statutes for 1902, which confers upon city councils the power to regulate by ordinance the rates of water, gas, light and sewer companies, concludes with the following proviso:

"* * Provided, that the city council or board of aldermen shall not prescribe any rate or compensation which will yield less than 10% per annum net on the actual cost of the physical properties, equipments and betterments" (Acts 1907, p. 217, section 1).

Article 1028 (Acts 1905, p. 348, section 4), which is made specifically applicable to "telephone companies, furnishing telephones to the public" by Article 1031, Section 7 of said Act, provides for an appeal to the courts from any rate fixed by the city and contains a similar provision, as follows:

"After a full hearing of all the evidence adduced by the parties, the court or jury shall have power, and it shall be their duty to fix the rates which may be charged by such public utility corporation, provided, that the rates fixed must be sufficient to yield such public utility company not less than 10% upon the investment, and the same shall continue in force for a period of three years."

We might have dismissed this question of rate of return, at the outset, as academic, since there was no return whatever from the rates in issue; but upon a consideration of the question upon its merits it is clear that 8% is not too high—indeed it might be argued with great force that it is too low—and that this assignment of error is without merit.

VII.

Purchase of equipment and supplies, and certain services from the Western Electric Company, Inc.

(The City's Sixth, Seventh and Eighth Assignments of Error.)

The City groups and argues together these three assignments of error (City's brief, p. 41). Two of the matters embraced by them are covered by previous assignments and argued in earlier sections of its brief. We have likewise argued those matters in preceding sections. The only new matter now presented for consideration is that indicated by the caption above.

This Company purchases the greater part of its equipment and general supplies, and obtains certain services, from the Western Company.

The whole course of the dealings between these two companies was gone into exhaustively upon the trial, and the Master and the trial court approved them as fair and advantageous to the Company, and legal (R. I, 44; 57). The City excepted to the Master's findings, and assigns error upon the action of the trial court in overruling its exception (City's twelfth exception, R. I, 48).

The City's contentions are:

- (1) That whatever profit the Western Company makes out of its transactions with the Company, so far as they relate to Houston, is the profit of the American Company, because the American Company owns the greater part of the stock of the Western Company. Such profit accruing to the American Company is the profit of the Southwestern Company, plaintiff, and must be credited to the Houston exchange as part of its revenues, because the American Company owns the stock of the Southwestern Company and hence is the actual plaintiff.
- (2) That the Western Company charges this Company exorbitant prices for equipment and supplies, and makes exorbitant profits out of these dealings.

The first contention is purely one of law, and the second purely one of fact.

The Question of Law Presented by the City.

The facts that bear on this question.

The Western Company is a manufacturing and merchandising corporation organized under the Business Corporation Law of the State of New York in the year 1915. (Its predecessor was an Illinois corporation organized in 1881.) Its principal business is, and always has been, the manufacture of telephonic equipment and apparatus of all kinds. The only relationship that has ever existed between the Company and the Western Company is the contractual one to be presently described. The two companies are separate and distinct corpora-

tions, organized at different times under the laws of different states and engaged in prosecuting businesses that are not only separate and distinct, but of an entirely different character and scope-the one, a telephone business confined to a few southwestern states, the other, a manufacturing and merchandising business extending throughout the world. Their officers and managing personnel are entirely different; there is no intercorporate stockholding, although the American Company owns most of the stock of both. In a word, the only contact between them is that which arises out of the fact that the Western Company has things to sell which this Company requires in its business and finds it advantageous, as the proof and the findings of the Master and the court show, to buy from the Western Company.

What we have said above may be said also concerning the relationship between the American Company and the Western Company, except that the American Company owns all but a small, though by no means inconsiderable, minority of the stock of the Western Company. The American Company exercises this stock control in a normal, fair and legal manner. It elects the directors of the Western Company, and in that sense and no other controls its business policy. Aside from that the Western Company is wholly independent of the American Company. There is a contract between them, entered into at the inception of the telephone industry about forty years ago, under which the Western Company is the licensed manufacturer of telephone equipment and apparatus of all kinds covered by the patents owned or controlled by the American Company. There is the closest cooperation between the two companies which, as the record shows, is in

the interest of the telephone industry and redounds directly to the advantage of the telephone using public (R. I, 218; and much other testimony).

At the earliest stages of the telephone industry the American Company owned the basic telephone patents and early developed and acquired large numbers of patents covering practically every improvement in the art as it was made. It was not and never has been a manufacturing company. It was necessary for the American Company to license a manufacturer to make and sell under its patents

The Western Company was an agged in the manufacture and sale of telegrame and telephone equipment and supplies, and was elected as the American Company's licensee because of the excellence of its products as compared with those of competing manufacturers (R. II, 663). The policy of the American Company then, as now, was to make available to the operating companies the very best apparatus and equipment that could be had (R. II, 815). These were matters of management.

In connection with this question of management and the action of the American Company in licensing the Western Company, it is worth while to note here that it was not only necessary that there be a dependable adequate supply of well-made apparatus, but also to take into account the peculiar nature of the telephone industry. various pieces of apparatus are co-ordinated and adapted to each other, such as the lines, the switchboards and the instruments. Switchboards are bought in sections, additional sections being added until the capacity of the exchange is reached. These facts deprive telephone companies of the opportunity to resort to competitive bidding when they want additional apparatus. Having adopted the apparatus of one manufacturer, they are required to continue its use until they are ready to abandon it and adopt that of another. These factors must be taken into account if one is to consider the question whether the American Company acted wisely in endeavoring to control the manufacture for the Bell System, instead of permitting the Bell System to be controlled by the manufacturer, and also whether the Southwestern Company acted wisely in patronizing this manufacturer. matter of common knowledge that the telephone industry is the only electrical industry whose development is not controlled by the manufacturers. The Bell System is in a position to require that its apparatus be designed not only with reference to its present needs but also with reference to the lines along which the art is developing, so that the greatest efficiency and greatest economy may be accomplished (R. I, 219; II, 663).

The business between the Company and the Western Company is covered by a contract between them known as the "Supply Contract". Each of the Associated Companies of the Bell System has a similar contract with the Western Company (R. II, 662). A form of the contract is in the record (Exhibit 141, R. II, 827-31), and supplementary letters and documents setting forth addenda and certain modifications of the contract (R. II, 832-47). This contract embraces three general classes of transactions, as follows:

1. Purchases of Articles of Western Electric manufacture. The telephone system of the Company is equipped with the instruments and appliances, covered by the American Company's patents, that are standard in the Bell System. The Company purchases them (except the instruments)

from the Western Company upon the terms provided in the contract, which are:

- (a) Underground, aerial and submarine cable manufactured by the Western Company, if shipped from factory, at factory cost plus 8% of such cost; if shipped from storeroom, factory cost plus 10%. Factory cost shall include only the cost to the Western Company of productive labor and materials, and that portion of the Western Company's overhead expenses properly assignable to manufacturing the cable.
- (b) Other manufactures of the Western Company at reasonable prices as low as its prices to its most favored customers in the United States.
- 2. Purchases of articles not manufactured by the Western Company. The Company has constituted the Western Company its purchasing agent to procure for it articles which the Western Company does not manufacture, such, for example, as paper for telephone directories, stationery, office furniture and fixtures, etc., at cost plus 6% if shipped from any storeroom of the Western Company, or cost plus 4% if shipped from any other point. In the case of hard drawn copper wire, the price is cost plus 5% if shipped from storeroom, cost plus 1% if shipped direct. In ascertaining "cost" herein, the Company is given the benefit of all rebates, discounts and commissions.
- 3. Services. The contract provides for certain services to be performed by the Western Company such as warehousing, inspection, carrying special stocks, operating local repair and emergency shops, cartage, handling shipments and shipping claims with railroads, receiving, storing and reissuing or

disposing of apparatus or material returned by the Company, etc.—services which the Western Company is equipped to perform with the greatest efficiency, economy and dispatch.

Only such services are performed for the Company as it may request and at such remuneration

as the parties may agree upon.

The rates of remuneration for these services as agreed upon from time to time are shown in the record, pages 834-870. The following items are typical:

- (4) Repair and emergency shops. So far as possible standard repairs will be charged at agreed on flat prices, representing the Western Company's cost (R. II, 839).
- (b) Recovery shop. The Western Company will charge the Company monthly its actual cost of labor, plus 15% loading to cover department expenses and supervision expense, and material at prices usually charged the Company (R. II, 839).
- (c) Handling shipping and shipping claims. The Western Company will make a monthly charge of \$80.00, representing approximately its cost of doing the work and interest for a period of forty-five days on the total amount of money advanced each month (R. II, 841-2).
- (d) Cartage. Actual cost of truck hire plus 6% to cover the cost of supervision of trucks and necessary clerical work (R. II, 842).
- (e) Inspections. Prices represent actual cost to the Western Company (R. II, 844-5).
- (f) Poles. Other than chestnut poles, which are ordinarily bought from dealers, cost plus 4% for inspection; cost being the net price that the Western Company pays the suppliers (R. II, 869).

It must not be understood that the Wester... Company's business is confined to the Bell system. It sells its telephone products in large volume to the general telephone trade, that is, to the independent (non-Bell) companies throughout the country.

In addition to the foregoing lines of business, the Western Company deals on a large scale in electrical goods of other manufacturers, not required or useful in the telephone business, such as electric fans, washing machines, electric ranges and the like (R. II, 662, 705).

In the year 1919 the Western Company's sales aggregated \$135,000,000, of which \$70,000,000 represented sales to the Associated Bell Companies, and \$65,000,000 sales to independent telephone companies, and to companies and concerns other than telephone companies (R. II, 704-5). These figures are for the domestic business alone.

The question presented upon these facts.

The proposition of law presented by the City upon this state of facts is that, solely because of the American Company's stock ownership, the separate corporate identities of the Western Company and of the Southwestern Company must be disregarded, so that any profit the Western Company makes in its Houston business (if it could be ascertained) must be treated not as its own, but as that of the Southwestern Company, plaintiff.

This is the same proposition advanced by the City in connection with the license contract payment to the American Company, argued in the fourth section hereof, *supra*, page 38. We desire to add here only two comments.

We concede here, as we did there, that it is proper, and may be obligatory under the law, for the court to scrutinize closely any dealings between these corporations whereby any unjust advantage might be taken by the stockholding company. The trial court applied that rule to these transactions and found them to be fair and advantageous to this Company (R. I, 57).

While the American Company owns the greater part of the stock of the Western Company, there are minority stockholders. What is the Western Company's obligation under the law to those minor-

ity stockholders?

It is the contention of the City that the American Company, which is in a position to assert a control over both the Southwestern Company and the Western Company, should compel the latter to sell its manufactured products to the former at cost in disregard of the rights and interests of the minority stockholders in the Western Company. It is unnecessary to inquire how such a course would appeal to these minority stockholders. If they were to come into a court of equity and assert that, abusing its control, the American Company was doing this, is there any question as to what the attitude of the court would be?

The Question of Fact.

The Proof is Overwhelming that the Prices Charged this Company by the Western Company are Fair.

The City claims that it has shown that the Western Company's prices to this Company are excessive and that the trial court erred in overruling its exception to the Master's finding to the contrary. The proof decisively refutes this claim. We address ourselves to that phase of the controversy. We shall set out first the Company's proof and then the City's.

Company's Proof on Western Company Prices.

The City refers in its brief, on page 42, to what it calls the "only effort" of the American Company, which it regards as the real plaintiff, to make a disclosure of the profits it realizes from these sales by the Western Company to this Company, and refers in that connection to the testimony of Mr. E. V. Cox that such profit was less than 8 per cent. The City's brief further characterizes this testimony as having been "volunteered on cross-examination" and complains that the witness did not furnish the expense bills of the Western Company to support this testimony.

This characterization of this testimony is inaccurate and misleading in several respects. In the first place, there was no "effort" made by this Company to prove in this case the amount, or the per cent., of the profits of the Western Company. The Company maintained that the fairness of the dealings between the two companies was to be determined by the results to this Company, and not by results to the Western Company, and that so long as the prices were fair and reasonable and the dealings advantageous and beneficial to this Company, it need not concern itself with the results to the Western Company, and was not called upon to make such proof in order to establish its case. In the second place, the evidence brought out by the City on cross-examination was responsive, was testified to by a witness who knew the facts of his own knowledge, and was competent evidence

in all respects except perhaps as against the best evidence rule, which the City, by the course of the cross-examination, waived. Lastly, the testimony was given by a witness called by this Company. The American Company had nothing to do with it, although the witness was in the employ of the American Company. We shall refer to this matter again in connection with our discussion of the testimony of Mr. Cox.

George P. Player, telephone valuation engineer, St. Louis, Missouri.

He started in the telephone business in 1898 and was for ten years in the employ of independent telephone companies operating in opposition to Bell Companies.

About 1908 he became Telephone Engineer to the Corporation Commission of the State of Oklahoma. He remained with the Oklahoma Commission five and one half years. In that position he made extensive field inventories, appraisals and valuations of telephone properties throughout the State.

In March, 1914, he became Telephone and Telegraph Engineer to the Public Service Commission of the State of Missouri. He made an appraisal for the city of the Bell Company's \$9,000,000 property in St. Louis. He made an appraisal of a \$1,000,000 telephone property at Springfield, Missouri, and of many other telephone properties ranging in size from \$50,000 to \$500,000. In 1916 the Missouri Commission made him Chief of the Telephone and Telegraph Department of the Commission, having direct supervision of rates, rules and regulations of the various telephone and telegraph companies under its jurisdiction. After the war, in which he served with the rank of Captain, he went into business for himself.

He is not an employee of any Bell Telephone Company. He was engaged by the plaintiff to value the Houston property and testify in this case (R.

II. 559-64, III, 1428).

Mr. Player appraised the central office equipment (much the largest item of which is switchboards) at Houston. He used average prices for the past five years and, checking the Company's prices over that period, found them to be conservative. He said:

"When I got those prices I made a check of them. I did this; I checked them in comparison with other appraisals that I had made of the same class of equipment, and found them to be conservative and correct and so I adopted them. This same procedure has been accepted by both the Oklahoma and Missouri Commissions and by the courts after that, in the cases of those commissions" (R. III, 1458-59).

Further testifying concerning Western Company prices generally, this witness said:

"In connection with the various rate cases that go before these Commissions, I have had and the Commissions in some of the cases in which I participated had occasion to investigate the prices of the Western Electric Company with reference to whether or not they were high or low, or how they compared with the other companies; we had done that, in fact, I personally have gone through the Western Electric plant at Hawthorne, Ill. I have also gone through the Automatic Electric Company in Chicago, and the Stromberg-Carlson Manufacturing plant there and I can say frankly that the prices of the Western Electric Company are no greater than they are of these other companies for the same class and character of equipment. As a matter of fact, the prices are a little bit lower, due to economical reasons more than anything else. Their facilities are so great of supplying the demand, they can turn the apparatus out more readily, thereby causing the Company that wishes to buy it to be served long before they can secure a similar type of equipment from some of the other companies or manufacturers. Not that the prices are any lower, but in the interim that they would have to wait for this equipment they are receiving revenue from apparatus installed where they would still be waiting for it from the smaller manufacturers" (R. III, 1461).

His testimony completely refutes the City's charge that the Western Company exacts excessive and exorbitant prices for its products.

James E. Allison, St. Louis, Missouri. Valuation engineer of the firm of James E. Allison and Com-

pany since 1914.

In 1909 Mr. Allison was appointed Commissioner and Chief Engineer of the St. Louis Public Service Commission, a commission created to make detailed valuations and recommend rates and regulations for all public utilities in the City of St. Louis. During four years in that position he had charge, as Chief Engineer for the city, of the valuation of public utility property aggregating \$107,000,000 in value. He resigned in 1914.

The witness has valued upon detailed appraisal \$45,000,000 worth of telephone properties, Bell and independent, besides his work as Commissioner in St. Louis.

On the public side of valuation and rate cases he has been employed as expert by the City of San Antonio, Texas, in litigation against the plaintiff company in 1918; by the City of New Orleans in connection with street railway property; by the City of St. Louis in its street railroad case before the Public Service Commission of Missouri, 1918.

As a witness for the utility he represented his firm in 1914 in the valuation of the electric light property in Houston.

He was employed by the plaintiff to appraise the exchange property in Houston, to do it in his own way, and be prepared to testify in this case (R. III, 1551-53, 1554). This is Mr. Allison's first employment by any Bell System Company (R. III, 1592).

Mr. Allison testified:

"In my valuation work I have occasion to be familiar with the prices for a number of years back. I am familiar with the prices which in a general way existed prior to the beginning of this World War which we have just gone through; we have eleven years' records in our office of prices and we have practically a complete record of vouchers and bills of all these companies, and they are all indexed, and copies of their contracts, and it forms a rule for records, and they have there all the prices practically of the material that enters into the make-up of public utilities since 1909" (R. p. 1554, f. 3042).

Referring specifically to Western Company prices he testified:

"I have been in this business for a good while and have investigated the prices of material a good many times, and I have had occasion to draw comparison between the prices of the Western Electric Company and the prices of other suppliers on telephone materials; we have made valuations of Independent Companies considerably, and we once had a study made in our office to see, as a matter of curiosity and information to ourselves, we didn't know we were going to use it, we found

that the Bell Telephone Company buy a little cheaper on the whole than the Independent Companies, that is, for the comparative items. That was made some years ago and I remember the results very clearly * * *" (R. III, 1557).

His testimony above quoted, that Bell Companies buy a little cheaper on the whole than independent companies, for comparative items, is supported by other like testimony to which we shall refer.

Counsel for the City volunteered to say that he did not question Mr. Allison's honesty or his integrity (R. III, 1581). We may add that he displayed a thorough knowledge of the matters to which he testified, and complete independence of judgment.

Benjamin T. McBurney, Vice-President and Assistant General Manager of the Cincinnati and Suburban Bell Telephone Company, Cincinnati, Ohio.

The Cincinnati and Suburban Bell Telephone Company is one of the two non-controlled "Associated Companies" of the Bell System. It has a capital stock of slightly more than \$10,000,000 par value with no bonds. The American Company owns approximately 30% of its stock, which it acquired about the year 1880 when the "License Contract" was entered into between the two companies. In 1913 the Cincinnati Company entered into the supply contract with the Western Company and has found it to be a very profitable contract.

Mr. McBurney testified as follows:

"Q. Do you feel that that (the Western Company contract) is advantageous to you?

A. We entered into that contract on September 1st, 1913, and I am rather familiar with it because, at that time, I had charge of the direc-

tion of the contracts, so to speak, and the result of that was, in the first year we cut supply expenses, which is the cost of warehousing and handling supplies, exactly in half; as I recall it, we figured that we saved at the end of the first year, under the operation of the supply contract on account of reduction in material costs to us, in the neighborhood of \$35,000.00, and also reduction in prices of material bought from the Western Electric Company, because we got it under more favorable prices under the supply contract than theretofore.

Q. That benefit has continued from year to

vear?

A. Yes, sir.

Q. So you figure on past experience that about \$35,000.00 is saved in that respect alone?

A. Yes, sir.

Q. Have you ever had the idea that the Western Electric contract was a contract that was put over on you by the American Company in order to make additional dividends?

A. No sir, we entered into the contract abso-

lutely on our own volition.

Q. Are you free to get (out of) it any time

you want to?

A. We are free to get (out of) it any time we want to, but as a matter of fact, we sometimes make our purchases outside if we feel we get better prices" (R. I, 395-96).

Frederick Leland Rhodes, telephone engineer, American Telephone and Telegraph Company, New York City. He testified chiefly concerning the license contract. On cross-examination however, being interrogated upon the matter we are now considering, he testified as follows:

"Q. You don't know what amount of profit it (the Western Company) has made in the last few years on the equipment sold to the Houston exchange here?

A. No sir, I do know this that the Western Electric Company sells a very considerable amount of telephone apparatus in competition with other manufacturers in the open market, and I understand that the associated companies never pay more than that market price and generally pay less, for the same apparatus" R. I, 283).

F. M. Hoag, Plant Supervisor of the Company, for the State of Texas, testified on cross-examination:

"A. No, sir, but I do know that the working arrangement which the Bell Telephone Company has with the Western Electric Company makes for great economy and makes for great efficiency in the general handling of our business" (R. II, 710).

C. A. Gates, Vice President of the Company, Dallas, Texas, testified on cross-examination:

"Q. You are Vice President of this Company and its General Manager,—what relationship is there between this company and the Western Electric Company?

A. Why, we have a working arrangement with them whereby we buy our material from them under certain conditions, at a certain price, which is materially less than we could buy it in general market.

Q. You have a contract whereby you buy all of your material from them that they can furnish?

A. Not necessarily all of it, we are not con-

fined to their market" (R. II, 711).

E. V. Cox, Supply Contract Auditor, New York City.

His testimony is printed in the Record, Vol. II, at pages 660-709, and the exhibits introduced during his testimony, numbers 141 to 145, inclusive, appear in Vol. II, at pages 827 to 876.

He testified that it was his duty to watch the workings under the contract in every particular. and to be certain that the Associated Companies receive the full benefits of the contract, that the prices are such as should be billed, and that the service is the best that can be given (R. II, 671).

Mr. Cox was peculiarly qualified, therefore, to testify as to costs and prices charged by the Western Company. His testimony shows that, both from the manufacturing and the supply standpoint, the contract relationship results in lower costs and

large economies to this Company.

He shows first that the prices charged the Associated Companies, of which the Company is one, by the Western Company are uniform in the sense that they are the same to all (R. II, 676-677; Plaintiff's Exhibit 145, R. II, 875).

He then shows that the prices made to all the Associated Companies are lower than the prices charged other companies, not a part of the Bell System, to whom the Western Company sells in competition with other manufacturers of telephone

equipment.

In 1914 the prices to the Company for telephone material and supplies covering all parts of the telephone plant were lower by 21 per cent., and in 1919 by 38 per cent., than the prices charged independent companies for the same material and supplies (R. II, 673-4; Plaintiff's Exhibit 143, R. II, 870).

The record shows that the Western Company sells its manufactured products (with the exception of a few articles under certain patents owned or controlled by the American Company which it has not released for use outside of the Bell System), to the general telephone trade, that is, outside the Bell system, to anyone who may care to buy. In 1914 such sales to the independent companies amounted to \$2,300,000; in 1918, to \$3,300,000.

These sales at higher prices were made in a competitive market. There are three principal independent manufacturers of telephone equipment of all kinds, the Kellogg Manufacturing and Supply Company, Stromberg-Carlson Company, and the Dean Company (R. II, 682), in active competition with the Western Company for the independent The fact that the Western Company sold its products to the amount stated in open competition with these companies establishes the fairness of even these higher prices of the Western Company's products (R. II, 674; Plaintiff's Exhibit 143, R. II, 871). Notwithstanding the price differential against them, the independent companies increased their purchases by about 43% between 1914 and 1918, showing thereby that the Western Company's prices met the test of competition.

The rise in costs due to the world war compelled the Western Company to increase its prices. It is extremely significant that under these conditions its prices to the Associated Companies increased only 52% as against an increase in its prices upon the same things to independent companies of 82%, and as against an average increase of 121% by other manufacturers of telephone apparatus (R. II, 673; Plaintiff's Exhibit 143, R. II, 870).

As further proving the advantage in prices made the Associated Companies, a study of the books and records was made to ascertain the costs of telephone apparatus to a company, the Utica Home Telephone Company, when it was an independent (non-Bell) company as compared with what the comparable articles of the Western Company's make would have cost (R. II, 674; Plaintiff's Exhibit 144, R. II, 871-4; 674-76). The Utica Com-

pany was established by the Stromberg-Carlson Telephone Manufacturing Company and was largely equipped with articles of its manufacture. Its books and records covered a period of eight years. The study showed that the cost of central office and substation equipment to the independent company, when purchased from companies other than the Western Company, was 18.69 per cent. higher than the cost of such equipment had it been purchased from the Western Company; and specifically as to lead cable that the cost to the said company when purchased from other manufacturing companies was 8.08 per cent. higher than if purchased from the Western Company.

By virtue of the contract (see Section 4, R. II, 829) this Company is also enabled to return to the Western Company old apparatus for renewal, or when a piece of apparatus has outgrown a particular situation, to have it disposed of to the best advantage by the Western Company, which has a wide market and established connections, an arrangement which this Company could not otherwise obtain (R. II, 664, 665). Through the control of the manufacturing design and the manufacturing process, it is possible for the Western Company to find a use for the renewed and outgrown equipment, and the savings to the Company through this service are large (R. II, 665).

On its manufacturing business the return to the Western Company is less than 8 per cent. of its investment. This was the testimony of Mr. Cox. It was not an unsupported general statement, as stated in the City's brief, but was ascertained by a careful study and computation made by the witness Cox of the Western Company's costs and prices and of the capital it has invested (R. II, 694).

The record does not justify counsel's criticism

of this witness. This testimony was brought out on cross-examination by counsel for the City. City attorney was cross-examining Mr. Cox as to the amount of profit made by the Western Company on switchboards. At page 683, Vol. II of the Record, the City attorney asked Mr. Cox if he was able to testify as to the profit on that item, and the witness replied that he had recently completed a study, so that he could give the total profit of the Western Company but could not give it as to switchboards separately. Counsel for the City then stated that he would like to know what the profits were and to see the expense bills "both in 1914 and 1919, on the switchboard and on the different items manufactured", also on the transmitters and receivers, and inquired of the witness whether or not he. had such expense bills. The witness answered that he did not have them (R. II, 683-4).

The cross-examiner thereupon dropped that line of inquiry. The witness had explicitly stated that, while he knew and could give the total profit of the Western Company, he did not have, and therefore could not exhibit, the expense bills.

But later in the cross-examination, at page 693, the City attorney returned to the subject and, asserting that the Company had it within its power to demand excessive prices, further cross-examined as follows:

[&]quot;Q. Now, you say you are here to tell us that you have not abused the power you have in that regard?

A. Yes.

Q. Well, can you tell us now, just in a general way, or can you give us the figures such as I referred to a while ago, the expense bills of the manufactured products?"

The witness answered that the profit was less than 8 per cent. upon the investment.

The cross-examination continued as to how the witness had ascertained that fact, and he explained the matter at length in answer to many questions. He explained how the books of the Western Company were kept, how he got at the facts. He had devoted ten days to the investigation at the Company's offices at Hawthorne with a force of forty men to assist him and with two men working with him for some weeks thereafter on the matter, and had found the fact to be as stated (R. II, 693-95). No objection to the testimony was made, no motion was made to exclude or strike it out, and no exception was taken to its retention in the record. The matter was not brought to the attention of the trial court. The attempt to avoid the force of it now, on the sole ground that it was not the best evidence, comes too late.

With respect to that phase of the contract by which the Western Company acts as purchasing agent for the Associated Companies, buying, keeping in readiness and shipping to the Associated Companies supplies when needed, the testimony shows that this is of great advantage to this Company and saves it large sums (R. II, 666). It results in an enormous concentration of buying The requirements of all of the Associated Companies of the Bell System are in a sense pooled. as all have entered into the same kind of a contract with the Western Company. They are not in the same market bidding against each other. The result is that instead of having to buy through jobbers, as the Company would be required to do were it buying only for itself, the Western Company goes for it directly to the source of the supply, the manufacturer, and deals with him on the basis of a large and preferred customer. This does not mean a benefit only in price. That is substantial. But it means also a benefit in service as a whole, which may be even more important (R. II, 666). It saves the cost of maintaining a large purchasing department, heavy travelling expenses, warehousing charges, inspectors, etc.

The contract with the Western Company is also of great advantage to the Company in enabling it to take care of emergency situations, such as the great storm in Houston in 1915 (R. II, 668). The Western Company maintains branch storehouses at strategic points in each company's territory. It has storehouses in Houston (R. II, 665, 666). These storehouses contain the various items of telephone equipment and supplies in sufficient quantities to meet almost any emergency, and back of these storehouses is the centralized warehouse in Hawthorne, Illinois, where great stores of material and supplies are kept (R. II, 668). Were it not for this service on the part of the Western Company this Company would be required to carry a much greater amount of merchandise and material than it now carries, and would incur the added expense incident thereto (R. II, 669, 677).

The savings to the Company as the result of constituting the Western Company its purchasing agent run all the way from 2 per cent. to 12 per cent. on the various items (R. II, 677, 678), while the profit to the Western Company from acting as purchasing agent is less than three-tenths of one per cent (R. II, 695).

The third class of transactions—certain services which the Company engages the Western Company to perform for it, which the Western Company's extensive organization and business connections covering the whole country enable it to perform with the greatest efficiency, economy and dispatch—can be dismissed with a few words. These transactions do not seem to be attacked in the City's brief. It is apparent upon the face of the exhibits, already referred to, that the Western Company performs these services practically at cost and that this Company and the public are the largest beneficiaries of this phase of the contract.

City's Testimony on Western Company Prices.

As against all the foregoing testimony offered by the Company showing that the Western Company's prices are fair and reasonable, the City cites in its brief and relies upon certain testimony given by its witnesses Kelsey and Lyndon concerning the Western Company's prices upon two classes of its manufactured products, viz., telephone instruments—that is, transmitters, receivers and induction coils—and switchboards. We shall now analyze this testimony.

Instruments—transmitters, receivers and induction coils.

The City cites the testimony of its witness Kelsey upon the prices of the independent manufacturers, who compete with the Western Company, for what he considers instruments of equal merit (City's brief, p. 45).

The comparable prices as stated in the City's brief are, Western Electric Company, \$5.50, Independent \$2.50; but the price placed upon a set of these instruments by the Company's witness Rhodes is \$4.50, not \$5.50 (R. I, 278). Moreover, Mr. Kelsey was testifying not as to the actual price made by any independent manufacturer, but merely to his opinion of what a proper manufacturer's

price should be (see his testimony quoted in City's brief, p. 45). His opinion is not shown to be based upon anything tangible in the way of actual knowledge of the subject.

But if the foregoing testimony of Mr. Kelsey could be said to have any real weight as evidence, it is entirely destroyed by his testimony elsewhere, so that the Master and the trial court could not reasonably have been expected to accept it.

Mr. Kelsey testified that, at and prior to the time of the trial, he was engaged in the business of buying these Western Company instruments after they had been discarded by the Bell Companies as no longer serviceable. He would then work them over and resell them to the general trade. He had sold as many as 125,000 instruments a year (R. II, 1068-9). He testified:

"A. Oh, no; we find that we can make more money by buying telephones that you folks throw away."

It will be recalled that the American Company owns these instruments, and supplies them to the Associated Companies, maintains them and keeps them in repair, as a part of the service it renders under the License Contract. It is fair to assume that it does not discard the instruments until they are so far gone that they are no longer capable of rendering telephone service up to the Bell standards.

For these discarded instruments Mr. Kelsey, even in 1914, before the era of war prices, found a ready market at \$2.60 an instrument. He testified:

"Q. What would a receiver and induction coil that has been worked over by you sell for?

A. Two dollars and fifty cents.

Q. That is just the induction coil, transmitter and receiver?

A. The rebuilt cost,—yes; the sale cost of 1914.

Q. That is for all three of them?

A. Yes, sir" (R. II, 1069).

He testified further, on the same page:

"A. We don't sell them brand new. We sell all transmitters for one dollar, all receivers for one dollar, all coils for sixty cents."

Yet, in the face of this testimony of its own witness, that discarded and worked over Bell instruments found a ready market at \$2.60, in 1914, before war prices supervened, and in reliance upon it, the City asserts that the Western Company should sell its brand new instruments to the company for \$2.50!

Moreover, Mr. Kelsey testified that the Kellogg Company, which is the Western Company's principal manufacturing competitor, sold its sets for \$4.60, or 10 cents more than the Western Company's price. He said:

"I think Kellogg got their price up to \$1.95 for transmitters, \$1.95 for the receiver and sixty cents for the induction coils, which would be \$4.60 per set" (R. II, 1070).

As a matter of fact, this testimony has nothing whatever to do with this branch of the case. This Company does not buy telephone instruments, either from the Western Company or any other. They are furnished, maintained, replaced and new types substituted as they are developed, for the use of this Company as a part of the service rendered by the American Company under the License Contract. We might have dismissed this part of the City's argument by pointing out that fact. But we desired to show that, if it has any relevancy here, it not only failed to support the City's claim of exces-

sive prices, but proved—or tended very strongly to prove—that the Western Company's prices were reasonable.

2. Switchboards. The only other testimony adduced by the City in support of its claim that the Western Company's prices are excessive is that concerning switchboards.

The City's claim, as stated in its brief, is that independent manufacturers "could furnish this equipment for \$600,000, or more than \$400,000 less than the figures of the Western Company included in the inventory" (City's brief, p. 46).

In the first place, this statement in the City's brief misrepresents the testimony of its own witness and greatly overstates the claim. The testimony of Mr. Kelsey is as follows:

- "A. It says Capitol unit here, ten sections of eight panel, three position subscribers switchboard, equipped with 8,800 subscribers multiple per section and 4,540 answering jacks; that doesn't appear in the summary at all. That's on page 69. We have Preston, then Preston again. It must mean that is Capitol,—That's a misprint. On page 69 you see you refer there—it seems the Capitol unit is included in the Preston exchange. It is included in with the Preston. That's pretty near a five-thousand line board, and that would make about \$600,000.00 for that office as against \$752,000.00.
- Q. Now, when you speak of these things, I understand that you are speaking of the manufacturing cost, plus the manufacturer's profit?
 - A. Yes.
- Q. And what an independent company would be glad to do the work for?
 - A. The same price, yes, sir" (R. II, 719).

So that, upon this testimony of the City's witness, the comparable figures are \$600,000 as against \$752,000, not as against \$1,027,000.

Following this there is further testimony of Mr. Kelsey, on page 720, concerning certain loading percentages to be applied to this and other property, such as for contingencies and omissions, engineering expenses, general expenses, etc. These have nothing to do with the question of Western Company prices. Kelsey leaves absolutely no room for misunderstanding what he deems the comparable figures to be, for on page 720, after his attention has been called to the other items just referred to, he again testifies:

"Q. As I understand you, then, in this comparison which you have just made, where you say the Preston, which includes the Capitol, would amount to around \$600,000.00?

A. Yes.

Q. By that you mean, that by an independent company it would reasonably cost to manufacture, plus the manufacturer's profit, \$600,000.00 as compared to \$752,000.00?

A. Yes."

The statement of the City's claim should be corrected accordingly.

Large switchboards such as these are made up of a multitude of separate parts-various types of jacks, plugs, kevs, relays, cords, cable, wires, frame, All these items are priced separately by the manufacturers and the current prices determine the price of the completed switchboard. See the crossexamination of Mr. Kelsey (R. II, 1093-96). From this cross-examination it appears that he must have based his idea of the independent manufacturer's price of \$600,000 upon Kellogg prices that were several years out of date, that he had no knowledge of current prices, and that the old prices he carried in his mind (assuming that he did actually know what they were) were far below current Kellogg prices. This renders his testimony valueless.

Moreover, Kelsey's testimony is directly at variance with that of the City's other witness, Lyndon. In 1914 the City of Houston employed Mr. Lyndon to value the Company's property in Houston for purposes of rate regulation by the City. At that time, in order to check up the Company's figures on central office equipment, Mr. Lyndon asked for and obtained prices from the Kellogg company. The two were so close together that the difference was negligible, and he used the Western Company prices to ascertain a valuation for the City.

In his report of that year to the City, beginning on page 1066 at the bottom, Mr. Lyndon says:

"Quotations were obtained from the Kellogg Switch Board and Supply Company, and this Company accorded us every courtesy in making up quotations for us. To make an estimate of this character of equipment delivered and installed, together with all the cable, wire and accessories, is a long and tedious process, and we could not expect any manufacturer to make such a close estimate for general estimate purposes as it would if there were a prospect of a contract for the material. The Kellogg Company's quotations, when loaded with overhead charges, came so near to the figures given by the Southwestern Telegraph and Telephone Company, that we have considered it better to accept the Southwestern Company's costs" (Italics ours. R. II, 1066-67).

The trial court found, with the Master, that the Western Company furnishes materials and supplies to this Company "at prices on the whole less than the same character of supplies could be procured from any other source", and that this Company was "charged fair and reasonable prices for services and materials".

Such testimony as that relied upon by the City is

wholly incapable of overturning these findings. The overwhelming proof sustains the findings.

The Contract is not an Exclusive Contract. It Does
Not Bind the Company to Purchase from
the Western Company.

Section one of the contract (R. II, 681) provides expressly that "nothing herein contained shall be construed as requiring the Telephone Company to purchase or use any article or articles manufactured or sold by the Western Electric Company, unless it shall desire to do so".

The contract never was an exclusive contract, and is not now. That is, it creates no obligation on the Company to buy any of its material and supplies from the Western Company. The Company is at liberty to buy from any other company or individual (R. II, 679, 681). Such patronage as the Company and the other Associated Companies give the Western Company is given in their own interest (R. II, 681).

The Prices Paid to the Western Company Have No Bearing on Any Issue Raised by the City.

The materials and supplies purchased by this Company and placed in the property become a part of its capital, its investment, except materials and supplies used in operating the property and charged to operating expenses, the amount of which is negligible in this case. Therefore, the prices paid the Western Company enter into the cost of the Company's property, and the amount of this cost is not in dispute except as to the item of \$754,000, part of the purchase price paid for The Houston Home Company's property upon consolidation. This item bears no relation to the question here. Therefore, the Western Company's prices are immaterial upon any issue raised by the City.

The Clayton Act.

In conclusion upon this assignment of error, the City asserts that these transactions constitute a criminal offense under Section 10 of the Clayton Act; or rather, that they would be criminal but for the fact that the effective date of that section has been postponed.

This point was not made in the district court and there is no assignment of error which in any way covers it.

But counsel are in error. Section 10 of the Clayton Act applies only to common carriers, and only "when said common carrier shall have upon its board of directors or as its president, manager, or as its purchasing or selling officer, or agent in the particular transaction, any person who is at the same time a director, manager, or purchasing or selling officer of, or who has any substantial interest in, such other corporation, firm, partnership or association * * *."

Even if the point were open to the City on the record there would be no merit in it because:

- 1. The Company is not a common carrier. Telegraph and telephone companies are not common carriers. Primrose v. Western Union Telegraph Company, 154 U. S. 1 (see also Propeller Niagara v. Cordes, 21 How. 7, 22; Hutchinson on Carriers, Section 47; Moore on Carriers, p. 18).
- 2. There is no interlocking between the two companies.
- 3. If the Clayton Act were being violated by these transactions the penalty would be that prescribed in the Act. The offending company would not be wholly outside the pale of the law so that its property could be confiscated with impunity by the City,

by the imposition of rates that have that result. The Company would still be safeguarded in its rights of property by the guaranties of the constitution. Citation of authorities is unnecessary.

VIII.

Confiscation.

(The City's Ninth Assignment of Error.)

Error is assigned upon the conclusion of the district court that the rates complained of are confiscatory, and upon the decree enjoining their enforcement.

We have shown that this assignment is without merit.

We do not wish to let pass the suggestion of counsel (City's brief, p. 56) that the peak of high prices resulting from the World War passed in the year 1919, and that prices have declined since 1919 so that they no longer furnish any criterion for determining the questions in this case. Counsel assert that this court will take judicial ratice that this is so, but we respectfully suggest that the case will be decided upon the record. The record shows that prices at the time of the trial in 1920, both for labor and materials, were very greatly in excess of those for the year 1919—the year as of which the property was valued and the case tried. Costs of labor and materials in the telephone business have not decreased on the whole since the trial.

We respectfully submit that the appeal of the City is without merit and that the decree of the district court should be affirmed.

PART II.

Upon the appeal of the Southwestern Bell Telephone Company, plaintiff (Case No. 220).

Statement.

The court is referred to the statement set forth in the opening section of this brief.

After the City had appealed, the Company filed a cross appeal in which it assigned error, (1) upon the action of the trial court in sustaining certain of the City's exceptions to the report of the Master and (2) upon the provision of the decree which enjoins the City from interfering with the Company "in charging and collecting such rates as will not produce more than a fair return upon its capital actually invested", whereas the Company claims that the basis of the injunction should have been the fair value of its property used or useful in rendering the service.

It is essential that the Company call attention to the assignment last stated, and its other assignments of provide dependent on it, to avoid the assertion, in any controversy that may hereafter arise, that the decree in the instant case as an adjudication binds the Company to an acceptance of investment instead of value for all time.

The matters involved in the Company's assignments of error are (1) the valuation of the property, (2) going concern value, (3) the amount of working capital, and (4) the amount of the annual depreciation.

The Company's Propositions.

The Company maintains the following proposi-

I.

The Company's property is confiscated by the imposition of rates which prevent it from earning a fair return upon the fair value of the property used or useful in rendering the service. The provision of the merger ordinance, upon which the trial court relied in substituting the cost of the physical plant for this fair value, is void (Fourth, Fifth and Sixth Assignments of Error).

II.

The element of going concern value which exists in the property was improperly excluded (First Assignment of Error).

III.

Materials and supplies used or useful in rendering service are working capital and a part of the property upon which the fair return must be computed, and were improperly excluded (Second Assignment of Error).

IV.

The annual amount for depreciation should have been computed upon the value of the property instead of upon the cost of the physical plant (Third Assignment of Error).

Assignments of Error.

(Record, Vol. II, pp. 782-86.)

1.

That the United States District Court for the Southern District of Texas Houston Division, erred in failing to overrule in said decree Defendants' fourth exception to the report of the Special Master and in sustaining Defendants' fourth exception to said report in setting aside the finding by the Special Master, that there should be included in the valuation of Complainant's property the sum of \$765,000.00 for that element of value over and above the value of Complainant's physical property, existing by reason of the fact that Complainant has an assembled and established telephone plant in the City of Houston, doing business and earning money, such value being referred to as going concern value, and in holding that the Complainant's agreement in accepting the merger ordinance of 1915 that the sum on which it should receive a fair return should be the capital actually invested, estopped Complainant from claiming any return upon such element of value, because said contract and agreement is in violation of, and prohibited by Article I, Section 17, of the Constitution of the State of Texas, prohibiting the granting of any irrevocable, or uncontrollable grant, franchise, privilege or immunity, and for the further reason that the court took as the capital actually invested the cost of the property as shown by Complainant's books and, as shown by the evidence, said books, in compliance with the Uniform System of Accounts prescribed by the Interstate Commerce Commission, showed only the original cost of the

physical property, and the order and finding of the court in eliminating the item of going concern value fails to permit Complainant to earn any return whatsoever upon said element of value, and is contrary to and not supported by the law or the evidence.

2

That the United States District Court for the Southern District of Texas, Houston Division, erred in not overruling in said decree Defendants' fifth exception to the report of the Special Master, and erred in sustaining Defendants' fifth exception to the report of the Special Master, and in setting aside the finding of the Special Master that the proper allowance for working capital to be included in the valuation of Complainant's property is \$238,000.00, and in substituting therefor the sum of \$120,000,00. or a reduction of \$118,000.00, because, as shown by the evidence, there was included in the amount allowed by the Special Master the value of certain telephone supplies and materials that are, and must be kept on hand by Complainant to take care of repairs and contingencies, and the court's finding is based on Complainant's average monthly operating expenditures, which do not include the value of such supplies and materials, and the value of same are not included elsewhere in the report of the Special Master. And said order and decree is contrary to the law and the evidence.

3

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Eighth exception to the report of the Special Master and erred in sustaining Defendants' Eighth

exception to the report of the Special Master in setting aside the finding of the Special Master that Complainant was entitled to set aside out of its revenue a sum equal to 6.33 per cent. of \$5,500,-000.00, the reproduction cost new of Complainant's physical property, as a reserve for depreciation, or \$348,150.00 for the year 1919, and substituting therefor the sum of \$289,380.00, the same being 6.33 per cent. of \$4,571,567.00, the actual cost of the property, or a reduction in the amount to be set aside as a reserve for depreciation of \$58,770.00, because the court used the original cost of the physical property as the basis for the reserve for depreciation, whereas the proper basis upon which the reserve for depreciation should be computed is the reproduction cost new of the physical property, and the finding of the court is contrary to, and not supported by the evidence.

4.

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Tenth exception to the report of the Special Master, and in sustaining Defendants' Tenth exception to said report in setting aside the finding of the Special Master that anything less than a return of eight per cent, upon the value of Complainant's property is confiscatory, and in holding that Complainant is only entitled to earn a fair return upon the capital actually expended by Complainant in the Houston plant, plus an allowance of \$120,-000.00 for working capital, making a total of \$4,691,567.00 upon which the Complainant would be entitled to earn a fair return, instead of upon \$6,000,000.00, the fair value of the property, because the court's application of the fair return to which Complainant is entitled, is, and should be, based on the fair value of the property, and under the finding and holding of the court Complainant is being deprived of any return whatsoever upon the difference between the original cost of its physical property, plus an allowance of \$120,000.00 for working capital, and the fair value of the property, which difference amounts to \$1,308,433.00, and Complainant, by the finding of the court and under the terms of the decree entered by the court, is being deprived of an annual return of \$104,674.64, to which it is justly entitled, and the finding and holding of the court is contrary to the law and the evidence.

5.

That the United States District Court for the Southern District of Texas, Houston Division, erred in failing to overrule in said decree Defendants' Eleventh exception to the report of the Special Master, and erred in sustaining Defendants' Eleventh exception to said report in setting aside the finding by the Special Master that Complainant is not estopped to claim more than a fair return upon the original cost of its property, and in holding that Complainant specifically waived the right to claim anything more than a fair return on its capital actually invested in its Houston plant, or the original cost of said property, by the terms of Subdivision "E" of Section "I" of the ordinance passed by the City of Houston in 1915, and accepted by the Southwestern Telegraph and Telephone Company, Complainant's predecessor, authorizing the consolidation of the properties of the Houston Home Telephone Company and The Southwestern Telegraph and Telephone Company in the City of Houston, and reading:

"The Southwestern Telegraph and phone Company agrees that it will not increase rates as at present charged by it for service in the City of Houston, unless it appears upon a satisfactory showing to be made before the City Council of the City of Houston, of all receipts and disbursements, and said showing must, in order to justify or warrant a raise in the rates, reasonably prove that there exists a necessity for an increase of charges in order that said Company may earn a fair return upon its capital actually invested in the Houston plant. And it is agreed for a term of five years from this date that a fair return upon said capital and investment is not less than 7 nor more than 8 per cent".

And in holding that said agreement constituted a contract binding upon the Complainant, because said contract, in so far as it attempts to fix the valuation upon which Complainant shall be entitled to earn a fair return, is contrary to, in violation of, and expressly prohibited by Article "I", Section 17, of the Constitution of the State of Texas, which provides that "no irrevocable or uncontrollable grant of special privileges or immunities shall be made; and all privileges and franchises granted by the Legislature, or created under its authority, shall be subject to the control thereof". And said contract is void and unenforceable, because the Legislature of Texas has never delegated to the City of Houston, and under the provisions of Article "I", Section 17, of the Texas Constitution aforesaid, the Legislature of Texas cannot delegate to the City of Houston the power to make said contract, because by the terms of said contract the City of Houston has attempted to and has

abandoned its police power and governmental authority and duty to regulate the rates to be charged by Complainant, to the end that Complainant shall only be permitted to earn a fair return upon the value of its property, which value at different times may be either in excess of or below the capital actually invested, and the finding and holding of the court is contrary to the law and the evidence.

6.

That the United States District Court for the Southern District of Texas, Houston Division, erred in providing in its decree of September 18, 1920, that the Defendants are restrained and enjoined from interfering with the Plaintiff in charging and collecting such rates as will not produce more than a fair return upon its capital actually invested, instead of restraining and enjoining the Defendants from interfering with Plaintiff in charging and collecting such rates as will not produce more than a fair return upon the fair value of the Plaintiff's property, because Plaintiff's capital actually invested in the Houston plant, as determined by the court, is \$1,308,433.00 less than the fair value of Plaintiff's property, and such order and decree of the court has prevented and is preventing Plaintiff from earning any return whatsoever upon the said difference, and Plaintiff is entitled to earn a fair return upon the value of all of its property being used in furnishing telephone service to its telephone subscribers in the City of Houston, and said order and decree is contrary to the law and the evidence.

ARGUMENT.

I.

The Company's property is confiscated by the imposition of rates which prevent it from earning a fair return upon the fair value of the property used or useful in rendering the service.

The provision of the merger ordinance, upon which the trial court relied in substituting the cost of the physical plant for this fair value, is void.

(Fourth, Fifth and Sixth Assignments of Error.)

The Master found that the fair value of the property was \$6,003,000 (R. I, 36) and that, to avoid confiscation, the Company was entitled to the protection of the court against the imposition of rates under which it could not earn a fair return upon that amount (R. I, 52).

The trial court, while apparently in accord with the Master as to the valuation, found the Company was bound to accept the cost of the physical plant in lieu of the fair value of the property. The court found the cost to be \$4,517,567 and substituted that amount for the Master's valuation (R. I, 36, 54).

The ordinance provision in question already appears in the statement, but for the convenience of the court we reprint it here:

"(e) The Southwestern Telegraph and Telephone Company agrees that it will not increase rates as at present charged by it for the service in the City of Houston, unless it appears upon a satisfactory showing to be made before the

City Council of the City of Houston, of all receipts and disbursements, and said showing must, in order to justify or warrant a raise in the rates, reasonably prove that there exists a necessity for an increase of charge in order that said company may earn a fair return upon its capital actually invested in the Houston plant. And it is agreed for a term of five years from this date, that a fair return upon said capital and investment is not less than seven nor more than eight per cent."

This provision of the ordinance is void, being in violation of Article 1, Section 17 of the Constitution of Texas. The decisions of this court in San Antonio Traction Company v. Altgelt, 200 U. S. 304, and City of San Antonio v. San Antonio Public Service Company, 255 U. S. 547, are decisive upon this point.

There is no controversy between the parties as to the invalidity of this provision of the ordinance. In paragraph 6 of the City's answer to the second count of the Bill of Complaint the City alleges as follows:

"
that said ordinance was passed during a period of normal conditions and was intended to apply and should apply only to normal conditions, and that the City of Houston had no power by ordinance, contract or in any other manner to waive or surrender its right of police regulation over the said Southwestern Telegraph and Telephone Company, including its right to determine the rates which could be charged by the said Company" (R. I, 18).

While the City excepted to the report of the Master as to the valuation of \$6,003,000, its exceptions do not go to this point. The City does not contend that the ordinance provision is valid. Its excep-

tions to the valuation found by the Master go simply to the proposition that it is not supported by the evidence and to the proposition that the Master erred "in attaching more weight to the testimony of the value based on the reproduction theory than that based alone on the historical or cost value" (R. I, 46).

The Master held that this ordinance provision was in violation of the constitution and laws of Texas. The trial court agreed with the Master, but held that the Company was estopped to assert its invalidity (R. I, 53).

Estoppel Was Not Pleaded and Was Therefore Waived. This is the well settled rule in the federal equity courts. Instead of complying with the rule, and pleading that the Company had estopped itself to assert the invalidity of the ordinance provision and claim the right to earn upon the fair value of the property, the City has affirmatively pleaded that the ordinance provision is invalid. This ruling of the trial court was therefore unauthorized, and was error.

We shall show, moreover, that there could be no estoppel in this case.

The provision in question purports to bind the City and the Company to an agreement that, for the purpose of the regulation of rates by the City, the "capital actually invested in the Houston plant", which the court construed to mean the cost to the Company of the physical property in the plant, shall be at all times taken as the base upon which the City may not deprive the Company of the opportunity to earn a fair return. This provision, so construed, if valid, would be a plain

limitation upon the City's right to regulate rates, and a plain bargaining away of its police power in that regard, pro tanto. It might require the City to accept as this base more than value. See the City's argument on the \$754,000 item. This the Constitution of Texas does not permit.

Article 1, section 17 of the Texas constitution contains the provision that:

"
o no irrevocable or uncontrollable grant of special privileges or immunities shall be made; but all privileges and franchises granted by the legislature, or created under its authority, shall be subject to the control thereof".

This is the provision that was before this court for consideration upon the point now presented, in the cases cited, supra. Both cases presented the question of the validity, as against this section of the constitution, of the ordinance provision enacted by the City of San Antonio that "said street railway companies shall charge 5 cents fare for one continuous ride over any one of their lines, with one transfer to or from either line to the other."

In San Antonio Traction Company v. Altgelt, 200 U. S. 304, the Texas court had awarded a peremptory mandamus requiring the Traction Company to issue half fare tickets in pursuance of the City Half Fare Law adopted in 1903. This court, in denying the Traction Company's application for a writ of error to review the judgment of the Court of Civil Appeals of Texas, said, at page 308:

"Assuming, but not deciding, that the ordinance of March 16, 1899, extending the franchise of the San Antonio Street Railway, and imposing certain limitations, constituted a contract pro tanto the question still remains

whether the provision 'that said street railway companies shall charge 5 cents fare for one continuous ride over any one of their lines, with one transfer to or from either line to the other', constituted a contract with respect to which no further legislation upon that subject could be enacted without impairing its obligation. Even if construed as a contract, it was still subject to the provision of the Constitution of 1876, which, in Section 17 of the Bill of Rights, declared that no irrevocable or uncontrollable grant of special privileges or immunities should be made; but that all privileges granted by the legislature or created under its authority shall be subject to the control thereof."

At page 309 the court continued:

"It is true that in this ordinance it was provided that all rights and privileges previously granted to the street railway company and the Edison Company were conferred unto the traction company, including all the limitations, contracts, and obligations; but this ordinance must be construed in connection with the Constitution of 1876, which made all such privileges and franchises subject to the control thereof. Such was the view taken by the court of civil appeals of Texas in this case, which expressly waived the question whether the provision of the former ordinance fixing a 5 cent fare constituted a contract or not, declaring that if it did, it was subject to further legislative control."

In the case of City of San Antonio v. San Antonio Public Service Company, 255 U. S. 547, the Public Service Company in 1918 applied to the City for permission to increase its rate of fare upon the ground that, although the five cent fare was remunerative at the time it was fixed, it had become

inadequate because of increased cost of operation and could not be continued without confiscating the property of the company. The City refused to accede to a higher fare and the company brought suit in the United States District Court to enjoin it from enforcing the ordinance rate. From a decree in favor of the Public Service Company the City appealed to this court, where the decree of the district court was affirmed.

Discussing the question whether the ordinance provision constituted a valid contract as to the rate of fare which the City could enforce even though confiscatory, the late Chief Justice White, delivering the opinion of the court, said:

"Primarily the answer to that question must depend upon whether the ordinance of 1899 fixing the five-cent rate was a contract. That it was not, and could not be, we are of opinion is the necessary result of the provision of section 17, article 1, of the state Constitution, existing in 1899, prohibiting 'any irrevocable or uncontrollable grant of special privileges', etc., when considered in the light of the irrevocable and uncontrollable elements which must necessarily inhere in the ordinance of 1899 to give it the contract consequence relied upon. Indeed, this result is persuasively established by the ruling in the Altgelt Case, to the effect that, if the contract right were conceded, there would, in view of the constitutional restriction, be such an inevitable conflict between that right and the dominant power to regulate as to render the contract right inoperative, and therefore to cause it to perish from the mere fact of admitting its conflict with the authority to regulate."

In both of these cases the ordinance was contractual in terms and had been accepted by the utility companies. They are therefore on all fours with the case at bar.

A municipality cannot, merely by adopting an ordinance which is contractual in form, foreclose the exercise of its regulatory power.

Puget Sound Traction Company v. Reynolds, 244 U. S. 574, 578-9.

Pawhuska V. Pawhuska Oil Company, 250 U. S. 394.

Rates fixed in a franchise ordinance by a city without authority to make an irrevocable contract are subject to the exercise of regulatory powers conferred upon the city by the legislative enactment. In the absence of clear authority the city cannot abridge its own legislative powers.

Wyandotte Gas Company v. Kansas, 231 U. S. 622.

Southern Iowa Electric Co. v. Chariton, 255 U. S. 539.

In the case last cited the court says (at p. 546):

"The total want of power of the municipalities here in question to contract for rates, which is thus established, and the state public policy upon which the prohibition against the existence of such authority rests, absolutely exclude the existence of the right to enforce, as the result of the obligation of a contract, the concededly confiscatory rates which are involved, and therefore conclusively demonstrate the error committed below in enforcing such rates upon the theory of the existence of con-And, indeed, the necessity for this conclusion becomes doubly manifest when it is borne in mind that the right here asserted to contract in derogation of the state law and of the rule of public policy announced by the court of last resort of the State is urged by municipal corporations whose every power depends upon the state law."

In the instant case the trial court recognized the law of these decisions of this court and that they applied to the ordinance provision here in question, and that the provision is void (R. I, 53), but held that the Company, by proceeding under the ordinance, was estopped to assert the invalidity of the contract which the ordinance purported to create.

The effect of this holding was to render this provision of the ordinance a contract binding upon the company, when under the constitution of Texas it was wholly void as a contract and therefore never binding upon either the City or the Company.

The conclusive answer to the proposition and holding of the trial court is the elementary principle—a part of the doctrine of estoppel—that an estoppel is bound to be mutual. There can be no estoppel which is not mutual. The same rule which accords the benefits of the estoppel to him who invokes it, equally visits its burdens upon him. He cannot claim in favor of the estoppel and against it at the same time. He is as fully bound to the status or condition produced by the estoppel in his favor as is the party against whom the estoppel operates. An estoppel could not be binding upon the party whom it adversely affects, and yet leave the party claiming its benefits free to repudiate the consequences which the estoppel produces.

It follows that if by the force of an estoppel the ordinance became binding upon the Company as a contract, the mutual operation of the estoppel made it likewise a contract binding upon the City. Otherwise, there would be no mutuality and so no estoppel.

The municipal bond cases are in point. Recitals in the bond are ineffectual to estop the municipality from denying that the bond was issued in violation of the provisions of the constitution. The principle

upon which these cases go is applicable here. The City is not estopped to assert its lack of constitutional authority to bind itself by this ordinance provision and to assert the invalidity of the provision upon that ground. Since the City is not bound it cannot be held that the Company is bound, either contractually or by way of an estoppel.

Dixon County v. Field, 111 U. S. 83; Lake County v. Graham, 130 U. S. 674; Sutliff v. Lake County Commissioners, 147 U. S. 230.

The argument that there is an unilateral obligation in the nature of a contract binding upon the Company, or that the Company, having accepted the benefits of the consolidation, is estopped to deny the existence of such a contract, cannot be maintained.

The same objections were raised in the $San\ Antonio$ case, but were overruled, the court saying (at p. 556):

"The duty of an owner of private property used for the public service to charge only a reasonable rate and thus respect the authority of the government to regulate in the public interest, and of government to regulate by fixing such a reasonable rate as will safeguard the rights of private ownership, are interdependent and reciprocal. Where, however, the right to contract exists and the parties, the public on the one hand and the private on the other, do so contract, the law of the contract governs both the duty of the private owner and the governmental power to regulate. Where, therefore, as in the case supposed in the argument, the regulating power of government wholly uncontrolled by contract, it would follow that that power would be required to be exerted and hence the supposed condition operating upon

the private owner would be nugatory. Such a case really presents no question of a condition, since it resolves itself into a mere issue of the exercise by government of its regulatory power."

Confiscatory rates cannot be enforced except by virtue of a contractual obligation. But a necessary element of the contractual relationship is mutuality. An attempted contract which is beyond the capacity of one of the parties is void, and partial performance of an invalid contract will not create a valid obligation.

As was said by this court in Central Transportation Co. v. Pullman's Car Co., 139 U. S. 24, 59-60:

"A contract of a corporation, which is ultra vires, in the proper sense, that is to say, outside the object of its creation as defined in the law of its organization, and therefore beyond the powers conferred upon it by the legislature, is not voidable only, but wholly void, and of no legal effect. The objection to the contract is, not merely that the corporation ought not to have made it, but that it could not make it. The contract cannot be ratified by either party, because it could not have been authorized by either. No performance on either side can give the unlawful contract any validity, or be the foundation of any right of action upon it."

See also Pullman's Car Co. v. Transportation Co., 171 U. S. 138, 149 et seq.

Under these circumstances the provision in the ordinance of 1915 fixing rates pro tanto operates simply as an act of regulation, binding upon the Company only until modified by subsequent act of regulation, or until the Company refuses to be bound owing to a change of conditions that renders them confiscatory.

The power to regulate rates imports a correlative obligation. An exercise of the continuing regulatory function, as was pointed out in the San Antonio and Chariton cases, will not give rise to an unilateral obligation by way of contract or estoppel for the purpose of defeating the declared public policy of the state.

The policy of the state as to regulation by municipalities, evidenced by the statutes already quoted (p. 59), fixing 10% as the minimum return to result from such regulation, could be overturned if such a contract could be made by an estoppel or in any other way.

II.

The element of going concern value which exists in the property was improperly excluded.

(First Assignment of Error.)

The Master recognized going concern value as an element of value existing in the property of the Company, in accordance with the holding of this court in Des Moines Gas Co. v. City of Des Moines, 238 U. S. 165, and Denver v. Denver Union Water Co., 246 U. S. 178. He found that this element of value was \$765,000 and accordingly included that amount in his final valuation of \$6,003,000 (R. I, 36).

The trial court, having held that the cost of the physical property must be substituted for its fair value by reason of the provision of the merger ordinance discussed in the preceding section, ex-

cluded this element of going concern value. He said:

"In the statements previously filed with the City of the valuation of its property, it does not appear that any going concern value had been included, and it seems clear that none was contemplated in the merger ordinance" (R. I, 54).

He indicates disagreement with the Master as to the amount of going concern value, if it were to be allowed, but rejects it altogether upon the ground stated.

The amount allowed by the Master is substantially below the lowest figure testified to by any witness for the Company, and according to our judgment is a less sum than should have been found, although the Company did not except to the master's report upon this item. On the part of the City, its witness Kelsey testified that he did not recognize going concern value (R. II, 1048). And its other witness Lyndon, without attempting to compute the amount, hazarded \$75,000 as his guess as to the proper amount (R. III, 1660-1; also 100-101).

Since the trial court, for the reasons stated, made no finding as to the amount, it would serve no purpose to discuss the evidence in detail bearing upon it.

If this court sustains our first proposition and holds the merger ordinance provision invalid and that the trial court erred in taking cost in lieu of value, then, of course, the action of the trial court in excluding this item altogether must be held to have been error.

III.

Materials and supplies used or useful in rendering service are working capital and a part of the property upon which the fair return must be computed, and were improperly excluded.

(Second Assignment of Error.)

There is no question of the obligation to include working capital in the valuation. The question is simply as to its amount.

The Master allowed working capital in the sum of \$238,000 (R. I, 36). The trial court reduced this to \$120,000 (R. I, 55).

As we understand what the trial court says upon this subject (R. I, 55), his error here arose out of the fact that he took into account only the average amount of cash spent monthly by the Company, and disregarded altogether the fact that the supplies and materials, which the Company had on hand and carries currently, constitute a part of the Company's property devoted to the public service and are included in working capital. It is true that the court first speaks of supplies necessary to meet contingencies (which would be only a part of the total materials and supplies) as being a part of working capital, but it seems fairly clear that he afterwards disregarded this item altogether and made no allowance on account of it.

The point we raise upon this assignment is, therefore, one of law. If the amount allowed by the trial court was only the cash item and represents nothing on account of materials and supplies, which the uncontradicted proof shows the Company had and required in its business, then the court committed error.

IV.

The annual amount for depreciation should have been computed upon the value of the property instead of upon the cost of the physical plant.

(Third Assignment of Error.)

The Master found 6.33 per cent. of the value of the property, or \$348,150, as the amount to be allowed on account of annual reserve for depreciation (R. I, 41).

The trial court adopted the report of the Master as to the rate of 6.33 per cent., but held that it must be applied to the investment or cost of the property, not to the value. This was pursuant to the court's decision that the Company was bound by the merger ordinance to accept cost in lieu of value. The court, moreover, expressed the opinion that 6.33 per cent. would be too high a rate if applied to the value found by the master (R. I, 58).

The error of the court here arises out of the fundamental error of taking cost in place of value. If this court sustains our position upon this fundamental proposition, then this assignment of error must also be sustained. The result is, therefore, that this assignment of error turns upon a question of law, and it is for this reason that we do not discuss the evidence.

Respectfully submitted,

Supreme Court of the United States

OCTOBER TERM, 1921.

No. 219

THE CITY OF HOUSTON,

Appellant.

VS.

SOUTHWESTERN BELL TELEPHONE COMPANY, Appellee.

SOUTHWESTERN BELL TELEPHONE COMPANY,
Appellee.

VS.

THE CITY OF HOUSTON,
Appellee.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF TEXAS.

SUPPLEMENTAL BRIEF ON BEHALF OF THE APPELLANT, CITY OF HOUSTON.

The appellee, Southwestern Bell Telephone Company, hereinafter in the interest of brevity called "the Company," has filed a brief in which is set out its reply to the brief heretofore filed by the appellant, City of Houston, hereinafter called "the City," and also the assignments of error, propositions and argument in support of the Company's cross-appeal.

Before answering the Company's propositions in support of its cross-appeal, we desire to reply briefly to its argument in answer to the brief filed by the City and correct some statements contained in such argument which we conceive to be inaccurate. In this reply, we wish to add nothing to what we have said, in our original brief, regarding the property cost, the rate of return, and the annuity for depreciation, but will confine our remarks to the revenues and expenses, the $4\frac{1}{2}$ per cent deducted by the A. T. & T. Co., the long distance tolls, and the relations of the operating company with the manufacturer, the Western Electric Company.

EXPENSES AND REVENUES.

The Company (Its brief, pp. 13 to 19, inclusive) presents the proposition that allowing all the contentions of the City, nevertheless the rate fixed by the ordinances and sought to be enjoined is confiscatory, and undertakes to support this proposition by four tables set out in its brief. The

proposition ignores two important elements.

That the operating expenses were for parts of the years 1919 and 1920, at the very peak of prices, and the cost of labor and material had advanced to a point never before known in the history of the country, but that the cost of material and labor has since the middle of 1920 greatly declined, in many instances to normal and below pre-war prices. Decline in prices of all material is bound to follow decline in prices of the great staples of the world. great staples have declined. Cotton from 40 cents in 1920 to 15 cents now; oil from \$3.00 per barrel in 1920 to \$1.00 now: wheat has greatly declined. Copper, a great staple, and largely used in telephone construction, is, we understand, practically at the pre-war price. Lead, also greatly used in the telephone business, is practically at the pre-war price. Pig iron, regarded as an index to price levels in the industrial world, has dropped 50 per cent or more in the last year. Lumber has declined in about the same proportion. Also steel. Wages are being cut all over the country. At this time instead of there being more jobs than there are laborers, as was the condition at the time of the trial, there are many more laborers than there are jobs. men throughout the country are clamoring for employment. Not only have wages been very considerably reduced, but the efficiency of labor has greatly increased. The court will take judicial notice of these facts. Lincoln Gas. & E. L. Co. vs. City of Lincoln, 230 U. S. 255, 64 Law Ed. 968. The company, although it objects to our suggestion that the court will take such judicial notice of these matters, made in support of our Ninth Assignment of Error (our brief p. 56) wherein we erroneously state that the peak of prices was reach in 1919 instead of 1920, invokes the same rule on page 7 of its brief, wherein it is stated that the fact that everything increased as a result of the World War "is a matter of common knowledge."

The Company states in its brief (p. 106), in this connection, that costs of labor and materials in the telephone business have not decreased on the whole since the trial. This is strange. Everything else has decreased, including material and labor in every other industry. If there is any competition in the purchase of telephone equipment and supplies, why should not such materials and supplies also decline?

2nd. All material and supplies were purchased, without competitive bidding, from the Western Electric Company. which, as fully shown in our original brief, is owned by the same company that operates the Houston telephone exchange, i. e., the American Telegraph & Telephone Company, hereinafter referred to as "the A. T. & T. Co." The room for profits in the purchase of material used in the operation of the plant and the extensions is, as we think we have shown in our original brief, sufficient to overcome any deficit and show a reasonable return. At any rate, until it is fairly shown what the profits resulting from the purchase of such material and supplies amount to, it cannot be said that the amounts collected from the people of the City of Houston directly and indirectly are not sufficient to afford such return upon the investment. For further discussion of this matter, we refer to our original brief, pp. 41 to 55, and also to pp. 11 to 19 of this brief.

CREDIT TO THE EXCHANGE FOR TOLL SERVICES.

It would appear from the Company's brief, pp. 24 to 27, that we are contending that the people of Houston are required to pay a return upon the property that is distinctive toll property. We are making no such contention. clearly understand that the property used exclusively for toll purposes, although it is located within the limits of the City of Houston, is not included in the property which it is claimed is being confiscated. Our contention is, as we flattered ourselves we made clear in our original brief, that the property used in operating the local exchange is also used in another capacity, that of helping to earn the long distance tolls. Not that it is the only property used in earning these tolls, but that it is also used in connection with the distinctive toll property. Further, that the value of the distinctive toll property is small when compared with the value of the use of the local property for the purpose of earning these tolls. Again, we do not mean to say that the value of the entire toll property is small when compared with the local property. Let us endeavor to make ourselves clear. There is a net-work of long distance toll lines running all over and across the State of Texas, connecting the larger cities of Houston, Dallas, San Antonio, and Ft. Worth, as well as the hundreds of smaller cities and towns. Each of these cities and towns are originating and terminating calls for the toll lines. Now prorating the value of the toll lines to all these cities and towns upon any fair basis, such, for instance, as the value of the local property, the value of that part of the toll lines so apportioned to each city, town or village would be small when compared with the local property, or even to the value of the use of such local property in originating and terminating the long distance calls. So, then, to state it again, our proposition is that while the company has even within the limits of Houston certain property that is distinctive toll property, it is, in addition thereto, using every bit of the local property in earning its long distance or toll revenues. Not only is this true, but the principal distinctive toll property, the switchboard, is housed in a building charged to the local exchange, and,

moreover, a great part of the expense in handling these long distance tolls is charged as local exchange operating ex-Now we say that this condition being created by the company, it has not on any basis that can be characterized as reasonably accurate, undertaken to say how much the use of the local property in handling these long distance tolls is worth, what rent it should pay for using the building of the local exchange for housing the distinctive toll property, and the toll operators and employees, or what it costs the local exchange to originate and terminate these calls and to perform such other services as it does perform in connection therewith. It, as stated in our original brief, simply arbitrarily credits the local exchange with 25 per cent of the outgoing calls without showing or attempting to show that it even pays the cost of the services performed by the local operators in handling these calls, and with affirmative testimony on the part of the City showing that it does not do so, as we have shown in our original brief. This would leave no compensation for the use of the local property in handling the long distance tolls.

Having failed to make any showing as to what would be a fair division of the tolls, considering the elements entering into such problem, such as the value of the use of the local property for toll purposes, the rental for the building used for the long distance equipment and its employees and the cost incurred by the local exchange in handling these calls, the company seeks to justify the 25 per cent allowance on account of the agreement having been entered into in a number of instances; but we say again such contracts are no evidence of the fairness of this transaction with the Bell System owning four-fifths of the telephone companies in the United States and owning large amount of stock in other so-called independent companies. The freedom of contract is destroyed and the instances cited reflect, after all, only the desires and policies of the Bell System, which is owned and controlled by the A. T. & T. Co., which also owns and controls the company furnishing not only the long distance service, but also, the local service to the people of the City of Houston.

The Company (its brief p. 31) says:

"The City has no power to regulate rates for toll services which extends outside the City and throughout the State of Texas and throughout the country."

This is true. We have never contended otherwise. However, the question presented here is one of confiscation. If the property of the local exchange, as well as its employees, are, in addition to furnishing local telephone service, engaged in another enterprise which yields other and additional returns, then, manifestly, it is not fair to make the people of the City of Houston pay a return upon the full value of the property so used or to permit the operating expenses, incurred in such additional enterprise, to be deducted from the revenues earned by the local exchange, and the City Council, in fixing rates, would have the right to take into consideration the additional use which was being made of the property, and to deduct from the operating expenses the expenses incurred in the other enterprise, and if the rates were sufficient after deducting only the portion of the expenses actually incurred in operating the local exchange to pay a fair return upon the value of the property properly depreciated, on account of the additional use, this clearly would not amount to confiscation. We are not speaking now of distinctive toll property. We are speaking of the local exchange, but say that the value of that, as distinguished from the distinctive toll property, should be depreciated on account of the additional use to which it is being put.

The Company says that the devision of the tolls cannot be made upon any accurate basis. We think a reasonably accurate adjustment could be made, such, for instance, as depreciating the local exchange property to the extent it is being used in the long distance enterprise, but be this as it may, the plaintiff is here claiming confiscation, and it will not do for it to say that it is not able to determine how much of the property of the local exchange is being used for the toll service, or how much expense is incurred by the local exchange in handling the long distance tolls.

THE FOUR AND ONE-HALF PER CENT DEDUCTION UNDER WHAT IS TERMED THE AMERICAN TEL. & TEL. CONTRACT.

Counsel for the Company in their brief, page 40, make the following statement:

"The City does not suggest that the contract should be abrogated and the services dispensed with. It does not question that the services are fully worth to the Company the amount of the payment. That they are of great advantage to the Company. That they are necessary to enable the Company to render efficient and economical telephone service to the public, and that they cannot be obtained anywhere else for less than this payment amounts to. The City's sole contention is that because the American Co. owns the stock of the Southwestern Co., it should render the service at cost, and if the Southwestern Co. did not show what the cost to the American Co. was, there was a failure of proof essential to the cause of action."

Counsel are mistaken. The record shows (pp. 487-519) that the City did question the necessity for the services other than the use of the induction coils, transmitters and receivers, and also questioned the services being worth the amount deducted by the plaintiff, also it questioned the fact that such services were of great advantage to the Company and that they were necessary to enable the Company to render efficient and economical telephone service. The witness Kelsey testified that the services were of no particular value to the operating plant, that the organization was an efficient one for the purpose of carrying on the many enterprises of the A. T. & T. Co., but that it was a burden upon the operating branch. (Record pp. 487-549.) The City undertook to determine from the plaintiff's witness what the Houston exchange received in return for the 41 per cent deducted, but was unable to discover where any services of any material value were rendered to the Houston exchange. The plaintiff claimed that they had developed many patents, but under cross-examination it was discovered that there were no patents used in the operation of the local exchange that were protected. (Record pp. 376-378.) They claimed that they furnished engineering services, but it was also disclosed upon cross-examination that the operating company, Southwestern Bell Telephone Company, had a competent corps of local engineers in Houston, another corps of engineers known as the state engineers and his force in Dallas, Texas, and a district engineer, with his force located in St. Louis. (Record pp. 198-199.) None of these were in any manner paid out of the 41 per cent. It was claimed in a general way that they aided in the accounting, but nothing definite was shown. It was claimed also that the A. T. & T. Co. helped finance the operating company, but, as we have shown, it being the owner of such company, it is difficult to see where it was entitled to compensation for financing, if, indeed, it did so. There is some testimony in the record to support the proposition that this so-called standardization is detrimental to the operating company (Record p. 492.) and it would seem ordinary human experience would support such testimony. Under this system there is no pride of local ownership, much less any incentive in the way of increased profits for the local operators to build up the plant and improve the service, the local operating force under this system become mere figure-heads, having not even the power of a highclass subordinate. General rules, which should be relaxed, in the exercise of proper discretion to meet local conditions, cannot be relaxed. All changes, even those involving the necessity for quick relief from objectionable conditions, if relieved at all under this system, must be in pursuance of a long and tedious course from one subordinate to another until it reaches the executive officers of the entire system. The result is over-standardization, lack of interest in the local property and the setting in of "dry rot." Without conceding that the so-called services are worth the amount which is deducted in consideration of them, but asserting that the contrary is the fact, we reiterate that regardless of these questions, the cost only of such service should be deducted from the operating expenses. Why this indirection? The A. T. & T. Co. owns the operating exchange as

well as many others to which it claims to render this service. This record shows that the company is very adept in the matter of allocations, and it should at least be able to determine the entire cost of this service, and allocate to the different local exchanges their proportionate part in the same manner it allocates so many other general charges. That it does not do so is, within itself, sufficient to show that there is a purpose in this indirection. By it the real owner of the exchange gets a revenue which it has failed to analyze, and if this character of practice is permitted the power to regulate is destroyed.

RELATIONS OF THE WESTERN ELECTRIC COMPANY, MANUFACTURER, WITH THE OPERATING COMPANY.

As stated in our brief, the A. T. & T. Co. owns both the manufacturer, the Western Electric Company, and the Southwestern Bell Telephone Company, the operating company, in the sense that it owns practically all the stock in both these companies. This is not denied. In its discussion of the City's assignment of error complaining of the deduction of the 41 per cent under the so-called A. T. & T. Service Contract, the company advances the proposition that it also advances here that the Western Electric Company, the manufacturer, and the Southwestern Bell Telephone Company, the operator, are separate legal entities, and the fact that practically all the stock of both companies is owned by another company does not impair the right of the manufacturing company and the operating company to contract with one another, and cite many cases to support this proposition. We do not propose to discuss the question of whether or not these two companies are technically separate legal entities. We are content to invoke the exception announced by the cases cited by the company on p. 43 of its brief, which is:

"That to correct and prevent a wrong, courts have announced seeming exceptions to the rule broadly stated as (1) that the separate corporate existence will be used as a legal fiction and disregarded when necessary under such conditions to remedy some wrong, and (2) that under such conditions it may be disregarded if a corporation is so organized and controlled and its affairs are so conducted as to make it merely an agency, instrumental or department of the stockholding corporation."

What stronger facts would be necessary to invoke the exception to the rule above referred to, announced by the adjudicated cases and conceded by counsel for the Company? Here we have the A. T. & T. Co. owning practically all the stock in another company which operate a large system of telephones, including the Houston exchange. Owning also practically all the stock in the Western Electric Company, which furnishes all the material for constructing such telephone exchange, as well as all material and supplies for the operation of same. Not only this, but it has practically monopolized the telephone business of the United States, as well as the business of furnishing material and supplies for the construction and operation of such tele-The owner of both these companies phone business. through its instrument, the operating company, is permitted to collect directly from the public whom it serves certain charges for telephone service. Through its other instrument, the manufacturer, it furnishes to the operating company all the material for the extension and operation of its plant. If the prices charged for such material and supplies are not fair and reasonable, the A. T. & T. Co. exacts from the public indirect charges in addition to the direct charges above referred to in the following manner: first. if the plant is constructed or extended out of material purchased at excessive costs the amount necessary to show a return upon the inflated value would be more than it would be to show a return upon the fair value, thus requiring a greater charge for the service; second, if the material and supplies used in the operation of the plant are furnished at excessive prices the operating expenses will be thereby increased, correspondingly reducing the net returns and thereby increasing the charges necessary to show a net return upon the property devoted to the public use. All the money thus received, both that from the direct charge and that from the indirect extortion, finds its way into the treasury of the A. T. & T. Co. through its two conduits the Western Electric Company and the Southwestern Bell Telephone Company. If the material for the construction and extensions of the local Houston exchange and the material and supplies for its operation are furnished by a company owned by the A. T. & T. Co. to another company which it also owns, at excessive prices, does this not create such conditions as make it necessary "to remedy some wrong," and do not the facts above stated show that the Western Electric Company and the Southwestern Bell Telephone Company are so "conducted as to make them merely agents, instrumentalities or departments of the stock-holding corporations?" If so, these are the things that invoke the exception referred to by counsel. We reiterate that the court will not look merely to the form of this matter and ignore the substance.

We do not base our contention upon the proposition alone that the mere creation of this relation is sufficient to deny the company equitable relief, although we think it should. On the bare ground of public policy. It is against a sound public policy to permit such relations. It not only tempts those who are so engaged to impose upon the public, but it creates a condition where it is almost impossible for the public to determine the extent of the imposition. ever, this aside, the Company should have made a full and fair disclosure regarding the dealings between the manufacturing and operating branch. This it has failed to do. Upon the other hand, the City has shown that, as a result of this relation, the public is being required to pay excessive prices for the material and supplies that go into the operation of the plant, thereby depreciating the revenues that could be otherwise used for paying a return upon the property, such property being also inflated by the excessive cost of the material used in constructing and extending it.

We submit that a review of the Company's testimony set out in its brief confirms and corroborates the statement

contained in the City's brief that no fair disclosure was made concerning the relations with the Western Electric Company. Such evidence is all of a general character by witnesses not in position to know the facts. There is no testimony upon the part of any executive or other officer of the Western Electric Company that has to do with the manufacturing of material and supplies. There are no books or records of the Western Electric Company in evidence, merely general statements of the Company's employees and certain expert valuation engineers. We wish to correct some statements contained in the brief of the Company which we regard as erroneous. While the witness, Mr. Cox, an employee of the A. T. & T. Co. was testifying and it developed that the Western Electric Company was furnishing practically all the material and supplies to the Houston exchange, and such witness was claiming that the arrangement was advantageous to the operating exchange. he volunteered the statement that the profit of the Western Electric Company on its manufacture of such material and supplies was 8 per cent. The Company on page 95 of its brief undertakes to show that this statement was not a voluntary statement of the witness but that it was elicited on cross-examination. As is shown by the questions and answers set out on page 95 of the Company's brief, the witness first stated that he was there to state that the power the A. T. & T. Co. had in regard to furnishing materials and supplies was not abused, and he was asked by counsel for the City whether he could testify in a general way only or whether he could give the figures such as had been referred to and the expense bills of the manufactured products, thus showing that he was asked merely in regard to the character of his information, whereupon he volunteered the unsupported statement that the profit of the Western Electric Company was 8 per cent.

Counsel for the Company, on pp. 101 and 102 of their brief, undertake to show that the testimony of the witness Kelsey, who compared the price of a switchboard furnished by the Western Electric Company with the price of such a board if purchased from other companies, was that

the price that would be charged by companies other than the Western Electric Company was \$600,000.00 as against \$752,000.00 charged by the Western Electric Company, and not as against \$1,027,000.00 as stated in the City's brief, and counsel follow this statement with the following statement:

"The statement of the City's claim should be corrected accordingly."

We have again referred to the testimony of the witness Kelsey and find that it supports our statement that the figure of \$600,000.00 of the independent companies is as against \$1,027,000.00 charged by the Western Electric Company, and not as against \$752,000.00 as stated in the Company's brief. We set out the following testimony bearing upon this question:

"Q. What other equipment, as set up in that inventory, is furnished by the Western Electric Company?

A. They have them all in there, I imagine. The central office equipment, that's in there, and current things, subject to all of these contingencies and omissions, engineering expense, general expense, taxes during construction. When that is built, contracted to be put in here and installed, I don't think that it is subject to the same treatment that the rest of the plant is; that apparatus is put in under a contract-fixed prices and—

Q. (Interrupting.) But all of these charges, for instance, Preston central office, they are all included in the \$750,000.00?

A. They have got other charges in there; 3½ contingencies and omissions, engineering expense—

Q. (Interrupting.) Over and above the \$750,000.00?

A. Yes.

Q. How much will that amount to?

A. Well, that is the total of all of them, but then this board—contingencies and omissions, \$139,667.00; engineering expense, \$191,000.00; general expense, \$99,741.00. You can easily conceive the engineering expense in your distributing system because it is built by the people here.

Q. But all that is included in the total of \$752,000.00?

A. No, they are all added to that.

Q. As I understand you, then, in this comparison which you have just made, where you say the Preston, which

includes also the Capitol, would amount to around \$600,000.00?

A.

By that you mean that by an independent company it would reasonably cost to manufacture, plus the manufacturer's profit, \$600,000.00 as compared to \$752,000.00?

A. Yes.

And that the Company has added to that a lot of Q. engineering and contingency charges?

A. Yes, they added that in addition when that is a con-

tract proposition.

Q. Now, your figure of \$600,000.00, that's a contract proposition, and that includes contingencies and omissions

and engineering?

To install that board, set up in active operation, fully tested out and up to specifications. You can't subject all these switch boards and instruments to the same thing that you do all other construction.

After they add to that the \$752,000.00, what figure

do they get on the central office equipment?

A. They add 3%, that's about \$22,500.00; 4%, which is \$30,000.00, and 3%. In other words, they add 50% before they get done with it,-add 50% to that switch board price.

Which would make a total of about how much on Q.

that?

- Well, that would run that up to almost a million dol-A. lars alone.
 - As distinguished from \$600,000.00? Q.

A. Yes, sir.

As the reasonable cost of installing it? Q.

A. Yes.

Now, Mr. Kelsey, just touch briefly on overheads, omissions, and contingencies and that sort of thing. Manufacturers of telephone equipment, where there is competition, will install that under a guarantee, put it up and test it out and eliminate any necessity for contingencies, omissions and supervision?

Always have done that.

And the prices you spoke of awhile ago include all of these things?

Everything. A.

- That same thing runs through all the other exchanges, does it not, and about the same percentage?
 - A. Yes, it does. * * * * (Record, pp. 719-721.)

Again, on pages 723 and 724, he says:

Q. I am talking about central office equipment. You stated you put that in for \$600,000.00?

A. Well, they would add about 20%.Q. And then a lot of added overcharge?

A. Well, added charges; it's in there in big type.

Q. And you stated a while ago that it would run up over a million dollars?

A. Yes, its added 50% indirect to the direct.

Q. I want you to make the calculation for Mr. Frank. You stated awhile ago, I believe, that the central office equipment was reasonably worth to manufacture, plus the manufacturer's profit, \$6,000,000.00?

A. \$600,000.0C.

Q. But as set up here in the inventory, after adding all these loading charges, it runs up over a million dollars, and I want to know this for Mr. Frank's benefit, what increase \$1,000,000.00 is over \$600,000.00 in percentage?

A. About 48%.

Q. Well, it is more than that on these figures. Just figure it out what per cent 600,000 is—what increase 1,-000,000 is over 600,000.

A. It runs over to \$1,027,000.00.

Q. Well, what increase would that be over \$600,000.00 in per cent?

A. Well, of course, it practically doubles it.

Q. Now, that would hold practically the same per cent upon all the material manufactured by the Western Electric Company and sold to the operating exchanges.

A. It would. There is no check or no restraint,—they make the prices; there are no salesman required and no

competition.

Q. They buy from one company,—one company owns

both companies?

A. There is no limit to the extravagance and they may wreck it; they have no limit and no restraining hand to hold them and they spare no expense.

Q. Do you know anything about the earnings of the Western Electric Company, Mr. Kelsey?

A. It has been one of the most profitable concerns in the whole world.

Q. Do you know of any substantial amounts in the gross value of the stock?

A. I don't think that any company in the world has paid the stock dividends and has the amount of earnings. I know of a stockholder, the Kellogg family,—they sold somethink like \$800,000.00 worth of stock which originally cost Mr. Kellogg, the father, in the '70's—the family got \$200.00 for every dollar that he put into the Western Electric.

Q. And they made it out of the profits of manufacture.

A. Oh! absolutely telephone manufacture.

Mr. D. A. Frank: A \$4,000.00 investment brought \$800,000.00?

A. Yes, sir.

After all that has been said, we feel that it almost idle to try and weigh the testimony relating to this matter as disclosed by the record, for it is known by all men that the Western Electric Company is a great monopolistic corporation that, from a modest beginning, without the addition of new capital, and through the instrumentality of stock dividends, has assumed gigantic proportions. enormous profits aside from being shown by the record (p. 724) are as much a matter of common knowledge as is the growth, through stock dividends, of such corporations as the Standard Oil, the United States Steel and Ford Motor These things are generally known and Car Company. courts will not be blinded to them, but will, we submit, take judicial notice of them. The growth of companies such as those above referred to and the profits realized by them are a part of the history of this country. As disclosed in the case of Dodge vs. Ford Motor Car Company, 170 N. W. 668; 3. A. L. R. 413, they are such as to stagger the imagination. We, of course, have no concern here with the last mentioned companies and have referred to them only by way of illustration, and say that in their history is found the parallel of the history of the Western Electric Company, is a matter of common knowledge. The only difference being that such companies other than the Western Electric Company sell their commodities to those who voluntarily purchase them, whereas, the Western Electric Company furnishes its commodities to a public service corporation from whom the public are compelled to purchase service, burdened with the enormous profits and earnings of the Western Electric Company. In face of these conditions, how flimsy is the testimony of the Company, contained in the record, that it purchases as cheaply from the Western Electric Company as it can purchase elsewhere. In the face of this history, for this plaintiff, involved as it is in a relation which has been denounced by Congress as criminal, to be granted relief in a court of equity, thereby enabling it to reap the fruits of its criminal relation merely by saying, contrary not only to the proof but also to history and common knowledge, that it has acted fairly, in equivalent to destroying the power of the public to regulate it. For, of course, it can always bring forward such testimony as it has brought forward in this case.

But counsel for the Company says it does not come within the criminal provisions of the Clayton Bill, because it is not a common carrier and because it is not "interlocking." We do not propose to follow counsel in any discussion as to whether or not the fact that practically all the stock of both the manufacturing company and the operating company is owned by the same Company makes them "interlocking," or whether a company engaged in transmitting messages is a common carrier within the meaning of the Clayton Act. If not within the letter, the A. T. & T. Co. is at least within the spirit of this law. This should operate as effectually against it when seeking in a court of equity equitable relief, such as it is here seeking, as if it was within the letter of the criminal statute.

PART II.

REPLY OF THE CITY TO THE COMPANY'S ASSIGN-MENT OF ERROR IN SUPPORT OF ITS CROSS-APPEAL.

We will reply to these assignments in the order in which they appear in the Company's brief.

The Company's Fourth, Fifth and Sixth Assignments of Error, its brief page 115, are grouped and present the proposition that the trial court erred in giving force to the provisions of the merger ordinance by substituting the cost of the Company's property for its fair value.

The first contention of the Company in support of the proposition presented by the above assignments is that the City did not plead that the Company was estopped by the merger ordinance from asserting any value on its property other than its cost, and, therefore, the City's defense of estoppel was waived. Counsel are mistaken in this statement. Such estoppel was pleaded. (Record pp. 26 and 27.)

Without stopping to discuss the question of whether or not the trial court erred in holding that the Company was estopped to deny the validity of the provisions of the merger ordinance, the City having performed by permitting the merger and the Company having accepted the benefits of the ordinance, we submit that if there was any error in the action of the trial court, such error was harmless, for the following reasons:

- (1) The prices of material and labor have so greatly declined since the trial, the amount fixed by the trial court is equal to the present fair value of the property, even tested by the reproduction theory. We have heretofore discussed this decline in prices, this brief page 4, to which we respectfully refer.
- The value of \$6,000,000.00 claimed by the Company at the time of the trial and found by the master was based largely upon the reproduction cost as of that time. (Master's Report, Record, pp. 35 and 36.) The court found that the cost of the property, as shown by the Company's books, was \$4,571,567.00 (Record p. 33), but this included \$754,-000.00 loss realized on the purchase of the property of the Home Telephone Company, and not representing any property now owned by the Houston exchange. (Record pp. 70 and 71.) So then, the cost of the property used and useful in the Houston exchange was \$4,571,567.00, less \$754,000.00, or \$3,817,567.00. This was its cost new, undepreciated. It should, of course, be depreciated, for the Company collected from the public an annuity for this purpose. But treating the property as new, still the value found by the Master was an increase of considerably over 50 per cent above the cost. We submit that the Company is not entitled to be protected in such an increase, or to have such increase included in the fair value of the property.

Wilcox vs. Consolidated Gas Co., 212 U. S. 52; 53 Law Ed. 399-400.

In this case the court says:

"And we concure with the court below in holding that the value of the property is to be determined as of the time when the inquiry is made regarding the If the property which legally enters into the consideration of the question of rates has increased in value since it was acquired, the company is entitled to the benefit of such increase. This is, at any rate the general rule. We do not say there may not possibly be an exception to it where the property may have increased so enormously in value as to render a rate permitting a reasonable return upon such increased value unjust to the public. How such facts should be treated is not a question now before us, as this case does not present it. We refer to the matter only for the purpose of stating that the decision herein does not prevent an inquiry into the question when, if ever, it should be necessarily presented." (Italic ours.)

We submit that the increase to which the utility is entitled within the meaning of this decision is the normal increase, not such an increase as is here shown, where the property has "increased so enormously in value as to render a rate permitting a reasonable return upon such increased value unjust to the public."

That the increase in the reconstruction cost of the Company's property, at the time of the trial, was the greatest known in the history of the country, is a matter of common knowledge, as is also the fact that such increase was temporary and brought about as a result of the World War.

As we have seen, the Company's property used and useful in furnishing telephone service to the people of the City of Houston was only \$3,817,567.00, undepreciated. It is admitted by the Company that the plant was in only 92 per cent physical condition (Record p. 1640), and this takes no account of accruing obsolescence. (Record p. 1640.) From this it appears that the cost of the property depreciated would not be more than \$3,500,000.00. The City's witness Lyndon placed it at \$3,000,000.00. (Record p. 1661.) But the court allowed a value of \$4,571,567.00. This sum, we

submit, was certainly sufficient to include a normal, as distinguished from an enormous increase. We suggest that the method adopted by the court in fixing the value of the Company's property, if error at all, was harmless error in favor of the Company, of which it cannot complain, for the reason that the value so fixed is in excess of what the Company is entitled to.

GOING CONCERN VALUE.

The Company, by its First Assignment of Error (its brief p. 125), complains of the action of the court in not adding any going concern value to the cost of the property as found by the court. There is no doubt, under the decisions, but what, under certain circumstances where it is proven, a going concern value should be allowed. It is suggested, however, that there was no error on the part of the trial court, in this case, in failing to allow going concern value. This for two reasons:

- (1) The uncontroverted proof shows that, if a telephone plant was constructed in Houston at this time to take the place of the Company's plant, it would be in a city of 160,000 people, educated to the use of the telephone and where the demand for the service exceeds the supply. Under these conditions there could be no value in the plant on account of its being a going concern. A telephone plant is naturally, and therefore rightfully, a monopoly. It would clearly be an unnecessary burden upon the people to have to support two separate and distinct telephone systems. So, with the people desiring all the service that can be supplied and the right to give this service being monopolized by one concern, how can it be claimed that it has a going value? As we understand it, going concern value is made up of the advantage which one concern, that is already established, has over others that have to acquire the business.
- (2) After all, it was the purpose of this hearing to determine the value of the Company's property, that is, the plant already in operation in the City of Houston, not some imaginary plant that might be constructed to replace it,

and the proof shows that the cost of acquiring the business that the Company now has, was paid for by the public in the regular course of business. (Record pp. 1535-1661-1663.) In other words, it was a part of the operating expenses that the public paid in addition to the return upon the property and the depreciation annuity. So far as we have been able to ascertain, it has never been decided that where the cost of establishing the business has been paid for by the earnings of a plant, which, in turn, were paid by the public, that the utility had a right to add to its property value the cost of establishing the business, and making it a going concern, and to exact from the public a charge sufficient to pay a return upon this addition to property value, and we submit that justice and logic operate against permitting the utility to do so.

WORKING CAPITAL.

The complaint that the court did not allow a sufficient amount for working capital is presented by the Company's Second Assignment of Error. (Its brief p. 127.) As stated by counsel for the Company, this question is simply one of amount. We think, however, that it raises a question of fact and not a question of law. We will not undertake to review the evidence which we think the record discloses fully sustains the court's findings, especially when it is taken into consideration that compensation for a considerable portion of the services rendered is paid for in advance, by which we mean to say that a great part of the service for any particular month is paid for on or before the 10th of such month. (Record p. 1272.)

THE ANNUITY FOR DEPRECIATION.

The Company under its Third Assignment of Error (Its brief p. 128) complains that the rate of 6.33 per cent should have been applied upon the value of the property in order to obtain the amount to be allowed on account of annual reserve for depreciation. The City contends that the

amount, even based upon the cost of the property, is excessive, and discusses this question in its original brief, pp. 39 and 40, to which it will add nothing here.

The appellant, City of Houston, prays, as it prayed in its original brief, that in order that justice may finally be done to the parties, the judgment, of the court below in this case, be reversed and rendered with costs.

SEWALL MYER,
W. J. HOWARD,
A. E. AMERMAN,
Solicitors for Appellant.

CITY OF HOUSTON v. SOUTHWESTERN BELL TELEPHONE COMPANY.

SOUTHWESTERN BELL TELEPHONE COMPANY v. CITY OF HOUSTON.

APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES
FOR THE SOUTHERN DISTRICT OF TEXAS.

Nos. 219, 220. Argued April 24, 25, 1922.—Decided May 29, 1922.

 The evidence establishes that the local telephone rate fixed by the appellant city was confiscatory. Pp. 321, 322.

2. In a suit by a local telephone company to restrain enforcement of an ordinance rate as confiscatory, there was evidence that the instruments used by the plaintiff were leased by it from another corporation which owned substantially all of its stock and also owned a large majority of the stock of a third corporation from which the plaintiff obtained much of its equipment and supplies, and that the charges paid by the plaintiff in return were reasonable and less than such services and supplies could be obtained for from other sources. Held, that the plaintiff was not obliged to prove the profits made by the two other companies, generally or in the business thus done with the plaintiff. P. 323.

3. A telephone company, by acceptance of a city ordinance approving its purchase of and merger with another company and containing an agreement on its part to measure its rates by a fair return upon its capital actually invested in the plant purchased, is not estopped from insisting that they shall be based upon the fair value of the property useful and used at the time of inquiry, when the ordinance is void as to the city, under the state constitution, and therefore lacks mutuality as between the parties. P. 324.

 Whether going-concern value should be considered in determining the base for fixing the rates of a public service corporation depends on the financial history of the corporation. P. 325. Galveston Electric Co. v. Galveston, 258 U. S. 388.

5. An assignment of error which involves careful study of a voluminous record will not be considered if the provisions of Equity Rule 75, that evidence be stated in simple, condensed form, and of Rule 21 of this court, that briefs refer to the pages of the record relied on, have not been properly complied with. P. 325.

268 Fed. 878, affirmed.

Opinion of the Court.

APPEAL and cross appeal from a decree of the District Court enjoining a city from enforcing a rate fixed by ordinance for a telephone company.

Mr. W. J. Howard and Mr. Sewall Myer, with whom Mr. A. E. Amerman was on the briefs, for the City of Houston.

Mr. C. M. Bracelen and Mr. Nelson Phillips, with whom Mr. W. H. Duls and Mr. N. T. Guernsey were on the brief, for Southwestern Bell Telephone Co.

Mr. Justice Clarke delivered the opinion of the court.

These are cross appeals in a suit to restrain the enforcement of an ordinance enacted by the City of Houston, Texas (hereinafter referred to as the City), prescribing rates for telephone service, based upon the claim that the rates are confiscatory.

The master to whom the case was referred found that the rates were clearly confiscatory and the District Court, while modifying his findings in some respects, confirmed his report and in its decree enjoined the enforcement of the ordinance. A federal constitutional question being involved a direct appeal brings the case to this court for review.

The Constitution of Texas, adopted in 1876, § 17, Article I, provides:

"No irrevocable or uncontrollable grant of special privileges or immunities shall be made; but all privileges and franchises granted by the legislature, or created under its authority, shall be subject to the control thereof."

It has been definitely decided that, while municipal corporations in Texas, as agencies of the State, may have the power to prescribe rates for public service corporations, this provision of the constitution prohibits their making contracts for the future which may not be modified at any time by appropriate action of the municipal-

ity. San Antonio Traction Co. v. Altgelt, 200 U. S. 304; San Antonio v. San Antonio Public Service Co., 255 U. S. 547, and Southern Iowa Electric Co. v. Chariton, 255 U. S. 539.

The ordinance here involved was passed in 1909 and therefore this state of the law would remove all question of contract from the case, if it were not that in 1915 the appellee in No. 219, the Southwestern Bell Telephone Company (hereinafter referred to as the Company), by purchase and merger acquired all of the property of a local corporation, the "Houston Home Telephone Company," and duly accepted an ordinance by which the City approved the merger. This ordinance contained the provision that the Company "agrees that it will not increase rates as at present charged by it for service in the City of Houston, unless it appears upon a satisfactory showing . . . that there exists a necessity for an increase of charges, in order that the said company may earn a fair return upon its capital actually invested in the Houston plant."

It is now contended by the City that the acceptance of this ordinance estops the Company from asserting that the value of its plant, as of the date of the inquiry, and not the cost of it—the "capital actually invested",—shall be the basis for rate-making, but the Company contends that the quoted provision of the state constitution rendered the City incapable of contracting by such an ordinance and that therefore it is void and not binding on

either party.

The master, treating the merger ordinance as void, determined the value of the property, used and useful in the operations of the Company, on the basis of its value at the time of the taking of the testimony in 1919, to be \$6,000,000; that the Company's total revenues for 1919, computed on the ordinance rates, amounted to \$908,258, and that its total expenses were \$1,214,462, thus showing

318.

Opinion of the Court.

a net loss to the Company for the year of \$306,204, without making any allowance for interest upon the investment.

Upon exceptions to the report of the master, the District Court decided that the Company was bound by the merger ordinance of 1915 to accept the cost of its plant. as distinguished from its value at the time of the inquiry. as the basis for rate-making, and thereupon reduced the valuation of the Company's property to \$4,571,567. The court also reduced the allowance of "reserve for annual depreciation", as found by the master, from \$348,150 to \$289,380. After making these and some other deductions the court, nevertheless, found that the operating expenses of the Company, not making any allowance for return on the investment, exceeded the income during 1919 by the sum of \$247,434. We fully agree with the District Court that there is a clear preponderance of the evidence in favor of the conclusion that the ordinance rate was confiscatory, and the decree of the court will, therefore, be affirmed.

The decree enjoining the City from enforcing the rate ordinance provides, that the City shall have the right to apply for a modification of it whenever it shall be made to appear that, by reason of change of circumstances or conditions, the rates prescribed by the ordinance (of 1909) are sufficient to yield a fair return upon the capital of the Company actually invested, and also that the decree is without prejudice to the rights of the City to exercise its rate-making power within constitutional limits. form of decree and the change in business conditions since it was entered render it so probable that there will be further controversy as to what are reasonable rates for telephone service in the City, in which it will be important to determine what the legal basis is for determining the value of the Company's property, that we think it proper to consider several of the assignments of error presented

ity. San Antonio Traction Co. v. Altgelt, 200 U. S. 304; San Antonio v. San Antonio Public Service Co., 255 U. S. 547, and Southern Iowa Electric Co. v. Chariton, 255 U. S. 539.

The ordinance here involved was passed in 1909 and therefore this state of the law would remove all question of contract from the case, if it were not that in 1915 the appellee in No. 219, the Southwestern Bell Telephone Company (hereinafter referred to as the Company), by purchase and merger acquired all of the property of a local corporation, the "Houston Home Telephone Company," and duly accepted an ordinance by which the City approved the merger. This ordinance contained the provision that the Company "agrees that it will not increase rates as at present charged by it for service in the City of Houston, unless it appears upon a satisfactory showing . . . that there exists a necessity for an increase of charges, in order that the said company may earn a fair return upon its capital actually invested in the Houston plant."

It is now contended by the City that the acceptance of this ordinance estops the Company from asserting that the value of its plant, as of the date of the inquiry, and not the cost of it—the "capital actually invested",—shall be the basis for rate-making, but the Company contends that the quoted provision of the state constitution rendered the City incapable of contracting by such an ordinance and that therefore it is void and not binding on either party.

The master, treating the merger ordinance as void, determined the value of the property, used and useful in the operations of the Company, on the basis of its value at the time of the taking of the testimony in 1919, to be \$6,000,000; that the Company's total revenues for 1919, computed on the ordinance rates, amounted to \$908,258, and that its total expenses were \$1,214,462, thus showing

Opinion of the Court.

a net loss to the Company for the year of \$306,204, without making any allowance for interest upon the investment.

Upon exceptions to the report of the master, the District Court decided that the Company was bound by the merger ordinance of 1915 to accept the cost of its plant. as distinguished from its value at the time of the inquiry, as the basis for rate-making, and thereupon reduced the valuation of the Company's property to \$4,571,567. The court also reduced the allowance of "reserve for annual depreciation", as found by the master, from \$348,150 to \$289,380. After making these and some other deductions the court, nevertheless, found that the operating expenses of the Company, not making any allowance for return on the investment, exceeded the income during 1919 by the sum of \$247,434. We fully agree with the District Court that there is a clear preponderance of the evidence in favor of the conclusion that the ordinance rate was confiscatory, and the decree of the court will, therefore, be affirmed.

The decree enjoining the City from enforcing the rate ordinance provides, that the City shall have the right to apply for a modification of it whenever it shall be made to appear that, by reason of change of circumstances or conditions, the rates prescribed by the ordinance (of 1909) are sufficient to yield a fair return upon the capital of the Company actually invested, and also that the decree is without prejudice to the rights of the City to exercise its rate-making power within constitutional limits. form of decree and the change in business conditions since it was entered render it so probable that there will be further controversy as to what are reasonable rates for telephone service in the City, in which it will be important to determine what the legal basis is for determining the value of the Company's property, that we think it proper to consider several of the assignments of error presented

by the appeal and cross appeal, although our conclusions with respect to them will not modify the result we have stated of this review.

While the City's assignments of error are numerous, in the brief they are frankly limited to three:

First: That the division of receipts derived by the Company from long distance tolls, approved by the court, was not a fair or adequate one.

The Company not only operated the Houston local exchange but it owned and operated long distance toll lines, connecting the local exchange with various towns and cities in Texas and several other States. The property used in the long distance service, which was not also used in the local service, was not included in valuing the investment for determining local rates, but, as the local lines were used to the extent of permitting a subscriber to connect from his home or office station with the long distance lines through the long distance station, the Company, in practice, and for the purposes of this suit, credited the local exchange with 25% of the long-distance toll revenues received from calls originating in Houston as compensation for the use made of the local plant in rendering long distance service. The City contends that this allowance is not enough, but that it should be at least 60%. Both the court and the master found: that the proportion so credited from long distance tolls was greater than that allowed to any one of eight independent exchanges in the State of Texas by independent long-distance toll lines with which they were connected; that the amount is larger than that paid by the Company to over 300 independent exchanges with which it has like connections; and that the allowance is one customarily approved by state commissions throughout the country. pared with the formidable and very convincing evidence on which these conclusions rest, the testimony introduced by the City is meager and unsatisfactory, and we agree

318.

Opinion of the Court.

with the District Court that upon the record before us the allowance was reasonably sufficient.

Second and Third: The American Telephone & Telegraph Company owns substantially all of the stock of the Company and a large majority of the stock of the Western Electric Company. From the American Telephone & Telegraph Company the Company leases its instruments and secures their maintenance and renewal and from the Western Electric Company it obtains the greater part of its equipment and supplies used in operating its local exchange. It is contended by the City that no fair disclosure was made of the profits made by the furnishing companies on the instruments and on the material and supplies so furnished and that, for this unique reason, the Company should not be heard in a court of equity and the case should be dismissed. It is true that the Company did not introduce proof to show what the profits of the two companies were, either upon the business done with it or on their entire business, but it did introduce much evidence tending to show that the charge made and allowed for the services rendered and supplies furnished by them was reasonable and less than the same could be obtained for from other sources. Under the circumstances disclosed in the evidence, the fact that the American Telephone & Telegraph Company controlled the Company and the Western Electric Company by stock ownership is not important beyond requiring close scrutiny of their dealings to prevent imposition upon the community served by the Company, but the court recognized and applied this rule. Here again, the evidence introduced by the City was meager and indefinite, while that of the Company was exceptionally full and complete, and both contentions must be denied.

In its cross appeal the Company assigns as error the holding of the District Court that the merger ordinance of 1915 obliges the Company to accept the cost of its physical plant as the basis for rate-making, instead of the usual basis, the value, at the time of the inquiry, of the property used and useful in operating the plant. (Willcox v. Consolidated Gas Co., 212 U.S. 19, 52; Minnesota Rate Cases, 230 U. S. 352; Denver v. Denver Union Water Co., 246 U.S. 178). The asserted reason for this contention is that the merger ordinance of 1915 and the acceptance of it by the Company did not constitute a contract binding upon either the City or the Company, but that, though contractual in form, it was void under the provisions of the state constitution and the decisions cited, supra. In its answer the City avers that it did not and could not, by that ordinance or otherwise, limit its rate-making power for the future. But, notwithstanding this agreement of the parties that the merger ordinance was void, the court held that the Company, having accepted and acted upon it, was estopped to claim that it was not bound by its Misrepresentation not being involved, mutuality was necessary to any estoppel growing out of this transaction, and while thus asserting that the ordinance is void as to itself the City may not successfully assert that its adversary is bound by the acceptance of it. We think that neither party was bound by the ordinance and the acceptance of it, that the District Court fell into error, and that the proper base for rate-making in the case is the fair value of the property, useful and used by the Company. at the time of the inquiry.

The master recognized "going concern value" as an element to be taken into consideration in determining the value of the Company's property and for this allowed \$765,000, which was included in the value which he fixed upon the plant. The court, however, changing the base from the value of the property to the cost of it, concluded that under the agreement in the merger ordinance no such allowance should be made, but stated, incidentally, in

its opinion, that if it had made such an allowance it would not have been in excess of one-half the amount allowed by the master. To thus reject going concern value is as-

signed as error by the Company.

Whether going concern value should be considered and allowed at all in determining the base for rate making, and if allowed what the amount of it should be, depends upon the financial history of the Company (Galveston Electric Co. v. Galveston, 258 U. S. 388), and it is impossible for us to determine whether the requisite history for deciding this question is to be found in the three large volumes of the transcript of the record of the case, containing 1664 pages, without reading the whole of it.

Equity Rule No. 75 provides that evidence to be included in the record shall not be set forth in full but shall be stated in a simple and condensed form, and Rule 21 of this court provides that briefs of the argument shall be filed in each case, with references to the pages of the record and the authorities relied upon in support of each point. The first of these rules has been wholly ignored in the printing of this record and the second has been so neglected in the preparation of the briefs that it is impossible for the court to consider this question except by itself reading and briefing the voluminous record. This we cannot consent to do, and for the reason that the record and briefs are not prepared in conformity with the rules prescribed by this court, we decline to consider this assignment of error.

The other questions argued in the briefs must necessarily be presented so differently on any further hearing of the issues involved that discussion of them here would be profitless. The decree of the District Court must be

Affirmed.

Mr. Justice Brandels took no part in the consideration or decision of this case.
